A As for Bromos [*i.* wild Otes] which the Greeks take for the ſeed of a certain ſpiked or eared weed, counted it is for one of the imperfections growing among corne, and may be ranged with the kinds of Otes: for blade and ſtalk, it commeth neere to wheat; it beareth in the haw or head certain grains hanging down, which reſemble ſmall locuſts; the ſeed is good to be vſed in t.. e cataplaſms, into which barley and ſuch like do enter; the iuice or liquor made of it, is ſingular for the cough. A weed there is which we named Orobanche, for that it choketh Eruile and other pulſe: ſome call it Cynomorion, for the reſemblance that it hath to the cullions and pizle or genitall member of a dog. It riſeth vp in a ſmall ſtem without any leaues or blade: fatty it is and red: ſometimes it is eaten alone; otherwhiles it is ſerued vp tender ſodden, between two diſhes, with other viands. Moreouer, there do ingender in pulſe, certain little venomous vermins,
B who will pricke and ſting their hands who are imploied in the plucking, yea and put them in danger of their life: a kind they are of theſe Solifugæ or Solpugæ. The remedies for all theſe, be the ſame which are ſet downe againſt Spiders, and Phalangia.

Thus much as touching all kinds of graine, as far forth as they concerne Phyſick. But this moreouer is to be noted, that of corn there be certain drinks made; as namely, Zythus in Egypt; Cœlia and Ceria in Spaine; Ale and Beere and many more ſorts, in Gaule and other prouinces. Now the froth or barme that riſeth from theſe Ales or Beers, haue a property to keepe the skin faire and cleare in womens faces. But for the operation that Ale and Beere hath in them who drink thereof, I mean to paſſe them ouer here; for I thinke it better to proceed to the treatiſe of wine: but firſt I will diſcipher the medicinable vertues of trees, and begin with the vine
C

THE TVVENTY THIRD BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

The Proeme.

THus far forth haue we gone ouer the vpper face of the earth, and ſhewed what medicinable vertues there be in all kinds of graine, as well corne as pulſe: as alſo what Phyſicke may be found in woorts and pot-hearbs: yea and in thoſe garden plants, which by reaſon of their faire floures and ſweet odours, ſerue mans turne for garlands and chaplets. It remaineth now to ſpeak of lady Pomona *and her gifts, who certes commeth not behind dame* Ceres *with all her riches. And verily this Nymph and goddeſſe* Pomona, *not content thus to protect, maintaine, and nouriſh vnder the ſhade of her trees, thoſe fruits of the earth aboue named; but diſpleaſed rather and taking ſcorne, that ſuch plants which grow farther from the Cope of Heauen, and began long after trees to come vp and ſhew themſelues, ſhould ſeeme to haue ſo many vertues: hath likewiſe furniſhed the fruits hanging vpon her trees, with their properties, and thoſe of no ſmall operation and effect in Phyſicke. And in truth, if we conſider and weigh the cauſe aright, ſhe it was that affoorded to mankinde the firſt food from thoſe her trees; inducing vs thereby to lift vp our eies and looke to Heauen-ward: yea and ſhe giueth the world to vnderſtand, that if* Ceres *and* Flora *both ſhould faile, ſhe with her goods only were able euen ſtill to ſuſtaine and feed vs ſufficiently. And to beginne with the Vine, which ought by right to be ranged in the higheſt ranke of all thoſe plants that beare the name of Trees: This bountifull Ladie not ſatisfied herein, that ſhee had done pleaſure vnto man in furniſhing him with noble perfumes, odours, and delicate Ointments, by meanes of the grape ver-*

20030 copy 1

juice, the Vine-floure Oenanthe, and namely the wilde Vine Massaris in Africke (according as I haue discoursed more at large heretofore;) hath therefore bestowed vpon Vines those medicinable vertues in greatest measure, and withall vsed these remonstrances vnto men in this manner: Call to minde (quoth shee) how many benifits and pleasures thou receiuest at my hands; Who is it but I, that haue brought forth Wine, that sweet juice of the Grape? Who but I, haue giuen thee Oyle, that daintie liquour of the Oliue? From mee, come Dates and Apples: from mee thou haste all Fruits of such varictie, that vnpossible it is to number them. Neither doe I dealc by thee as dame * Tellus doth, who bestoweth nothing vpon thee without labour and sweat of thy browes; nothing (I say) but before it doth thee any good, requireth tillage by Oxe and Plough, thrashing with flaile vpon the floore, or trampling of beasts feet vpon the mow, and then the Mil-stones to grinde it: Such adoe there is, and so long a time first, before thou canst enioy the benifit thereof for thy food. But contrariwise, whatsoeuer commeth from mee, is ready at hand; there needes no intreating of the Plough, nor any great labour and industrie to haue and inioy my fruits; for they offer themselues of their owne accord: yea, and if thou thinke much of thy paines to climbe, or to put vp thy hand and gather them, loe they are readie to droppe downe and fall into thy mouth, or else to lie vnder thy feet. See how good and gracious Nature hath beeue vnto vs herein, and how shee hath strouen with her selfe, Whether she should profit, or pleasure, man more! & yet I take it, that she affected Commoditie rather than Delight.

* The Earth.

G

H

For to come vnto the vertues and properties of the vine, The very leaues and tender burgeons thereof, applied with barley groats, do mitigate the paine of the head, and reduce all inflammations of the bodie vnto the due temperature. The leaues alone of the vine, laid vnto the stomack with cold water, allay the vnkinde heats thereof: and with barley meale, are singular for all gouts and diseases of the ioints. The tendrils or young branches of the vine being stamped and applied accordingly, drie vp any tumors or swellings whatsoeuer. Their iuice iniected or poured into the guts by a clysire, cureth the bloudy flix. The liquour concreat (which is in manner of a gumme issuing from the vine) healeth the leprie and all foule tettars, scabs and manges, in case the parts affected were prepared and rubbed before with salniter. The same liquor or gumme is likewise depilatorie: for if the haires be often annointed with it and oyle together, they will fall of: but the water especially that sweateth out of greene vine branches as they burne, hath a mightie operation that way, insomuch, as it will fetch off Warts also. The drinke wherein young vine tendrils haue lien infused, is good for those who reach vp and spit bloud; as also for women who beeing newly conceiued and breeding childe, haue many swawmes come ouer their heart, and be eftsoones subiect with faintings. The vine barke or rinde, likewise the dried leaues stanch the bleeding in a wound, yea and doe consolidate and heale vp the wound it selfe. The iuice drawne out of the white-Vine beeing stamped greene, and Frankincense together, take away shingles, ring-wormes, and such like wilde-fires, if it bee applied thereto. The ashes of the vine-stocke, vine-cuttings, and of the kernels and skinnes of grapes after they be pressed, applied with vineger vnto the seat or fundament, cure the piles, swellings, fissures, chappes, and other infirmities incident to that part: but incorporate with oile-Rosat, Rue, and vineger, they helpe dislocations, burnes, and swellings of the spleene. The same ashes strewed with some aspersion or sprinckling of wine, vpon S. Anthonies fire, without any oyle, doe cure the same: as also all frets and galls betweene the legges, and besides eat away the haire of any place. The ashes of vine-cuttings, besprinckled with vineger, are giuen to drinke for the diseases of the spleene; so as the Patient take two cyaths thereof in warme water, and when hee hath drunke it, lie vpon the spleene side. The very small tendrils of the vine whereby it climbeth, catcheth, and claspeth about any thing, being punned and taken in water, staieth and represseth vomiting in those, whose stomacks vse ordinarily to be keckliish and soone to ouerturne. The ashes of vines tempered with old hogges grease, is singular to abate swellings, to cleanse fistulous vlcers first, and soone after to heale them vp cleane: likewise for the paine of sinewes proceeding of cold, and for contraction and shrinking of the nerues: also for bruises, being applied with oyle. Moreouer, they eat away all excrescence of proud flesh about the bones, beeing tempered with vineger and niter: and last of all, mixed with oile, they heale the wounds made by scorpions or dogs. The ashes of the vine-barke alone, cause the haire to come againe in a burnt place.

I

K

L

How grape veriuice should be made, when the grapes are young and nothing ripe, I haue shewed in the Treatise of Perfumes and Ointments. It remaineth now to discourse of the medicinable vertues thereof: and first to begin withall, It healeth all vlcers that happen in moist parts, and namely those of the mouth, Tonsils or Almond-kernels on either side of the throat, and of the priuie members: the same is soueraigne for to clarifie the eie-sight: it cureth the asperitie and roughneße of the eie-lids, the fistulous vlcers in the corners of the eies, the clowdes or filmes that shadow and couer the sight, the running sores

M

in

A *in any part of the body whatſoeuer: the corrupt and withered cicatrices or ſcars, and the bones charged with purulent and skinny matter. Now if this veriuice bee too tart and eager, it may be delaied with honey or wine-cuit: and ſo it is good for bloudy flixes, and the exulceration of the guts, for thoſe who reiect and reach vp bloud, and for the Squinance.*

Next after the wine verjuice Omphacium, I cannot chuſe but write of Oenanthe, which is the floure that wild vines do beare, whereof I haue already made mention in my diſcourſe of ointments. The beſt Oenanthe is that of Syria, eſpecially along the coaſts and mountaines of Antiochia and Laodicea. That which groweth vpon the white vine, is refrigeratiue and aſtringent: being powdered and ſtrewed vpon wounds, it doth very much good: applied as a liniment to the ſtomack, it is exceeding comfortable. A proper medicine it is for the ſuppreſſion of vrine, the infirmities and diſeaſes of the liuer, the head-ache, the bloudie

B *flix, the imbecility of the ſtomack, and the looſeneſſe proceeding from it: alſo for the violent motion of cholerick humours proceeding vpward and downeward. The weight of one obolus thereof taken with vineger, helpeth the loathing that the ſtomacke hath to meat, and procureth appetite. It drieth vp the running ſcales breaking out in the head: and moſt effectuall it is to heale all vlcers in moiſt parts, and therefore cureth ſores in the mouth, priuie members, and the ſeat or fundament. Taken with hony and ſaffron, it knitteth the belly. The ſcurfe and roughneſſe of the eie-lids it doth cleanſe and make them ſmooth: it repreſſeth rheume in watrie eies. Giuen in wine to drink, it comforteth and confirmeth feeble ſtomackes; but in cold water, it ſtaies the caſting and reaching vp of bloud. The aſhes thereof is much commended in collyries & eie-ſalues;*

C *alſo for to mundifie filthy and vlcerous ſores; to heale likewiſe whit flawes riſing at the naile roots, and either the going away of the fleſh from them, or the excreſcence thereof remaining about them. For to bring it into aſhes, it muſt be torrified in an Ouen, and ſo continue vntill the bread be baked and readie for to bee drawne.*

As for Maſſaris, or the Oenanthe in Africke, it is imploied onely about ſweet odours and pomanders: and both it, as alſo other floures, men haue brought into ſo great name, by making haſte to gather them before they could knit to any fruit: ſo inuentiue is mans wit, and ſo greedy to hunt after nouelties and ſtrange deuiſes.

Chap. I.

D ¶ *The medicines which grapes freſh and new gathered do yeeld. Of Vine branches and cuttings: of grape kernels, and the cake remaining after the preſſe. Of the grape Theriace. Of dried grapes or Raiſins. Of Aſtaphis: of Staphis-acre, otherwiſe called Pituitaria. Of the wild vine Labruſca: of the wild vine both white and blacke. Of Muſts or new wines. Of ſundry kinds of Wine, and of Vineger.*

E OF Grapes that grow to their ripeneſſe and maturitie, the blacke are more vehement in their operation than the white: and therefore the wine made of them is nothing ſo pleaſant: for in very truth the white grapes be ſweeter far, by reaſon they are more tranſparent and cleare, and therefore receiue the aire into them more eaſily. Grapes new gathered do puffe vp the ſtomacke and fill it with winde; they trouble alſo the belly, which is the cauſe that men are forbidden to eat them in feuers, eſpecially in great quantity; for they breed heauineſſe in the head, and induce the Patient to ſleepe ouermuch, vntill hee grow into a lethargie. Leſſe harme doe thoſe grapes, which after they be gathered hang a long time: by which means they take the impreſſion of wind and aire, and ſo become wholſome to the ſtomacke and to any ſicke perſon; for they doe gently coole and bring the Patient to a ſtomacke againe. Such grapes as haue bin condite and preſerued in ſome ſweet wine, are offenſiue to the head and fume vp into the brains. Next in requeſt to thoſe

F aboueſaid, which haue hanged a long time, be ſuch as haue bin kept in chaffe: for as many as haue lien among wine-marc, or the refuſe of kernels & skins remaining after the preſſe, are hurtfull to the head, the bladder and the ſtomacke: howbeit they doe ſtop a laske, and nothing is there better in the world for thoſe that doe caſt and reach vp bloud: and yet thoſe grapes that haue bin kept in muſt or new wine, are much worſe than ſuch as haue lien in the marc aforeſaid.

20030 copy 1

Moreouer, wine cuit, if they haue come into it, maketh them hurtfull and offensiue to the stomack. But if they must needs be preserued in some liquor, the Physitians hold them most wholsome which haue bin kept in rain water, although they be least toothsome: for they do the stomack a great pleasure in the hot distemperature thereof; they be comfortable when the mouth is bitter, by occasion of the regurgitation of choler from the liuer and the burse of the gal; they giue great contentment also in bitter vomits; in the violent and inordinat motion of cholerick humors raging vpward and downward; as also in case of dropsie, & to those that lie sick of burning feuers. As touching grapes preserued in earthen pots, they refresh and season the mouth which was out of tast: they open the stomack, and stir vp the appetite to meat: howbeit this inconuenience they bring with them, That they are thought to lie more heauy in the stomacke, by reason of the breath and vapor which exhaleth from their kernels. If hens, capons, cocks, and such like pullen, be serued among their meat with the floures of grapes, so as they once tast and eat thereof, they wil not afterwards peck or touch any grapes hanging by clusters vpon the vine. G H

The naked branches and bunches wherupon there were grapes, haue an astrictiue vertue; and indeed more effectual that way be such as come out of the pots abouesaid. The kernels or stone within the grapes, haue the same operation: and in very truth, these be they and nothing els, whereby wine causeth head-ach. Being torrified & beaten to pouder, and so taken, they be good for the stomack. Their pouder is vsually put into the pot in manner of barly groats for to thicken broth and suppings, which are ordained for them who haue the bloudy flix, who are troubled with a continual loosnesse following them by occasion of the imbecillity of the stomack; and for such as are ready to keck and heaue at euery little thing. Their decoction serueth very wel, to foment those parts which are broken out and giuen to bleach and itch. The stones themselues are lesse hurtful to the head or bladder, than the little kernels within. The same beeing driuen into pouder, and applied with salt, are good for inflammations of womens brests: the decoction thereof, whether it be taken inwardly, or vsed by way of fomentation, helpeth as well those who haue gone a long time with a dysentery, or bloudy flix, as them who through imbecility of stomack, do scoure and purge downward continually. I

The grape Theriace, whereof we haue written in due place, is good to be taken as a counterpoison against the sting of serpents: & it is a common receiued opinion, that the burgeons and branches of that vine, should likewise be taken inwardly as meat, & applied outwardly for the same purpose: as also that both wine and vineger which is made of them, is of singular operation to the same effect. K

The dried grape or raisin, which they call Astaphis, would trouble the stomack, belly, and intrails, but for the kernels that are within the stones, which serue as a remedy to preuent and cure those inconueniences; which being taken forth, raisins be thought good for the bladder: but particularly for the cough, those of the white grapes be the better. Soueraigne are they also for the wind-pipe and the reins: like as the sweet cuit which is made thereof hath a speciall power and vertue against the Hæmorrhois alone, of all other serpents. A cataplasme made of them, together with the pouder of Cumin or Coriander seed, applied to the cods, cureth their inflammation. Likewise, if they be stamped without their stones or kernels, together with Rue, they are singular good for carbuncles and gouts: but before this cataplasm be laid to any vlcers, they ought before hand to be bathed and fomented with wine. Applied with their stones, they heale chilblanes and bloudy falls, yea and ease the paines and wrings which accompany the bloudy flix. Of them boiled in oile, there is a liniment made, which being applied with the outward rind of a radish root and hony, helpeth gangrenes: but if there be Panace or Loue-ach added therto, the liniment cureth the gout, and confirmeth nails which be loose. Being chewed alone with some pepper, they purge the head and the mouth. L

Astaphis agria, or Staphis, which some (though vntruly) call Vva Taminia (for this is a seuerall kind by it selfe, growing vp with straight black stalks, and carying leaues like to the wilde vine Labrusca) beareth bladders or little cods more like than grapes, of a green color, & resembling cich-pease, within which is to be seen a three-cornered kernel: it waxeth ripe and beginneth to change colour and looke black, at vintage time: whereas we know that the grapes of the Taminian vine be red: also we are assured, that Staphis-acre loueth to grow in Sun-shine places, but the Taminian grape no where but in the shade. The said kernels I would not aduise to be vsed for a purgation, considering the doubtfull euent and danger that may insue of choking M

and

A and ſtrangulation: neither for to draw downe fleame and wateriſh humors into the mouth, for ſurely they be enemies to the throat and weaſin pipe. The ſame, if they be done into pouder, rid lice out of the head & al parts of the body beſides: which they do the better & with more eaſe, in caſe there be Sadaracha or Orpiment among. In like manner, they kill the itch and the ſcabs. For the tooth-ache, they vſe to be ſodden in vineger; for the diſeaſes alſo of the ears, for rheums and eating cankers of the mouth. The floure beaten into pouder and ſo taken in wine, is ſingular for the biting and ſting of ſerpents: for I would not giue counſell to vſe the ſeed, ſo exceeding hot it is and of ſo fiery a nature. Some call this herb Pituitaria, and apply it as a liniment to the ſores occaſioned by the biting of ſerpents.

As for the wild vine Labruſca, it carieth alſo a floure named in Greeke Oenanthe, whereof I
B haue written enough before. The wild vine which the Greeks name Ampelos Agria, hath thick leaues, and thoſe inclining to a white colour: the ſtalkes or branches be diuided by ioints and knots, & the bark or rind is all ouer ful of chinks & creuiſes: it beareth certain red grapes much like vnto the berries wherewith they colour ſcarlet; which being ſtamped with the leaues of the ſame plant, and applied with juice of the own, are good to cleanſe and beautifie the skin in womens faces; and beſides, do help the accidents and griefs that may befall to the haunch, huckle-bone, and the loins. The root boiled in water, and ſo taken in two cyaths of the * wine of the I- * Much like to our Malvaſey.
ſland Coos, doth euacuat watery humors gathered in the belly, and by conſequence is thought to be an excellent drink for them who are in a dropſie. And this is the plant, which in my iudgement ſhould be that vine which commonly is called in Latine Vva Taminia, rather than any
C other. Vſed much it is for a counter-charme againſt all witchcrafts: and giuen it is to gargariſe only with ſalt, thyme, and honied vineger or oxymell, to them that ſpit and caſt vp bloud, with this caueat, To let none of it go down the throat: and therefore men feare to purge therewith, ſo dangerous it is thought to be. Another plant there is much like to this, called in Latine Salicaſtrum, for that it groweth in willow rews: and albeit theſe two carry diuers and diſtinct names, yet they be of the ſame nature and property, and be vſed to the like purpoſes. Howbeit this Salicaſtrum is taken to be more effectuall of the twain for to kill the ſcab, ſcurfe, and itch, as well in men as in four-footed beaſts, if it be bruiſed and applied with honied vineger.

There is a certain wild white vine, which the Greekes call * Ampeloleuce, ſome Ophioſta- * Some take it for Bryonie.
phylon, others Melothron or Pſilothrum; ſome Archezoſtis or Cedroſtis, others Madon. This
D plant putteth forth long and ſlender twigs, parted and diuided by certaine joints or knots, and theſe climb vp and claſp whatſoeuer they meet withall. The leaues grow thick and full of tendrils or yong burgeons, as big as Iuy leaues, diuided & jagged in maner of other vine leaues: the root is white & big, like at the firſt to a radiſh; from which there ſpring certain ſhoots or ſions reſembling the buds of Aſparagus: theſe yong ſprouts ſodden & eaten with meat, purge both by ſiege and vrine: the leaues and branches be exulceratiue, and wil raiſe bliſters vpon the body; and therfore applied with ſalt as a liniment, they be good for corroſiue vlcers, gangrens, wolues, and the old morimall ſores in the legs. The ſeed or graine thereof is contained within certaine berries hanging down thin here and there in ſmall cluſters, which yeeld a certain red juice or liquor at the firſt, but afterwards it turneth to a yellow ſafron colour: this know the curriors well
E who dreſſe skins, for they vſe it much. There is an ordinary liniment made therewith, for ſcabs, mange, and leproſie. The ſeed being boiled with wheat, and ſo taken in drink, cauſeth nurces to haue good ſtore of milk. The root of this wild vine is very ſoueraigne, and ſerueth in right good ſtead for a number of purpoſes: firſt if it be powdered to the weight of two drams and giuen in drink, it is ſingular againſt the ſting of ſerpents: it is excellent to ſcoure the skin of the face, to take away all ſpots and ſpeckles, flecks and freckles, in any part of the body; the black and blew tokens of ſtripes, by reaſon of bruſed bloud lying vnder the skin; foul & vnſeemly ſwert skars, it reduceth to the freſh & natural colour: theſe operations it hath, being boiled in oile: the decoction alſo is vſually giuen in drink to thoſe who be ſubiect to the falling euill: likewiſe to ſuch as be troubled in mind & beſide themſelues: to as many as are giuen to dizzines & giddines of
F the brain, and do weene that euery thing turnes round; but they muſt take the poiſe of one dram euery day throughout the yeare. The ſame root if it be taken in any great quantity, * purgeth * Purgat, rather ruſheth out of Diaſcorides, throughout the ſences. But the principall and moſt excellent vertue that it hath, is this, That if it be ſtamped with water, and ſo applied, it draweth forth ſpels of broken and ſhiuered bones as well and effectually as the verie true Bryonie, which is the cauſe that ſome doe call it White Bryonie:

for there is another which is black,and of greater efficacie to the ſame purpoſe, if it be applied with hony & Frankincenſe.It is very good to reſolue impoſtumes and biles which are in growing, and not yet come to ſuppuration; but if they haue continued and gather to an head, it bringeth them ſoone to maturation,and afterwards clenſeth them. It bringeth downe womens monthly ſickneſſe,and prouoketh vrine. An electuary or lohoch made therof, to licke,and ſuffered gently to melt vnder the tongue and go downe leiſurely,is ſingular good for ſuch as bee ſhort-winded and labour for breath: alſo for pleuriſies or pains of the ſide, for convulſions and inward ruptures.If one drink the weight of three oboli 30 daies together, it will waſt and conſume the ſwelled ſplene. The ſame ſerueth in a liniment to be applied with figs to the excreſcences or riſings of the fleſh ouer the naile,called Pterygia.Being laid too as a cataplaſm with wine,it fetcheth away the after-birth in women: and taken to the weight of a dram, in honied water,it purgeth flegmatick humors. The juice of the root muſt be drawne before the fruit or ſeed be ripe:this juice either alone,or incorporat with Eruile meale, if the body be annointed therewith doth illuſtrat the colour,make the skin ſoft and tender;and in one word it is ſuch an embeliſhment,that it maketh any perſon better for the ſale: [* where by the way note, that it chaſeth ſerpents away.]Moreouer,the very ſubſtance of the root, if it be ſtamped with fat figs, doth lay the riuels and wrinckles of the skin plain and euen, if it be rubbed or annointed therewith:but then the party muſt walk immediatly vpon it,a good quarter of a mile; for otherwiſe it will fret and burne the skin, vnleſſe preſently it be waſhed off with cold water. Howbeit the black wild vine doth this feat more gently and with greater eaſe,for ſurely the white ſetteth an itch vpon the skin. There is therfore a black wild vine,which properly they call Bryonia, ſome Chironia,others Cynecanthe or Apronia, like in all reſpects to the former, but only in the colour[of the root grape or berry]for it is black,as I haue before ſaid. The tender ſprouts & ſions that ſpring from the root,*Diocles* preferred to be eaten in a ſallad or otherwiſe, before the very crops and tender ſhoots of the true garden Sperage; and indeed they prouoke vrine and diminiſh the ſpleen far better:it groweth commonly in hedges among buſhes and ſhrubs, and moſt of all in reed-plots. The root without-forth is blacke,but within of a pale yellow box colour; and this is of much more efficacie to draw out broken bones than the aboue-named white Briony. Moreouer,this peculiar property it hath beſides,To cure the farcines or ſores in horſe necks and for this,it is thought to be the only thing in the world. Said commonly it is, that if a man do ſet an hedge or hay thereof round about a grange or ferm houſe in the country,there will no kites nor hawks,nor any ſuch rauening birds of prey,come neere;ſo as the pullen and other foul kept about the ſaid ferme,ſhall be ſecure from their claws or tallons.If it be tied about the ankles of a man,or the paſterns of laboring horſes,vnto which there is a fall either of Phlegmatick humors,or of a bloud,cauſing the gout in the one and the pains in the other,it cureth the ſame. Thus much concerning the ſundrie ſorts of Vines, and their properties reſpectiue to Phyſicke.

G H I K

* I ſee no reaſon of this clauſe here, but thinke it ſuperfluous, according to ſome manuſcript copies.

As touching Muſts or new wines,the firſt and principall difference of them lieth in this,that ſome by nature are white,others blacke,and others again of a mixt colour between them both. Secondly,ſome Muſts there be,whereof wine is made;and others,which ſerue only for cuit:but if we regard the artificiall deuiſes and the carefull induſtry of man about them, there be an infinit number of muſts all diſtinct and different one from the other. Thus much may ſuffice to deliuer fully in generall terms concerning muſts or new wines. As for their properties,There is no muſt or new wine,but it is hurtfull to the ſtomack, though otherwiſe pleaſant to the veines and paſſages. Certes, if a man poure downe new wine haſtily, without breathing or taking the wind between,preſently as he commeth out of the bain or hot-houſe, hee doth enough to kill himſelfe. Howbeit,of a contrary nature it is to the Cantharides,& ſaueth thoſe that are in danger by drinking them. A ſingular counterpoiſon is new wine in the lees,againſt al ſerpents,but principally the Hæmorrhoids and the Salamanders. It cauſeth head-ache, and is an enemy to the throat and windpipes:wholſome it is for the kidnies, the liuer,and the inward parts of the bladder,for it eaſeth them all of pain. But a ſingular vertue it hath againſt the venomous worm or flie Bupreſtis,aboue the reſt: if one drink it with oile,and caſt it vp againe by vomit, it is an excellent remedy for thoſe who haue taken too much Opium: it helpeth thoſe who are in danger of crudled milk within the body:ſuch alſo as are poiſoned with hemlock, envenomed with the poiſon Toxica & Dorycnium. In ſum,white new wine is not ſo powerful in operation as o-

L M

thers.

A thers. Likewiſe, the Muſt, wherof cuit is made, is pleaſanter than the reſt, & cauſes leſſe headach.

As touching the ſundrie kinds of wine, which are exceeding many as alſo the vertues, and properties of euery ſeueral ſort in manner by it ſelfe, I haue ſufficiently diſcourſed in a former Treatiſe. Neither is there any point more difficult to be handled, or that affourdeth greater variety of matter. And a man canot readily ſay, Whether wine be more hurtfull or wholſome for our bodies? conſidering the doubtful euent and iſſue preſently on the drinking therof, for that ſomtime it is a remedy and a helpe, otherwhiles it proueth to be a miſchiefe and a very poiſon. For mine owne part, according to my firſt deſſign and purpoſe, I am to treat only of ſuch things as Nature hath brought forth for the health and preſeruation of man. Wel I wote, that *Aſclepiades* hath made one entire volume expreſſely, of the manner how to giue wine in drinke. Vpon
B which treatiſe or book of his, an infinit number there were who haue written their Commentaries. As for me, according to that grauity which beſeemeth Romanes, and to ſhew affection and loue to all liberall Sciences, I will not diſcourſe thereof as a Phyſician, but with great care and diligence write ſo diſtinctly, as a deputed judge or arbiter delegat to determin of mans health, and the preſeruation thereof. To diſpute and reaſon of euery ſeuerall kind, were a endles peece of work, and ſo intricat, as I wot not how a man ſhould rid himſelfe out of it, if he were once entred; ſo repugnant and contrarie are the Phyſicians one to another in that argument.

To begin firſt with the wine of Surrentum, our ancients haue held it ſimply for the beſt aboue all others. But our later and more moderne writers, haue made greater account of the Albane and Falerne wines. In ſumme, euery one hath iudged of the goodneſſe of wine, according to his
C owne conceit and fantaſie: a moſt vnequall courſe of proceeding, without all reaſon and congruitie, to pronounce definitiuely vnto al others that for beſt, that pleaſed and contented his owne taſt moſt. And yet ſet the caſe and ſay, they were all agreed and of one opinion as touching the moſt excellent wines; How is it poſſible, that the whole world ſhould enioy the benefit thereof, ſince that great lords and princes themſelues haue much adoe to meet with pure and perfect wines, without one ſophiſtication or other? In good faith, the world is grown to this abuſe, that wines be bought and ſold now at an higher or lower price, acording to the name and bruit that goeth onely of the cellars from whence they come: whereas in truth, the wines were marred and corrupted at the firſt in the very preſſe or vatt, preſently after the vintage and grape-gathering. And therefore it is, that now adaies (a wonderfull thing to be ſpoken) the ſmalleſt and baſeſt
D wines are of all others leaſt ſophiſticate and moſt harmeleſſe. Well, how ſoeuer it be, and admit the nobleſt kinds of wine are moſt ſubject to thoſe bruings and ſophiſtication, which make indeed the ods that is; yet thoſe wines beforenamed, to wit, the Falern, Albane, and Surrentine, do ſtill import and carrie away the victory and priſe from all the reſt, by the generall voice & conſtant ſentence of al writers. As touching the Falerne wine, it is not wholeſome for the body, either very new, or ouer old; a middle age is beſt, and that begins when it is fifteen yeres old, and not before. This wine is not hurtfull to a cold ſtomacke: but I cannot ſay of a hot ſtomack. If it be taken alone and pure of it ſelfe in a morning, and drunke faſting, it doth much good to them who haue bin troubled with a long cough, or vexed with a quartan ague. And verily, there is not a wine that ſtirreth the bloud and filleth the veines ſo much as this. It ſtaieth the laske, &
E riſheth the body. Howbeit generally receiued and beleeued it is, That this wine dimmeth the eye ſight, and doth no good to the bladder and neruous parts. And indeed, the Albane wines agree better with the ſinews. And yet the ſweet wines that come from the vineyards of the ſame tract are not ſo wholeſome to the ſtomack: but the harſh and hard auſtere wines of this kind, be in that regard better than the Falerne wines aboueſaid. And in one word, theſe Albane wines help digeſtion but little, and in ſome ſort ſtuffe and fil the ſtomacke. But the Surrentine wines charge not the ſtomacke any jot, nor yet fume vp in the head: nay, they reſtrain and repreſſe the rheumaticke fluxions both of ſtomacke and guts. As for the wines of Cæcubum, they bee now paſt date, and none of them are made any more. But thoſe of Setinum, that remaine ſtill and be in ſome requeſt, doe mightily aid concoction, and cauſe the meat for to digeſt. In a word, Sur-
F rentine wines haue moſt ſtrength, the Albane drink harder, and the Falerne be more mild and nothing ſo piercing as the reſt.

The Statane wines come not far behinde theſe abouenamed. As for the Signine wine, out of all queſtion it is ſimply the beſt to bind the body, & ſtop a vehement flux: thus much for wines and their properties in particular. It remaineth now to ſpeake of their vertues in generall.

First

Firſt and foremoſt, wine maintaineth and fortifieth the ſtrength of man, engendreth good G
bloud,and cauſeth a freſh and liuely colour. And herein verily conſiſteth the principall diffe-
rence betweene our temperat climat within the heart (as it were) and middle part of the world,
from thoſe intemperat Zones on either hand. And looke how much the diſtemperature of the
two Poles,worketh in the inhabitants of thoſe parts, and hardneth them to endure and ſupport
all kind of trauell: ſo much doth this ſweet and pleaſant liquor of the grape enable vs to abide
and ſuffer the like labour. And becauſe we are entred into this theame, note thus much moreo-
ner, That the drinking of milke nouriſheth the bones: of beere and ale, and ſuch like, made with
corne; feedeth the ſinewes and neruous parts: but of water, maintaineth the fleſh and brawnie
muſcles onely. Which is the cauſe, that ſuch nations as drinke either milke, ale, beere, &c. or
ſheere water, are nothing ſo ruddie of colour, nor ſo ſtrong and firme to vndergoe painefull tra-
uell, as thoſe, whoſe ordinarie & familiar drink is wine. And in truth, as the moderat vſe of wine
comforteth the ſinews & helpeth the eyeſight; ſo the ouer-liberal taking thereof offendeth the H
one, and enfeebleth the other. Wine recreateth & refreſheth the ſtomack: wine ſtirreth vp the
appetite to meat: wine allaieth ſorrow, care, and heauineſſe: wine prouoketh vrin, and chaſeth a-
way all chilling cold out of the body. Finally, wine induceth ſleep and quiet repoſe. Moreouer,
this good property hath wine, To ſtay the ſtomack & repreſſe vomits, taken into the body: and
without-forth applied with wooll embrued and bathed therein, to diſſipat and reſolue all ſwel-
ling apoſtumes. *Aſclepiades* was ſo addicted to the praiſe of wine, that he baſhed not to make
compariſons & pronounce, that the power and puiſſance of the gods was hardly able to match
and counteruaile the might and force of wine. Moreouer, this is to be noted, that old wine will I
beare a greater proportion of water than new, and prouoketh vrine more: although it withſtand
and allay thirſt leſſe. Sweet wines do not ſo much inebriate and ouerturne the brain, as others;
but they flote aloft in the ſtomacke: whereas auſtere and hard wines be lighter of digeſtion and
ſooner concocted. The lighteſt and ſmalleſt wine is that which ſooneſt commeth to his age,
and ſheweth it moſt quickely. The wines which by age and long keeping, lay downe their ver-
dure and become ſweet, are leſſe hurtful to the ſinews than others. The groſſe, fattie, and blacke
wines, are not ſo good for the ſtomack; howbeit, they be moſt nutritive: for the thin and bruske
harſh wine nouriſheth the body leſſe; but yet more agreeable and nutritiue it is to the ſtomack.
It paſſeth more ſpeedily away by vrine, but fumeth vp ſo much the rather into the head. And K
take this for a generall rule once for all, not only in wines, but in any other liquors whatſoeuer,
that be penetratiue, ſubtile, and piercing, That they be alwaies offenſiue to the head, howſoeuer
otherwiſe they be piercing and paſſe ſoone away. Furthermore, wines that are laid vp in ſmokie
places, therby ſooner to ſeeme refined and old, are of all others moſt vnwholſome. But this and
ſuch caſts were deuiſed by huckſters, vintners, & tauerners, after the wines were laid vp in their
cellars. And now adaies good houſekeepers alſo haue inuented means to renue their wines, and
make them ſeem freſh and new, after they haue by long lying gotten a fuſty rotten taſt, and ga-
thered a mouldy mother of themſelues, which is called Caries in Latin. And verily, our aunci-
tors by vſing this tearme, in wines ouerſtale and kept ouer their due age, haue giuen vs counſell
and taught vs ſufficiently, how to take away this vnpleaſant taſt of wine, (*i.*) by ſmoake: for like
as ſmoake eateth away and conſumeth the moiſture and mouldineſſe in timber, which cauſeth L
rottenneſſe, ſo it doth in wines. But we forſooth, contrariwiſe are perſuaded, that the bitterneſſe
of ſmoke, when it hath caught the wine, maketh it to appeare ſtale & old. Such wines as be very
pale and whitiſh, proue the better and more wholeſome by age and long lying: the more excel-
lent that the wine is and of the kindlier grape, the thicker and groſſer it waxeth by age; and in
this gathering turneth to a kind of bitterneſſe, which is hurtful to mans body. Alſo, as vnwhol-
ſome it is to mix, ſeaſon, and confect therewith ſome other wine, that is not ſo old, & ſo to keep
or drinke them together. Each wine agreeth beſt with the ſtomack, and doth leaſt harme, when
it hath no other liquor nor taſt, but the owne, and euery wine is moſt pleaſant and delightſome
when it is taken in due time, that is to ſay, neither old nor new, but of a middle age, which is the
very floure. Such perſons as would feed, and deſire to be corpulent, or to keep their bodies ſolu- M
ble, and haue the riddance of their bellie at commaund, ſhall do well to drinke often at their re-
paſt: Contrariwiſe, they who feed ouermuch, and deſire to be gant and ſlender, and withall, to be
coſtiue, ought to forbear drinking at meales, ſo long as they eat, but after meat they may drink
moderatly. To drinke wine vpon an emptie ſtomacke faſting, is a new found deuiſe lately come

vp,

A vp,and it is moſt vnwholeſome for the body, and namely for thoſe who are to goe into the field for to fight a battell: for it hindereth the forecaſt of the mind, and dulleth the vigor and quickneſſe of the ſpirit:fitter indeed to bring and lull men aſleep in the bed of ſecuritie:certes,it was a practiſe long agoe among ſuch as deſired reſt and peace, and who loued to ſleepe in a whole skin,for to drinke wine faſting: for ſo we read in *Homer*,how *Helena* that faire ladie, preſented a cup of wine before meat. And hereupon came the prouerbe, That wine doth ouerſhadow and darken the light of wiſdome & vnderſtanding:verily we that are men haue this property aboue all other liuing creatures,and we may thanke wine for it,That we drinke many times when wee be not dry nor a thirſt. And therfore paſſing good it is to drink fair water otherwhiles between. In like manner ſuch as vſe ordinarily to be drunk,& are lightly neuer ſober, ſhall not do amiſſe
B to take a good draught of cold water preſently vpon their liberall pouring in of wine,for it will forthwith diſpatch and diſcuſſe thoſe fumes which cauſe drunkennes. *Heſiodus* giueth counſell to drinke wine ſomewhat delaied with water, for 20 daies before the riſing of the Dog ſtar,and as many after. True it is indeed,that Mere* wine not delaied,is a remedy againſt hemlock; Coriander,the poyſon Aconite or Libard-baine,the venomous gum of the plant Chamæleon,called Ixia,Opium,or the juice of Poppie,and Quickeſiluer:alſo, for ſuch as haue been ſtung with Bees Waſpes,and Hornets,the venomous ſpiders Phalangia,Serpents,and Scorpions,and generally,againſt all thoſe poyſons,which by reaſon of a cold quality moritifie naturall heat. But particularly it is a ſpecial countrepoiſon againſt the venomous worms called Hemorrhoids & Preſters,as alſo the deadly Muſhroms. Ouer and beſides,ſingular good is wine againſt ventoſi-
C ties, gripings, and gnawings about the midriffe and precordiall parts about the heart: alſo for thoſe,whoſe ſtomacks are ready euery while to ouerturne & caſt:and where the belly or entrails be troubled with rheumatick fluxes. Semblably,wine a little delaied,is ſingular for the bloudy flix:for ſuch as be giuen to faint ſweates,old coughs,and any violent fluxes either into the eyes or other inferiour parts. But a fomentation of meere wine may be applied with a ſpunge to the left pap in the caſe of the Cardiacke paſſion,which is a feebleneſſe and trembling of the heart. And in theſe caſes white wine is better than any other,ſo it be of ſom reaſonable age. Alſo it is found by experience,That horſes and ſuch beaſts,either for the ſaddle and pack or draught, become very luſty,if their ſtones or genetors be bathed with wine hot:& when they be tired out, there is nothing (by report) better to refreſh their courage, than to poure wine into them with
D an horne. Apes and Marmoſets,and other four-footed beaſts,whoſe feet are diuided into claws or toes,will not grow (men ſay) if they be vſed to drinke pure wine. But it is my purpoſe now to treat of the properties of wine,touching Phyſick and the cure of maladies. For gentlemen,well born and bred,who haue wherwith,and may haue what they wil,the wines of Campain I count wholſomeſt,ſo they make choiſe of the ſmalleſt and the thinneſt. But the common ſort may be Phyſicians to themſelues, and drinke euery man what wine he liketh moſt, and findeth beſt to agree with him. Howbeit to ſpeake generally, the wholeſomeſt wines both of the one ſort and the other,and for all perſons, be ſuch as haue run through a ſtrainer or Ipocras bag,and thereby loſt ſome part of their ſtrength. But this we muſt remember euery one of vs,That the liquor of wine gets all the force and ſtrength that it hath by working, ſpurging,and ſeething(as it were)
E in the lees while it is Muſt. To mingle ſundry kinds of wine together,can be good for none,either rich nor poore. Contrariwiſe, that wine is held moſt healthfull, that is of it ſelfe,and had nothing put thereto in the firſt vatt or veſſell when it was new and meere Muſt of the grape,and the better will it bee, if there come no pitch into the barrells or veſſells wherein it is tunned or filled. For as touching thoſe wines, that are medicined with marble,plaſtre,and quickelime, what a man is he(were he neuer ſo healthy & ſtrong)but he may be afraid well ynough to drink thereof? wel then,wines either tunned vp or delaied with ſea water,be hurtfull to the ſtomack, ſinewes,and bladder,as much as any other. As for the wines dreſſed and confected with Parrozine,they are thought to be wholſom for cold ſtomacks:but contrariwiſe,good they are not for ſuch as are prone to vomit,no more than Muſt it ſelf,or cuit,whether it be ſapa or paſſum:wine,
F wherin roſin hath bin newly put, is not for any man to drink;for it cauſeth headach,ſwimmings and dizzineſſe in the brain:and no maruel if this mixture be called Crapula,for it intoxicateth the braine. Howbeit,theſe wines thus brued and dreſſed with roſin,are good for the cough and all rheumes;likewiſe, for feeble ſtomacks and the flux thereof enſuing;as alſo in dyſenteries or exulcerations of the guts,and their bloudy flix;and laſt of all,for womens termes. In theſe kind

of

* *Merum*;

20030 copy 1

of wines thus mixed and ſophiſticated, the claret or deep red are more aſtringent and hot than G
all others. Leſſe harme yet commeth of thoſe wines which bee prepared with pitch alone, and
nothing elſe. Neuertheleſſe, we muſt not forget, that pitch is nothing elſe but the liquor that
runneth from burnt Parrozin. And in truth, theſe wines that ſtand vpon pitch, doe heat the ſto-
macke, helpe concoction, and purge offenſiue humours: they be good for breaſt and belly: alſo,
comfortable to the matrice, for they doe allay the paines thereof, if the women haue no feaue-
rous diſpoſition; and doe cure Rheumes and Catarrhes, which haue continued their courſe a
long time: they heale inward vlcers, ruptures, ſpaſms, and convulſions; impoſtumes bred within
the interiour parts, feebleneſſe of the ſinewes, ventoſities, coughs, purſiueneſſe, wheezing, and
ſhortneſſe of breath; and finally, helpe diſlocations, beeing applied with vnwaſhed and greaſie
wooll, as it grew in the fleece. But note, that for all theſe infirmities abouenamed, the wine is H
more effectual, which naturally hath the taſt of pitch, and therupon is called Picatum, than any
other, that by artificiall meanes is dreſſed and prepared with pitch. And yet the wines made of
the Heluenake grapes, if a man drink ouer-liberally of them, are wel known to trouble the head,
notwithſtanding they taſt of pitch naturally. To come now vnto the diſeaſe, which we call the
feuer or ague, this is certaine, That wine ought not to be giuen in that ſickneſſe, vnleſſe the pa-
tient be well ſtept in yeres and aged, the diſeaſe chronicke and of long continuance, or that the
ſickneſſe begin to decline and weare away: for in hot, quick and ſharpe feauers, which common-
ly be very dangerous, the ſicke perſons, be they young or old, ought to be reſtrained altogether
from wine; except a man may euidently perceiue ſome remiſſion or alleuiation of the diſeaſe:
and the ſame rather in the night, than by day time; for certainly, the daunger is leſſe by the one I
halfe, if they drinke wine toward night, and in hope to procure ſleepe. Moreouer, women newly
deliuered & brought to bed (whether they went the full time, or ſlipt an abortiue fruit vntime-
ly) are not allowed in any caſe to drink wine: neither thoſe perſons who haue weakned their bo-
dies with the immoderat vſe of women, and thereupon fallen ſicke: ne yet ſuch as be ſubject to
the headach: no more than thoſe, who during the fits of agues, feele their legges and other ex-
treame parts to be cold: or haue a cough ioined with their feauer. Moreouer, wine is an enemie
to all thoſe who haue a ſhaking and trembling of their joints, or be pained either in their ſi-
newes or throat. Furthermore, in caſe the force of the diſeaſe be knowne to lie much about the
*Circa ſſia. * ſmall guts and hypocondriall parts, the patient muſt altogether forbeare to drink wine. They
are to abſtaine likewiſe when there is any hardneſſe felt in the midriffe and precordiall parts: K
and when the pulſes beat mightily, and goe faſter than ordinarie. Semblably, in caſe the cramp
doe draw the necke farre backe with a cricke, ſo as the head cannot ſtirre forward: or take the
whole bodie ſo, as it is not able for to turne any way, but ſeeme as ſtiffe as if it were all of one
peece; no wine muſt be giuen vnto ſuch a patient. In like ſort, thoſe are forbidden to drinke
* Eſpecially if it proceed fró ſome hot or ſharpe humor. wine, who are giuen to * yexing: and much more they, who in an ague labor for breath, and
draw their wind hardly. But moſt of all muſt the ſicke be kept from wine when their eies be ſet
in their head, and their eye-lids ſtand ſtiffe and ſtarke, with their eyes broad open: or bee ſhut,
by reaſon that they are weake and heauie. Alſo, they muſt auoid wine (if they bee wiſe) who in
their ſickneſſe, as they winke or twinckle with their eyes, doe imagine that they ſparkle & glit-
ter againe: like as thoſe who cannot lay their eyes together and cloſe their lids, but ſleepe open L
eyed. And euen ſo they ought to flie from drinking of wine whoſe eyes be red and bloud-ſhot-
ten, or otherwiſe giuen to bee full of viſcous and gummie matter. Neither are they permitted
to drinke any wine, who eftſoones ſtut and cannot pronounce their words perfectly, whether it
bee, that their tongue bee ouer-light and ſpongeous, or otherwiſe dull and heauie: no more
than thoſe, who hardly and with much difficultie, make water: who are affright ſodainly at eue-
ry little thing that they heare or ſee: who are giuen to crampes and crickes: ſuch alſo as other-
whiles lie benummed, as if they were dead aſleepe. And laſt of all, as many as ſhed their ſperme
involuntarily in their ſleepe. True it is, and no man maketh any doubt, That the onely hope
and right way to cure them, who in the Cardiake diſeaſe, for very faintneſſe are troubled with
the trembling and ſhaking of the heart and giuen vnto diaphoreticall ſweats, conſiſteth in M
the drinking of wine. And yet in the manner thereof, Phyſicians are not agreed: For ſome
are of aduiſe, not to giue it but in the very fit and extremitie of the diſeaſe: others againe pre-
ſcribe it at no time elſe, but when the violence of the fit is paſt, and the patient at ſome eaſe.
They who are of the former opinion, haue a regard to their ſweat, for to repreſſe it: but theſe

haue

A haue an ey to the danger of the patient,being of this mind,that it is a more ſafer courſe to giue wine when the violence of the ſickneſſe abateth. And indeed of this judgement I ſee that moſt Phyſicians are. As touching the time to drinke wine,this is certaine,that good it is not but at meat:neithe r preſently after ſleepe,nor immediatly vpon any other drinke,which is as much to ſay,as neuer but when a man is drie and thirſty. Neither muſt a ſicke man be allowed it, but in caſe of neceſſity or deſperat extremity.In ſumme,we graunt it to men rather than to women:to aged perſons ſooner than to young folke:and yet to a luſtie young man,before a child:in Winter oftner than in Summer, and to conclude, to ſuch as bee accuſtomed thereto more than to thoſe who haue not drunke thereof beforetime. A meaſure alſo and mean would be kept,in the allowance of wine,according to the ſtrength thereof,and the proportion of water mixed there-
B with:and the common opinion importeth thus much, That to one cyath of wine it is ſufficient to put two cyaths of water ordinarily. But in caſe the ſtomack be weak & feeble,ſo as the meat digeſt not nor paſſeth away downeward, meer wine is to be giuen to the patient,or at leaſtwiſe in greater proportion to the water.

But to retuin again to thoſe artificial and made wines,I haue heretofore ſhewed many ſorts therof:the making of them is at this day giuen ouer,as I ſuppoſe,and their vſe needleſſe and ſuperfluous,conſidering that now we giue counſel & preſcribe,to vſe the very ſimples themſelues in their owne nature,which go to their compoſition. Certes,beforetime the Phyſicians vpon a vain oſtentation, becauſe they would ſeem to haue their apothecary ſhops furniſhed with ſuch variety, exceeded all meaſure in this behalfe:inſomuch,as they were prouided of a wine,made
C forſooth of Nauewes,bearing the world in hand,that it was ſingular good for militarie men, if they found themſelues ouerwearied either with the practiſe or the bearing of arms,or in riding their horſes:yea,and to ſay nothing of all the reſt,they had the wine alſo of Iuniper:but is there any man ſo fooliſh,as to think and maintain, That Wormwood wine ſhould be more profitable to our bodies,than Wormewood the hearb it ſelfe ? What ſhould I ſtand vpon the wine of dates;among others of this range,conſidering that it cauſeth head-ach,and is good for nothing els but * to eaſe the coſtiueneſſe of the body,& for ſuch as reach vp bloud ? As for that which we called* Bion,I canot ſee or ſay,that it is an artificiall wine:for ſurely,al the art and cunning that goeth to the making of it,lieth in this only, That it is made and huddled vp in haſt:& yet profitable it is for a weake ſtomack readie to ouerturn,or that is not able to concoct and digeſt
D the meat within it, wholeſom for * women with child:comfortable to thoſe who be feeble and faint:good for the palſie,the ſhaking of the lims, the ſwimming and giddines of the head, the wrings and torments of the belly.and the gout Sciatica:moreouer it hath the name for to haue a ſingular vertue to helpe in time of plague,and to ſtand them in great ſtead who are pilgrimes and trauellers into far and ſtraunge countries.Thus much may ſuffice for Wines.

* Contrarie to *Dioſcorides*, who giueth it *Cœliacis & dyſentericis*.
* or *Biæon*.
* Troubled with *κυρσὰ* and *μαγμώδη*, a corrupt and deprauate appetite, longing after this and that, and not alwaies the beſt things.

Moreouer,ſay that wine be turned,corrupted,and changed from the own nature,yet it leaueth not to retain certaine vertues and properties requiſit in Phyſicke:for vinegre alſo is medicinable. Exceeding refrigeratiue it is,& cooleth mightily:howbeit,no leſſe vertue and force it hath to diſcuſſe and reſolue:an euident proofe wherof we may ſee in this, That if it be poured on the ground,it will fome and caſt a froth. Concerning the manifold operations that it hath in com-
E poſition with other things,I haue written oftentimes alreadie,& wil write ſtil as occaſion ſhall ſerue.But vinegre, euen taken alone by it ſelfe,fetcheth the ſtomack & appetite again to meat, and ſtaieth the yex or hocquet:and if it be ſmelled vnto,it ſtinteth immoderat ſneeſing. Being held in the mouth,it preſerues folk from fainting with extreme heat,while they are in the bain or hot houſe.Of it and water together there is made Oxycrat, which is a drink more mild than vinegre alone. And the ſame with water is comfortable to thoſe who vpon the Suns heat haue gotten the headach or a day-feuer and be newly recouered:being vſed alſo in the ſame ſort with water,it is counted moſt wholeſom for the inflammation or rheum of the eies. A fomentation with oxycrat or water and vinegre,is ſingular good vpon * burns,ſcaldidgs,or riſing of the pim-
F ples.In like maner it cureth the leproſie,ſcurfe,and dandruffe,running vlcers and ſcals,bitings of dogs,ſtinging with ſcorpions,ſcolopendres,and hardiſhrews;and generaly,it is good againſt all prickes of venomous beaſts,or pointed darts,and any itch whatſoeuer. Likewiſe againſt the biting or prick of the* Cheeſlip or Many-foot worme.Applied hot with a ſpunge to the ſeat,it is ſingular for the infirmities of the fundament. But for this purpoſe there muſt be a decoction or fomentation made, with three ſextars of vinegre, whereunto there ſhould be put of Sulphur

* *Poſt vredines*, Some read *hirudines*, i. after the ſucking of Horſe leeches.
* *Multipeda*, called otherwiſe *Sepa*.

or

or Brimſtone two ounces,or a bunch of Hyſſop, and then ſet ouer the fire for to boile together. G
In caſe of much effuſion and loſſe of bloud,which enſueth and followeth thoſe who are cut for the ſtone,or any thing els taken out of the body;ther is nothing better than to foment the place without-forth,with the ſtrongeſt vinegre that may be had,in a ſpunge,and then to take inwardly in drinke 2 cyaths of the ſame:for ſurely it cutteth and diſſolueth the cluttered bloud lying within-forth. Vinegre taken inwardly & applied outwardly,cureth the filthy tettars called Lichenes. Being miniſtred by way of clyſter,it knitteth the belly,and ſtaieth al rheumatick fluxes that haue taken a courſe by the guts and entrails. And the ſame helpeth as well the fall and ſlipping downe of the Longeon or fundament, as the laxitie and hanging forth of the Matrice.
*For it ſtirreth the cough at the beginning. *Dioſcorides.* An * old cough it reſtraineth: the rheumes alſo and catarrhes it repreſſeth, which light on the throat and windpipe:it openeth the paſſages in them who labor for breath, & canot take their H
wind but ſitting vpright:it confirmeth alſo the teeth looſe in the head:mary it hurteth the bladder,and doth harme in all infirmities of the ſinewes. The Phyſicians were ignorant heretofore of the ſoueraign vertue that vinegre had againſt the ſting of the ſerpent called Aſpis, vntil by a meere chaunce they came to the knowledge hereof. And thus ſtood the caſe: It fortuned that a certaine fellow carying about him a bottle of vinegre,trode vpon the ſaid adder or ſerpent,that turned vpon him againe and ſtung him:howbeit he felt no harme at all ſo long as he carried the vinegre: but ſo often as he ſet the bottle downe out of his hands, the ſting put him to ſenſible paine. By which experiment it was found and knowne,that vinegre was the only remedy,and ſo with a draught therof he had help out of hand,and was cured. But behold another proofe and triall thereof. They that vſe to ſuck out the poyſon of venomed wounds giuen by ſerpents and I
ſuch like,vſe no other collution to waſh their mouths withal, but only vinegre:certes,the force of vinegre is ſuch,that it conquereth not only the ſtrength of our viands & meats, but alſo many other things:for the very hard rocks,which otherwiſe it was vnpoſſible to cleaue before with the violence of fire,ſoone breake and giue way,when vinegre is poured aloft. This ſingular gift moreouer it hath, that no liquor in the world giueth a better taſt to our meats and ſauces, or quickneth them more than vinegre doth:for which purpoſe, if it be ouerſharp and ſtrong,there is a means to mitigat and dull the force thereof,either with a toſt of bread,or ſome wine:again, if it be too weake and apalled,the way to reuiue it againe,is with Pepper or the ſpice Laſer:but nothing moderateth it better than ſalt. And to knit vp and cloſe this diſcourſe of vinegre, I cannot forget nor ouerpaſſe one rare and ſingular accident that befell of late:*M. Agrippa* in his K
later days was much troubled and afflicted with a grieuous gout of his feet;and being not able to endure the intollerable paines therof, took counſell of a certaine leaud leech,ſome bold and venterous Emperick,who made great boaſt of his deep skill and admirable knowledge(for the Emperour *Auguſtus Cæſar*,whoſe daughter he had eſpouſed, he made not acquainted with the matter;) who gaue him counſell to bath his legs with hot vinegre, and to ſit therein aboue his knees,at what time as his diſeaſe tormented him moſt:true it is indeed,that he was eaſed of his paine by this means,for he loſt the very feeling of his feet. Howbeit, *Agrippa* choſe rather to be paralyticke in ſome ſort, and to want both vſe and ſence of his legges, than to abide the extremitie of his gout.

L

Chap. II.

¶ *Of vinegre Scylliticke. Of Oxymel. Of the double cuit wine Sapa. The lees of wine: dregs of vinegre: and of the foreſaid cuit.*

THe vinegre of Squilla or ſea-Onions,called Scillinum, the elder it is and longer kept, the more is it eſteemed. This vinegre, ouer and aboue the other vertues of common vinegre before rehearſed,hath this property, To helpe the ſtomacke,in caſe the meats lie ſouring and corrupting therein:for no ſooner doth a man taſt thereof,but it diſpatcheth and riddeth away the foreſaid inconuenience:moreouer, it is good for them that are giuen to vomit,faſting, M
in a morning:for it hardeneth the throat & the mouth of the ſtomacke which is ouerſenſible,& knitteth the ſame. It cauſeth a ſweet breath,confirmeth the fleſh about the gums,faſteneth the teeth which are looſe,and maketh a bodie look with a freſh and liuely color. Being gargarized, it draweth away and doth euacuat thoſe groſſe humors which cauſed hardneſſe of hearing, and openeth

A openeth the auditory paſſages of the ears;and ſo by conſequence clarifies the ſight of the eies. Soueraigne it is beſides for thoſe who haue the falling ſickneſſe,and who are troubled in mind by occaſion of melancholy. It cureth the turning and dizzineſſe of the braine,the ſuffocation or riſing of the mother. It helpeth ſuch as be ſore and bruiſed with dry blowes,ſuch as are falne headlong from high places,and thereby haue cluttered bloud gathered within their bodies:as many alſo as haue the infirmity or weakneſſe of ſinews,or otherwiſe be diſeaſed in the kidnies: howbeit offenſiue it is to thoſe that haue any vlcer either within or without.

Touching the ſyrrup Oxymel, *Dieuches* ſaith, That the auncients in old time prepared and tempered it in this manner. They tooke of honey ten pounds, of old vinegre fiue hemines, of bay ſalt one pound,of Sauerie three ounces, of ſea water fiue ſextars:Theſe together in a kettle
B they did ſet to boile,and let them haue tenne walms ouer the fire:then they lifted the pan from the fire, poured this liquor out of one veſſell into another,& ſo kept it for their vſe:but *Aſclepiades* comes after,diſproueth all the maner of this compoſition, and withall condemneth the vſe thereof:for the phyſicians before his time,feared not to preſcribe it to be drunk euen in feuers; and yet both he and all,do confeſſe and agree,that this was a good drink againſt the venomous ſerpent called Seps: alſo for them who were poyſoned with Opium, [*i.*the juice of Poppey]or with the gum Ixia,which commeth from the hearb Chamæleon. Moreouer,they all commend it to be gargled hot for the ſquinancy, for the paine and deafneſſe of ears,for the accidents and infirmities of the mouth and throat:like as at this day we vſe in all theſe caſes,the ſharpe brine or pickle called Oxalme;which if it be made of ſalt and new vinegre that is freſh and quick, it
C is better in operation.

As for the cuit named in Latine Sapa, it commeth neere to the nature of wine,and in truth nothing els it is,but Muſt or new wine boiled til one third part and no more do remain:& this cuit,if it be made of white Muſt is counted the better. Vſe there is of it againſt the flies Cantharides and Bupreſtes:againſt the worms breeding in Pine trees,named thereupon Pityocampæ,againſt Salamanders, and generally all thoſe beaſts whoſe ſting or tooth is venomous. If a woman drink thereof,together with ſcallions or ſuch bulbs,it ſendeth downe the after-burden, and expelleth the dead infant out of the womb. And yet *Fabianus* mine author ſaith, That it is no better than a very poiſon, if a man drink it faſting preſently after he is come out of the bain.

A conſequent and appendant to theſe foreſaid things,is the lees of wine;that is to be conſi-
D dered according to the wine from whence it commeth:and verily the lees of wine are ſo ſtrong, that oftentimes it ouercommeth and killeth thoſe,who go downe into the vats & veſſels wherein the wine is made. But to know and preuent the daunger thereof, this experiment is fonnd; namely,to let down a candle into the ſaid vat:for ſo long as it will not abide light, but goe out ſtill,daungerous it is for a man to enter into thoſe veſſels. And yet wine lees without any waihing at all,goe into the compoſition of many medicines. Take wine lees a certaine quantity,and of the floure-de-lis or Ireos root a like weight, concorporat them together into a liniment:ſingular it is to annoint the ſmall pocks and ſuch like cutanean eruptions. The ſame either drie or wet, may be applied with very good ſucceſſe to the places ſtinged with the venomous ſpiders called Phalangia;to the inflammations alſo of the genetoirs or priuy members; to the paps,or
E any other part of the body whatſoeuer. Now for the better preparing therof,it ought to be ſodden in wine,together with barley meale and the pouder of frankincenſe;which done,to be burned and ſo dried. And to know whether it be ſufficiently ſodden or no,make this triall: If you touch it neuer ſo little at your tongues end and ſo taſt therof,when it is throughly cold,it will ſeeme to bite and burne it, if it haue had ſufficient boiling as it ought: but it ſoone loſeth the heart and force, if it be not kept in a place well encloſed: by the ſaid burning,it commeth to be much more ſtronger in operation. Sodden with figgs,it yeeldeth an excellent decoction to repreſs tettars,ſhingles,and ſuch like wildfires;to ſcoure away alſo ſcurfe and dandruffe:& in that ſort either applied as a cataplaſme or fomentation,it cureth the leprie and running ſkals of the
F head. Being taken in drinke,eſpecially raw,it is a ſoueraign countrepoiſon for ſuch as haue eaten venomous muſhromes. Boiled and waſhed,it is mingled with collyries which ſerue for the eyes. A liniment thereof,cureth the accidents that befall to the cods and genetoirs. Taken in wine,it helpeth the ſtrangury,and giueth them eaſe who otherwiſe could not piſſe but by dropmeale. Les of wine, after it hath loſt the cauſtick operation and life that it had,wil ſerue very wel for a good lie or water to cleanſe the skin of our bodies, and to waſh or ſcoure clothes: and

20030 copy 1

then verily, it hath the aſtrictiue power of Acacia, and ſerueth for the ſame vſe. G

The dregs of vinegre, muſt of neceſſitie be much more ſharpe, biting, and vlceratiue, than wine lees, in regard of the matter whereof it commeth: it driueth backe impoſtumes or biles, and keepeth them from ſuppuration. A liniment of it, helpeth the ſtomack, belly, and entrails: it ſtaieth the flux of thoſe parts, and the ouerflow of womens months: it diſcuſſeth puſhes and ſmall biles, and ſquinances, if they be taken betimes before they feſter and impoſtumat: and a cerot made with it and wax together, is good againſt S. *Anthonies* fire. The ſame drieth vp the milke in womens breaſt, who would not be nources, or bee troubled with ouermuch milke. It taketh away with eaſe the ilfauoured rugged nails, and giueth roum for new to come vp in their place. Applied with groſſe barley meale or groats, it is ſingular and moſt effectuall againſt the venome of the horned ſerpents, called in Greeke Ceraſtæ: and with Gith or Nigella Romana, it H is vſed for the biting both of crocodile and mad dog. The burning alſo of theſe dregs, quickeneth & fortifieth the ſtrength therof, & being thus burnt and incorporat with the oile of Lentiske, * it coloureth the haires of the head in one night red, if they bee annointed withall: The ſame lapped in a fine linnen cloth, and put vp in forme of a peſſarie, cleanſeth and mundifieth the ſecret parts of women.

* *Serenus Samonitus* calleth this ointment *Vnguentum Cineris*, alledging *Plenie* for his author.

To conclude with the grounds or lees of the cuit Sapa; vinegre dregs are knowne to be very good for to heale burnes; and the cure proceedeth better, in caſe they be mixed with the furry cotton or downe of reeds: the ſame being ſodden, and the decoction thereof taken as drinke, cureth inueterat coughs. Saſt of all, they vſe to ſeeth or ſtew it betweene two platters with ſalt and greaſe, wherwith they make a liniment or ointment to take down the ſwelling of the chaws I and the nape of the necke.

Chap. III.

¶ *Of Oliue trees: of the leaues of Oliues: their floures and their aſhes. Of the white and blacke Oliue berries: and of the mother or lees of Oile-oliue.*

NExt after the Vine, there is not a tree bearing fruit, of ſo great authority and account as the Oliue. The oliue leaues, are exceeding reſtringent, good to cleanſe, good alſo to reſtraine or ſtop any flux: being chewed and applied to vlcers, they heale them: and reduced with oile into a liniment, they aſſuage the pain of the head. A decoction of their leaues, together with honey, is ſingular to bath and foment the parts cauterized by the Chirurgian, according to the direction of the learned Phyſician: the ſame vſed by way of a collution, cureth the inflammation of the gumbs, whitflaws, and excreſcenſes of ranke fleſh in filthy vlcers: with honey alſo it ſtaunceth the flux of bloud, proceeding from any neruous parts. The juice of oliue leaues is ſingular for the little vlcers in manner of carbuncles, with a cruſt or rouſe vpon them, riſing about the eies; and all other ſmall wheals or bliſters: as alſo in caſe the bal or apple of the eye be readie to ſtart forth; and therefore it is vſed in collyries or eye-ſalues: for it healeth weeping eies that haue run with water a long time, and the excoriations or frettings of the eie-lids. Now this juice is drawn out of the leaues, firſt ſtamped, and then well ſprinckled and wet with wine & rain water, & ſo preſſed forth; which being afterwards dried, is reduced into trochiſkes, L The ſame rolled in wooll or bombaſt to the forme of a peſſarie, and ſo put vp into the naturall parts of women, ſtaies the immoderat flux of their fleurs. Good it is alſo for thoſe, who rid corrupt bloud by the inferiour parts. Moreouer, it eaſeth the ſwelling piles or bigs ſticking out in the fundament; killeth the cholerique exulcerations called S. *Anthonies* fire; healeth corroſiue and eating ſores, and allaieth the paine of night-foes or childblanes, called by the Greeks Epinyctides. The ſame effects haue their floures. The tendrons or young twigs of Oliues being in floure, if they be burnt, yeeld a kind of aſhes that may ſerue as a ſuccedan in ſtead of Spodium: but the ſame muſt be burnt a ſecond time, after they haue beene well drenched and ſoked with wine. Theſe aſhes applied as a liniment, or the very leaues only ſtamped and tempred with honey, are good for impoſtumes growne to ſuppuration, and for the puſhes or biles named Pani: M but if they be mixed with groſſe barly meal or groats, they are in a liniment comfortable to the eyes. Take the green branches of an Oliue and burne them, there will deſtill and drop from the wood a certaine juice or liquor, which healeth ringwormes, tettars, and ſhingles, ſcoureth away the skales of the skin and dandruffe, and cureth the running skalls of the head.

Touching

A Touching the gum that iſſueth from the oliue tree it ſelf, and namely that wild oliue which is called Æthiopica; I cannot wonder enough at ſome, who giue counſell therwith to annoint the teeth which ake, conſidering that they themſelues giue out, That it is a poiſon, and to be found as wel in wild oliues as others. The rind or bark pared from the root of a moſt tender and yong oliue, reduced into an electuary, and often licked and let downe by leiſure into the throat after the manner of a lohoch, cureth thoſe who reach vp bloud, and cough out filthy and rotten matter. The aſhes of the very oliue it ſelf, mixed with ſwines greaſe, cure all tumors; draw forth corruption of fiſtulous vlcers; and when they are thus mundified, heale them vp cleane. White oliues agree very well with the ſtomack, but they are not ſo good for the belly. A ſingular commoditie they yeeld before they be put vp in their compoſt or pickle, for to be eaten greene by
B themſelues as meat: for they ſcoure away grauel with vrine; & good they are for the teeth, whether they be worne, rotten, worme-eaten, or looſe in the head. Contrariwiſe, the blacke oliue is not ſo friendly to the ſtomacke; better for the belly; but offenſiue both to the head and the eies. Both the one and the other, as well the white as the black, being punned and applied to burned or skalded places, do cure them: but the black haue this propertie, That if they be chewed, and preſently as they be taken out of the mouth, laid to the burne or ſcald, they will keep the place from bliſtering. Oliues in pickle are good to clenſe foule and filthie vlcers, but hurtful to thoſe who piſſe with difficultie.

As touching the mother or lees of oile oliue, I might be thought to haue written ſufficiently, following the ſteps of *Cato*, who deliuered no more in writing: but I muſt ſet down alſo the me-
C dicinable vertues obſerued therein: Firſt and foremoſt therefore, it helpeth the ſorenеſſe of the gumbs, cureth the cankers & vlcers of the mouth; and of all other medicins it is moſt effectuall to faſten the teeth in the head. If it be dropped or poured vpon S. *Anthonies* fire, and ſuch other corroſiue and fretting vlcers, it is of ſingular operation to heale them: but for kibed heeles, the grounds or dregs of the black oile-oliue is the better; as alſo therewith to foment ſmal children. As for that of the white oliues, women vſe to apply it with wooll to their ſecret parts, for ſome accidents thereto belonging. Be it the one or the other, generally it is more effectuall ſodden than otherwiſe. Boiling it ought to be in a copper or braſſe veſſell, vntill it come to the conſiſtence of honey. Vſed it is with vineger, old wine, or with muſt according as the cauſe requireth, in curing the infirmities of the mouth, teeth, and eares; in healing running skalls; and finally, in
D the cure of the genetoirs or priuie members, & of the fiſſures or chaps in any part of the body. In wounds it is vſed with linnen cloth or lint; but in diſlocations, it is applied with wooll. And verily in theſe caſes and in this practiſe, it is much emploied, eſpecially if the medicine be old and long kept: for being ſuch, it healeth fiſtulous ſores. And being injected by a ſyring into the vlcers of the fundament & genetoirs, or otherwiſe by a metrenchyte into the ſecret ſores within the naturall parts of women, it cureth them all. Alſo a liniment thereof is ſingular for to be applied to the gout of the feet: alſo in the reſt, whether they be in the hands, knees, hucklebone, or any other joint, ſo they be not ſetled or inueterat, but taken at the firſt. But in caſe it be ſodden againe in the oile of green oliues, vntill it come to the conſiſtence of honey, and ſo applied, it cauſeth thoſe teeth to fall out of the head without paine, which a man would willingly be
E rid of. It is wonderfull to ſee how it healeth the farcines and manges of horſes, being vſed with the decoction of Lupines and the herbe Chamæleon. To conclude, there is no better thing than to foment the gout with theſe lees of oile, raw.

Chap. IIII.

¶ *Of the wild Oliue leaues. The oile of the floures of the wild vine Oenanthe. Of the oile Cicinum. Of Palma Chriſti. The oile of Almonds: of Bayes, of Myrtles, of * Ruſcus or Chamæmyrſine, of Cypreſſe, of Citrons, and of Nuts.*

* i. Butchers broome.

F THe leaues of the wild oliue haue the ſame nature that the leaues of the tame. As for Antiſpodium, or the aſhes made of the tender branches of the wild oliue, it is of greater force and operation in ſtaying and repreſſing of rheume, catarrhes, and fluxes, than that abouenamed in the former chapter. Ouer and beſides, it aſſuageth the inflammations of the eies, it mundifieth vlcers, it doth incarnat and fill vp the void places where the fleſh is gone, it gently

cateth away,and without mordication, the excreſcence of ranke and proud fleſh, drieth the G
ſores,healeth and skinneth them vp. In other caſes this oliue is vſed as the other oliues: & yet
one peculiar propertie hath the wild oliue, That a ſpoonefull of the decoction of their leaues
with hony,is giuen with good ſucceſſe to them that ſpit and reach vp bloud. Howbeit,the oile
made hereof is more ægre and ſharpe, yea and mightier in operation than that of the other O-
liues; and a collution thereof to waſh the mouth withall ſetleth the teeth that be looſe. The
leaues of the wild oliue reduced into a cataplaſm with wine,and ſo applied,do cure whitflawes
about the root of the nails;carbuncles,and generally al ſuch apoſtemations:with hony the ſaid
cataplaſme ſerueth well to clenſe and mundifie where need is. The decoction of the leaues,yea
and the juice of the wild oliue is put into many compoſitions and medicines appropriat to the
eies. To good purpoſe alſo the ſame is dropped into the ears with hony,yea although they ran H
filthy atter. A liniment made with the floures of the wilde Oliue, is ſingular for the ſwelling
piles and the chilblanes that be angry in the night: and the ſame applied with barley meale to
the belly,or with oile to the head for the ache thereof,occaſioned by ſome rheume,is known to
do very much good. The young tendrils or ſprings of the wild oliue, being boiled and laid to
with hony,do re-ioyn and re-vnite the skin of the head which was departed from the bones of
the skull. The ſame tendrils pulled ripe from the wild oliue,and eaten with meat, do knit the
belly,and ſtay lasks: but torrified,and ſo beaten to pouder and incorporat with honey, they do
mundifie the corroſiue and eating vlcers: they breake alſo carbuncles.

As touching oile of oliues,the natute and manner of making it I haue already treated of at
large. But foraſmuch as there are many kindes thereof, I purpoſe to ſet down in this place ſuch I
as ſerue for phyſick only. And firſt to begin with the oile made of vnripe oliues,called in Latin
Omphacinum,and which commeth neere to a green colour,it is thought of all others moſt me-
dicinable: moreouer,the ſame is beſt when it is freſh and new (vnleſſe it be in ſome caſe when
it were requiſit to haue the oldeſt that may be found) thin and ſubtil,odoriferous,and nothing
at all biting;which be qualities al of them contrarie to that oile which we vſe with our meats.
This greene or vnripe oile (I ſay) is good for the ſores of the gumbes: and if it be held in the
mouth,there is no one thing preſerueth the whiteneſſe of the teeth better:it repreſſeth alſo im-
moderat and diaphoretical ſweats.

The oile Oenanthemum, made of the floures of the wild vine Oenanthe,hath the ſame ope-
rations that oile roſat hath. (But note by the way,that any oile,howſoeuer it doth mollifie the K
body,yet it bringeth vigor and addeth ſtrength thereto.) Contrary it is to the ſtomacke,it en-
creaſeth filthineſſe in vlcers,doth exaſperat the throat,and dul the ſtrength of all poiſons,eſpe-
cially of ceruſe or white lead,and plaſtre;namely if it be drunk with honied water or the broth
of dried figs: but it is taken againſt Meconium or Opium, with water: againſt the Canthari-
des,Bupreſtis,Salamanders,& the worms Pityocampæ, if it be drunk alone without any thing
els: but if it be vomited and caſt vp againe out of the gorge, it hath no fellow in all thoſe caſes
aboue named. Moreouer,in laſſitudes and extreme colds,oile is a preſent refreſhing & remedy.
Taken hot to the quantity of ſix cyaths,it mitigateth all wrings and torments of the belly, the
rather if rue be ſodden with it,and in that maner it expelleth wormes out of the guts. Drink it
to the meaſure of one hemina with wine and hot water,or els with the juice of husked barly, it L
looſeth the belly. It ſerueth in good ſtead for vulnerarie ſalues and plaſtres:it ſcoureth & clen-
ſeth the skin of the face. Conueyed vp into the head of kine and oxen, vntill they belch & de-
liuer it again,it doth allay & reſolue all their ventoſities:but old oile doth heat more,and is of
greater force to reſolue a body into ſweats than the new; as alſo to diſſipat all hard tumors and
ſwellings. More healthfull alſo it is to thoſe who lie of the lethargie,and eſpecially when the
diſeaſe is in declining and wearing away. Somwhat it is thought to clarifie the eies,namely if
it be applied with an equal quantitie of hony that neuer came neere ſmoke. A proper remedie
it is for the head-ache: likewiſe in ardent feuers it is very good with water,to allay their heat;
and if there cannot any old be gotten,it ought to be well ſodden, that thereby it may ſeeme to
haue age ſufficient.

The oile of Ricinus or Tickſeed,called Cicinum, taken as a drink with the like quantitie of M
hot water,is ſingular to purge & euacuat the belly:& it is ſaid to haue a ſpecial vertue to clenſe
the midriffe and thoſe precordial parts neere the heart. Soueraigne it is for all gouts,hard tu-
mors,the infirmities of the matrice,of the ears,and for all burns or ſcaldings. And if it be med-

led

A led with the aſhes of ſhell-fiſhes called Burrets, it cureth the inflammation of the fundament, and any ſcab or mange whatſoeuer. It giueth a freſh color to the skin of the viſage, and cauſes the haire to grow plentifully where it is applied. The ſeed wherof it is made, there is no liuing creature will touch. Of the grapes which this Palma Chriſti or Ricinus carieth, there be made excellent weiks or matches for lamps and candles, which will caſt a moſt cleer light, & yet the oile that is drawne out of the ſeed, giueth but a dim blaze or obſcure flame, by reaſon of the exceeding groſſeneſſe & fatnes thereof. Of the leaues tempered with vinegre, there is a liniment made, which is good for S. *Anthonies* fire: and of themſelues alone being freſh and greene, they be applied with good ſucceſſe to the paps, and any violent fluxion whatſoeuer: the ſame, boiled in wine, and laid too, with groſſe barly meale or groats and ſaffron, are ſingular for al inflamma-
B tions: and if they be applied by themſelues without any other thing, to the viſage, they do embeliſh and poliſh the skin paſſing wel within 3 daies. Oile of Almonds is laxatiue: it ſerueth to ſoften the body and make it tender; the skin which was riueled, it cauſeth to look neat, ſmooth, and cleare: and being applied with hony, it taketh away freckles and ſpots out of the face. Boiled with oile roſat, hony, the * rind of pomegranats, it is comfortable to the eares, it killeth the * *Tegmine.*
worms therein, reſolueth thoſe groſſe humors that were the cauſe of hard hearing, of the thumping, tinging, and other inordinat ſounds within the eares; and withall, eaſeth the head-ach and cureth the dimnes of the eies. Reduced into a cerot with wax, it healeth felons, and cleereth the
C skin of thoſe who be tanned and ſun-burnt: waſh the head with it and wine together, it kils the running skall, and riddeth away the dandruffe: applied with Melilot, it diſcuſſeth the ſwelling piles and bigges in the fundament: if the head be annointed with it alone, it procureth ſleepe. Oile-de-baies, the newer that it is and greener of colour, the better it is thought to be: hot it is of nature, and therefore good in a palſie, crampe, ſciatica, and for bruiſed places looking blacke and blew vpon ſtripes: and being heat in the rind or coat of a pomgranat, and ſo applied as a cataplaſme, it helpeth the head-ach, old rheumes, and infirmities of the eares. Oile of Myrtles is made after the ſame manner: aſtringent it is, and ſerueth to harden any part of the body: it knitteth the flaggie gumbs, helpeth the tooth-ach and bloudy flix; it cures the exulceration of the matrice and bladder; healeth all old vlcers which run and yeeld filthy matter, if it be brought into a cerot with the skales of braſſe, and wax. Alſo it cureth the meazles, and angry wheales: &
D ſo it doth all burns and skalds. It healeth and skinneth any gall and raw place, it skoureth dandruffe, and repreſſeth the breeding thereof: it cureth clifts and chaps: piles and ſwelling bigs in the fundament, it bringeth down and reſolueth, it knitteth diſlocations of joints, and taketh away the ſtrong and rank ſauor of the bodie. A countrepoyſon it is againſt the Cantharides and the Bupreſtis: as alſo againſt all other venome which is corroſiue and hurteth by exulceration. Touching the ground-Myrtle Chamæmyrſine, or Oxymyrſine, it hath the ſame nature that the other Myrtle hath; and the oiles be of ſemblable vertues. The oile of Cypreſſe alſo & likewiſe of Citrons, be not vnlike to the oile of Myrtles in operation, but the oile drawne from the walnut kernels (which we called Caryinum) is ſingular to bring haire againe, where it is faln away by ſome infirmitie: and inſtilled into the eares, it helpeth the hardneſſe of hearing: if the forehead be annointed therewith, it cureth the head-ach. Otherwiſe, it is but dull in operation, and
E yet a ſtinking ſmel it hath with it. If but one nut kernel be corrupt and rotten, it marreth all the oile that is made of the reſt, were there a pecke of them. The oile which is made of the graine or ſeed of the plant Thymelæa, is of the ſame vertue that the oile of Palma Chriſti, or Tickſeed aboue-named. The oile of the Lentiske is paſſing good to make an ointment of, againſt laſſitude and wearineſſe: and verily it were æquiualent euery way to oile-roſat, but that it is found to be more aſtringent: it is vſed much in repreſſing of immoderat ſweats, and thoſe angrie pimples which riſe after much ſweat. Nothing is there ſo effectuall to heale the farcines or skab in horſes, and ſuch like beaſts. The oile of Ben, mundifieth freckles, cureth felons and biles, take away ſpots and mols, and healeth the apoſtemations in the gumbs.

As for Cypiros, what a plant it is, and how there is an oile made therof, I haue ſhewed alrea-
F die. By nature it is hot, and ſoftneth ſinews which be ſtiffe and ſtark. The leaues ſerue to make a good liniment for to annoint the pitch of the ſtomacke: and their juice applied in manner of a peſſarie, ſetleth the mother when it rolleth euery way and is out of her place. The greene leaues chewed and applied, cure the running skalls in the head, the cankers and ſores in the mouth, all riſings and apoſtemations, and likewiſe the piles. A decoction of the ſaid leaues, is ſingular for

20030 copy 1

burns and skals, likewiſe for lims out of joynt, if they be bathed therin. The very leaues in ſubſtance ſtamped and incorporat with the juice of a peare-quince into an ointment, ſet a reddiſh yellow colour vpon the haire of the head. The floures brought into a liniment with vinegre aſſuage the paine of the head: the ſame calcined and burnt into aſhes within a pot of vnbaked or raw earth, either alone or with hony, healeth corroſiue ſores and putrified vlcers. Theſe floures haue a certaine ſauor with them, which procureth ſleep. The oile called * Gleucinum is aſtringent; and yet it cooleth after the ſame ſort that the oile Oenanthium. The Balſame oile, called Balm, is of all others moſt pretious (as hertofore I haue ſaid in my treatiſe of odoriferous ointments) and of great efficacie againſt the venome of al ſerpents. It clarifieth the eie-ſight mightily, and diſpatcheth miſts and clouds which dimmed the ſame: it eaſeth all thoſe who draw their breath with difficultie: it aſſuageth impoſtumations and hard ſwellings: it keepeth bloud from cluttering, and is excellent to mundifie foule vlcers: ſingular comfortable to the eares in caſe of paine, hardneſſe of hearing, & ſinging within: to the head alſo for to aſſuage the ach: for the nerues, againſt ſhaking, trembling, and convulſions; & withal, a proper remedy for ruptures. It danteth and mortifieth the poiſon of Aconitum, if it be taken with milk. If the patient lying ſicke of an ague, be annointed all ouer therewith, it mitigateth the fits comming with ſhaking and ſhiuering. Howbeit, folke muſt be warie and vſe it with moderation; for being hot in the higheſt degree, it is cauſtick, and ſo doth enflame and burne: and therfore if a mean be not kept it bringeth a miſchiefe for a remedie, and doth more harme than good.

* Some read *Melinum.*

G

H

Concerning Malobathrum, the nature and ſundrie kinds thereof, I haue diſcourſed heretofore. Now for the vertues which it hath in Phyſicke; firſt, it prouoketh vrine: being ſtamped, the juice drawne out of it with wine by way of expreſſion, is excellent to be applied vnto the eyes, for to ſtay their continuall watering: the ſame laid to the forehead as a frontall, procureth ſleep to them that would gladly take their repoſe. And more effectually it worketh, in caſe the noſethrils alſo be annointed therewith, or if it be drunke with water. The leafe of * Malabathrum, if it be but held vnder the tongue, cauſeth the mouth and the breath to ſmell ſweet: like as, if it lie among apparell, it giueth them a pleaſant ſauour. The oile of Henbane is emollitiue, howbeit an enemie to the ſinewes: certes, if it be taken in drinke, it troubleth the braine. The oile of Lupines, called Therminum, is likewiſe an emollitiue, and commeth neareſt of any to the operation and effects of oile-roſat.

* *Folium Indicum.*

I

Touching the oile of Daffodills, I haue ſpoken of it in the treatiſe of the floures thereof. Radiſh oile cureth the lowſie diſeaſe; and namely, when lice are engendred vpon ſome long and chronick diſeaſe: it clenſeth the skin of the face from all roughneſſe, and maketh it ſlicke and ſmooth. The oile of Seſama, cureth the paine of the eares, and healeth vlcers which eat as they ſpread, euen ſuch as be morimals and check the Chirurgians hand. Oile of Lillies, which wee haue named Lirinon, Phaſelinum, and Sirium, is moſt agreeable and wholſom for the kidnies: alſo to procure and maintaine ſweat, to mollifie the matrice and naturall parts in women, & to promote digeſtion inwardly. The oil or ointment Selgiticum (as we haue already ſaid) is comfortable to the ſinues: like as the * graſſe-green oile, which the Inguinians (dwelling vpon the cauſy or ſtreet-way Flamminia) vſe to ſel. * Elæomeli, an oil which (as I haue declared before) iſſueth from oliue trees in Syria, carrieth a certaine taſt of hony: howbeit their ſtomacks it maketh to riſe at it, who licke therof; and it is of power to ſoften the belly. It purgeth choler *Electiuè*, if two cyaths thereof be giuen to drink in one hemine of water: howbeit theſe ſymptomes or accidents do follow them who drinke thereof: They lie as it were in a dead ſleepe, and muſt eftſoons be awakened. Our luſtie drunkards who make profeſſion of carouſing, vſe to take one cyath thereof before they ſit down to drink one another vnder bourd. The oile of Pitch is vſed euery where, for to heale the skurfe, mange, and farcins in beaſts.

K

L

* *Herbaceum.*
* Called likewiſe *Oleum Syriacum.*

Next to vines and oliues, Date trees are to be raunged in the higheſt place, and doe cary the greateſt name. Dates, if they be freſh and new, doe inebriat and ouerturn the braine: and if they be not very wel dried, they do cauſe head-ach: neither are they (ſo far as I can ſee) any way good for the ſtomacke: againe, they do exaſperat the cough and make it worſe, yet they be great nouriſhers, and cauſe them to feed who eat of them. Our ancients in old time drew a certaine juice or liquor out of them when they were boiled, which they gaue vnto ſicke perſons in ſtead of an hydromell or honyed water to drinke; and that for to refreſh them, to reſtore their ſtrength, and to quench thirſt: and for this purpoſe, they preferred the Dates of Thebais in high Ægypt

M

before

A before all others. Being eaten as meat eſpecially at meals, they are good for them who reach vp bloud. The dates Caryotæ ſerue to make a liniment for the ſtomack, the bladder, belly & guts, with an addition of Quince among. Being incorporat with wax & ſafron, they reduce the black and blew marks remaining after ſtripes in the skin, to their naturall colour. Date ſtones with their kernels are burnt in a new earthen veſſel which was neuer occupied before, and being thus calcined, and their aſhes waſhed, they ſerue in ſtead of Spodium, and doe enter with other ingredients into collyries or eie-ſalues: and with ſome Nard among, they make ſukes to paint and imbeliſh the eye-browes. *Calliblepharæ.*

Chap. V.

B ¶ *Of the Myrabolan Date, and the Date Elate.*

THe beſt Palm or Date tree which beareth a fruit like to Myrabolanes, is that which groweth in Ægypt. Theſe Dates haue no ſtones, like to others. Being taken in vnripe and hard wine, they ſtop the flux of the belly, and ſtay the extraordinary courſe of womens fleures, and do conſolidat wounds.

As touching the Date-tree, called Elate or Spathe, it affoordeth for vſe in Phyſick, the yong buds, the leaues, and the barke. The leaues ſerue to be applied vnto the midriffe and precordial parts, the ſtomacke, liuer, and ſuch coroſiue vlcers, as hardly will be brought to heale and skinne vp. The tender rind thereof incorporat with wax and roſin, healeth all maner of ſcales, within 20
C daies. The ſame boiled and applied accordingly, cureth the accidents befalling to the cods and genetoirs. The very perfume thereof coloreth the haire of the head black: and the ſuffumigation fetcheth downe the dead infant out of the mothers belly. It is giuen inwardly in drinke for the infirmities of the kidnies, bladder, & precordial parts: howbeit, an enemy it is vnto the head and ſinews. A decoction or bathe thereof, if a woman ſit in it, ſtaieth the immoderat fluxe both of Matrice and belly. Likewiſe, the aſhes taken in white wine, are ſingular for the pains and torments of the collick: as alſo a collution therewith, is as effectuall to cure the fal of the * Vvula and other defects incident to that part.

**Vvularũ vitiys.* Some read *vulvarum*, i. of the matrice & naturall parts of women.

Chap. VI.

D ¶ *The medicinable vertues conſidered in the floures, leaues, fruit, boughes, branches, bark, wood, iuice, root, and aſhes of many trees of ſeuerall kinds.*

IT remaineth now to decipher the manifold medicines which apples & ſuch like fruits tender skinned, do affoord, according to the variety of trees which bring them forth. Of which, thus much in generall is to be noted, That all fruits which ripen in the Spring, while they be ſoure and harſh, be enemies to the ſtomack; they trouble the belly, diſquiet the guts and bladder, and withall, be offenſiue to the ſinews: but if they be ful ripe or ſodden, they are the better. But to grow vnto particulars. Quinces if they be boiled, baked, or roſted, are ſweeter and more pleaſant to the taſt, than raw. Yet being throughly ripe vpon the tree, although they be eaten raw, they
E are good for thoſe that ſpit and reach bloud, and are diſeaſed with the bloudy flix: ſuch alſo as vpon the violent motion of vnbridled cholerick humors void vpward and downward: as alſo for them who be ſubiect to continual looſneſſe of the belly, occaſioned by the feeblenes of the ſtomack. Being once boiled or baked, they are not of the ſame operation: for they loſe therby that aſtringent vertue which their iuice had. In hot and ſharp feuers they ſerue for to be applied to the breſt. And yet if they be ſodden in rain water, they will do well in thoſe caſes aboue recited: but for the pain of the ſtomack, it matters not whether they be raw, ſodden, or baked, ſo they be reduced into the form of a cerot, & laid too. Their down or moſſineſſe which they beare, if it be boiled in wine, and reduced into a liniment with wax, healeth carbuncles. And the ſame maketh the haire to grow again in bald places occaſioned by ſome diſeaſe. Raw Quinces, condited
F and preſerued in hony, do ſtir the belly, & moue to ſiege. They impart vnto the hony a pleaſant taſt, whereby it is more familiar and agreeable to the ſtomack. But ſuch as being parboiled before, are then kept and confited in honey, be thought good for the ſtomacke, in the opinion of ſome, who ordaine and preſcribe to ſtamp them firſt, and then to take them in manner of a meat or conſerue, being incorporat with Roſe leaues boyled, for the infirmities of the Stomacke.

The

The iuice of raw Quinces is a ſoueraigne remedy for the ſwoln ſpleen, the dropſie, and difficulty of taking breath, when the patient cannot draw his wind but vpright. The ſame is good for the accidents of the breaſts or paps, for the piles, and ſwelling veines. The floure or bloſſom of the Quince, as well green and freſh gathered, as drie, is held to be good for the inflammation of the eies, the reaching and ſpitting of bloud, and the immoderat flux of womens monthly terms. There is a mild iuice drawn alſo from theſe floures, ſtamped with ſweet wine, which is ſingular for the flux proceeding from the ſtomack, and for the infirmities of the liuer. Moreouer, the decoction of them is excellent to foment either the matrice when it beareth down out of the body, or the gut Longaon, in caſe it hang forth. Of Quinces alſo there is made a ſoueraigne oile, which is commonly called Melinum: but ſuch Quinces muſt not grow in any moiſt tract, but come from a ſound and dry ground: which is the reaſon, that the beſt Quinces for this purpoſe be thoſe that are brought out of Sicily. The ſmaller Pear Quinces called Struthia, are not ſo good, although they be of the race of Pome Quinces. The root of the Quince tree tied faſt vnto the Scrophules or Kings-euill, cureth the ſaid diſeaſe: but this ceremony muſt be firſt obſerued, That in the taking vp of the ſaid root, there be a circle made round about it vpon the earth with the left hand, and the party who gathereth it is to ſay, What root he is about to gather, and to name the Patient for whom he gathereth it: and then, as I ſaid, it doth the deed ſurely. G

The Pome-Paradiſe, or hony Apples called Melimela, and other fruits of like ſweetneſſe, do open the ſtomacke, and looſen the belly, they ſet the body in a heat, and cauſe thirſtineſſe, but offenſiue they be not to the ſinews.

* Orbiculata. The * round Apples bind the belly, ſtay vomits, and prouoke vrine. Wildings or Crabs are like in operation to the fruits that be eaten ſoure in the Spring, and they procure coſtiuneſſe. And verily for this purpoſe ſerue all fruits that be vnripe. I

As touching Citrons, either their ſubſtance, or their graines and ſeed within, taken in wine, are a counterpoiſon. A collution made either with the water of their decoction, or their iuice preſſed from them, is ſingular to waſh the mouth for a ſweet breath. Phyſitians giue counſell to women with child for to eat the ſeed of Citrons, namely, when their ſtomackes ſtand to coles, chalk, and ſuch like ſtuffe: but for the infirmity of the ſtomack, they preſcribe to take Citrons in ſubſtance: howbeit, hardly are they to be chewed but with vineger.

* Nouem, and yet heretofore hee named but fiue. * Dioſcorides affirmeth the contrary. As for Pomgranats, needleſſe altogether it were now to iterate and rehearſe the * nine kinds thereof. Sweet Pomgranats, all the ſort of them, which by another name we called Apyrena, are counted * hurtfull to the ſtomack: they ingender ventoſities, and be offenſiue to the teeth and gums. But ſuch as in pleaſant taſt are next vnto them, which we called Vinoſa, hauing ſmal kernels within, are taken and found by experience to be ſomwhat more wholſom: they do ſtay the belly, comfort and fortifie the ſtomack, ſo they be eaten moderatly, and neuer to ſatisfie the appetite to the full: & yet ſome there be who forbid ſick perſons once to taſt of theſe laſt named: yea, and in no hand wil allow any Pomgranats at all to be eaten in a feuer; foraſmuch as neither their iuice and liquor, nor the carnous pulp of their grains is good for the patient. In like maner they giue a charge and caueat not to vſe them in vomits, nor in the riſing of choler. Certes, Nature hath ſhewed her admirable worke in this fruit: for at the very firſt opening of the rind, ſhe preſently maketh ſhew of a perfect wine, without appearance of any grape at all, nor ſo much as of Muſt, which ordinarily is the rudiment of wine. All Pomgranats, as wel ſweet as tart, are clad with a very hard coat & rough rind. And verily the coat which the ſour kind hath, is much vſed and in great requeſt: and namely the Curriers know full well how to dreſſe their skins therwith: and this is the cauſe, that the Phyſitians name it in Latine *Malicorium. And they would bear vs in hand, That the ſame doth prouoke vrine: as alſo, that the decoction therof in vineger, with gal-nuts among, doth confirm and keep the teeth faſt, which do ſhake and are looſe in the head. Women with child, and giuen to longing after a ſtrange and vnreaſonable manner, finde much good and contentment hereby: for no ſooner taſt they of it, but the childe doth ſtir and ſprunt in their wombe. The Pomgranat diuided into quarters or parcels, and laid to ſteepe and infuſe in raine water, for three daies or thereabout, yeeldeth a good and wholſome drinke for them to take actually cold, who are troubled with looſeneſſe of the body, occaſioned by a flux from the ſtomacke; and with caſting and reaching vp bloud. Of the tart and ſoure Pomgranat, there is a ſingular compoſition, which the Greeks call Stomatice: for that it is a moſt ſoueraigne medicine for the infirmities incident to the mouth: and yet it is as wholſom for the accidents of the K L M

* For Corium ſignifies a skin or leather.

noſthrils

A noſthrils and eares,as alſo for the dimneſſe of the eies, for the troubleſome ouergrowing & turning vp of the skin and fleſh about the roots of the nailes, for the genitoirs or priuie members, for corroſiue vlcers which they cal Nomæ,and for the proud fleſh and all excreſcences in ſores. Againſt the poiſon or venom of the ſea-hare, there is an excellent compoſition made with Pomgranats in this manner:take the grains or kernels of Pomgranates,being deſpoiled and turned out of their outward rind or skin,ſtampe them well,and preſſe out their iuice and liquor from them: ſeeth the ſame vntil a third part be conſumed,together with Safron,Roch-allom,Myrrh, and the beſt Attick hony,of each halfe a pound. Others do compound and prepare a medicine after another ſort in this wiſe: they take and pun many ſoure Pomgranats,and draw out of them a juice,which they ſeeth in a new cauldron or pot of braſſe,neuer vſed before, to the thickneſſe
B of honey: this they vſe in all infirmities of the fundament and priuy parts;for al griefs and maladies which be cured with the medicinable juice Lycium: with this they clenſe eares that run with filthy matter; reſtraine all violent fluxes of humors newly begun, and eſpecially taking a courſe to the eies; and rid away the red pimples and ſpots that ariſe in any part of the body. Whoſoeuer carieth in his hand a branch of the Pomgranat tree,ſhall ſoone chaſe away any ſerpents. The pill or rind of a ſoure Pomgranate boiled in wine, and ſo applied,cureth kibes. A Pomgranat ſtamped and then ſodden in three Hemines of wine vntill one remain,is a ſingular remedy for the torments of the Collick,and driueth wormes out of the belly. A Pomgranate torrified in an ouen within a new earthen veſſell neuer occupied before, well ſtopped and couered with a lid;and ſo being calcined and drunk in wine, ſtaieth the flux of the belly, and aſſuageth the wrings in the guts. The firſt knitting of this fruit, when the tree * begins to floure, is
C called by the Greeks Cytinus. Of which there be obſerued ſtrange properties,approued by the experience of many men:for if any perſon,man or woman,vnbraced,vnlaced,vnpointed and vnbuttoned, with girdle looſe, hoſe vngartered, & ſhooes vnbuckled,and hauing not ſo much as a ring about any finger,come and gather one of theſe tender bnds or knots,with 3 fingers only,to wit,the thumb and the fourth ring-finger of the left hand; and after this ceremony performed proceed forward to another,namely,to touch lightly with the ſame bud the compas of the eies round about,as if the prieſt ſhould ſacre or hallow them;and withal,when this is don,coueigh the ſame into the mouth,and ſwallow it down whole,ſo as a tooth touch it not: there goeth an opinion,That he or ſhe for certain ſhal feele no impediment or infirmity of the eyes that year
D throughout. The ſame knots or yong Pomgranats,if they be dried and beaten to pouder, are very good to keepe downe all excreſcences of ranke fleſh,and be wholeſome for the gummes and teeth:moreouer,the very juice drawn out of them after they be ſodden,do faſten the teeth in the head,although they were looſe and ready to fall out before. The very * yong Pomgranats themſelues alone newly knit,and making ſhew vpon the tree, if they be ſtamped to the form of a liniment,are ſingular for any corroſiue vlcers,& ſuch as tend to putrifaction. Likewiſe,they be excellent good in that ſort prepared and applied,for the inflammation of the eies, & of the entrailes,and in manner for all thoſe occaſions wherein the outward rinds and pils do ſerue. And here before that I proceed any farther, I canot ſufficiently admire and wonder at the careful induſtry and diligence of our antients before time,which they imploied in the conſideration of
E Natures workes,ſearching as they did into euery ſecret,and left nothing behind them vnaſſaied and vntried: inſomuch,as they took regard of thoſe little pretty floures appearing vpon theſe knots or buds beforeſaid,ſuch I meane as break forth and ſpring, before the Pomgranat it ſelfe is formed,and maketh any appearance;which ſmal bloſſoms,as I ſaid before,* are called Balauſtia. For euen theſe,as little as they be,our anceſtors haue found by their experiments to be aduerſe vnto ſcorpions. And true it is,that being taken in drinke, they do reſtraine the extraordinary flux of womens fleurs: they heale the cankers and ſores in the mouth, the diſeaſes of the Tonſils or Amygdales,and of the Vvula:they do helpe the ſpitting and reaching vp of bloud: they cure the feebleneſſe both of belly and ſtomack,with the fluxes thereupon inſuing:they are ſingular beſides for the grieuances of the priuy members, and for all running vlcers ſpreading
F in any part of the body what ſoeuer. Moreouer,they made proofe of the ſaid floures dried, and this high magiſtery they found,That being beaten to pouder, they cured thoſe of the bloudie flix,who lay at the very point of death on that diſeaſe;as alſo that there was not a better thing in the world to ſtay any laſk or flux of the belly. Nay,they ſtaid not here(ſo inuentiue were our forefathers)nor thought much to make trial of the very kernels or ſtones,within their grains,to

ſee

* *Florere incipiantis*:rather *deſinentis*, according to *Galen*.for then the fruit is ſaid to knit,when a tree ſheddeth the bloſſome.

* *Ipſa corpuſcula*.Some reade *Vaſcula*,meaning the veſſels containing the graines.

* Here is *Pliny* out of the way

ſee if they could meet with any goodneſſe therein, for to deliuer vnto poſterity and the age following. And in good faith, they found, That euen thoſe as contemptible as they ſeem, beeing torrified and ſo pulverized, doe help and comfort the ſtomacke, if either the meat be ſtrewed or ſprinckled, or the cup ſpiced with the ſaid pouder. And in truth, if they be drunk with rain water, they bind the body: the root of the Pomgranat tree, if it be boiled, yeeldeth a liquor or iuice which being taken in drink to the weight of a Roman victoriat [*i.* halfe a denier, or half a dram] killeth the worms in the belly. The ſame throughly ſodden in water, is of the ſame operation that Lycium is for any purpoſe that it ſhall be put vnto. G

Finally, there is a wild Pomgranat, ſo called for the reſemblance that it hath to the planted Pomgranat: the roots are red without-forth, * which being taken to the poiſe of one denier or dram in wine, do procure ſleepe. The graines or ſeeds in drink, drie vp the watery humours that be gotten between the skin and the fleſh, in that dropſie which is called Intercus. To conclude, a perfume made with the rind or pill of a Pomgranat, chaſeth Gnats out of the place, where it burneth. H

* I doubt that *Plinie* miſtaketh here: and is caried away with the ſimilitude of two Greeke names to wit, *ροιας*, *i.* the red wandering Poppy, and *ροας* the Pomgranat. For ſurely the properties by him aſſigned to his wild Pomgranat, in ſome ſort accord with thoſe of *Papauer erraticum*, or Corn-Roſe.

Chap. VII.

¶ Of Peares, and the properties obſerued in them. Of tame Fig-trees, and their Figs. Of the wild Fig tree. Of Erineus, and other plants, with the medicines which they affoord.

ALL Peares whatſoeuer, are but a heauie meat, euen to them that are in good health. And ſick folke are debarred for eating them, as well as for drinking wine. And yet if the ſame be well boiled or baked, they are maruellous wholſome and pleaſant to the taſt, eſpecially thoſe of Cruſtuminum. There is no kind of Peare at all, but if it be ſodden or baked with hony, agreeth with the ſtomack. Of Peares there be vſually made certaine cataplaſmes, which are ſingular good to diſcuſſe all puſhes, riſings, and pimples vpon the body: and their decoction ſerueth wel to reſolue all hard tumors. Peares in ſubſtance be a good counterpoiſon againſt venomous Tadſtools and Muſhroms; for either they driue them down by their very weight and ponderoſity, or els chaſe them out of the ſtomacke, through a certain ſecret antipathy in Nature, that their juice hath. The wild choke Peares be very late ere they ripen. The manner is to cut them into certaine ſlices or roundles, and ſo to hang them vp a drying, for to ſtay the laske and knit the belly; which their decoction alſo will do ſufficiently, if the patient doe drinke it. The leaues likewiſe, together with the Peare, are vſed to be ſodden for the ſame purpoſes. The aſhes alſo of the Peare tree * wood, in caſe of peſtilent Muſhroms is of more efficacie than the Peare it ſelfe. Poor iades that carry Apples and Pears vpon their backs in paniers, are ſhrewdly loden: and wonderfull it is to ſee, how heauy they do weigh, and how a few of them wil make the poore beaſts to ſhrink vnder their burden: but what is the remedy? Let them eat ſome of thoſe Peares before, or do but ſhew them vnto them, they will vndergoe (as folke ſay) their load more willingly, and go away with it more roundly. I K

* *Pyrorũ ligni. Quære*, if he meane not the ſtonie kernels of ſome Pears, which he vſes otherwhiles to call *Lignum*.

The milke or white juice that the Fig-tree yeeldeth, is of the ſame nature that vineger: and therefore it wil cruddle milk as wel as rennet or rindles. The right ſeaſon of gathering this milky ſubſtance, is before that the figs be ripe vpon the tree, and then it muſt be dried in the ſhadow: thus prepared, it is good to breake impoſtumes, and keepe vlcers open: alſo to bring down the monthly termes of women, either applied with the yolk of an egge, or taken in drinke with * Amyl or * Starch pouder. If the ſame be tempered with the floure of Fœnigreek ſeed and vineger, and ſo applied in manner of a liniment, it helpeth the gout. Alſo it is depilatory, and fetcheth off haires: it taketh away the skurfe of the eie-lids. In like maner it killeth tettars, ringworms, & any wild ſcabs. It openeth the body, and makes it ſoluble. This fig-tree milk is naturally aduerſe vnto the venomous ſtings of Hornets, waſps, and ſuch like. But particularly to the prick of Scorpions. The ſame if it be incorporat with hogs greaſe, taketh away warts. Fig tree leaues & green figs vnripe, reduced into a liniment, do diſcuſſe and reſolue the Scrophules, called commonly the kings euil, yea, and all ſuch nodoſities as are to be mollified. The leaues alſo alone wil do as much. There is another vſe of them beſides, namely, to rub therewith tettars and bald places, which through ſome infirmity haue loſt haire: & generally all thoſe parts that had need to be bliſtered: the tender tops & twigs of fig-tree branches are ſingular to cure the biting M

* *Amylo. Dioſc.* hath *Amygdalis*, Almonds.

of

A of mad dogs,if they be applied to the skin where it is broken. The ſame brought to a liniment with honey,healeth the wens or impoſtumations which be called Ceria, yeelding forth an humor like to hony out of the comb. And if they be tempered with the leaues of the wild Poppy, they draw forth broken ſpils or ſhiuered bones. Fig-tree leaus ſtamped with vineger,do reſtrain the venom,occaſioned by the biting of mad dogs:the white tendrils or ſprigs of the blacke fig-tree made into a cerot with wax,and ſo applied,do cure felons and the biting of hardiſhrewes. The aſhes made of black fig-tree leaues,heale gangrenes,and conſume all excreſcence of dead or proud fleſh. Ripe figs prouoke vrine, make the belly ſoluble, mooue ſweat,and bring foorth ſmall pocks and meaſels:in regard of which operation thus to open the pores, they be vnwholſome to be eaten in Autumne or at the fall of the leafe: for when by their means our bodies be
B ſet into a ſweat,they are more ſubiect to take a through cold. Neither be they wholſome for the ſtomack:but the beſt is,their offence continueth but a while. Mary,they are well knowne to be enemies to the voice. The figs which be of a later breed (as it were) and come laſt,are wholeſomer than thoſe which ripen betimes: (whereas verily, if they be brought to their maturitie by medicining,*i.* by caprification,then they are neuer good:) and theſe figs increaſe the ſtrength of young folk: preſerue elder perſons in better health,and make them looke more yong and with fewer wrinckles. They do quench and allay thirſt,and coole vnkinde heat. And therefore ſuch muſt not be denied vnto the patient,in feuers proceeding from the conſtriction of the pores, which agues the Greeks call Stegnas. Dry figs offend the ſtomack: but for the throat and weaſant they are exceeding good. Theſe dried figs are by nature hot in operation, and therefore in-
C gender thirſt. They ſet the belly into a looſeneſſe: in which regard they are not good to be eaten in any flux or Catarrhs,taking a courſe either to it or the ſtomack: wholſome they be at all times for the bladder for ſuch alſo as be ſhort winded and purſie. Semblably,they open the obſtructions of liuer,kidnies,and ſpleen,and cure their infirmities. Nutritiue they be, and therefore much eating of them cauſeth a man to grow corpulent,and natheleſſe to be ſtrong and luſty withall: which is the cauſe,that profeſſed wreſtlers and champions were in times paſt fed with figs. For *Pythagoras*, a great maſter and warden of theſe exerciſes, was the firſt man who brought them to eat fleſh meat. Moreouer,figs be reſtoratiue,and the beſt thing that they can eat who are brought low by ſome long and languiſhing ſickneſſe, and now vpon the mending hand and in recouerie. In like manner they are ſingular for the falling euil and the dropſie. Figs
D applied as a cataplaſme, are excellent either to diſcuſſe or els bring to maturity any impoſthumes or ſwellings:but they doe the feat more effectually,if either quicke-lime or ſal-nitre be mixt therwith. Boiled with Hyſſop they clenſe the breſt,break and diſſolue the flegmatick humors either fallen to the lungs,or there ingendred;& ſo by conſequence rid away an old cough. Sodden in wine,& ſo applied as a liniment,they cure the infirmities incident to the ſeat or fundament, they mollifie and reſolue the ſwelling tumors of the paps, they diſcuſſe and heale fellons,puſhes,biles,& riſings behind the ears. A fomentation made with their decoction,is good for women. And the ſame being ſodden with Fæni-greek,are excellent for the pleuriſie & Peripneumony,*i.* the inflammation of the lungs. Boiled with Rue,they aſſuage the ventoſities or collicke in the guts. The ſame being incorporat with verdi-greaſe or the ruſt of braſſe,cureth
E the morimals of the legs:and with Pomgranats they heale the riſing & exulceration of the fleſh and skin about the naile roots. But made into a cerot with wax,they heale burnes,ſcaldings, & kibed heels. Seeth Figs in wine with wormwood and barley meale,and put nitre to them,they are paſſing wholeſome for thoſe who are in a dropſie. Chew them,they *binde the belly. Make a cataplaſme of Figs and ſalt together: the ſame is ſingular for the ſting of ſcorpions. Boyle them in wine,and ſo apply them,you haue an excellent remedy to draw forth carbuncles to the outward parts,and bring them to an head. Take the fatteſt & fulleſt Figs you can get,lay them vpon the vgly and ill-fauored tumor called Carcinoma,*i.* the Canker,ſo it be not yet exulcerat. I aſſure you it is a ſoueraigne remedy, and hardly can be matched againe: and ſo it is alſo for the feſtering and eating vlcer Phagedæna. There is not another tree againe growing vpon the
F face of the earth that yeeldeth better or ſharper aſhes than the wood of the Figge-tree doth,either to clenſe *vlcers,or to incarnat,conſolidat,and reſtrain flux of humors. It is taken in drink for to reſolue cluttered bloud within the body. Semblably,if it be giuen to drink with water & oile,of each one cyath,it ſerues wel for thoſe who are dry beaten & bruiſed,who are fallen from ſome high place:ſuch alſo as haue ſpaſms & inward ruptures. And thus they vſe to giue it in a l cramps,

**ἰσχνὰ*, rather *cient*, or *vtileſſunt*. ἀκίνδυνα. *Ex Dioſc.*

**Vlcera*, out of *Dioſcorides*, though ſome reade *aciem*, *i.* the ſight of the eie: which hath no warrant from the author, whom hee followeth and would ſeeme to tranſlate.

20030 copy 1

cramps, and namely, in that vniuerſall convulſion, which holdeth the body ſo ſtiffe, that it can ſtir no way nor other, as if it were made of one intire piece without any ioint. Likewiſe, both taken in drink, and alſo infuſed or iniected by clyſtre, it helpeth the fluxe, occaſioned either by a feeble and rheumatick ſtomacke, or els by the vlcer of the guts. If a man rub the body all ouer with it and oile together, it ſetteth it into an heat, were it before benummed. A liniment made of it, and wrought with wax and oile Roſat together, skinneth a burnt or ſcalded place, moſt finely, leauing no skar at all to be ſeen. Temper it with oile, and therwith annoint their eies who are pore-blind, ſand blind, or otherwiſe ſhort-ſighted, it amends their eie-ſight: & to conclude, rub the teeth often therewith, it preſerueth them white, neat, and from rotting. Thus much of Fig-tree aſhes. G

Moreouer, it is commonly ſaid, That if one come to a Fig-tree, bend a bough or branch therof downward to the ground, and bearing vp his head without ſtooping, reach and catch hold of a knot or ioint with his teeth, and ſo bite it off, that no man ſee him when he is doing of it, and then lap the ſame within a piece of fine leather, tied faſt by a thred, and hang it about his necke, it will diſpatch the kings-euill and ſwelling kernels or inflammations behind the eares. H

The bark of the Fig-tree reduced into pouder, mixed with oile, and ſo applied, healeth the vlcers of the belly. Green Figs taken raw, ſtamped and incorporat with niter and meale, take away all warts, whether they be ſmooth or rough. The aſhes made of thoſe ſhoots that ſpring from the root, is a kind of Antiſpodium, and may go for Spodium indeed. If the ſame be twice calcined and burnt, and then mixed with ceruſſe or white lead, and ſo reduced into trochiskes, they make a good collyrie or eie-ſalue, to cure the roughneſſe and exulceration of the eies. I

As many vertues as the mild fig-tree hath, yet the wild is much more effectuall in operation: how ſoeuer ſhe yeeldeth leſſe milke or white juice than the other doth. For a branch onely of it, is as good as rennet or rindles to make milk turn and run to a cheeſe curd. Howbeit, that milky liquor which it hath, if it be gathered and kept vntill it be dry and wax hard, ſerueth to ſeaſon our fleſh meats, and giue them a good taſt. For which purpoſe it is wont to be mixed and diſſolued in vineger, & then the fleſh muſt be well rubbed and poudred therwith. The ſame is vſually mingled with cauſtick and corroſiue medicines, when there is an intention to raiſe bliſters, and make an iſſue. It cauſeth the belly to be laxatiue, and openeth the matrice, if it be vſed with Amyl pouder. Being taken in drink with the yolk of an egg, it prouoketh womens fleurs. Applied in a liniment with the floure of Feni-greeke, it eaſeth the pains of the gout: it clenſeth the leproſie, and foul wild ſcab: it killeth ring-worms and fell tettars: it ſcoureth away freckles and ſuch flecks as disfauor the face: likewiſe it cureth the parts ſtung with venomous ſerpents, or bitten with mad dogs. Moreouer, this juice of the wild Fig-tree, applied vnto the teeth with a lock of wooll, allaieth their ach: ſo it doth alſo if it be put into them that be worme-eaten and hollow. The tender yong branches, together with the leaues, if they be mingled with Eruile, are good againſt the poiſon of venomous ſea-fiſhes. But then, according to ſome Phyſitians, there muſt be wine added to this receit. The ſaid tender branches being put into the pot with Bœuf, and ſo boiled together, ſaue much fewell, for leſſe fire by far will ſerue to ſeeth the meat. The green figs of this wild fig-tree brought into a liniment, do mollifie and diſcuſſe the kings euil, and all other tumors and apoſtemes. And in ſome meaſure the leaues alſo haue the ſame operation: Chuſe the ſofteſt and tendereſt of them, let them be ſtamped and mixed with vineger, they will cure running ſcails and ſores, eaſe bloudy fals and chilblanes, yea, and ſcoure away filthy ſcurfe or dandruffe. The ſaid green figs, together with the leaues, incorporat with hony, doe cure the wens or exulcerat bunches, which yeeld matter out of them reſembling hony: likewiſe they heale the biting of mad dogs. The greene and freſh figs newly gathered, if they be laied too with wine, doe heale filthie eating vlcers: and mixed with Poppie leaues, they draw and fetch away broken bones out of the body. The greene Figs of the wild Fig-tree, doe ſcatter and diſcuſſe inflammations, onely by their perfume, if they be burnt. They are a counterpoiſon, in caſe one haue drunk Buls bloud, or ceruſſe: the ſame alſo put away the danger of milk crudled within the ſtomacke, if they be taken in drinke. Likewiſe, ſodden in water, and reduced into a liniment, they cure the riſings & tumors behind the ears. The tender branches & the leaſt green Figs of this wild Fig-tree, being taken in wine, are very good for the ſting of Scorpions: with this charge, that the milky iuice thereof be inſtilled into the wound, and the leaues laied aloft. The ſame alſo ſerueth for the hardi-ſhrew. The aſhes of the ſmall tendrons beeing burnt, duely K

applied, I. M

A applied, bring the Vvula againe into the right place, and aſſuage the paine therof. The aſhes of the very tree it ſelfe, being incorporat with honey, do cure the rhagadies, fiſſures, and chaps in the feet, or elſwhere. The root boiled in wine, eaſeth the tooth-ache. The winter wild fig-tree, (which beareth fruit late in the yere) if it be ſodden in vineger, and ſo ſtamped and brought into a liniment, is ſingular to kill tettars and wild ſcals. But to prepare this medicine, the wood & boughs of the tree muſt be deſpoiled of the barke, and then ſhauen or ſcraped ſo fine as any pouder or ſaw duſt, that they may be reduced into an ointment. Yet there is one medicine more belonging to the wild-fig-tree, which is admirable, and may make a man to wonder at it: if a yong boy not yet vndergrowne nor 14. yeares of age, break a branch or bough of the wild fig-tree, and with his teeth do pill the ſaid branch, and fetch off the rind before it haue gathered any downe
B or moſſe about it; then the marrow or pith within the ſaid branch, if it be taken forth and tied faſt about one that hath the kings euill (ſo that all this be done in a morning before the Sun-riſing) doth repercuſſe and ſmite back the ſaid diſeaſe, ſo that it ſhall not ariſe and grow. Moreouer, this wild fig-tree hath one ſingular property beſides, That if a collar made of the branches thereof be but about a buls neck, it wil make him perforce to ſtand ſtil and not to ſtir, how fell and fierce ſoeuer he be otherwiſe; ſuch a wonderfull vertue it hath to bridle and keep vnder his courage.

Moreouer, ſince that the Greeks do terme this wild fig-tree in their language Erineos, which putteth me in mind of a certain herb called Erineos alſo in their tongue, I cannot wil nor chuſe but for affinity and neighbor-hood ſake, deſcribe the ſame in this place, and ſet downe the pro-
C perties and vertues thereof. An herb it is, one good handful high, riſing vp commonly with fiue or ſix little ſtalks or branches, much like vnto Baſil; bearing a white floure, a black ſeed, and the ſame ſmall: which ſeed beaten to powder and medled with the beſt Atticke honey, cureth the rheume which falleth into the eies and cauſeth them to weep and water continually: as touching the herb it ſelfe, if it be applied or vſed accordingly, with a little ſal-nitre put thereto, it is a paſſing good remedy for the pain of the ears. The leaues are a counterpoiſon.

To come now to the Plum tree: the leaues thereof boiled in wine, are good for the infirmities incident to the amigdales, the gums, and the Vvula, in caſe the mouth be oftentimes waſhed with a collution made of their decoction. Plums themſelues make the body ſoluble, & very commodious they are to the ſtomack; but this benefit continueth but a ſmall while.

D Peaches are much better than Plums; and ſo is their iuice, principally if it be drawn in wine or vineger: and verily for a fruit, there is not in the world any more harmleſſe than it. You ſhall not ſee a fruit againe, to haue leſſe ſmell, & more juice within than the Peach; and yet as liquid as it is, it cauſeth them to be dry and thirſty who eat therof. The leaues of the Peach-tree, punned and applied, do ſtanch bleeding. The kernels of Peaches, incorporat in vineger and oile to a liniment, and laied too as a frontall, allay the head-ache.

Bulleis, Skegs, and Slone (which are the berries, as it were, or fruit of the wild Plum tree) or the very barke and rind growing to the root, boiled in one hemine or ſmal pint of ſome hard and crabbed wine, vntill a third part only remaine, do veeld a decoction effectuall to allay the pains of the cholick, and to ſtop the flux of the belly: of this liquor, a cyath is a ſufficient draught to
E be taken at a time. As well in this wild kind as in planted Plum trees of the hortyard, there is to be found a certain skinny gum, in Greek called Lichen, which hath a wonderfull operation to cure the rhagadies or chaps, yea, and the ſwelling piles or knobs that appeare in the fundament.

In Egypt and Cypres both, there groweth the Sycomore, which is a kind by it ſelfe between a fig tree and a mulberry tree, as I haue before ſaid; the fruit or berries whereof be full of liquor, which ſo ſoon as the vppermoſt rind or pill only is pared away, appeareth in great abundance: cut and gaſh them deeper in, they ſeeme drie, after a wonderfull and incredible manner. This juice iſſuing out of them, is a ſingular defenſatiue againſt the poiſon of Serpents: a wholeſome medicine for the bloudy flix; and * a notable carminatiue to diſcuſſe and reſolue puſhes, biles, and al impoſtumations. It ſoudereth and healeth vp wounds, it allaieth head-ach, and aſſuageth
F the wens or pains of the ears. Such alſo as be ſpleniticke or diſeaſed in the ſplcene, finde much eaſe and comfort by drinking thereof. Moreouer, a liniment made therewith, is good to chauſe and heat thoſe, who chill and quake for extremity of cold: howbeit, laſt it will not, but breed worms very quickly. Certes, the juice of our mulberries which we haue, is of no leſſe operation and effect; for if it be taken in wine, it is a ſingular counterpoiſon for them who haue drunke ei-

* The like is *Emplaſtrum Diamoreon*: commended by *Galen*, and deſcribed by *Ægineta*.

20030 copy 1

ther the iuice of Aconit,[*i.*Libard-bane] or ſwallowed a venomous ſpider. The ſame doth looſen the belly,euacuat ſlimy and roping fleame,and expelleth the broad wormes and other ſuch vermin ingendred in the belly. Of the like efficacy is the bark, if it be pulueriſed and ſo taken in drink. The leaues boiled in rain water,together with the barke of the blacke fig-tree and the vine,do make a lauature or water to * colour the haire [blacke.] The iuice of mulberries doth work ſpeedily,and prouoke to the ſiege:and the very fruit or mulberry it ſelfe,for the preſent is comfortable to the ſtomacke; it cooleth for the time, but bringeth thirſt with it. If a man eat them alone,or laſt,and lay no other meat vpon them,they ſwell in the ſtomack and be very flatuous. The iuice drawn out of vnripe mulberries,are of vertue to bind the belly. In ſum,there be ſtrange and wonderfull properties worthy to be obſerued in this tree, which ſeemeth to haue ſome ſenſe and vnderſtanding,as if it were a liuing and ſenſible creature,whereof I haue already * written more at large in the deſcription of it,and the nature thereof. There is a notable * compoſition made of mulberries,reſpectiue to the mouth and throat,called thereupon Panchreſtos Stomatice,and by another name, Arteriace:the receit and making whereof, is in this manner; *Recipe*,of the iuice drawne out of Mulberries,three ſextars,ſeeth it ouer a gentle and ſoft fire[or rather let it ſtew in balneo Mariæ]vntil it be reduced to the conſiſtence of hony:afterwards put thereto of veriuice made of dried grapes,the weight of two * deniers or drams; of myrrhe,the poiſe of one denier;of ſaffron likewiſe,one dram or denier. Let theſe ingredients (I ſay) be firſt beaten to pouder(ſuch I mean as need pulveriſing) and ſo mingle them together with the foreſaid decoction,and put it vp for your vſe. A better and more pleaſant medicine there is not,for the mouth,the windpipe,the uvula and the ſtomack. There is another way of making it in this ſort, Take of the iuice aforeſaid,the quantity of * two meaſures called ſextars,of Atticke hony one ſextar,ſeeth them together as before. Many maruels beſides are reported of this tree, of which I will giue you a little taſt:Spie where the little mulberries that ſhall be are newly knit, to wit,when the tree firſt buddeth and before the leaues be fully out;gather their yong knots of the fruit toward,which the Greeks call Ricinos,but in any caſe with the left hand;take heed alſo that they touch not the ground,howſoeuer you do:and if when you haue obſerued theſe circumſtances, you weare them about your wreſts, hang them about your necke, or otherwiſe tie them about you,be ſure they will ſtanch bloud,whether it guſh downe from your noſthrils,flow out of a wound,run out of the mouth,or iſſue by the hæmorrhoid veins. And in truth, folke vſe to keepe theſe little buds or knots very carefully for this purpoſe. The ſame vertue and operation the branches haue(as they ſay)but then they muſt be broken from the tree at the full of the moon,when they begin to knit & giue ſome hope of fruit:& if the ſame touch not the ground, then they haue a ſpeciall property reſpectiue vnto women,for to reſtrain the immoderat flux of their monthly terms,being tied or faſtened to their arms. And it is thought, that they work this effect,if the woman her ſelfe do gather them at any time whenſoeuer:prouided alwaies,that the branch in any wiſe touch not the ground, and that ſhee weare it faſt about her in manner aforeſaid. The leaues of the mulberry tree ſtamped greene, or beeing dry and boiled, ſerue in a cataplaſme to be applied vnto thoſe places which are ſtung by ſerpents: the ſame good they do alſo,if they be taken in drink. The iuice of the bark which grew to the root,if it be drunk either in wine or oxycrat[*i.*vineger and water together] is ſingular againſt the pricke of ſcorpions. But here I muſt ſet downe the compoſitions that our antients deuiſed and made of mulberries: firſt and formoſt,they tooke a quantity of the iuice preſſed out of mulberries,as well ripe as vnripe, which they ſod in a braſſe pan,vnto the conſiſtence or thickneſſe of honey. Some vſed to put thereunto,myrrh and Cypreſſe,ſetting all to frie and take their fermentation in the ſun,vntil it grew to hardneſſe in the foreſaid veſſell,ſtirring it thrice a day with a ſpatule:This was the ſtomaticall medicine of the antients,which they vſed alſo in healing & skinning vp wounds. And yet there was another kind made after this ſort: they preſſed forth the iuice of the vnripe mulberries,but firſt they let the ſaid fruit to be very wel dried, & this ſerued them in lieu of ſauce, which gaue an excellent taſt to their other meats. In phyſick alſo,they imploied it much,namely,about corroſiue and eating vlcers,and for to euacuat tough fleame out of the breſt: they vſed it alſo as need required,as an aſtrictiue,to corroborat the noble and principall parts within the body, It ſtood them alſo in good ſtead for collutions, to waſh the teeth withall. Moreouer,a third kind of iuice they had,which they drew from the leaues and roots after they were wel boiled:and with this iuice & oile together,they were woont to annoint any burnt or ſcalded place

of

* *Tingunt capillum*: for the black colour was in moſt requeſt in thoſe daies.

* *Lib.*16.*ca.*25.

* *Diamorum*,or the compound ſyrrup of mulberries.

* *Pondus X duorum.*

* Somewhat vnder two wine quarts with vs.

A of the body: for which purpoſe, the leaues alſo they applied alone without more ado. As touching the root of the Mulberry tree, it yeeldeth in harueſt time (by way of inciſion) an excellent juice for the tooth-ach, for biles, and impoſtumes, eſpecially ſuch as are growne to ſuppuration and be at hand to break: the ſame purgeth the belly. The leaues of the Mulberry tree infuſed & ſoked in vrine, fetch off the haire from thoſe skins which are to be courried and dreſſed.

Cherries looſen the belly, and be hurtfull to the ſtomack; yet, if they be hanged vp and dried, they do bind the belly, and prouoke vrine. I find a notable experiment in ſome authors, That if a man eat Chery-ſtones and all in a morning, new gathered from the tree with the dew vpon them, they will purge ſo effectually, that he ſhall find himſelfe cleane rid from the gout of the feet, if he were diſeaſed that way.

B Medlars, all of them, except thoſe great ones called Setania (which indeed are more like to Apples) do cloſe vp the ſtomack, and bind the belly. In like manner Sorueiſes, if they be dried; for being freſh and new gathered, they be good to ſcoure and ſend excrements ſpeedily out of the ſtomacke and belly both.

Chap. XVIII.

¶ Of Pine-nut s, or Pine-apples: of Almonds, Filberds, and Hazell-nuts: of Wal-nuts, Fiſticks, Cheſtnuts, Carobs, and Cornoils. Of the fruit of the Arbut or Strawberry tree, and the Bay.

C THe Pine apples or nuts, which haue roſin in them, if they be lightly bruiſed, and then ſodden to the half in water, with this proportion, to wit, one ſextar of water to euery ſuch apple, do yeeld a decoction ſingular good for ſuch as reach and ſpit vp bloud; ſo that the patient drink two cyaths thereof at one time. The decoction likewiſe of the Pine-tree barke boiled in wine, is giuen to drink for the pains and torments in the belly. The kernels of the Pine-nuts quench thirſt; they pacifie and ſtil the frettings and gnawings of the ſtomack: they rectifie the corrupt and putrified humors there ſetled and bedded: they ſtrengthen weak bodies in manner of a reſtoratiue, and are right good & agreeable to the reins and bladder: howbeit they ſeem to exaſperat the throat, & to encreaſe a cough. Being taken inwardly, either in water, wine, ſweet cuit, or the decoction of * dates or tamarinds, they purge cholerick humors: when the gnawing *Balanorum decoctio.*
D gripes within the ſtomack be exceeding violent and painfull, it is good to mix therewith Cucumber ſeed and the juice of Pourcellane: likewiſe in caſe either bladder or kidnies be exulcerat: for diureticall they be alſo, and prouoke vrine.

Touching the bitter Almond tree, the decoction of the roots thereof, doth ſupple the skin and lay it euen and ſmooth without wrinckles; it imbeliſheth the viſage with a freſh, liuely, and cheerfull colour. The bitter Almonds themſelues bring folk to ſleep, and get them appetite to their meat: they moue vrine, and ſtir the ordinary courſe of womens monethly fleurs: they ſerue in a liniment for the head-ach, eſpecially in feuers; but if the ſaid head-ach come by occaſion of drunkenneſſe or a ſurfet of wine, they would be applied with vineger, oile roſat, and a ſextar of water. They haue a property to ſtanch bleeding, mixed with Amylfloure and mints. They are
E good in a lethargy, and the falling ſickneſſe, if the head be therewith annointed all ouer. They cure the angry night-foes, called chilblanes and bloudy-falls: applied with cold wine, they cure vlcers which grow to putrifaction; and with hony, the bitings of mad dogs: they take away the ſcales and dandruffe about the face, if ſo be there haue bin vſed before, ſome conuenient fomentation to prepare the skin for this medicine. An Almond milk drawn with water, and taken as a drinke, eaſeth the pains of the liuer and kidnies. Bitter Almonds reduced into a loch with Terpentine, worke the ſame effect, ſo that the Patient be often licking thereof. For thoſe who be troubled with the ſtone and grauell, with difficultie alſo of piſſing, they be very effectuall if they be taken with ſweet wine cuit: alſo beaten with honied water, they be ſingular to cleanſe the skin, and make it look neat and faire. Reduced into the form of a loch with hony, they be whol-
F ſome for the liuer, good to ripen and diſpatch a cough, & excellent for to mitigat the paines of the cholique: and this electuarie muſt bee taken, to the quantity of one hazell nut at a time, with a little ſauge put thereto. It is ſaid, that our luſty toſſe-pots and ſwil-bols, if they eat foure or fiue bitter almonds before they ſit them down to drink, ſhall beare their liquor well, and neuer be drunke, quaffe they and poure they downe as much as they wil: alſo, that if foxes chance

to eat of them, and cannot come by water neere at hand to lap, they wil die thereof. Sweet almonds are not ſo medicinable as the bitter, and yet they be purgatiue, abſterſiue, and diureticall. If they be new and freſh, they charge and ſtuffe the ſtomacke. G

Hazel-nuts and Filbirds, otherwiſe called the Greekiſh nuts, beeing taken in vineger with wormwood ſeed, cure the yellow jauniſe, as it is commonly ſaid: & a liniment made with them doth help the diſeaſes incident to the ſeat, and particularly the piles and ſwelling bigs there appearing. The ſame medicine is good for the cough, and ſuch as ſpit and caſt vp bloud.

κάρυον, of κάρη, i. the head: like as in Latin, *Nux, a nocendo, vel necendo*

As for Walnuts, the Greeks haue giuen them a * name importing as much as the heauines of head, and not without good cauſe, for the very ſhade of the tree and the ſent of the leaues, do pierce and enter into the head: ſo do the kernels alſo in leſſe while, if they be eaten: now the newer they be, the more pleaſant taſt they haue: the drie are more oily and vnctious, hurtfull to the ſtomack, hard of digeſtion, cauſing head-ach, naught for them who haue a cough, and for ſuch as would vomit in a morning faſting: good only in that troubleſom running to the ſtoole and ſtraining for nought, by reaſon of their property to euacuat fleam. The ſame being eaten before meat, do dull the force of any poiſons: they help the ſquinancy alſo, applied with Rue and oil. Aduerſe & contrary they are to the nature of onions, & do keep down & repreſſe their ſtrong ſmell which riſeth from them, after a man hath eaten them. Applied with a little hony, they are thought to be very good for the inflammation of the eares; & with Rue, for the breſts and paps; as alſo for diſlocations and parts out of ioint. But if they be vſed with onions, ſalt, and hony, they are ſingular for the biting both of dog & man. The ſhel of a wal-nut, is thought to be of a cauſtick quality, and good to burn or ſeare an hollow tooth: the ſame being burnt, pulverized, and incorporat with oile or wine, ſerueth to annoint the heads of yong babes for to make the hair grow thick: & in that maner it is vſed to bring the haire again of elder folk, when through ſome infirmity it is ſhed. The more Walnuts that one eateth, with more eaſe ſhal he driue worms out of the belly. VVal-nuts that haue bin very long kept, do cure carbuncles, gangrenes tending to mortification, and reduce the black and blew ſpots (remaining after ſtripes) to their own color. The bark of the wal-nut tree, is a ſoueraign remedy for the bloudy flix, and the foule tettars or ringworms. The leaues bruiſed & ſtamped with vineger, & ſo applied, put away the pain of the ears. After that *Mithridates* (that moſt mighty and puiſſant king) was vanquiſhed, *Cneus Pompeius* found in his ſecret cloſet or cabinet, among other precious jewels, the receit of a certain antidote or preſeruatiue againſt poiſon, ſet down vnder the hand of the ſayd prince, in a priuat note-book of remembrances, in this maner following: Take 2 dry walnut kernels, as many figs, of rue, 20 leaues: ſtamp al theſe together into one maſſe, with a graine or corn of ſalt among. Vnder which receit, was thus much ſubſcribed, VVhoſoeuer vſe to eat of this confection in a morning next his heart, there ſhall no poiſon hurt him that day. It is ſaid moreouer, that the kernels of walnuts chewed by a man or woman faſting, doe cure the biting of a mad dog, ſo that the place be annointed and dreſſed therewith. H I K

But to return again to Hazle-nuts and filberds, they do cauſe head-ach, they breed winde in the ſtomack: and a man would not think nor beleeue, how ſoon they wil make one fat, but that experience approueth it. If they be roſted or torrified, they cure a rheume: and if they be beaten to pouder, and giuen to drink in honied water, they rid away an old cough that hath ſtucke to one a long time: ſome put thereto certain pepper cornes, and others drinke them in wine cuit that is ſweet. Fiſticks are vſed in the ſame ſort, and haue the ſame operation and effects as the Pine-nut kernels haue: ouer and aboue, they are ſoueraigne for the ſting of ſerpents, whether they be eaten or taken in drinke. L

Cheſtnuts be exceeding aſtringent, and mightily ſtay all fluxes both of the ſtomack and the belly: for ſuch as ſcour ouermuch and haue *a great lask vpon them: alſo for them who reach vp bloud, they be paſſing wholeſome; and withall, nutritiue and breeding good faſt fleſh.

* *Aluo citæ, & non aluũ cient.*

Carobs, which be freſh and greene, are hurtfull to the ſtomacke, and doe looſe the belly; yet the ſame, if they be dried, do bind, and are more wholſome for the ſtomacke: diureticall they be alſo, and prouoke vrine. As for thoſe Carobs or Cods of Syria, ſome vſe to ſeeth three of them in a ſextar of water vntill halfe be conſumed, and drink that iuice or liquor thereof for the paine of the ſtomack. If a man take the green twigs of a Corneil tree, there will (by the meanes of a red hot plate or ſlice of yron ſet vnto them) ſweat or fry out a certain liquid humor, which muſt be receiued ſo, as no wood touch it: the ruſt of yron beſmeared with this liquor, cureth foul tettars M

A tars and ringwormes called Lichnes,if they be taken at the firſt before they haue run far. The Arbut or Strawberry tree,otherwiſe named Vnedo,beareth a fruit hard of digeſtion,and offenſiue to the ſtomack. The Lawrell,both leafe,bark,and berry,is by nature hot;and therefore it is agreed among all writers,That their decoction, eſpecially of the leaues, is comfortable to the bladder and natural parts of women:the ſame being applied as a liniment,be ſingular good for the prick or ſting of waſps,hornets,and bees;and likewiſe againſt the poiſons of ſerpents, eſpecially of the viper,and Seps otherwiſe called Dipſas.Boiled with oile, they are good to bring down womens fleurs. The tender leaues of the Bay ſtamped,and mixed with groſſe barly meale or groats,cure the inflammations of the eies:with Rue,they help the hot tumors and ſwellings of the cods:but incorporat with oile Roſat,or with oile of Ireos or floure-de-lys, they aſſuage
B the head-ach. Whoſoeuer doth chew and ſwallow downe three bay leaues, for three daies together,ſhall be deliuered by that means from the cough. The ſame, if they beaten to pouder & reduced into an electuary or loch with hony,are good for ſuch as be purſie and labor for wind. The bark or rind growing to the root, is dangerous for women great with child,and ſuch muſt take heed how they meddle with it. The very root it ſelfe,breaketh or diſſolueth the ſtone, and is wholſom for the liuer, if it be taken to the weight of three oboli in odoriferous wine. Bay leaues giuen to drink,do prouoke vomit. Bay berries bruiſed and ſo applied, or otherwiſe pulverized and taken in drink,draw down the iſſue of womens terms. Take two Bay Berries, rid or cleanſe them from their huske and drinke them in wine, it is a ſingular medicine for inueterate coughs,& the difficulty or ſtraitneſſe of breath,when a man is forced to ſit vpright for to fetch
C and deliuer his wind:howbeit, if the Patient be in a feuer,it is better to take theſe berries in water;or els by way of a loch or electuary,after they haue bin ſodden in honied water or ſweet cuit. And in this manner they be good in a phthiſick or conſumption of the lungs, & all catarrhs which fall to the pectorall parts;for they ripen fleam,and ſend it out of the cheſt. Foure Bay berries drunk with wine,are a good remedy for the ſting of ſcorpions. The ſame being brought to pouder and reduced into a liniment with oile,& ſo applied, do heale the bloudy-fals called Epinyctides;rid away freckles and pimples;cure running ſcalls and vlcers,cankers and ſores in the mouth;and clenſe the body of ſcurfe,ſcals,and dandruffe. The juice drawn out of Bay berries,killeth an itch that fretteth the skin,& beſides, the lice that crawle and ſwarm all ouer the body. The ſame,mingled with old wine and oile roſat,and ſo dropped into the ears,cureth their
D pain and deafneſſe: and whoſoeuer be annointed all ouer therewith, need feare no venomous things,for they will flie from them. The ſame iuice,eſpecially if it be drawn from the beries of that Lawrel which hath the ſmaller and thinner leaues,may be taken in drink, and ſo it is effectuall againſt all ſtings. The berries drunk in wine,withſtand the venom of ſerpents,ſcorpions, and ſpiders. Brought into a liniment with oile and vineger,and ſo applied,they help the ſpleen and liuer;but with hony,they heale gangrens. Such as be wearied with trauel,or otherwiſe ſtiffe and benummed with cold,find much good by being annointed with the ſaid liniment or iuice, if ſome ſal-nitre be put thereto. Some are of opinion,That if a woman in labor drink the quantity of one acetable of the Lawrell root in water,ſhee ſhall haue the more ſpeedy deliuerance: and for this purpoſe(they ſay)that a freſh and green root is better than a dry. Others preſcribe,
E to giue in drink ten bay berries againſt the prick of ſcorpions. Alſo when the Vvula is falne, ſome giue counſell to take three ounces of the leaues and berries, and ſeeth them in three ſextars of water to the thirds,& to gargarize with this decoction hot:alſo for the head-ach,to take ſome odde number of bay berries,and ſtamp them with oile into a liniment, & therwith to annoint the fore-head & temples,as hot as the patient can well abide it. The leaues of the Delphick Lawrel beaten to pouder,and held to the noſe and ſmelled vnto euer and anon,ſerue for a good preſeruatiue in time of the contagious peſtilence;and the rather, if they be burnt, their perfume doth rectifie the infection of the aire. The oile of the ſaid baies of the Iſle Delphos,is good for to make thoſe cerots which put away laſſitude & wearineſſe,to diſcuſſe & reſolue the cold humors which cauſe quiuering and quaking,to mollifie and ſtretch the ſinews,to allay the
F pain of the ſides in a pleuriſie,and laſt of all, to driue away the cold fits of agues. Semblably,if the ſame be warmed in the rind of a Pomgranat,& inſtilled into the ears,it eaſes their pain:the leaues boiled in water to the conſumption of a third part,keepe vp the Vvula, vſed by way of a gargariſme:but the ſaid decoction taken inwardly,allaieth the pains of belly and guts; the tendreſt leaues that may be had,ſtampt with wine into a liniment,do repreſſe & keep down wheals

20030 copy 1

and itching, if the body be annointed therwith euery night. Next vnto this, the other kinds are G
to be ranged according to the validitie of their operation. As for the Lawrell Alexandrica or Idæa, if a woman in trauell of child-birth take three deniers weight of the root, and drinke the ſame in three cyaths of ſweet wine, ſhe ſhall be quickly deliuered and brought to bed: the ſame drink ſendeth forth the after-birth, and prouoketh womens monthly terms.

Daphnoides, or the wild Lawrell (or call it by any other of thoſe names before rehearſed) hath many good vertues: it purgeth the belly, if you take the leaſe either green or drie, to the weight of three drams with ſalt, in hydromel or honyed water: being chewed, it draweth downe flegmatick and watery humors. The leaf alſo moueth to vomit, and is offenſiue to the ſtomack. The berries likewiſe be purgatiue, if a man take fiue or ten of them at once.

H

Chap. IX.

¶ *Of the tame or gentle Myrtle tree planted. Of Myrtidanum, and the wilde Myrtle.*

OF garden Myrtles, the white is not ſo medicinable as the black: the fruit or berries of the Myrtle, help thoſe that reach vp bloud: taken with wine, they put by the danger of venomous muſhrums: chew them in your mouth, your breath will be the ſweeter for it two daies after. It appeareth by the Poet *Menander*, that the good-fellows Synariſteuſæ were wont to eat Myrtle berries: the weight of one denier in wine, is good for the bloudy flix. If they haue a little ſiuering or waulm ouer the fire in wine, they make a good water or liquor to cure vntoward vlcers to heale, eſpecially ſuch as be in the extreame parts of the body. Of them and barley I
groats, there is made a cataplaſme for bleered eies: for the fainting alſo and trembling of the heart, being applied to the left pap or breaſt. In like manner, the ſame being vſed with pure vndelaied wine, is ſingular for the prick of ſcorpions: for the infirmities of the bladder, the headach, and the apoſtemations betweene the angle of the eies and the noſe, if they be taken before they yeeld filthy matter: and ſo they cure other tumors or ſwellings: and if their pepins or kernels be taken forth, and then incorporat with old wine, they be ſingular for the ſmall pocks and meazles. The juice of Myrtle berries bindeth the belly, but prouoketh vrine. A liniment alſo is made thereof with wax, for the ſaid pox and meazles: alſo againſt the ſting of the venomous ſpiders Phalangia. The ſaid juice doth colour the haire blacke. Of the ſame Myrtle there is an oile made, more lenitiue and mild than the iuice or liquor aboue-named: & yet there is a wine K
of Myrtles more kind & gentle than it, which wil neuer ouerturn the brain or make one drunk. The ſame, if it haue lien and be ſtale, bindeth the belly and ſtaieth a laske: it ſtrengtheneth the ſtomack alſo, and repreſſeth vomits: it aſſuageth the griping pains in the guts, and reſtoreth appetite to meat: the pouder of drie Myrtle leaues, reſtraineth ſweats, if the body be ſtrewed therwith, though it were in a feuer. The ſame pouder is good for the feebleneſſe of the ſtomack, and the flux from thence proceeding: it reduceth the matrice into the right place, when it beareth down out of the body: it cureth the infirmities of the ſeat; healeth running ſcalls and vlcers; wariſheth S. *Anthonies* fire, and the ſhingles, being vſed thereto in ſome fomentation; retaineth and ſtaieth the haires ready to ſhed; ſcoureth away dandruffe; drieth vp wheals, pocks, and meazles; and laſt of all skinneth burnes and ſcaldings. The pouder entreth into thoſe vnguinous or L
oleous plaſters which the Greeks call Liparas. And ſuch a kind of plaſter in like manner as the oyle of theſe Myrtle berries, is moſt effectuall in thoſe ſores which light vpon moiſt parts, as for example the mouth and the matrice. The leaues in ſubſtance, beaten to pouder and tempered with wine, are a counterpoiſon againſt venomous muſhrums; but incorporat with wax into a liniment, they do eaſe the gout of any joints, and driue back riſings and impoſtumations. The ſame leaues boiled in wine, are giuen to drink for the bloudy flix, and the dropſie. VVhen they be dried and brought into pouder, they ſerue to caſt and ſtrew vpon vlcers; alſo to reſtraine any bleeding. They ſcoure away freckles, and ſuch like ſpots of the skin: they heale the riſing, ouergrowing, and parting of the skin about the naile roots; alſo whitflaws, chilblanes, piles, & ſwelling bigs in the fundament; the accidents befalling to the cods; filthy maligne and morimall vlcers; and laſt of all, burns (applied in manner of a cerot.) For the ears running with filthy mat- M
ter, there is good vſe of the leaues burnt; alſo of their juice and decoction. The ſame are likewiſe burned, to ſerue for certain antidots or counterpoiſons. In like manner, to the ſaid purpoſe the tender ſprigs of the Myrtle with the floure vpon them, are gathered and calcined within an

ouen,

A ouen, in a new earthen pot, well couered and cloſe luted: after which they be reduced into pouder, and mixed with wine. The aſhes of the leaues burnt, healeth burnes. To keepe the ſhare or groine from ſwelling, although there be an vlcer there, it is ſufficient, if the party haue about him a ſhoot or branch only of the Myrtle; prouided alwaies, that it touched neither yron nor the earth.

As touching Myrtidarum, how it is made I haue ſhewed already. Applied vnto the matrice or natural parts of a woman either by way of fomentation or liniment, it doth much good. And much better, if it be made with the bark, leafe, and berry of the Myrtle. Moreouer, of the ſofteſt leaues braied and ſtamped in a mortar, there is a juice preſſed forth, by pouring green wine by little and little among, and otherwhiles raine water: which is vſed much for the vlcers and ſores
B of mouth, ſeat, matrice, and belly: to dye the haire black: to waſh and *bath the arm-holes with: to ſcoure away ſpots and freckles: and in one word, when and whereſoeuer there is need of aſtriction. * *Alarum perfuſiones.*

The wilde Myrtle or Oxymyrſine, called alſo Chamæmyrſine, differeth from the ciuill and gentle Myrtle, in the redneſſe of the berries, and the ſmal growth. The root is highly eſteemed: for boiled in wine, and ſo taken in drink, it cureth the paine in the raines, the difficulty of vrine, eſpecially when it is thick, and of a ſtrong ſauor. The jaundiſe alſo it helpeth, and cleanſeth the matrice, if it be brought into pouder, and mixed with wine. The yong and tender buds eaten after the manner of Sperage crops with meat, firſt roſted in the embers; the ſeed likewiſe taken in wine, oile, or vineger, break the ſtone. The ſame ſeed ſtamped and drawne with vineger and oyle
C roſat, allaieth the head-ach; but in drink it cureth the jaundiſe. *Caſtor* called Oxymyrſine (with the ſharp prickie leaues like the Myrtle, and wherewith beeſomes be made) by the name of Ruſcus, and ſaith it hath the ſame properties. Thus much for planted trees, and their medicinable vertues: proceed we now forward to the wild.

CHAP. I.

¶ *Medicinable vertues obſerued in wild trees.*

F NAture, that ſacred and bleſſed mother of all things, willing and deſirous that man, whom ſhe loueth ſo well, ſhould find euery place ſtored with proper and conuenient remedies for all maladies incident vnto him; hath ſo diſpoſed of her workes, and taken that order, that the rough woods and forreſts, euen the moſt hideous parts of the earth, and fearfull to ſee vnto, bee not without their plants medicinable. Nay, the very wilds and deſarts are enriched and furniſhed therewith: inſomuch, as in euerie coaſt and corner of the world there may be obſerued both ſympathies and antipathies (I meane thoſe naturall combinations and contrarieties in thoſe her creatures.) From whence proceed the greateſt miracles which are to bee ſeene in this round Fabricke and admirable frame.

20030 copy 1

frame. For firſt and formoſt, the Oke and the oliue tree beare ſuch mutual rancor and malice (as it were) and are ſo ſtiffely bent to war one with another, that if a man replant one of theſe trees in the trench or hole from whence the other was taken vp, it wil ſurely die. Alſo, if an Oke be ſet neare vnto a walnut-tree, it wil not liue. The Colewort and the Vine hate one another to the very death; in ſuch ſort, that if a Vine ſtand neare vnto it, a man ſhall ſenſibly perceiue the ſame to ſhrinke away and recule backward from it: and yet this wort, which maketh the Vine thus to retire and flie, if it chance to grow ouer-againſt Origan or Cyclamine, will ſoone wither and die. Moreouer, it is commonly ſaid, That trees in the forreſt fully grown, which haue ſtood many a yeare, and namely ſuch as are ready to be fallen and laid along for timber, proue harder to be hewed, and ſooner wax dry, if a man touch them with his hand before hee ſet the edge of the axe to their butt. And ſome ſay, that pack-horſes, aſſes, and other labouring beaſts which haue Apples and ſuch like fruit aload, wil quickly ſhrinke and complaine vnder their burden, yea, & preſently run all to ſweat (carry they but a very few to ſpeak of) vnleſſe the ſaid fruit, wherewith they are to be charged, be firſt ſhewed vnto them. Aſſes finde great contentment and good by feeding vpon Fenel-geant or Ferula plants: and yet to horſes, garrons, & other beaſts of cariage and draught, they are preſent poiſon, if they eat them: which is the cauſe that the Aſſe is a beaſt conſecrated vnto the god *Bacchus*, as well as the foreſaid plant Ferula. Ouer and beſides (ſee the admirable operation in Nature) the very inſenſible and liueleſſe creatures, yea, the leaſt that be, meet euery one of them with ſome contrary thing or other, which is their bane and poiſon: for as our cooks know well enough, the inner bark of the Linden tree ſliued thin into broad flakes and fine boulted floure together, doe drink and ſuck vp the ſalt of viands, ouermuch poudered, and make it freſh again. Likewiſe, ſalt giueth a good relliſh to any meat that is ouer ſweet, and tempereth thoſe that haue a luſhious and wallowiſh taſt. If water be nitrous, brackiſh, & bitter, put ſome fried barly meale into it, within two houres and leſſe it will be ſo well amended and ſweet, that a man may drink thereof: and this is the reaſon that the ſaid Barly meale is put ordinarily in thoſe ſtrainers and bags through which wines do paſſe, that thereby they may be refined and drawn the ſooner. Of the ſame operation alſo and effect there is a kind of chalke in the Iſland of Rhodes: and our clay here in Italy will do as much. Thus you ſee what enmity & diſcord there is in ſome things. Contrariwiſe, we may obſerue in others, how wonderfully they accord and agree together: for pitch will diſſolue, ſpread, and be drawne out with oile, being both as they are of a fatty nature; oile alone will incorporat and mingle well with lime; & they hate water, the one as well as the other. Gums are ſooner diſſolued and more eaſily tempered with vineger than with any thing els; & ink with water: beſides an infinit number of other ſuch, that I ſhall haue occaſion to write of continually in their due places. And indeed, this is the very ground and foundation of all our Phyſick. For (to ſay a truth) Nature ordained at the firſt ſuch things and none but ſuch, for to be the remedies of our diſeaſes, which we feed & liue daily vpon; euen thoſe which are ſoon found and as ſoon prepared, which be ready at hand, common euery where, and coſt vs little or nothing at all. But afterwards the world grew to be ſo full of deceit and couſenage, that ſome fine wits and nimble heads deuiſed to ſet vp Apothecary ſhops, promiſing and bearing vs in hand, that euery man might buy his life and health there for mony. Then anon a ſort of compoſitions, mixtures, and confections were ſet on foot; then there was no talk but of ſtrange and intricat receits, and theſe were bruited abroad for the only medicines, of wonderfull and vnſpeakable operations. So that now adaies wee vſe no other drugs but thoſe that come from Arabia and India. And if a man aile neuer ſo little, or haue the leaſt puſh or wheale about him, he muſt haue ſome coſtly Phyſick forſooth for it: & a plaſter that came from as far as the red ſea: whereas in truth, the right remedies appropriat for euery maladie, be no other than ſuch as the pooreſt man that is feedeth vpon euerie night ordinarily at his ſupper. But if we went no farther than to the garden for medicines, and ſought after herbs, ſhrubs, and plants only, for to cure our ſickneſſe, or maintain our health, certes there were not a baſer occupation in the world than the profeſſion of Phyſick, and Phyſitians would be nought ſet by: but will you haue the truth? To this paſſe are we come, the old world we haue bidden farewell vnto: the antient manners and rites of Rome citie are dead and gone: our ſtate is growne ſo much in greatneſſe, as there is no goodneſſe left. Our victories and conqueſts be theſe, and nothing elſe, which haue vanquiſhed & ſubdued vs: for ſubiect we muſt acknowledge our ſelues to ſtrangers and forraine Nations, ſolong as Phyſicke (one of their Arts) is able to command our commanders,

20030
copy 1

A ders, and ouerrule our Emperors. But the diſcourſe of this matter in more ample manner, I will reſerue to ſome other time and place.

Chap. II.

¶ *Of Lotos.*

AS touching the herbe * Lotos, the Ægyptian plant likewiſe of that name: as alſo, of ano- * Called otherwiſe *Colocaſia*, and the Egyptian Beane.
ther tree about the Syrtes ſo called, I haue written ſufficiently in their due places: as for this Lotos, which our countrymen call in Latine the Greekiſh Bean, hath a property for to bind and knit the flux of the belly, with the fruit or berries which it beareth. The ſhauings
B or ſcrapings of the wood therof, boiled in wine, and ſo taken inwardly, cure the bloudy flix and exulceration of the guts; repreſſe the immoderat flowing of womens moneths; help the dizzineſſe and ſwimming of the braine; and thoſe who be ſubiect to the falling ſickneſs: the ſame decoction alſo * keepeth the haires from ſhedding, if the place be bathed therewith. But won- * *cohibent capillum. Dioſc.* hath *ἐυθρίξους*, *i. Rufant, i.* coloureth them yellow.
derfull it is, that theſe ſmall ſhauings ſhould be ſo bitter, as nothing more, when the fruit it ſelf is as ſweet as any other. Moreouer, of the fine duſt ſawed or filed from this wood, ſodden in Myrtle water, then kneaded or wrought into paſt, & ſo reduced into ſeuerall trochisks, there is a ſoueraigne medicine made for the bloudy flix: if the patient drinke the weight of one Victoriat or halfe dram of theſe troſches in three cyaths of water.

C

Chap. III.

¶ *Of Maſt.*

ACornes or Maſt of the Oke, beaten to pouder, & incorporat with Hogs lard ſalted, heale all thoſe hard and ſwelling cankerous vlcers, which they call in Greeke Cacoethe. In all theſe trees bearing Maſt, the very ſubſtance of the wood is more forcible than the fruit; the outward bark more than the wood; and the inner rind or tunicle vnder it, more than the bark or all the reſt. This membrane or pellicle if it be boiled, is ſingular for the flux of the ſtomack, proceeding of weakneſſe. The very Maſt or Acorne it ſelfe reduced into a liniment and applied, ſtaieth the bloudy flix: and the ſame reſiſteth the venom of ſerpents ſtings, reſtraineth
D rheums, and catarrhs, and namely, that flux of humors which cauſeth apoſtemations. As well the leaues, the maſt or beries of this tree, as the bark or juice drawn from it, after boiling, are excellent againſt the poiſons called in Greek Toxica. The barke ſodden and brought into a liniment with Cow-milk, is very good to be applied vnto the place where ſerpents haue bitten or ſtung; it is giuen alſo in wine for the bloudy flix: of the ſame vertue & efficacy is the holm-oke

Chap. IIII.

¶ *Of the [Scarlet] graine of Holme-oke: of Galls and Miſſelto: of certaine little balls growing vpon the Oke: of Maſt: of the root of * Cerrus: and of Corke.*

* The great Holm-Oke.
* *Coccum Ilicis* our Kermes or Kutchenel, as ſome thinke.

E THe * Scarlet graine growing vpon the Oke-holm, is very good to be laid to freſh wounds with vineger. It is applied with water for the flux of watery humors vnto the eies: & dropped likewiſe into them when they be bloud-ſhotten. Now there is a kind of it growing commonly in the region of Attica and throughout Natolia, which very quickly turneth to be a grub or Magot (wherupon it is called Scolecion) and is rejected, as being of no worth. Many more ſorts there be of it, whereof the chiefe and principall I haue ſhewed already.

As touching the Gal-nuts, I haue likewiſe made of it as many kinds: for ſome be ſolid and maſſie, others full of holes, as if they were bored through. You ſhall haue of them white, and black: ſome great, & others ſmal: but how different ſoeuer they be in ſubſtance, colour, or quantity, they be all of like nature. The beſt are thoſe of Comagene. Gals are good to eat away the
F ſuperfluous excreſcences in the body. They ſerue very wel for the infirmities of the gums and uvula; for the cankers & exulcerations breeding in the mouth. Being firſt burnt, & then quenched in wine, they are ſingular for the fluxes occaſioned by a feeble ſtomack. Applied in maner of a liniment, they help the bloudy flix. Incorporat in hony, they cure whitflaws, riſings, & partings of the fleſh and skin about the naile roots; the roughneſſe of the nailes, the running ſcals

and

and vlcers in the head: the knobs or ſwelling piles in the fundament, and in one word, all thoſe corroſiue and eating vlcers, which conſume the fleſh to the very bone. Boiled in wine, and ſo inſtilled into the eares, they cure the infirmities of that part. So do they likewiſe help the eies, if they be annointed therewith. Applied with vineger, they diſcuſſe fiegmatick wheales and ſuch like breakings out, as alſo the flat biles and impoſtumes called Pani: the round kernell within them if it be chewed, allaieth the tooth-ach. The ſame is good to skin raw and galled places, & any burn or ſcalded place. Take vnripe Gal-nuts, & drink them with vineger, they wil conſume and weare away the ſwelled ſpleen. Burn the ſame, and quench them with ſalted vineger; a fomentation thereof, ſtaieth the immoderat flux of womens fleurs, & reduceth the matrice (fallen downe) into the right place. All the ſort of theſe Gals do colour the haires of the head blacke. G

Concerning Miſſelto: That the principall and beſt is found vpon the Oke, how it is cut and in what maner birdlime is made therof, I haue already ſhewed. Some for to make the ſaid glew or birdlime, ſtamp Miſſelto firſt, and then ſeeth it in water, * vntill it ſwim aloft. Others vſe to chew the grains or kernels onely which they beare, and ſpit out their outward pils or skins. But the very beſt is that, which hath no husk or skin at all: which alſo is the * ſmootheſt: without-forth of a light tawnie or yellowiſh red: within, as greene as a leeke: for indeed, there is not a thing more glutinous or glewy than it. This Miſſelto is a great emollitiue; for it ſofteneth, diſcuſſeth and reſolueth alſo hard tumors: it is excicatiue beſides, and drieth vp the Scrophules or ſwelling kernels, knowne by the name of the kings euill. If it be incorporat with roſin & wax, it mitigateth all ſorts of impoſtumes or flat biles whatſoeuer. Some put thereto Galbanum alſo, in equall quantity or weight: and ſo vſe it in the ſame manner for to heale wounds. It polliſheth and maketh ſmooth the rough & vneuen nails, if it be laid too for ſeuen daies, and the medicine not remoued before: but the nails ought to be wel waſhed with ſalnitre. Some obſerue certain ſuperſtitious ceremonies herein, and are of opinion, That it will worke the better & with more efficacy, in caſe it be gathered from the Oke, the firſt day of the new Moon: alſo if it be not cut downe with any bill, hook, knife, or edged yron toole. Moreouer, they do hold, That if it touch not the ground, it cureth thoſe who are troubled with the falling ſicknes. Semblably, if women do but carry it about them, it helpeth them to conceiue. Finally, if it be chewed and ſo applied vnto vlcers, it is moſt effectuall to heale them perfectly. H I

Donec innatet Some read *Donec nihil innatet*: that is, ſo long vntill it ſettle all to the bottom, which may ſtand wel with the firſt reading in this ſence, ſo long as it ſwimmes aloft:

* *Sæviſſimum.*

As for the little round bals or apples found vpon the Oke Robur, if they be incorporat with Bears greaſe, they cauſe the haire to come thick again, where it is ſhed, in caſe the bare or bald place be annointed therewith. K

Of the great Oke Holm Cerrus, thus much I haue to ſay, That the leaues, the bark, and maſt thereof do diſcuſſe and drie vp all gathering of impoſtumations, enen ſuch as grow to ſuppuration or mattering; and ſtay the flux of humors which feed them. A decoction thereof doth corroborat any member or part of the body which groweth to be ſenceleſſe or benummed, if the ſame be fomented therwith. Alſo for to dry, bind, & confirm any part which is feeble & weak, it is ſingular good to ſit in a bath of this decoction. The root of this Cerrus is powerful againſt the prick of ſcorpions. D

The bark of the Corke tree beaten into pouder and taken in hot water, is excellent for to repreſſe any flux of bloud, whether it be vpward or downward. The aſhes of the ſaid bark giuen in wine hot, is greatly commended for the reaching and ſpitting of bloud. L

Chap. V.

¶ *Of the Beech and Cypreſſe trees. Of the great Cedars and their fruit called Cedrides: of Galbanum.*

THe leaues of the Beech tree being chewed, do much good to the gums and lips, in any accidents that befall vnto them. The aſhes of Beech maſt is ſingular for the * ſtone, if it bee applied as a liniment. The ſame alſo bringeth haire againe, when by occaſion of ſickneſſe it is ſhed and fallen away, if the place be annointed with it and hony together.

* *Calculis.* Some reade, *oculis*, *i.* eyes: others, *Callis*, *i.* hard knots or calloſities: & both to better ſence in mine opinion.

Cypreſſe tree leanes ſtamped and ſo applied, are a conuenient remedie for the ſting of Serpents. Alſo laid vnto the head with dried groats of Barley, they eaſe the pain therof, occaſioned by the heat of the Sunne. In like ſort, the ſame cataplaſme cureth ruptures. For which cauſe a drinke made of them is very good. A liniment alſo of Cypreſſe leaues and waxe mingled together, M

20030
copy 1

A ther,aſſuageth the ſwelling of the cods. Tempered with vineger, they will make the haire cole black. Moreouer,if they be ſtamped with two parts of ſoft dough or the tender crums of bread, & ſo incorporat together with Ammînean wine,they allay the paine of the feet or the ſinews. The little bals or Apples hanging vpon Cypreſſe trees,are ſoueraigne for to be taken in drinke againſt the ſting of ſerpents,and for the caſting vp of bloud out of the body. Brought into an ointment,they ſerue for the ſwellings or impoſtumes gathered to a place. Take them whiles they be yong and tender,ſtamp them with ſwines greaſe and Bean floure,they do much good to thoſe that are burſten:and for that purpoſe a drink made of them, is paſſing effectuall. With ordinary meale they ſerue in a cataplaſme to be applied vpon the ſwelling kernels behinde the ears,as alſo the kings euill. There is a juice drawn out of theſe apples after they haue bin ſtam-
B ped together with their grains or ſeed within:which if it be mingled with oile,helpeth them to their cleare ſight again,whoſe eies are ouercaſt with a web & dimmed. The ſame effect it hath if it be taken in wine to the weight of one Victoriat or halfe dram. But Cypreſſe apples rid and cleanſed from their grains within,and reduced into a liniment with fat dried figs, and ſo applied vnto the cods,cure their infirmities,and namely,reſolue the tumors incident to thoſe parts: but incorporat with leuaine,they diſpatch the Scrophules or kings euill. The root and leaues punned together,and then taken in drink,do comfort the bladder, and help ſuch as are diſeaſed with the ſtrangury:they ſerue alſo againſt the prick of the venomous ſpiders Phalangia. Their ſmall ſhauings or ſcrapings if a woman take in her drinke, procure her monethly terms,and are ſingular for the ſting of ſcorpions.

C The great Cedar,called by the Greeks Cedrelate,as one would ſay,the Fir-Cedre,yeeldeth a certain pitch or parroſin named Cedria,a ſingular medicine for the tooth-ach; for it breaketh them,fetcheth them out of the head and eaſeth all their pain. As touching the liquor that runneth from the Cedar,and the manner how it is made,I haue written already:this*kind of pitch were excellent for the eies but for one diſcommodity,in that it cauſeth head-ach. It preſerueth dead bodies from corruption,a world of yeares:contrariwiſe,liuing bodies it doth putrifie and corrupt. A ſtrange and wonderfull property,thus to mortifie the quick,and quicken(as it were) the dead. It marreth and rotteth apparell,as wel linnen as woollen:and it killeth all liuing creatures. And therefore I would not aduiſe as ſome haue done,to taſt this medicine and take it inwardly for the ſquinancie or crudities of the ſtomack:neither would I be bold,but fear rather,to
D preſcribe it in a collution with vineger to waſh the mouth withall for the toothach, or to drop it into their eares who be hard of hearing or otherwiſe haue vermine within them. But a monſtrous and beaſtly thing it is which ſome report of it, That if a man do annoint therwith the inſtrument or part ſeruing for generation,at what time as he is minded to know a woman carnally,it wil bring her to an * abortiue ſlip,if ſhe were conceiued before;or hinder conception,if ſhe were cleare. Howbeit,I would not make doubt to annoint therwith the head & other parts, for to kill lice,or to rid away the ſcurffe or ſcaily dandruffe among the haire,either in head or face. Some giue counſell for to drink it in ſweet wine cuit,vnto them who are poiſoned with the ſea Hare. For mine own part,I hold it a ſafer way and an eaſier to annoint therwith the leproſie. But ſome of the foreſaid authours haue applied it to filthy,putrified, and ſtinking vlcers,& the ex-
E creſcences therein: as alſo to rub or annoint therwith the eies againſt the pin and web, & ſuch accidents as dim and darken the ſight. Moreouer,they haue preſcribed to drink a cyath of it for to cure the vlcer of the lungs,and to expell wormes and vermin out of the belly. Of this pitch or roſin there is an oile made,which they call Piſſelæon,and the ſame is far more ſtrong in operation for all the infirmities aboue named,than the ſimple roſin it ſelfe. Certaine it is,that the fine duſt ſcraped or filed from the Cedar wood,chaſeth away ſerpents:ſo do the berries alſo of the Cedar beaten to pouder and reduced with oile into a liniment, in caſe a man annoint his body all ouer with the ſame.

As touching Cedrides(*i.*)the fruit of the Cedar,it is ſoueraign for the cough,and prouokes vrine,bindeth the belly,& healeth ruptures. It cureth ſpaſmes,convulſions or cramps: yea, and
F helpeth the infirmities of the matrice,if it * be applied accordingly. Alſo it is a counterpoiſon againſt the venomous ſea-Hare: and a medicine for other maladies aboue named, and namely for apoſtemes and inflammations.

Of Galbanum I haue written heretofore. Good Galbanum ſhould be neither moiſt nor dry; but ſuch in all reſpects as I haue deſcribed already. Being taken of it ſelfe alone in drink, it cureth

* *cedrium.*

* *Arborium fieri Græcorum* φθόριον ἀπὸ τοῦ φθείρειν.

* *Admoti*:ſome read *poti*, *i.* taken in drinke.

reth an inueterat cough ſhortneſſe,and difficultie of winde,ruptures,crampes, and convulſions. G
Outwardly applied, it is ſingular for the Sciatica,pleuriſie,or pains of the ſide,angry biles,and
fellons. It is good alſo to be vſed, in caſe the fleſh (corrupted by meanes of corroſiue vlcers, as
wolues and ſuch other) is departed and eaten from the bone: moreouer,for the wens called Scro-
phules or the kings euill: the knots and nodoſities growing vpon the ioints: and the tooth-ach :
it ſerueth alſo in a liniment with hony for to annoint ſcald heads. With oile of Roſes or with
Nard,it is good to be infuſed or dropped into ears that run with matter: the very perfume alone
or ſmell thereof is good to raiſe them who are taken with the epilepſie or falling ſickneſſe: alſo
to recouer women,lying as it were in a trance or dead,vpon a fit of the mother: & to bring them
again who are gon in a ſwoune. If a woman fall to trauell before her time,it is good to fetch out
that vntimely fruit of hers (if it be loth to come away) either by way of cataplaſme or ſuffumi- H
gation. The ſame effect it hath, if the branches or ſmall roots of Ellebore be well annointed
therewith, and ſo put vp as a peſſary. The ſmoke of it frying in the fire (as I ſaid before) driueth
ſerpents away: and more than ſo,ſerpents will not come neere to them that are beſmeared with
Galbanum. And ſay that one be ſtrucken with a ſcorpion, a plaſter of Galbanum will heale the
wound. If a woman haue bin long in labor of childbirth,and cannot be deliuered,let her drinke
in one cyath of wine,as much Galbanum as the quantity of a Bean, ſhe ſhal fall to her buſines
and be deliuered anon. The ſame is a good medicine to reduce the mother into the right place,
if it be vnſetled or turned. If Galbanum be taken in wine with Myrrhe, it ſendeth out the dead
infant in the mothers womb. Alſo with Myrrh and * wine,it is good againſt all poiſons, and e-
ſpecially thoſe which be called Toxica. Incorporat Galbanum with oile and * Spondylium to- I
gether,it will kill any ſerpents,if they be but touched therewith. Howbeit, there is an opinion
of Galbanum,that * in difficulty of vrine it is not good to be vſed.

*Vino. Rather acetо, i. vineger after Dioſcor.
*Cow parſnep or Maincope.
*Dioſcorides reporteth the contrary.

CHAP. VI.

¶ *Of Gum Ammoniack: of Storax: Spondylium: Spagnos: Terebinth: Chamæpitys: of Pituyſa: of Roſius: of the Pitch tree: and the Lentiske.*

SInce we are fallen into the mention of Gums, it will not be amiſſe to treat of Ammoniack;
being as it is ſo like in nature (as I haue ſaid) to Galbanum: for it hath vertue to mollifie, to
heat,diſcuſſe,and diſſolue. Vſed in collyries, it is a proper medicine to clarifie the eieſight: K
and ſerueth wel to take away the itch,the ſpots or cicatrices,the pin and web alſo of the eies. It
allaieth the tooth-ach,but more effectually,if it be ſet a burning, & the fume receiued into the
mouth. Taken in drink,it helpeth thoſe who hardly fetch and deliuer their winde. It cureth the
pleuriſie,Peripneumony or inflammation of the lungs,the infirmities of the bladder, piſſing of
bloud,the ſwelled ſpleen,and the Sciatica. And in that manner it eaſeth the belly, and maketh
it ſoluble. Boiled with the like weight of pitch or wax and oile roſat together, and ſo reduced
into an ointment,it is good for all gouts,and eſpecially that which lieth in the feet. It ripeneth
the biles called Pani,if it be applied to them with honey: and fetcheth away any corns by the
roots. In which ſort it doth ſoften any hardneſſe. Incorporat with vineger and Cyprian wax,or
els with oile roſat,it maketh an excellent plaſter for to mollifie the hard ſpleen. Moreouer,if it L
be reduced into an ointment with vineger,oile,& a little ſal-nitre,it is ſingular to annoint thoſe
that haue a laſſitude or wearineſſe vpon them.

Touching Storax and the nature thereof, I haue ſaid enough in my Treatiſe of ſtrange and
forraine trees. But ouer and aboue the qualities or properties before required, I take that for
the beſt Storax,which is fatteſt,pure,and cleane,and whereof the pieces or fragments do break
white. This drug cureth the cough,the ſoreneſſe of the throat,and the accidents of the breſt: it
openeth the obſtructions of the matrice,& mollifieth the hardnes therof. Whether it be taken
inwardly in drinke, or outwardly applied, it prouoketh womens fleurs,& moueth to the ſiege.
I reade in ſome authors, that if one drink Storax Calamita,in ſmall quantity, it will procure
gladneſſe and mirth of heart: but if it be taken in greater quantity,it breedeth heauineſſe of the
mind. Inſtilled or poured into the eares,it riddeth away all the ſinging therin: and in a liniment M
it reſolueth the wens called the Kings euill,and the nodoſities of the ſinews. Soueraign it is a-
gainſt thoſe poiſons which hurt by meanes of their coldneſſe,and therefore it is good for them
that haue drunk the juice of Hemlock.

Likewiſe

20030
copy 1

A Likewiſe of Spondylium, a kind of wild Parſnep or Madnep, I haue ſpoken thereof heretofore, together with Storax. An embrochotion made of it, to be infuſed vpon the head, is excellent for ſuch as be in a frenſie or lethargy: alſo to cure the inueterat pains of the head. Taken in drink with old oile, it helpeth the infirmities of the liuer, the jaundiſe, the falling ſickneſſe, the ſtraitneſſe of breath (whereby one cannot take his winde but ſitting vpright) and the riſing or ſuffocation of the mother; in which caſes, a ſuffumigation thereof is good. This Spondylium is effectual to mollifie the belly, and make the body ſoluble. Reduced into a liniment with rue, it ſerueth fitly to be applied vnto vlcers that ſpread and eat as they go. The juice of the floures is of great effect, if it be poured into the ears that run with filthy matter: but when this juice is a preſſing or drawing forth, it had need to be kept well couered, for feare of flies and ſuch like,
B which are very greedy thereof, and loue a-life to ſettle vpon it. The root of Spondylium, or a piece therof ſcraped, if it be put in maner of a tent into a fiſtula, eateth away all the hardnes and calloſitie thereof. Being dropped into the ears, together with the juice, it is exceeding good for them. The root giuen alone in ſubſtance, cureth the jaundiſe, the infirmities of the liuer & matrice. If the head be all ouer annointed therewith, the haire will curle and frizle.

Concerning the ſweet Moſſe, called of the Greeks * Sphagnos, Sphacos, or Bryon, growing (as I haue ſhewed before) in France, it is good for the naturall parts of women to ſit ouer the decoction of it, in manner of a bath: likewiſe if it be mingled with creſſes, and ſo ſtamped together in ſalt water, it ſerueth well to be applied as a cataplaſme to the knees and thighs, for any tumors or ſwellings in thoſe parts. Taken in wine with dry per-roſin, it cauſeth one moſt ſpee-
C dily to make water. Stamped with Iuniper, and drunk with wine, it doth euacuat the aquoſities in the dropſie. * *Vſnea.*

The leaues and the root of the Terebinth tree, applied in form of a cataplaſme, are good for the collection of humors to an impoſtumation. A decoction made with them, doth comfort and fortifie the ſtomack. In caſe of head-ache, of ſtopping and difficultie of vrine, it is paſſing good to drink the ſeed or grains of the Terebinth tree in wine. The ſame gently eaſeth and ſofteneth the belly; it prouoketh alſo carnal luſt. The leaues of the * Pitch tree & * Larch tree bruſed and ſodden in vineger, do eaſe the tooth-ache, if the mouth be waſhed with the decoction. The aſhes made of their barks, skin the places that be chafed, fretted, and galled betweene the thighs; and heale any burn or ſcald. Taken in drinke, they bind the belly, but open the paſſages
D of the vrin. A perfume or ſuffumigation therof, doth ſettle the matrice, when it is looſe and out of the right place. But to write more diſtinctly of theſe two trees; the leaues of the Pitch tree haue a particular property reſpectiue to the liuer, and the infirmities thereof, if one take a dram weight of them and drink it in mead and honied water. It is well known and reſolued vpon, that to take the aire of thoſe woods and foreſts only where theſe trees be cut, lanced, and ſcraped, for to draw pitch and roſin out of them, is without all compariſon the beſt courſe which they can take who either be in a conſumption of the lungs, or after ſome long and languiſhing ſicknes, haue much ado to recouer their ſtrength. Certes, ſuch an aire is far better, than either to make a long voiage by ſea into * Egypt, or to goe among the cottages in ſummer time for to drinke new milk comming of the freſh and green graſſe of the mountains.

* *Piceæ.*
* *Laricij.*
It ſeemes that *Pliny* tooke πίτυν, which is the Pine, for *Picea*; and πίτυς, which is the Pitch tree, for *Larix.*

* *i.* Into a more groſſe aire.

E As for Chamæpitys, it is named in Latine by ſome Abiga, for that it cauſeth women to ſlip their conception beforetime: of others, *Thus terræ* [*i.* ground Frankincenſe:] this herb putteth forth branches a cubit long; and both in floure and ſauor reſembleth the * Pine tree. A ſecond kind there is of Chamæpitys, lower than the other, ſeeming as though it bended and ſtooped downward to the ground. There is alſo a third ſort, of the ſame odor that the reſt, and therefore ſo named. This laſt Chamæpitys, riſeth vp with a little ſtalke or ſtem of a finger thickneſſe; it beareth rough, ſmall ſlender, and white leaues; and it groweth commonly amongſt rockes. All theſe three be herbs indeed, and no other, and ſhould not be ranged among trees: yet for names ſake, becauſe they carry the denomination of Pitys [*i.* the Pitch-tree] I was induced the rather to treat of them in this preſent place, & to ſtay no longer. Soueraigne they bee all againſt the
F pricks or ſtings of Scorpions: applied in manner of a liniment with dates and quinces, they be wholſome for the liuer: their decoction together with barly meale, is good for the infirmities of reins and bladder. Alſo the decoction of theſe hearbes boiled in water, helpeth the jaundiſe and the difficulty of vrine, if the Patient drinke thereof. The third kind laſt named, taken with hony, is ſingular againſt the poiſon of ſerpents: and in that maner only applied as a cataplaſme,

* or rather, the Pitch tree.

it clenſeth the matrice & natural parts of women. If one drink the ſame herbe, it will diſſolue G
and remoue the cluttered thick bloud within the body: it prouoketh ſweat, if the body be ther-
with annointed; and it is eſpecially good for the reins. Being reduced into pills, together with
figs, it is paſſing wholſome for thoſe that be in a dropſie; for it purgeth the belly of wateriſh
humors. If this herb be taken in wine to the weight of a victoriat piece of ſiluer; *i.* halfe a Ro-
man denier, it wariſheth for euer the pain of the loins, and ſtoppeth the courſe of a new cough.
Finally, if it be boiled in vineger, and ſo taken in drink, it is ſaid that it will preſently expel the
dead infant out of the mothers wombe.

For the like cauſe and reaſon, I will do the herb Pityuſa this honor as to write of it among
trees, ſince that it ſeemeth by the name to come from the Pitch tree: this plant ſome do reckon
among the * Tithymals: a kind of ſhrub it is, like vnto the Pitch tree, with a ſmall floure, and H
the ſame of purple color. If one drink the decoction of the root, to the quantity of one hemina;
it purgeth downward both fleam and choler: ſo doth a ſpoonfull of the ſeed therof, put vp into
the body * by ſuppoſitories. The decoction of the leaues in vineger, doth cleanſe the skin of
dandruffe and ſcales: & if the decoction of rue be mingled therwith, it is ſingular for ſore breſts,
to appeaſe the wrings and tormenrs of the cholick, againſt the ſting of ſerpents, and generally
for to diſcuſſe and reſolue all apoſtemations and botches a breeding.

* *i.* Spurges.

* *In balanis* vnleſſe we reade, *Cum Phœnicobalanis*, *i.* a kind of Date, as ſome think, Tamarinds.

But to returne againe to our former trees; how Roſine is ingendred in them, of their ſeuerall
kinds, and the countries where they grow, I haue ſhewed before, firſt in the treatiſe of wines, and
afterwards in the diſcourſe and hiſtories of Trees. And to ſpeak ſummarily of roſins, they may
be diuided into two principal kinds; to wit, the dry and the liquid roſin. The dry is made of the I
Pine and the Pitch trees; the liquid commeth from the Terebinth, Larch, Lentisk, & Cypreſſe
trees; for theſe beare roſin in Aſia and Syria: & wheras ſome there be of opinion, That the ro-
ſins of the Pitch and Larch trees be all one, they be much deceiued; for the Pitch tree yeeldeth
a fatty roſin, and in maner of frankincenſe, vnctuous: but from the Larch tree there iſſueth * a
ſubtill and thin liquor, running like to life hony, of a ſtrong and rank vnpleaſant ſmell. Phyſiti-
ans ſeldome vſe any of theſe liquid Roſins, and neuer preſcribe them but to be taken or ſupped
off with an egge. As for that of the Larch tree, they giue it for the cough and exulceration of
ſome noble parts within: neither is that per-roſin of the Pine tree much vſed: as for the reſt, they
be not of any vſe vnleſſe they be boiled. Touching the diuers manners of boiling them, I haue
ſhewed them ſufficiently. K

* Which is thought to be our Terpentine.

But if I ſhould put a difference between theſe roſins according to the trees from whence they
come; the right Terpentine indeed which the Terebinth yeeldeth, liketh and pleaſeth me beſt,
being of all others lighteſt and moſt odoriferous. If I ſhould make choice of them in regard of
the countries where they are found; certes they of Cypreſſe and Syria be beſt, and namely thoſe
that in colour reſemble Attick hony: and for the Cyprian roſin, that which is of a more fleſhie
ſubſtance and drier conſiſtence. Of the dry per-roſins, thoſe are in moſt requeſt, which be white,
pure, tranſparent or cleare, quite through. In generall, thoſe that come from trees growing vpon
mountains, be preferred before them of the plains: alſo regarding the Northeaſt, rather than any
other wind. For ſalues to heale wounds, as alſo for emollitiue plaſters, roſins ought to be diſſol-
ued in oile: for drinks or potions, with bitter almonds. As touching their medicinable vertues, L
they be good to cleanſe and cloſe vp wounds: to diſcuſſe and reſolue any apoſtemes which bee in
gathering. Moreouer, they be vſed in the diſeaſes of the breſt (and namely true Terpentine) by
way of liniment; for then it is ſingular good, eſpecially if it be applied hot: alſo for the pains of
the lims, and for thoſe that be plucked with the cramp, in caſe the grieued parts be wel rubbed
therewith in the ſun; which they know well enough who buy ſlaues and ſell them for gain, after
they haue trimmed and ſet them out for ſale: for they eſpecially are very curious to annoint
their bodies al ouer with this Terpentine, for to looſen the skin when they be hide-bound, lank,
and carrion lean, to giue more liberty and ſpace for euery part to receiue nutriment, and ſo to
make their bodies ſeeme fat and faire liking. Next vnto the right Terpentine, is the roſin of the
Lentiske Tree: this hath an aſtringent or binding qualitie; but of all others it prouoketh vrine
moſt: all the reſt doe mollifie the belly and make it ſoluble, concoct and digeſt all crudities, M
ſtent the inueterate cough, and draw downe all the ſuperfluous burdens of the matrice: for
which purpoſe laſt named, their fume receiued by a ſuffumigation, is very effectuall. They are
more particularly as good as a counterpoiſon againſt the venomous gum Ixia, growing vpon
the

20030
copy 1

A the plant Chamæleon. Incorporat with buls tallow and hony, they cure the biles called Pani, and ſuch riſings in the fleſh. The Lentisk roſin, is ſingular good for to lay euen and ſtreight the haires of the eie-lids when they grow into the eies. In fractures and broken bones, it is moſt neceſſary, as alſo for the ears running with filthy matter: likewiſe to kil the itch in the priuy members. Finally, the per-roſin of the Pine tree, is a moſt ſoueraigne medicin to cure all the wounds of the head.

Chap. VII.

¶ *Of Stone-pitch: of Tarre: of Pitch twice boiled: of Piſſaſphalt or Mummie: of Zopiſſa: of Torch-wood, and the Lentiske.*

B FRom what tree Pitch commeth, and the ſundry waies of making it, I haue declared heretofore: alſo that there be two principall kinds thereof; to wit, the thick or faſt Pitch, and the thin or liquid: of the former ſort, the beſt for vſe in Phyſick is the Brutian Pitch, for that (being of all others fattieſt & fulleſt of gum) it yeeldeth a twofold commodity both for medicines, and alſo to trim and roſin wine-veſſels; for which purpoſes, that which inclineth to a reddiſh yellow is counted the chiefe. But whereas ſome do ſay moreouer, that the better Pitch commeth from the male tree, I cannot conceiue what they ſhould mean thereby, neither doe I think it poſſible to diſcerne any ſuch difference. True it is, that Pitch by nature is hot, & a good incarnatiue: a ſpeciall and particular property it hath againſt the venom inflicted by the ſting
C or tooth of the horned ſerpent Ceraſtes, if it be made into a cataplaſme with fried barly groats: and being applied with honey, it healeth the ſquinancy, cureth catarrhs, and reſtraineth ſneezing: with oile of roſes, it ſerueth well to be poured into running ears, out of which there doth ooſe filthy matter: or being applied in manner of a liniment with wax, it is paſſing good: it healeth the il-fauored tettars called Lichenes, and it looſeneth the belly: licked or let downe leiſurely in maner of a loch, it is a good means to void and reach vp from the breſt, tough fleame: and to annoint the tonſils or almonds in the mouth with it and hony together, is a proper medicine: being in that manner prepared and vſed, it clenſeth vlcers: and if it be incorporat with raiſins and ſwines greaſe, it doth incarnat and fill them vp again with new fleſh: carbuncles alſo it doth mundifie; ſo doth it ſores that begin to putrifie & gather corruption: but if they be ſuch
D as ſpread & be corroſiue withal, then there would be an addition of the Pine tree bark, or brimſtone. Some haue preſcribed, for the conſumption of the lungs, and a cough of long continuance, to drinke the quantity of one cyath in Pitch. The fiſſures and chaps as wel about the ſeat as in the feet, it cureth: for the flat biles named Pani, it is very good: as alſo to take away the rough nails that be ſo troubleſome. The very odor or perfume thereof, helpeth the hardneſſe of the matrice; and ſetleth it again, being either faln down, or turned out of the due place: likewiſe it helpeth ſuch as be ſurpriſed with the lethargy. Moreouer, if it be boiled in the vrine of a yong boy vnder 14 yeares of age with barly meale, it is a good maturatiue, and bringeth the wennes called the Kings euill to ſuppuration. As for dry pitch or ſtone pitch, it helpeth much to make the haire grow again, where it is ſhed by ſome diſeaſe. The Pitch called Brutia, or of Calabria,
E boiled in wine to a waulm or two, with the fine floure of the bearded wheat Far, and ſo applied in a cataplaſm as hot as may be ſuffered, is ſingular good for womens paps. Concerning liquid Pitch or Tar, as alſo the oile which they cal Piſſelæon, and how it is made, I haue already written at large. Some boile it a ſecond time, and then they name it Palimpiſſa. With this liquid Pitch it is good to annoint the ſquinzy that groweth inwardly; as alſo the uvula within the mouth: the ſame is ſingular for the pain in the ears, to clarifie the ſight, to clenſe the mouth furred as it were, ſo as it hath no taſt of meat: likewiſe for thoſe who are ſhort winded: for women who are diſeaſed in their matrice: to ripen & rid away old coughs; and to eaſe them that can doe nothing but ſpit & reach out of the cheſt: for ſpaſmes, cramps, ſhaking, and trembling: moreouer, it helpeth them whoſe heads or bodies are drawn backward: it cureth palſies, and any pains
F or griefs of the ſinews. There is not a better thing to kill either the mange in dogs, or the ſcab and farcines in horſes, aſſes, and ſuch like trauelling beaſts.

Moreouer, as touching Piſſaſphalt, which is of a mixt nature, as if pitch and Bitumen were mingled together, it groweth naturally ſo, in the territory of the Apolloniats; yet ſome there be who make an artificial piſſaſphalt, and meddle the one with the other, and hold it for a remedy

to cure the farcins and ſcabs of cattell; as alſo when the young ſucklings doe hurt the teats of their dams. Of this kind, that is beſt which is of it ſelfe, and come to maturity and perfection: the ſame in boiling ſwimmeth aloft.* Zopiſſa, is that Pitch, which (as I ſaid heretofore) is ſcraped from ſhips, and is confected of wax well ſoked in the ſalt water of the ſea: the beſt is that which commeth from ſhips that haue bin at ſea and made ſome voiages: it goeth into emollitiue plaſters, for to reſolue the gathering of impoſtumes. As for Tæda or Torch-wood, if it bee ſodden in vineger, it maketh a ſingular collution for to waſh the teeth withall when they ake. G

* *Pix nauali.*

Let vs come now to the Lentisk tree: the wood, the ſeed or fruit, the bark and gum therof, do prouoke vrine, and bind the belly: a fomentation made with their decoction, is excellent good for eating and corroſiue vlcers: it ſerueth in a liniment for al ſores in moiſt & flegmatick parts: likewiſe to cure S. *Anthonies* fire, and to waſh the gums withall: chew the leaues thereof and cruſh them well between the teeth, the ſame will eaſe their ach: waſh them with their decoction, and they wil ſet them faſt in the head. The ſame are good to colour the haire black: the gum which this tree doth yeeld, is ſoueraign for the infirmities of the ſeat, eſpecially ſuch as require either drying or heating. The very decoction of Maſtick is comfortable to the ſtomack, it cauſeth it to rift, & is beſides diuretical. Applied vnto the head as a liniment, incorporat with the fried groats of barly, it cureth the ach or pain therof: the tender leaues be applied to right good purpoſe, for the inflammation of the eies. Moreouer, this Maſtich, which is the gum of the Lentisk tree, is vſed ordinarily to lay the hairs of the eielids euen, & to extend or make plaine and ſmooth the riueled skin of the face: therefore it is vſed in ſope, and waſh-bals. Moreouer, there is a good vſe thereof, for ſpitting and reaching vp of bloud, & for an old cough. In one word, it ſerueth all thoſe turns whereto the gum Ammoniacke is vſed. It healeth all places galled and chauſed, where the skin is rubbed or fretted off: and if the cods and members of generation be fomented either with the oile made of the ſeed of the maſtich tree mixed with waxe, or with a decoction of the leaues boiled in oile or els in water, it will skin any raw part thereof. To knit vp this diſcourſe, I am not ignorant that *Democritus* the Phyſitian, who had in cure *Conſidia*, the daughter of *M. Seruilius* late Conſull of Rome, for an * infirmity or malady of hers (for that this damoſell could not abide to heare of any vnpleaſant Phyſick) cauſed her to be fed a long time with the milk of goats which were kept with the Lentisk tree leaues, and did eat nothing els, and ſohe cured her of her malady. H I

* It ſhould ſeeme the vlcer of the lūgs o kidnies, or els ſome outragious flux of bloud.

K

Chap. VIII.

¶ *Of the Plane tree, the Aſh, and Maple: of the white Poplar and Elme, the Tillet or Linden tree, the Elder, and the Iuniper.*

THe Plane tree is an enemy to Bats or Reremice: their little bals which they beare, if they be taken to the weight of foure Roman deniers in wine, do cure all poiſons of ſerpents and ſcorpions: likewiſe they heale any burn. Being braied or ſtamped with ſtrong & ſharp vineger (which if it be Squilliticum is the better) they ſtanch any bleeding whatſoeuer. Incorporat in hony, they mundifie and clenſe all cancerous vlcers, the red pimples and ſpecks, with all black ſpots and marks in the skin which haue remained a long time. The leaues and bark reduced into a liniment, their decoction alſo, help to rid away any gathering of humors to an head, and namely if they matter and run. The decoction of the barke ſodden in vineger, is a ſingular remedy for the tooth-ach; like as the tendreſt leaues boiled in white wine, for the infirmities of the eyen. The aſhes which come of the foreſaid little bals, do heale vp any burn, occaſioned either by fire or extreame cold. The barke taken in wine, repreſſeth the venome of the ſcorpions ſting, ſo that it ſhall go no farther. L

As touching the Aſh tree, of what effectuall operation it is againſt ſerpents, I haue declared heretofore: it beareth a * ſeed incloſed within certain * cods, which being taken in wine, is an ordinary remedy for the obſtructions & infirmities of the liuer; as alſo for the pain in the ſides. The ſame alſo do euacuat the aquoſities or wateriſh humors ſpread between the skinne and the fleſh in the dropſie Leucophlegmatia: the leaues do take down by little & little and make lean a body ouer-groſſe, and do eaſe it of the troubleſome cariage that it hath of ſo much fat, if the ſame be ſtamped and giuen in wine: but herein good regard ought to be had of the ſtrength of the party, after this proportion: If it be a child, fiue leaues of the aſh are ſufficient to be infuſed in M

* Called *Lingua auis.*
* Which are named Keyes.

20030
copy 1

A in three cyaths of wine; but elder folk and of a ſtronger complexion, may abide ſeuen well enough in fiue cyaths, and drink the infuſion. But before I do leaue this tree, it would not be forgotten that the ſmall chips and ſhauings, yea, and the ſaw duſt or filed pouder of this wood, are thought to be hurtfull vnto ſome, and they are forbidden to meddle withall. The root of the Maple tree, ſtamped into a cataplaſme, is ſingular to be applied for the griefs of the liuer, and worketh mightily.

As touching the white Poplar or the trembling Aſp, I haue ſhewed heretofore how the perfumers vſe the berries or * grapes thereof in their ſweet ointments. The barke infuſed and taken in drink, is good for the ſciatica and the ſtrangury. The iuice drawn out of the leaues, dropped hot into the ears, eaſeth their pain. Whoſoeuer carieth a twig of Poplar in their hands, ſhal not
B need to feare any ſurbating of the feet, or galling between the legs. The beſt blacke Poplar and of greateſt operation in Phyſick, is that reputed which groweth in the Iſland Creta; the fruit or grain thereof if it be drunk in wine, is ſingular for thoſe who be taken with the falling ſickneſſe. This Poplar yeeldeth a certain ſmall gum or roſin, which is much vſed by Phyſitians in emollitiue plaſters: the leaues ſodden in vineger, make a proper cataplaſme to be applied vnto the gout: the liquor or humor that iſſueth out of the pores or concauities of the blacke Poplar, taketh away warts and wheals, it skinneth alſo galled & raw places in any part of the body: theſe Poplars as wel white as black, beare vpon their leaues certain warts like to drops of water ſtanding vpon them, out of which the Bees do gather that cereous ſubſtance named Propolis. The drops alſo of water, which the ſaid Propolis doth yeeld, if they be mingled with water, is a very
C effectuall remedy for many things.

* And yet heretofore he ſaith, that it hath neither the one nor the other.

Now for the Elme: the leaues, the bark, and the wooddy ſubſtance of the branches, haue a glutinous nature to conſolidat, vnite, and heale wounds: the thinner rind or tunicle verily which lieth between the outward bark and the tree, doth aſſuage the leproſie, called of ſome S. *Magnus* euill: ſo do the leaues alſo, applied with vineger. The barke of the Elm puluerized and taken to the weight of a Roman denier in one hemine of cold water, is a very purgatiue, and doth euacuat flegmatick and wateriſh humors particularly. The liquor that iſſueth from the tree as a jelly, is ſingular good for apoſtemations, wounds, and burnes; but if the places were fomented before with the decoction, it would be the better. The Elm beareth certaine ſmall bladders or huskes, wherein there is ingendred and contained a wateriſh humour, which is very proper to imbeliſh
D the skin, & beautifie the face. The firſt tender ſprouts of the leaues boiled in wine, do aſſuage al tumors, & * draw filthy matter and corruption forth of fiſtulous ſores: the ſame do the inward thin rinds within the bark. Many are of opinion, That the very bark chewed only, and applied to green wounds, is ſingular good to heale them. They affirme moreouer, That the leaues bruiſed and applied to the feet, allay their ſwelling, ſo there be water ſprinckled among. Furthermore, the water or liquor which runneth from the heart or pith of the wood when the tree is lopped or disbranched (as I haue ſaid before) if the head be annointed or bathed withall, cauſeth the haire to grow again if it be loſt, and keepeth it on if it be ready to ſhed and fall.

* *Extrahunt ſanies pus fiſtulis.*

As touching the Tillet or Linden tree, the very wood thereof is vſed for all things in a manner that the wild oliue is imploied vnto, if the ſame be lightly bruiſed or ſtamped: howbeit, the
E leaues only are occupied; which, if they be chewed and ſo applied, do cure the cankers breeding in the mouth of ſmall infants. Being boiled and their decoction inwardly taken, they prouoke vrine: outwardly applied, they do ſtay the inordinat and exceſſiue flux of womens fleurs; but giuen in drink, they euacuat the ſame ſuperfluous bloud.

There is a ſecond kind of Elder more wild of nature, which ſome of the Greeke writers call * Chamæacte, others Helion, and it groweth much lower than the other. The decoction of the leaues as well of VValwoort as Elder, boiled in old wine, is contrarie and noyſome to the ſtomacke, and purgeth downeward waterie humors: euen ſo doth the decoction either of the ſeed or the root, if it be taken inwardly to the quantity of two cyaths: the ſame is excellent to coole any inflammation; and namely, to take out the fire of any new burn or ſcald. The yong and ten-
F der leaues, as well of Elder as VVall-woort, reduced into a cataplaſme and laied too with barly groats, doe cure the biting of a dogge. The juice both of the one and the other, infuſed and conueighed accordingly into the head, is a ſoueraigne lenitiue for all impoſtumes of the braine, and eſpecially thoſe which are growing in the fine membrane or pellicle called Pia Mater, which immediately lappeth and enfoldeth the braine. The fruit or berries of the Elder or

* i. Groũnd. Elder, Wall-wort, or Dane-wort.

of Walwort, are weaker in operation than the other parts of the tree or plant: howbeit, they ſerue G
wel to colour the haire of the head black. The ſame alſo taken in drinke, to the meaſure of one acetable, be diureticall and prouoke vrin. The ſofteſt and tendereſt leaues are eaten ordinarily in a ſalad with oile and ſalt, for to purge fleam and choler. In ſumme, the leſſer plant, which is the VValwort, is in all things more effectuall than the elder it ſelfe; for if the root thereof be ſodden, and a draught of two cyaths be giuen to them who are in a dropſie, it will purge mightily and euacuat watery humors. A decoction of the roots and leaues of Danewort, is ſingular to mollifie the matrice and naturall parts of a woman, if ſhe ſit ouer the ſame and take the vapour thereof into her body. The tender ſprigs of the milder Elder, boiled betweene two platters, do make the body ſoluble, and moue to the ſeege. The leaues drunke in wine, reſiſt and kil the poiſoned ſting of ſerpents. The tendrons of the elder, incorporate with goats tallow, and reduced H
into a liniment, are ſingular good for the gout, if they be applied to the grieued place: the water of their infuſion, if it be caſt or ſprinkled in any room of the houſe killeth fleas: and if the place be likewiſe ſprinkled with the decoction of the leaues, it will not leaue a flie aliue. There is a kind of diſeaſe [much like to purples or meazles] when the body is bepainted all ouer with red bliſters: a branch of the Elder tree is excellent good to laſh the ſaid wheales or riſings, for to make them fal again and go down. Take the inner bark or rind of the Elder, beat it into pouder, and ſo drink it in white wine, it is a ſufficient purgation.

The Iuniper of all other trees, paſſeth, either for to heat any part, or to extenuat & make ſubtill any humors: in operation much like to the Cedar. Of it there be two kinds; the greater, and the leſſe: a perfume made with the one as well as the other, driueth away ſerpents: the ſeeds or I
berries of Iuniper, aſſuage the pains of ſtomack, breſt, & ſides: the ſame ſerue wel to break wind and reſolue all ventoſities, yea and to euaporat all cold and chilneſſe: they ripen any cough, and mollifie al hardneſſe: a liniment made therof applied outwardly, cauſeth any tumor to go down and repreſſeth the riſing therof: likewiſe if the beries be drunk in ſome groſſe or thick red wine, it will ſtay a lask: like as they will abate the ſwelling of the belly, if they be laid too by way of a cataplaſme or liniment. The Iuniper berry is reckoned among the ingredients which go into antidots, or preſeruatiues againſt poiſon; ſuch I mean, as be * penetratiue and of quick operation. It is diureticall and moueth vrine. In caſe the eies do water much by reaſon of a continuall rheum taking to them, it is good to apply a liniment vnto them made therewith. Foure Iuniper berries are giuen in white wine, or 20 of them boiled in wine, for convulſions, crampes, K
ruptures, wrings, and torments in the belly, for the griefes of the matrice and the Sciatica. To conclude, ſome there be, who fearing to be ſtung with ſerpents, vſe ordinarily to rub or annoint their bodies with a liniment made of Iuniper ſeed or berries.

*Oxyporis.

Chap. IX.

¶ *Of the Sallow, Willow, or Withy: of the twig Withy or Oiſier Amerina. Of twigs or binding rods. Of Heath or Lings.*

THe fruit which the willow or Sallow yeeldeth, if it be ſuffred to hang, before it doth ripen is conuerted into a certaine ſubſtance reſembling a cobweb; but beeing gathered ere it be L
thus transformed, it is ſingular good for ſuch as reach or caſt vp bloud. The aſhes of the rind pilled from the firſt branches that the willow putteth forth, and tempered with water, taketh away corns and calloſities of the feet: they ſerue alſo to rid the ſpots and ſpecks which diſfigure the viſage, the rather if they be incorporat with the juice of the willow. Now there bee found in the ſaid willow, 3 ſorts of juice: the firſt ſweateth out of the tree it ſelf in manner of a gum: the ſecond iſſues forth by way of inciſion, when the tree is in the bloom; prouided alwaies that the cut or gaſh in the bark, be made three fingers broad: this liquour is ſingular good to clenſe the eies, and to rid away ſuch impediments as hinder the ſight; likewiſe to incraſſate or thicken where need requireth; to prouoke vrine, and draw forth all inward impoſtumes outwardly: the third juice is that which diſtilleth from the branches preſently after the bill or cutting- M
hook, when the tree is lopped, or the boughs cut from the body. Take any one of theſe juices, and heat the ſame well with oile of Roſes in the rind of a Pomegranat, excellent it is for to bee dropped into the ears: likewiſe the decoction of Sallows, or the leaues ſtamped and incorporat with wax, and ſo applied, do the like: as alſo laid too in maner of a cataplaſm, they eaſe the pain

of

20030
copy 1

A of the gout. The decoction of the leaues and bark boiled in wine, is paſſing wholſom to foment the nerues withall. The blooms or chattons of the willow, ſtamped together with the leaues, cleanſe the branny ſcales that appeare in the face. The leaues of the willow punned and taken in drink, do coole them that are giuen too much vnto laſcivious luſt, and ouer hot in the action of *Venus*: and if they vſe to take the ſame often, they will diſable them altogether for the act of generation. The ſeed of the black Oiſier or willow called Amerina, mixed in like weight with white litharge of ſiluer, and brought into a liniment, is a depilatory, and fetcheth off the haire if the place be annointed therwith preſently after the baine.

There is a kind of tree named Vitex, not much different from the willow, in regard of the vſe that the twigs be put vnto, and alſo of the leaues which reſemble thoſe of the willow in out-
B ward ſhew, but that their ſmell is more pleaſant and odoriferous: the Greeks, ſome cal it Lygos others Agnos, *i.* chaſt; for that the dames of Athens, during the feaſt of the goddeſſe *Ceres*, that were named Theſmophoria, made their pallets and beds with the leaues thereof, to coole the heat of luſt, and to keep themſelues chaſt for the time. And two ſorts there be of it. The greater riſeth vp to a tree in maner of a willow: the other, which is leſſe & lower, brancheth thick, bearing white leaues, and thoſe full of down and cotton. The former of theſe two, which is called the white Agnus Caſtus, putteth forth white floures & purple one with another: whereas contrariwiſe, all the floures of the leſſe, which is called the black, be purple only. Both the one and the other loue to grow in plains and moors. The ſeed of Agnus Caſtus, if it be taken in drinke, hath a certain reliſh or taſt of wine, and it is commonly thought that it cureth feuers: & who-
C ſoeuer is annointed therewith, being incorporat into a liniment with oile, ſhall ſoon ſweat: and by that means it is good to rid away wearineſſe. Agnus Caſtus, as well the one as the other, prouoketh vrine, and the monthly terms of women. Both of them fume vp into the head as wine doth: and no maruell, for they haue the very ſmell of wine. They be ſingular to ſend all ventoſities downward. They ſtop the flux of the belly, and be excellent good for thoſe who are in a dropſie, or troubled with the ſpleen. They haue this ſpeciall property beſides, to breed good ſtore of milk in milch nurces. Aduerſe they be to all poiſons of ſerpents, ſuch eſpecially as doe miſchiefe by their cold quality. The leſſe is more effectuall againſt ſerpents. And for this purpoſe they vſe to giue either one dram of the ſeed to drink in wine or Oxycrat, which is vineger and water; or els two drams of the moſt tender leaues. There is neither of them both, but as wel
D the ſeed as the leaues, reduced into a liniment, be ſingular good for the pricke of ſpiders. And there is not any venomous creature that wil come neere thoſe who are but annointed therwith: nay they wil flie from the very perfume therof, or the couch which is made of the leaues: they abate the heat of wanton luſt: and in that regard eſpecially they be contrary to the venomous ſpiders Phalangia, which by their ſting do prick a man forward that way, and cauſe his fleſh to riſe. The floures and yong tendrils of Agnus Caſtus incorporat in oile roſat, do allay the headach, occaſioned by drinking ouerliberally: but if the ſaid headach be exceeding great, it is good to foment the head in a decoction of the ſeed of the ſaid Agnus: for it will reſolue & diſpatch the extremity therof. The ſame likewiſe by way either of ſuffumigation or cataplaſme, mundifieth and cleanſeth the matrice. And being taken as a drink with penyroial and hony, it is a pur-
E gatiue, and ſcoureth the belly. Mixed with Barly meale, and applied pulteſſe wiſe, it mollifieth thoſe botches & byles which hardly grow to ripeneſſe. The ſeed tempered with ſalt petre and vineger, healeth tettars, ringwormes, and red pimples: and with hony cureth the cankers or ſores of the mouth; yea, and any wheals and breaking forth whatſoeuer. The ſame reduced into a liniment with butter and vine leaues, wariſheth the infirmities incident to the cods: and if the ſeat be annointed with it & water medled together, it taketh away the chaps & fiſſures in that part. Brought into a cerot with ſalt, nitre, & wax, it is ſingular good for al diſlocations: both the ſeed and leaues of Agnus, enter into many cataplaſmes or mollitiue plaſters, deuiſed for the ſinewes and the guts: the ſeed boiled in wine, maketh a good decoction, which if it be dropped vpon the head by way of embracation, is right ſoueraign for lethargy and frenſie both. It is ſaid, that who-
F ſoeuer beareth in his hand a twig of Agnus, or gird himſelfe about the middle therewith, ſhall not be galled or fretted between the legs.

As touching Heath or Lings, which the Greeks call Erice, it is a ſhrub not much different from Tamariske, in colour and forme of leafe, ſuch as it is, reſembling Roſemary. The leafe of this plant (they ſay) is an enemy to ſerpents.

As

As for Broom, it ſerueth alſo very well to make halters and cords of. The floures pleaſe bees passing well. I am in doubt and not able to ſay, whether this Geniſta or Broome, be that which the antient Greek writers called Sparton; for I haue ſhewed, that they vſed therof to make their fiſhing nets: and I wot not well whether *Homer* meant it, when he ſaid, that the ſhip-ſparts were vntwiſted and looſe. For this is certain, that neither the ſpart of Africk, ne yet the Spaniſh ſpart was as yet in any vſe: and at what time as barges and veſſels were ſowed together with ſeams, it is wel known, that the ſtitches were made with linnen thred, & not with ſpart. The ſeed that it beareth, which the* Greeks giue one and the ſame name to, growing within ſmal cods in maner of Phaſeols, is as ſtrong a purgatiue [of Melancholy] as Ellebore; if it be taken when one is faſting, to the weight of a dram and halfe, in four cyaths of honied water: the branches & leaues (ſuch as they be) of Geniſta or Broome, being ſtamped after they haue lien infuſed in vineger, yeeld a certain juice ſingular good for the Sciatica, if it be drunk to the quantity of one cyath. Some chuſe rather to ſteep it in ſea-water, and to draw forth the juice, and ſo miniſter it with a clyſter for the ſaid purpoſe. The ſaid juice incorporat with oile, ſerueth for an ointment alſo to be applied outwardly for the Sciatica. Some vſe the ſeed for the ſtrangury. The ſubſtance of Broom ſtamped with ſwines greaſe, helpeth the ach or pain in the knees.

*For they call it *Sparton*, as well as the plant.

To come now to Tamarisk, which the Greeks call Myrice, *Lenæus* affirmeth, That it is vſed in maner of the Amerian willow for beeſomes: and more than ſo, that if it bee ſodden in wine, ſtamped and reduced into a liniment with hony, it healeth cankerous vlcers: and in very truth, ſome hold, That the Myrice and Tamariske be both one. But doubtleſſe, ſingular it is for the ſpleen, in caſe the patient drink the iuice preſſed out of it in wine. And by report, there is that wonderful antipathy and contrariety in Nature betweene Tamariske and this one part alone of all the other bowels, that if the troughs out of which ſwine drinke their ſwil, be made of this wood, they wil be found when they are opened, altogether without a ſpleen. And therfore ſome Phyſitians do preſcribe vnto a man or woman alſo diſeaſed in the ſpleen, and ſubject to the opilations therof, both to drinke out of cups or cans of Tamarisk, and alſo to eat their meat out of ſuch treen diſhes as be made of that wood. One renowned writer aboue the reſt, and for knowledge in great credit and authority among Phyſitians, hath affirmed and auouched conſtantly, That a twig of Tamarisk ſlipped or broken from the plant, ſo as it touched neither the ground, nor any yron toole, aſſuageth all belly ache, in caſe the patient weare it about him ſo, as that his girdle and coat hold it faſt and cloſe to the body. The common people cal it The vnlucky tree, as I haue heretofore ſaid, becauſe it beares no fruit, & is neuer with vs ſet or planted. In Corinth and all the territory or region round about, they name it Brya, and make two kinds thereof; to wit, the wilde, which is altogether barren, and that which is of a more tame and gentle nature. This Tamarisk in Egypt and Syria beareth in great plenty a certain fruit, in ſubſtance hard and wooddy, in quantity bigger than the gal-nut, of an vnpleaſant and harſh taſt; which the Phyſitians do vſe in ſtead of the Gal-nut, and put into thoſe compoſitions which they name Antheras. Howbeit, the very wood of this plant, the floure, leaues, and barke alſo, be vſed to the ſame purpoſe, although they be not ſo ſtrong in operation as the ſaid fruit. The rind or barke beaten to pouder, is giuen with good ſucceſſe to them that caſt vp bloud: alſo to women who haue a great ſhift of their fleurs: likewiſe to ſuch as be troubled with a continual flux, occaſioned by the imbecility of the ſtomack. The ſame bruiſed and applied as a cataplaſme, repreſſeth and ſmiteth backe all impoſtumations a breeding. The juice preſſed out of the leaues, is good for the ſame infirmities: moreouer, they vſe to boil the leaues in wine, for the ſame intent. But of themſelues alone being brought into a liniment with ſome hony among, they are good to be applied vnto gangrenes. The foreſaid decoction of the leaues beeing drunke in wine, or the leaues applied with oyle of Roſes and wax, mitigat the ſaid gangrenes; namely, when the fleſh tendeth to mortification. And in this manner they cure the night-foes or chilblanes. Their decoction is wholſome for the paine of teeth or eares: for which purpoſe ſerueth the root likewiſe and the leaues. Ouer and beſides, the leaues haue this property, That if they be brought into the form of a cataplaſme with barly groats and ſo applied, they keep down and reſtrain corroſiue vlcers. The ſeed if it be taken to the weight of a dram in drinke, is a preſeruatiue and counterpoiſon againſt ſpiders, and namely thoſe called Phalangia. And if the ſame be incorporat with the tallow or greaſe of any fatlings or beaſts, kept vp in ſtall, ſtie, or mow, into a liniment, it is ſingular good for any vncome or fellon. Of great efficacy it is alſo againſt the ſting of all ſerpents, except

the

20030
copy 1

A the Aſpis. The decoction likewiſe of the ſeed clyſterized, is ſingular for the jaundiſe, it kils lice and nits, and ſtaieth the immoderat flux of womens months. The aſhes of the very wood of the tree, is good in all thoſe caſes beforeſaid: which if they be mingled in the ſtale of an oxe, and ſo taken of man or woman, either in meat or drink, it will diſable them for hauing any mind to the ſports of *Venus* euer after. And a burning cole of this wood, when it is quenched in the ſtale or beaſts piſſe, they vſe to ſaue & lay vp in the ſhade for that purpoſe: but if one liſt to kindle luſt, * then they ſet it on fire againe. To conclude, the Magitians ſay, That it would do as much if the vrine only of a gelded man were taken for the ſaid purpoſe.

*Rurſum vrinur.

CHAP. X.

B ¶ *Of the Bloud-rod. Of Siler. Of Priuet. The Alder tree, and Ivy. Of Ciſthus and Ciſſos. Of Erithranos. Of Chamæciſſos or Ground-Ivie. Of Smilax or Bindweed. Of Clematis.*

THe Plant called the Sanguin-rod, is as vnhappy as the foreſaid Tamariske. The inner bark thereof is ſingular good to open again thoſe vlcers, which are healed aloft only and skinned before their time.

The leaues of * Siler, brought into a liniment and applied as a frontall to the forehead, allay the paine of the head. The ſeed thereof driuen into pouder and incorporat with oile, is good for the louſie diſeaſe, and keepeth the body from lice. The very ſerpents cannot abide this plant or C ſhrub, but flie from it: which is the cauſe, that the peaſants of the country make their walking ſtaues thereof.

* Some think it is the broad-leafed Oiſier.

Our Liguſtrum or Priuet, is the very ſame tree that Cypros is in the Eaſt parts. To good vſe it ſerueth amongſt vs here in Europ: for the juice of it is wholſome for the ſinews, the ioynts, and any extreme cold. The leaues applied with ſome corns of ſalt, heale all inueterat vlcers in any part whatſoeuer, and particularly the Cankers in the mouth. The graines or berries that it beareth, are good to kill lice: alſo for any gal, where the skin is fretted off between the legs: and ſo be the leaues likewiſe. The foreſaid berries do cure the pip in Hens and Pullen.

As for the Alder tree: the leaues if they be applied hot as they be taken out of ſcalding water, do cure without faile any tumor or ſwelling.

D As touching the Ivy tree, 20 kinds therof and no fewer I haue already ſhewed; and of al theſe there is not one, but the vſe of it in Phyſick is doubtfull and dangerous. For firſt and formoſt, Ivy, if it bee drunke in any quantity, howſoeuer it may purge the head, ſurely it troubleth the brain. Taken inwardly, it hurteth the ſinews: applied outwardly, it doth them much good. Of the very ſame nature it is, that vineger. All the ſorts of Ivies be refrigeratiue. In drink they prouoke vrin. But the ſoft and tender leaues, ſodden in vineger and oile roſat, and then ſtamped, and ſo tempered with more oile of roſet put too afterwards, vntil they be reduced into an ointment, are a ſingular remedy for the pains of the head; and eſpecially for the braine and the thin pellicle Pia mater, which inwrappeth the brains: to which effect the forehead ought to be annointed with the foreſaid liniment, the mouth to be fomented and waſhed with the decoction, and E the whole head afterwards well rubbed alſo with the abouеſaid vnguent. They are good for the ſpleene, both taken inwardly in drink, and outwardly applied as a liniment. The decoction of the ſame leaues may be drunke very well againſt the fit of an ague, to driue away the ſhaking cold: alſo for the ſmal pocks and meazles: for which turn likewiſe they ſerue, if they be pulueriзed and taken in wine. The berries of the Ivie cure the oppilation and hardneſſe of the liuer, either giuen in drink, or applied outwardly. So do they open alſo the obſtructions of the liuer, if a liniment be vſed only. Applied accordingly to the naturall parts of women, draw down their monthly ſickneſſe. The juice of yvie (and ſpecially of the white, which is planted in gardens) clenſeth the noſthrils of the foule vlcers and vermine therein breeding, it rectifieth alſo the filthy ſmell proceeding from thence. If the ſame be conueighed vp into the noſe, it purgeth the F head: but more effectually, if ſal-nitre be put therto. Moreouer, it is to right great purpoſe dropped into the ears with oile, in caſe they either run matter, or be pained. It reduceth cicatrices or wounds and vlcers newly skinned, to the naturall colour of the other skin: the juice of the white Ivy is of more force and better operation for the oppilations of the ſpleen, & the ſwelling hardneſſe thereof, if it be made hot with a red hot yron, than otherwiſe: whereof ſixe berries in two

cyaths

cyaths of wine,is a ſufficient doſe. Moreouer, three berries of the ſame white Ivie drunke at a G
time in Oxymell,do expell the worms in the belly:during which cure,it were not amiſſe to ap-
* Golden berry Ivy. ply them outwardly alſo. As for the Ivie,which I called * Chryſocarpos, if one take twelue of
the golden yellow berries thereof beaten to pouder,and put them to a ſextar of wine, three cy-
aths therof giuen to drink,according to *Eraſiſtratus*,purge by vrine the watery humors between
the skin and the fleſh,which ingender the dropſie. The ſame *Eraſiſtratus* was wont to take fiue
ſuch berries ſtamped into pouder and mixed with oile roſat,which after they were made hot in
the rind of a Pomgranat,he vſed to drop into the eare of the contrary ſide,for the tooth-ach:the
berries of Ivy which yeeld a iuice as yellow as Safron,if a man take before he ſit down to drink,
may be aſſured,that he ſhal not be drunk at that ſitting. Likewiſe,they eaſe them much who are
giuen to caſt and reach vp bloud,or be ſubiect to the collick and wrings of the belly. The white H
berries of the black Ivie if a man take in drinke,dull the vigor of his genetall ſeed, and diſable
him for getting children:any Ivy whatſoeuer,being boiled in wine,& ſo brought to a liniment
and applied,doth cure all vlcers,euen morimals,and ſuch as be vntoward for to be healed. The
liquor iſſuing out of Ivy,is depilatory;but as it taketh away haire,ſo it riddeth lice and vermin.
The floures of any kind of Ivy,taken (as much as a man may comprehend with 3 fingers) twice
a day in ſome green and hard wine,help the dyſentery or bloudy flix; yea, and any other laske.
The ſame reduced into a liniment with wax,are very good to skin and heal burns or ſcaldings.
The berries of Ivy,colour the haire of the head black. The juice of the Ivie root drawn with vi-
neger and taken in drinke; is ſingular againſt the poiſon of the venomous ſpiders Phalangia.
Moreouer,I find in ſome writers, That the drinking out of a cup or diſh of Ivy wood alſo,as wel I
as of Tamarisk,cureth thoſe who haue hard Spleens. The ſame authors preſcribe to bruiſe the
berries,afterwards to burn them,and with the aſhes to dreſſe and beſtrew the place that is burnt
or ſcalded,ſo that it be firſt waſhed & bathed in hot water. There are Phyſitians who giue order
to cut and lance the Ivy tree,for to draw a juice or liquor from the place of the inciſion,which
is to be vſed for rotten and worm-eaten teeth:and by their ſaying, the faulty teeth will breake
and crumble into pieces if they be annointed therwith: prouided alwaies, that the ſound and
good teeth ſtanding next,be wel defended with wax for catching harm by this medicine:more-
ouer,they ſeek and lay for the gum of Ivy, which they would perſuade vs aſſuredly vpon their
word to be ſingular for the teeth,being applied thereto with vineger.

For the vicinity and likeneſſe of the name of Ivy in Greek,which is Ciſſos,I may take occa- K
ſion to ſpeak in this place of another ſhrub or plant called Ciſthos,bigger than Thyme,& lea-
ued like Baſil. Of it be two kinds;namely,the male,with a red Roſe colored floure; the female
with a white:both ſorts are good for dyſenteries or bloudy flixes, and all looſeneſſe of the bel-
ly,if there be drunk twice a day in ſome green & hard wine,as much of their floures as may be
held at three fingers ends:which if they be made into a cerot with wax,heale old vlcers, burnes,
and ſcaldings:and alone of themſelues cure the cankers or ſores in the mouth.

Vnder this plant ſpecially grows Hypociſtis,wherof I haue written in my treatiſe of Ivies.

Likewiſe, there is another plant like vnto the Ivy,and the Greeks call it Ciſſos Erythranos:
which being taken in drink,helpeth the Sciatica,and is good for the loins: but they ſay it is ſo
vehement and forcible in operation,that together with vrine it will euacuat bloud.

Moreouer,there is an Ivy which creepeth and traileth alwaies cloſe by the ground, and the L
ſame the Greeks call Chamæciſſos. This herb being ſtamped and taken in wine to the quanti-
ty of one Acetable,cureth the infirmity of the ſpleen. The leaues incorporat with ſwines greaſe
ſerue to cure burns.

Furthermore,the Bindweed Smilax,known alſo by the name of Nicephoros,reſembleth Ivy,
but that it hath ſmaller leaues. They ſay,that a chaplet or guirland made of this Smilax, is ſin-
gular for the headach;prouided alwaies, That the leaues which goe to the making of it, bee in
number odde. Some haue ſaid that Smilax is of 2 ſorts: the one,which continueth a world of
yeres,growes in ſhadowie vallies,climbing trees,& tufted in the head with cluſters (as it were)
of berries in manner of grapes;a ſoueraigne plant againſt all poiſons;inſomuch, as if the juice
or liquor of the berries be oftentimes dropped into the ears of yong babes or little infants, no M
poiſons (by report) will euer hurt them afterwards. As for the other Smilax or Bindweed,it lo-
ueth places well toiled and husbanded,wherin it vſually groweth:but of no vertue it is & ope-
ration:the former Bindweed is that,the wood wherof we ſaid would giue a ſound,if it were held

cloſe

20030

A cloſe to the eare. Another herb there is like to this, which ſome haue called Clematis. This plant creepeth & climbeth vpon trees, hauing many ioints alſo or knots. The leaues are good to mundifie the foule leproſie. The ſeed drunk to the meaſure of one acetable, in a hemin of water or mead, maketh the belly looſe. The decoction thereof is giuen likewiſe to the ſame effect.

Chap. XI.

¶ *The vertues and properties of Canes or Reeds, of the Papyr reed, of Ebene, Oleander, Sumach, otherwiſe called Rhus Erythros, Madder, Allyſſon, Sope-wort or Fullers-weed, Apocynon, Roſemary, Cachrys, Sauine, Selago, and Samulus. Alſo of Gummes.*

B HEretofore haue wee ſhewed 29 ſundry kinds of Reeds, all indued with their medicinable vertues: and in no plants more appeareth the admirable power of dame Nature, the only ſubiect matter handled in all theſe books of ours. For in the firſt place, there preſenteth it ſelfe vnto vs the root of Reeds or Canes, which being bruiſed and applied accordingly, draweth forth of the body any ſpills of Fearne ſticking within the fleſh: ſo doth the Fearne root by the Reed. And foraſmuch as we haue ſet downe many ſorts of Canes, that amongſt the reſt, which commeth out of India and Syria, and whereof perfumers haue ſo great vſe in their ſweet ointments and odoriferous compoſitions, hath this property beſides, That if it be boiled with the graſſe called Dent de Chien [*i.* Quoich graſſe, or Parſley ſeed] it is diureticall and prouoketh vrine. Applied outwardly, it draweth down the deſired ſickneſſe of women. Taken in drink to the C weight of two oboli, it cureth thoſe who are ſubiect to conuulſions or cramps: it helpeth the liuer and the reines: it is a remedy alſo for the dropſie. As for the cough, a very perfume thereof will ſtay it, and the rather, if it be mixed with Roſin. The root ſodden in wine with Myrrh, clenſeth ſcurfe and dandruffe, it healeth alſo the ſpreading vlcers & running ſcals of the head: there is a juice beſides drawn from it, which becommeth like to Elaterium, or the juice of the wilde Cucumber. Moreouer, in any Reed, the beſt and moſt effectual part therof is that holden to be, which is next to the root. The ioints alſo and knots be of great efficacy. The Cyprian Cane is named Donax, the rind whereof, if it be burnt and brought into aſhes, is ſingular for to bring haire againe in places where it is ſhed: it healeth likewiſe vlcers growing to putrifaction. The leaues thereof are vſed, to draw forth any pricks or thorns. The ſame be of great vertue againſt D S. *Anthonies* fire, the ſhingles, and ſuch like, yea & againſt all impoſtumations: the common and ordinary Reeds haue an extractiue or drawing faculty, if they be ſtamped greene: which is not meant of the root only, but alſo the very ſubſtance of the reed it ſelf, which they ſay is of great operation. The root being reduced into a liniment, and applied with vineger, cureth all diſlocations, and eaſeth the pains of the chine bone. The ſame punned green and new, ſtirreth to luſt, if it be drunk in wine. The down or cotton growing vpon the cane, if it be put into the ears, cauſeth hardneſſe of hearing.

There groweth in Ægypt a certain plant named Papyrus, which reſembleth much the Cane or Reed: a thing of great vſe and commodity, eſpecially when it is dry; for it ſerueth as a ſponge E both to ſuck vp the moiſture in Fiſtulaes, and alſo to inlarge them. For ſwelling as it doth, it keepeth the vlcer open, and maketh way for the medicines to enter accordingly by that means. The paper made thereof when it is burnt, is counted to be cauſtick. The aſhes of it being drunk in wine, cauſe ſleep: and applied outwardly, taketh away hard calloſities.

Touching Ebene, it groweth not (as I haue already ſaid) ſo neare vnto vs, as in Ægypt. And albeit my meaning and purpoſe is not to deale with any medicinable plants growing in the ſtrange & vnknown countries of another world: yet in regard of the wonderfull properties that Ebene hath, I will not paſſe by it in ſilence. For firſt and foremoſt, the fine duſt or pouder filed from it, hath the name to be a ſingular medicine for the eies: as alſo, that the wood therof being ground vpon an hard ſtone, together with wine cuit, diſpatcheth away the cloudy miſt which F ouercaſteth the eies. As for the root, if it be vſed likewiſe and applied with water, it conſumeth the pin and web, and other ſpots in the eies. The ſame being taken with equall quantity of the herb Dragon in hony, cureth the cough. In ſum, Phyſitians repute and range Ebene among the medicines which be corroſiue.

Oleander, called in Greek Rhododendros, which ſome name Rhododaphne, and others Ne-

rion,

rion,hath not bin ſo happy yet,as to find ſo much as a name among the Latines. A ſtrange and G
maruellous quality of this plant:the leaues are a very poiſon to all four-footed beaſts ; and yet they ſerue man as a preſeruatiue and counterpoiſon againſt ſerpents, if they be taken in wine with Rue among. Alſo ſheep and goats if they chance to drink of the water wherin thoſe leaues lay ſoked,(wil by report)thereupon die.

Neither hath Rhus a Latine name,notwithſtanding it be much vſed in Phyſick,& otherwiſe. For it is a wild plant growing of it ſelf, bearing leaues like vnto the Myrtle, vpon ſhort ſtalkes and branches;ſingular for to expell any poiſon and worms out of the body:and beſides,called it is,the Curriers ſhrub,for that they vſe to dreſſe their skins with the dry leaues therof,inſtead of pomgranat rinds. Of a reddiſh colour it is,a cubit in height,& a finger thick. Moreouer,Phyſitians imploy the medicins wherinto this Rhus is put,for bruiſes:likewiſe, for the flux proceeding from a feeble ſtomack,as alſo for the vlcers in the ſeat. But the leaues ſtamped and incorporat with hony,and ſo brought into a liniment or ſalue with vineger,do heale cankerous ſores ſuch as with inflammation do eat away the fleſh to the very bone. Their decoction is ſingular to be inſtilled into the ears that run with filthie matter. Moreouer, there is made a ſtomaticall compoſition of the branches of this Rhus,boiled,which ſerueth in the ſame caſes as the aboue-named Diamoron,*i.* of the Mulberries:but if it haue allum ioined withall, it is of greater efficacy. The ſame being brought into a liniment,is paſſing good for the ſwellings in a dropſie. As for the * Rhus,which is called Erythros,*i.* the red, it is a ſhrub, and the ſeed thereof is both aſtringent and refrigeratiue. Much vſed is the grain or ſeed of this Rhus in ſtead of ſalt to pouder & ſeaſon meats. Laxatiue it is,and giueth a pleaſant taſt to any fleſh meats,eſpecially if Silphium be mingled withal:tempered with hony,it cureth and healeth all running vlcers: and in that maner prepared,it is excellent for the roughnes of a furred tongue,for places bruiſed,looking black & blew,or otherwiſe raw where the skin is raſed & pilled off. Nothing ſo ſoon healeth any wounds in the head, and bringeth them ſo quickly to cicatrice. And taken inwardly with other meats,it ſtoppeth the immoderat flux of womens fleurs. H I

* This kitchin Rhus or meat-Sumach, is all one with the other: but that the cooks vſed the ſeed,and the curriers occupied the leaues and the branches.

As touching Madder,which ſome Greeks call Erythrodanus,others,Ereuthodanus,and wee in Latine Rubia,it is an herb different from Rhus Erythros aboue named. Diers vſe it much to colour their wooll & woollen cloth,ſo do curriers about their skins and leather. In Phyſicke it ſerueth to prouoke vrine:it cureth the jaundiſe, if it be taken in mead or honied water : and reduced into a liniment with vineger,it healeth the il-fauored tettars called Lichenes. Ouer & beſides,it is good for the Sciatica and the palſie,in caſe the patient who drinks therof,do likewiſe bath euery day. The root and ſeed both of Madder,draw down womens months, ſtop the laske, and diſcuſſe or reſolue any impoſtumations breeding. The branches and leaues therof reduced into a cataplaſme and laid too,are good for the ſting of ſerpents. The leaues alſo haue a ſpeciall property to colour the haire of the head. I reade in ſome writers, that if this herb be tied about the neck or ſome other part of the body,and the patient do no more but look thereupon, it is ſufficient to cure the jaundiſe. K

* Some take it to be *Aſperula i.* Wood-Roſe.

The herb * Alyſſon differeth from this Madder,in regard of the leaues and branches onely; which be leſſe. It took that name Alyſſon,becauſe thoſe that be bitten with a mad dog, if they drink it with vineger,or weare it tied faſt about them,ſhall not likewiſe run mad. But it is verie ſtrange which is ſaid moreouer of this herb;namely, That the very ſight thereof is enough to dry vp and conſume that venomous matter or humour infuſed by the tooth of the ſaid dog,and which is the cauſe of madneſſe. L

As for the Fullers weed,which the Latines cal Radicula,and the Greeks Struthion,as I haue beforeſaid,it ſerueth to ſcoure and prepare wooll and woollen cloth for the diers hand. In Phyſick the broth or decoction thereof drunk,cureth the jaundiſe,and the infirmities or diſeaſes of the breſt. It prouoketh vrine,looſeth the belly, and cleanſeth the matrice , which is the cauſe, that Phyſitians call it Aureum poculum,*i.* the golden cup,or golden drinke. The ſame taken with honey in manner of an electuary,to the quantity of one ſpoonefull at a time, is of ſingular operation for the cough and ſhortneſſe of breath,when the patient cannot draw and deliuer his wind but ſitting vpright. Reduced into a liniment with parched barly groats and vineger,it cureth and clenſeth the foule leproſie. Drunke with Panaces and Caper rootes, it breaketh the ſtone,and expelleth it out of the body. Sodden with Barly meal in wine,and brought to a pulteſſe,it diſpatcheth riſings in the fleſh,or broad flat biles called Pani. It is vſualy put into emo- M

litiue

20030

A litiue cataplaſmes, yea, and into collyries ordained for to cleare the eie ſight. I know few things ſo good to prouoke ſneezing as this Radicula: neither is there a better herb for the ſpleene and the liuer. The ſame alſo if it be drunk to the weight of a Roman denier or dram, in mead or honied water, helpeth thoſe that be ſhort-winded. So doth the ſeed therof taken with water, cure the pleuriſie and any ſtitches or pain in the ſides.

To come now to Apocynon: a ſhrub it is bearing leaues like vnto Ivy, but that they be ſofter, and the ſhoots or tendrils therof not ſo long: the ſeed is ſharp pointed, clift, or diuided, full of a ſoft down, & of a ſtrong or vnpleaſant ſauor. Being giuen either to dogs or any other four-footed beaſts in meat, it is their bane, and killeth them. Moreouer, there is the Roſemary, wherof be two kinds: the one is barren and bears no ſeed: the other, which riſeth vp alſo in a ſtem or
B main ſtalk, carieth ſeed or a roſinous gummy fruit, called Cachrys. The leaues in ſmel reſemble Frankincenſe. The root freſh and new gathered, reduced into a ſalue, healeth green wounds: applied to the ſeat, it reduceth the fundament when it is fallen, into the right place, reſolueth the ſwelling piles, and cureth the running hemorrhoids. The juice both of the branches and herb it ſelf as alſo of the root, is ſingular for to ſcour the jaundiſe, and al things els which haue need of clenſing and mundification: it cleareth and quickneth the eieſight. The ſeed is giuen to drinke with great ſucceſſe for all old accidents of the breſt: but with wine and pepper it is good for the matrice, & helpeth to ſend down womens monthly terms. Made into a cataplaſm with * cocle floure, it is applied with good effect vnto the gout. It clenſeth and ſcoureth away morphew: it ſerueth wel to bring any part to heat that hath need of chauſing; yea, & to procure ſweat, if the
C caſe require, ſo the place be anointed therwith: alſo it helpeth any convulſion or cramp. Drunk in wine, it increaſeth milk, ſo doth the root likewiſe: the very ſubſtance of the herb reduced into a liniment, cureth the wens called the kings euil, if it be applied vnto them with vineger: and taken with hony, it is good for the cough. As for Cachrys, there be many kinds of it, as I haue ſhewed before. But this Cachrys of the Roſemary aboueſaid, if it bee rubbed, yeeldeth a ſubſtance or liquor of roſin. Contrary it is to poiſons & ſtings of all venomous beaſts, but only of Snakes. It moueth ſweat, diſpatcheth the wringing torments of the belly, and cauſeth nurces to haue plenty of milk. Sauine the herb, called by the Greeks Brathy, is of two ſorts: the one in leafe reſembleth the Tamariſk, the other the Cypreſſe tree: whereupon ſome haue giuen it the name of Candy Cypreſſe. Many vſe it in ſuffumigations & perfumes, for Frankincenſe. But in
D medicines we Phyſitians take the double weight of it inſtead of Cinnamon, & it is thought to haue the ſame operations and effects. It driues back & keepeth down all ſwelling impoſtumes: it repreſſeth alſo thoſe vlcers which be corroſiue and cankerous: brought into a ſalue, it mundifieth filthy ſores. Applied outwardly, it drawes dead infants out of the body: & no leſſe it worketh, being but receiued by way of perfume. Made into a liniment, it healeth S. *Anthonies* fire, and carbuncles. Drunk with hony and wine, it cureth the jaundiſe. It is ſaid, that the very fume or ſmoke of this herb wil rid hens and ſuch like pullen of the pip.

* *Æriua.* Some reade *Eruina*, i. of Eruile.

Much like vnto this herb Sauine, is that which they cal Selago. Many ceremonies are to be obſerued in the gathering of this herb: firſt and formoſt, the party who is to gather it, muſt bee apparelled all in white, as it were in a ſurplice; go barefoot he muſt, and haue his feet waſhed in
E faire water: before he commeth to gather it, he ought to do ſacrifice vnto the gods with bread and wine: moreouer, no kniſe or yron toole is to be vſed hereabout: neither will any hand ſerue but the right, and that alſo muſt do the deed not bare and naked, but by ſome skirt or lappet of his coat between, which was done off with the left hand; and ſo cloſely beſides, as if he came to ſteal it away ſecretly: laſt of all, when it is gathered, wrapped it muſt be, and caried in a new linnen napkin or towell. The Druidæ of France haue agreat opinion of this herbe thus gathered, and haue preſcribed it to be kept as the only preſeruatiue againſt all hurtfull accidents & miſfortunes what ſoeuer, ſaying, that the fume thereof is ſingular good for all the infirmites & diſeaſes of the eies. The Druidæ or Prelats of France aboue named, make great account of another herb growing in moiſt grounds, which they name Samolus: and (forſooth) if you did well you
F ſhould gather it faſting, with the left hand in any wiſe: & in the gathering, not look back howſoeuer you do. Moreouer, when it is thus gathered, it ought not to be laid down out of the hand in any place, but in the troughs, ciſterns or channels, where ſwine, kine, or oxen vſe ordinarily to drink, where it muſt be likewiſe ſtamped: and then without faile, the foreſaid cattell ſhal be wariſhed and ſecured from all diſeaſes.

As concerning gums, I haue heretofore declared how many kinds thereof are to be found. G
To ſpeak of them in generall, The better that any gum is, the more effectuall be the operations thereof: hurtfull they are to the teeth: they haue a property to thicken or coagulat bloud, and therefore be good for thoſe who caſt and reach vp bloud: likewiſe they be ſingular for burns, as alſo for the windpipe and inſtruments of reſpiration. The ſuperfluous and corrupt vrine within the body, they prouoke and giue paſſage vnto. They dul & diminiſh the bitterneſſe of other medicines wherin they be mingled, how ſoeuer otherwiſe they be aſtringent & do fortifie other qualities. That which commeth from the bitter almonds, and is of a ſtronger operation to thicken and incraſſat, hath vertue alſo to heat the body. The beſt gums be thoſe of Plum-trees, chery trees, and vines: they haue all of them a drying and aſtringent quality, if any part be annointed with them: and diſſolued in vineger, they kill the tettars or ringwormes in children, & heale H
them vp. Being drunk to the weight of foure oboli, in * new wine, they be good for any inueterat cough. Moreouer, they be thought to make the colour more freſh, liuely, & pleaſant; to procure and ſtir vp the appetite to meat; alſo to help thoſe who be pained with the ſtone, in caſe they be drunk in ſweet wine cuit. And to conclude with ſome particularity, The * gum of the Egyptian thorne is ſoueraigne for wounds, and all accidents of the eies.

* *Muſto, et Miſto, i.* in ſome made or compound wine.

* Thought to be *Acacia.*

Chap. XII.

¶ *Of the Arabian Thorne: of* the white Thiſtle Bedegnar: of Acanthium and Acacia.*

* Our ladies thiſtle.

TOuching the Arabian Thorne or Buſh, and the commendable qualities therof, I haue ſufficiently ſpoken in the treatiſe of perfumes and odoriferous confections: yet thus much moreouer I haue to ſay of the medicinable vertues, that it doth thicken and incraſſat thin and rheumatick humors, it reſtraineth all catarrhes and diſtillations, it repreſſeth the reaching vp bloud, & ſtaieth the immoderat flux of womens monthly terms: for which purpoſes the root is more effectuall than any other part of the plant. I

The ſeed of the white Thiſtle is ſingular for the ſting of ſcorpions: a garland made of it and ſet vpon the head, aſſuageth the paine thereof. Much like vnto this, is that Thiſtle which the Greeks call Acanthion, but that the leaues be much ſmaller, and thoſe are ſharpe pointed and prickly all about the edges, and couered with a downe reſembling a cobweb; which the people of the Eaſt countries do gather, and therof make certain cloth for garments, reſembling ſilke. K
The leaues or roots drunk in ſubſtance, are ſuppoſed to be a ſingular remedy for the crampe or conuulſion which draweth the neck and body backward.

Moreouer, there is a kind of Thorne, whereof commeth Acacia, and it is the juice thereof. It is found in Egypt to iſſue from certain trees, which be white, black, and green: howbeit, the beſt Acacia by far, is that which the former (that is to ſay, the white and the black) do yeeld. There is made likewiſe a kinde of Acacia in Galatia, which is moſt ſoft and tender; and the tree that affoordeth it, is more pricky and thorny than the reſt. The ſeed or fruit of all theſe trees, is like vnto Lentils, but only that the grain is leſſe, and the cod or huske wherein it lieth, ſmaller. The right ſeaſon to gather this fruit is in Autumn; for if it be taken before, it is too too ſtrong. L
For to draw this juice which we cal Acacia, the cods wherin the grains lie, ought to be throughly ſteeped firſt in rain water: ſoone after, when they be punned or ſtamped in a mortar, the ſayd juice is preſſed forth with certaine inſtruments ſeruing for the purpoſe: which done, they let it remaine within mortars in the ſun, and there take the thickening: and ſo at length reduce it into certain trochisks, and reſerue them for vſe. There is a iuice likewiſe drawne out of the leaues, but the ſame is not ſo effectual as the other. The curriours vſe to dreſſe their skins with the ſeed or grains therof, in lieu of Galls. The juice which the leaues of the Galatian thorne aboueſaid doth yeeld (and namely, the blackeſt) is reiected for naught; like as that alſo which is of a deepe red colour. Contrariwiſe, that which is either purple or aſh-colored and ruſſet to ſee too, as alſo that which will be ſoone diſſolued, is of exceeding efficacy to thicken and coole withall; and is M
preferred before all other in colyries or eie-ſalues: now for theſe vſes, ſome are wont to waſh the troſches aforeſaid, others torrifie and burn them. They are good to colour the haire of the head black: they heale S. *Anthonies* fire, and corroſiue ſores; yea and all grieuances of the body that conſiſt in moiſture: they cure any impoſtumes, joints that are bruiſed, kibed heels, and the turning

20030

A ning vp of the skin and fleſh from the naile roots. They repreſſe the exceeding flux of womens monthly fleurs: the matrice and tiwell if they be ſlipt and faln out of the body, they reduce into their place again. In ſum, for the eies, for the ſores and infirmities of the mouth, and naturall parts ſeruing for generation, they be ſoueraigne.

Chap. XIII.

¶ *Of the common Thorne: of the wilde or wood Thorne: of Eryſiſceptrum: of Spina Appendix: of * Pyxacanthus, and * Paliurus: of Hulver or Holly: of Yeugh: and Brambles: with the medicinable vertues of them all.*

* B. x. therne.
* Some call it Chriſts thorn.

B THe common Thorn alſo, wherewith the Fullers vſe to fill their vats and caudrons, hath the ſame operation that * Struthium, and is put to the ſame vſe. Many there be verily in all parts of Spaine, who vſe it both in ſweet Pomanders, and alſo in ointments, calling it Aſpalathus: and without all doubt, there is a kind of wild white thorne of this race growing in the eaſterly countries (as I haue ſaid) among the woods, and riſeth to the full height of a good tree. Yea and a ſhrubby plant there is, lower than the other, but as full of pricks, growing in Niſyrus and the Iſlands of the Rhodians, which ſome cal Eryſiſceptron; others, Adipſatheon, or Dipſacon, or Dracheton: the beſt is that which groweth nothing like to the Ferula, and being deſpoiled of the rind, is of a reddiſh colour inclining to purple. It is found in many places, but not euery where odoriferous. Of what force it is, when the rainebow ſeemeth to reſt vpon it, I haue

* *Radicis*, for it is called *Radicula*.

C ſhewed already. It healeth the filthy cankers or ſores of the mouth, and the ſtinking vlcers or alepocks in the noſthrils: likewiſe the ſores, botches, and carbuncles in the priuy parts, the creniſes alſo and clifts in the fundament, or elſe-where, applied vnto the place affected: but if it be drunk, it abateth all ſwelling of ventoſities: the bark or rind therof, diſpatcheth thoſe obſtructions and impediments which cauſe the ſtrangury or piſſing by drop-meale. The decoction is a ſingular remedy for them that either piſſe or vomit bloud. The foreſaid rinde ſtoppeth the flux of the belly. The like effects is that thought to work which groweth in the woods [and is called Aſpalathus of the Leuant.]

There is a kind of thorny buſh called * Appendix, for that there be red berries hanging ther-

* Some take it for the Barbery buſh.

D to, which be likewiſe named Appendices. Theſe berries, either raw by themſelues, or elſe dryed and boiled in wine, do ſtay the flux of the belly, and beſides aſſuage the torments and wrings therof. As for the berries of Pyxacanthus, they be drunk to right good purpoſe againſt the ſting of ſerpents. Paliurus alſo is a kind of thorny buſh: the people of Africk call the ſeed of it Zura, which is found to be moſt effectuall againſt ſcorpions; and for thoſe who are troubled with the ſtone, and the cough. The leaues haue an aſtringent or binding qualitie. The root reſolueth and diſpatcheth biles, impoſtumes, and botches: and if the ſame be taken in drink, it procureth vrin: if it be ſodden in wine, and the decoction drunk, it ſtoppeth a laske, and is a defenſatiue againſt the poiſon of ſerpents: the root eſpecially is giuen in wine: ſome there be who ſtamp the leaues, putting ſalt thereto, and beeing reduced into the forme of a cataplaſme, apply the ſame to the gout. The leaues be good to ſtay the immoderat flux of womens termes, the looſeneſſe of the

E belly occaſioned by a feeble ſtomack, the bloudy flix, and the inordinat motions of cholericke humors both vpward and downward. The root boiled and brought to a liniment, draweth forth whatſoeuer ſticketh within the body. Soueraign it is and of exceeding great operation, in caſe of diſlocations and ſwellings.

As touching the Holly of Hulver tree, if it be planted about an houſe, whether it be within a city, or ſtanding in the country, it ſerueth for a countercharm and keepeth away all ill ſpels or inchantments. *Pythagoras* affirmeth, that the floure of this tree wil cauſe water to ſtand all vpon an yce: alſo that a ſtaffe made thereof, if a man doe fling it at any beaſt whatſoeuer, although it chance to light ſhort for default of ſtrength in his arms who flung it, wil notwithſtanding etch forward and roll from the place where it fell vpon the earth, and approch neere to the beaſt a-

F foreſaid; of ſo admirable a nature is this Holly tree.

The fume or ſmoke of any Yeugh tree, killeth mice and rats. Neither hath Nature produced brambles for nothing els but to prick and do hurt; for ſuch is her bounty, that the berries which they beare are mans meat, beſides many other medicinable properties: for they haue a deſiccatiue and aſtringent vertue, and ſerue as a moſt appropriate remedy for the gums, the inflamma-

tion of the Tonſils,& the priuy members:the flours alſo as well as the berries of the brambles, G
be ſingular againſt the Hæmorrhoid and the Preſter, which are the two wickeddeſt and moſt miſchieuous ſerpents that be. The wounds inflicted by ſcorpions,they cloſe & heale vp againe without any danger of rankling or apoſtemation:and withall,they haue a property to prouoke vrine. The juice drawne and preſſed out of the tendrons or yong ſprouts of brambles ſtamped, and afterwards reduced vnto the conſiſtence of honey by ſtanding in the Sun,is a ſingular medicine either taken inwardly or applied outwardly,for all the diſeaſes of the mouth and eies;for them that reach vp bloud;for the ſquinancy;the accidents of the matrice and fundament;finally,for the immoderat flux of the belly occaſioned by the weakneſſe of ſtomack. As for the ſores and infirmities of the mouth, the very leaues alone of the bramble if they be but chewed, are paſſing good:but if they be reduced into a liniment and ſo applied,they heale running ſores or H
any ſcals whatſoeuer in the head:& euen ſo being laid alone vpon the left pap, they be wholeſome for ſuch as are giuen to the fainting & trembling of the heart,and ſubject to fal into cold ſweats:likewiſe being applied accordingly,they eaſe the pain of the ſtomack,and ſuch as haue their eies ready to ſtart out of their head : and to help the infirmities of the ears,their iuice is excellent to be dropped into them. The ſame juice incorporat with the cerot of roſes,healeth the clifts and ſwelling knubs in the fundament:& for the ſaid infirmity,the decoction of yong tendrils in wine, is a preſent remedy, in caſe the place be bathed and fomented therein. The ſame yong ſprings eaten alone by themſelues in a ſalad,in maner of the tender crops and ſpurts of the Colewort ; or boiled in ſome harſh, groſſe, and greene wine,do faſten the teeth which be looſe and ſhake in the head:they ſtop a lask,and reſtrain an vnnaturall iſſue or flux of bloud;and I
beſides,are good in the bloudy flix.Being dried in the ſhade,and afterwards burnt, their aſhes are ſingular to ſtay the uvula for falling. The leaues alſo being dried and beaten to pouder, are excellent good for the farcines and ſores in horſes,and ſuch like beaſts. As for the blacke berries which theſe brambles do beare,there is a kind of Diamoron made of them,which is far better for the infirmities of the mouth,and more effectual,than the other of the garden mulberies. The ſame being ſo prepared in that ſtomaticall compoſition aforeſaid,or drunk only with Hypoquiſtis and hony,be ſingular to repreſſe the fury of choler prouoking both waies:they be cordiall likewiſe,in caſe of faintings and cold ſweats : and laſtly,a preſeruatiue againſt the poiſon of the venomous ſpiders. Among thoſe medicines which they cal Styptick or aſtringent,there is not a better thing than to boile the root of this blackberry bramble in wine to the thirds;and K
namely to make a collution therwith to waſh the cankers or ſores breeding in the mouth,or to foment the vlcers growing in the fundament. And verily of ſuch a binding and aſtringent force is this bramble,that the very ſpungeous bals that it beareth,will grow to be as hard as ſtones.

Another kind of brier or bramble there is,vpon which groweth a roſe:ſome cal it Cynosbatos,others Cynoſpaſtos:it beareth a leaſe like to the print or ſole of a mans foot. A little bal or pill it breedeth,furred or briſtled much after the maner of the Cheſtnut,which ſerueth as a ſpeciall remedy for thoſe that be ſubiect to the ſtone. As for Cynorrhonos, it is another plant different from this;wherof I will ſpeak in the next book.

Chap. XIV.

L

¶ *Of * Cynosbatos,and the Raſpice : of the Rhamnos,and of Lycium and Sarcocolla. Of a certaine compoſition in Phyſicke called Oporice.*

* i.the Canebrier or Canker brier.

AS for the bramble named Chamæbatos,it beareth certain black berries like grapes,within the kernell wherof it hath a certain ſtring like a ſinew, whereupon it came to be called Newroſpaſtos:it is a different plant from the Caper,which the Phyſitians haue named alſo Cynosbatos. Now the tender ſtems of the foreſaid * Cynosbatos or Chamæbatos condite in vineger,are good for them to eat who are troubled with the opilation of the ſpleen, & with ventoſities;for it is a ſingular remedy for thoſe infirmities. The ſtring or ſinew thereof chewed with Maſtick of Chios,purgeth the mouth. The wild roſes that grow vpon this brier,being incorporat with ſwines greaſe,are excellent for to make the haire grow againe,when it is ſhed by M
ſome infirmity. *The beries of theſe brambles if they be tempred with oile oliue made of green and vnripe oliues,colour the haire black. The proper ſeaſon to gather the floures of theſe brambles that cary beries like to mulberies,is in haruеſt time:the white kind of them drunk in wine, is a ſoueraign remedy for the pleuriſie,& the flux of the ſtomack:the root ſodden to the thirds,

* *Rubus canis.*

*Obſerue how confeſſedly *Plinie* ſaieth down the ſtory o *Cynobatos* and *Chamæbatos*, i the Canebrier & th blackberry bramble.

ſtoppeth

20030

A ſtoppeth a lask, and ſtaieth the flux of bloud: likewiſe a collution made therwith, faſtneth looſe teeth, if they be waſhed withall. The ſame decoction or liquor is good to foment the vlcers of the ſeat priuy parts. The aſhes of the root burnt, keep vp the uvula from falling.

The Raſpis is called in Latin Rubus Idæus, becauſe it groweth vpon the mountain Ida, and not elſwhere* [ſo plenteouſly.] Now is this bramble more tender, & leſſe in growth: it putteth forth alſo fewer ſtalkes vpright, and thoſe more harmeleſſe and nothing ſo pricky as the other brambles before named: beſides, it loueth well to grow vnder the ſhade of trees. The floures of this bramble reduced into a liniment with hony, reſtrain the flux of rheumaticke humors into the eies, and keepeth down the ſpreading of S. *Anthonies* fire: and giuen in water to drink, it cureth infirmities of the mouth. In all other caſes, it hath like operations to the former brambles

* *Ex Dioſcor.*

B Among the diuers kinds of brambles, is reckoned the Rhamne, which the Greeks cal Rhamnos, notwithſtanding that it is whiter & more branching than the reſt. This Rham beareth many flours, ſpreading forth his branches armed with pricks not crooked or hooked as the reſt, but ſtreight and direct, clad alſo with larger leaues. A ſecond kind there is of them growing wilde in the woods, blacker than the other, & yet inclining in ſome ſort to a red colour: this carieth as it were certain little cods. Of the root of this Rham boiled in water, is made the medicine that is called Lycium. The ſeed of this plant draws down the after-birth. The former of theſe two, (which alſo is the whiter) hath a vertue more aſtringent and cooling than the other, & therfore better for impoſtumations and wounds: howbeit the leaues of both, either green or boiled, are vſed in liniments with oile for the ſaid purpoſe. But as touching Lycium, the beſt of all other is

C (by report) made of a certain Thorne tree or buſh, which they cal Pyxacanthos Chironia, the form wherof I haue deſcribed among the Indian trees: & indeed the moſt excellent Lycium, by many degrees, is that Indian Lycium thought to be. The manner of making this Lycium, is in this wiſe: they take the branches of this plant, together with the roots which be exceeding bitter, & after they be well punned and ſtamped, ſeeth them in water within a braſen pan, for three daies together or therabout: which don, they take forth the wood, & ſet the liquor ouer the fire again, where it taketh a ſecond boiling, ſo long till it be come to the conſiſtence or thicknes of hony: howbeit ſophiſticated it is many times with ſome bitter juices, yea and with the lees of oile & beaſts gall. The very froth & ſcum, in maner of a flory that it caſteth vp, ſome vſe to put into colyries & medicines for the eies. The ſubſtance of the juice beſides is abſterſiue, it mun-

D difieth the face, healeth ſcabs, cureth the exulcerations or frettings in the corners of the eies: it repreſſeth old rheumes & diſtillations, clenſeth ears running with filthy matter, repreſſeth the inflammations of the almonds in the mouth, called Tonſillæ, & of the gums; ſtaieth the cough, reſtraineth the reaching & caſting of bloud, if it be taken to the quantity of a bean: being ſpred in maner of a plaſter or liniment and ſo applied, it drieth vp running and watery ſores; it healeth the chaps and clifts in any part of the body, the vlcers of the ſecret parts ſeruing for generation, any place fretted or galled, new and green vlcers, yea and ſuch as be corroſiue and withall growing to putrefaction: it is ſingular for the caloſities, werts, or hardcorns, growing in the noſthrils, and all impoſtumations: moreouer, women find great help by drinking it in milke, for any violent ſhift or immoderat flux of their monthly ſicknes: the beſt Indian Licium is known by this,

E That the maſſe or lump therof is black without-forth, red within when it is broken, but ſoon it commeth to a black colour. An aſtrictiue medicine this is, and bitter withal; and hath the ſame effects which the other Lycium is reported to haue, but ſpecially if it be applied to the priuie members of generation. As touching Sarcocolla, ſome be of opinion that it is the gum or liquor iſſuing from a certain thorny plant or buſh: and they hold, that it reſembleth the crums of frankincenſe, called Pollen or Manna Thuris, & in taſt ſeemeth to be ſweetiſh, & yet quick and ſharpe withall. This Sarcocoll ſtamped with wine, and ſo applied, repreſſeth all fluxes: & in a liniment, good it is for yong infants. This gum alſo by age and long keeping, waxeth black; but the whiter is the better, & thereby is the goodneſſe knowne.

But before I depart from this treatiſe of Trees, and their medicinable vertues, I muſt needs

F ſay, we are beholden to them yet for one excellent medicine more, which is called Oporice by the Greeks, as one would ſay, made of fruits. This compoſition is ſingular for the bloudy flix or exulceration of the guts; alſo for the infirmities of the ſtomack. The manner of making it, is in this wiſe: Take 5 quinces, with their kernels, ſeeds & all, as many pomgranats likewiſe, let them boil gently ouer a ſoft fire in one gallon of new white wine, put therto the weight or meaſure or

one ſextar of Seruiſes,and as much in quantity of the Sumach which is called Rhus Syriacum, G
together with halfe an ounce of ſaffron; ſeeth all theſe together to the height or conſiſtence of
hony. Thus much concerning the properties of trees ſeruing in Phyſicke. It remaineth now to
annex hereunto a diſcourſe of thoſe plants which the Greek writers (by giuing them names in
ſome analogie reſpectiue vnto trees) haue left an ambiguity, and made vs doubt of them whe-
ther they be trees or herbs.

Chap. XV.

¶ *Of* * *Chamædrys, i. Germander* : * *Chamædaphne, i. Lawreoll* : * *Chamelæa* : * *Chamæſyce* :
* *Chamæciſſos, i. Ale-hooue* : * *Chamæleuce, i. Fole-foot* : * *Chamæpeuce* : * *Chamæ-cy-*
pariſſus, i. Lauander-cotton : * *Ampelo-praſos* : *Stachys* : *Clinopodium*, H
Centunculus, and Clematis Ægyptia, with the
medicines that they affoord.

* ground-oke, or petie oke.
* ground-bay, or pety Lawrell.
* ground-oliue, &c.
* ground-fig-tree, &c.
* ground Ivie.
* ground Poplar.
* ground-pine, or Pitch tree.
* ground Cypreſſe.
* Porret vine. or Leek-vine.

GErmander is an herb, called in Greek Chamædrys, and in Latine Triſſago: ſome haue named it Chamædrope, others Teucrion: it beareth leaues for bignes reſembling mints, in colour like vnto the oke leaues, cut and indented alſo after the ſame maner. Of ſome it is called Serrata; and they affirme that the firſt pattern of a ſaw was taken from the leafe of this herb, whereupon it ſhould be ſo called. The floure beareth much vpon the purple colour: it loueth to grow in ſtony places, and would be gathered whiles it is full of iuice: and thus gathered in due ſeaſon, whether it be taken in drink, or taken outwardly in a liniment, moſt effectuall it is I
againſt the poiſon of ſerpents: likewiſe it is wholſome for the ſtomack, good againſt an inueterat cough; ſingular to cut, diſſolue, and raiſe the tough fleam ſticking in the throat: a ſpecial remedy for ruptures, conuulſions, and pleuriſies: it waſteth away the ouergrown ſpleen: it prouokes vrine, and womens fleurs: in which regard, a bundle or handfull of Germander boiled in 3 hemines of water, vntill a third part be conſumed, maketh a ſoueraigne decoction or drinke for thoſe who are newly faln into a dropſie. Some there be, who ſtamp this herb and ſprinkle water among, and ſo reduce it into troſchs. Ouer and beſides the vertues before rehearſed, it it is good to heale botches newly broken and full of matter; yea old vlcers, though they be filthy and putrified, if it be applied thereto: for the ſpleen, it is vſually taken with vineger: & this iuice doth chauſe and heat thoſe parts which be annointed therewith.

As touching Lawreol, called by the Greeks Chamædaphne, it ariſeth vp with one only ſtem K
of a cubit high or thereabout: the leaues are but ſmal, howbeit like to thoſe of the Lawrell: it bringeth forth a reddiſh ſeed appearing among the leaues, which being vſed in a liniment freſh and green, eaſeth the head-ach. The ſame cooleth all exceſſiue heats: and if it be drunk in wine, appeaſeth the wrings and torments of the belly. The iuice thereof taken in drink, drawes downe womens fleurs, and prouokes vrine: the ſame applied in wooll to the naturall parts of a woman, cauſeth her to be ſoon deliuered when ſhe is in hard trauell of child-birth.

* otherwiſe called *Mezereon*, Widow-waile.

As for * Chamelæa, it hath leaues like vnto thoſe of the oliue: the ſame be bitter in taſt, and in ſmell odoriferous. This plant groweth in ſtony grounds, and exceedeth not in heigth a hand-breadth or ſpan at moſt; a purgatiue herb it is; for thereof is made an excellent ſyrrup to euacuat fleame and choler; namely, if there be taken one part of the leaues of this herbe, with two L
parts of wormwood, and ſo boiled; for certainly this decoction drunk with hony, is ſingular for to purge the foreſaid humors. A cataplaſme made with the leaues, cleanſeth vlcers. It is commonly ſaid, that if this herb be gathered before the ſun-riſing, and the party to ſay expreſſely in the gathering, That it is for the pin and web in the eies; it will diſpatch and rid away the ſaid infirmity, if one do but weare it tied about him. And howſoeuer it be gathered, whether it be with any ſuch circumſtance and ceremony, or without, yet is it ſingular for the haw gnawing in the eies of horſes and ſheepe.

Chamæſyce beareth leaues reſembling thoſe of the Lentil, but they alwaies creep along the ground and riſe not vp. This herbe groweth in drie and ſtony grounds: the ſame boiled in wine M
and vſed as a liniment vnto the eies, cleareth their ſight; for it is ſingular to diſpatch and remoue cataracts, ſuffuſions, and cicatrices, growing therein: as alſo to rid away the miſty clouds and films that ouercaſt the ſight. Being put vp into the matrice within a linnen cloath in manner of a peſſarie, it allaieth the paines thereof. VVarts of all ſorts it taketh away, if they be annointed

20030

A nointed therewith. It is a ſoueraigne remedy alſo for thoſe who cannot take their wind but ſitting vpright.

* Chamæciſſos groweth vp ſpiked with an ear like vnto wheat, and ordinarily putteth forth fiue branches, and thoſe ful of leaues. VVhen it ſheweth in the floure, a man would take it to be the * white Violet or Gilloſre. The root is but ſmall. They that are troubled with the Sciatica, vſe to drinke the leauc thereof to the weight of three oboli in two cyaths of wine, for ſeuen daies together: but it is an exceeding bitter potion. * It is not our ground Iuie or Alchove. * *Viola alba.*

As for Fole-foot, it is called in Greeke Chamæleuce: but we in Latine name it Farranum or Farfugium. It loueth to grow by riuers ſides. The leaues ſomwhat reſemble thoſe of the Poplar, but that they be larger. If the root of Fole-foot be burnt vpon the coles made with Cypres wood, the ſmoke or perfume thereof receiued or drunk through a pipe or tunnell into the
B mouth, is ſingular for an old cough.

Touching * Chamæpeuce, in leaſe it is like vnto the Larch-tree: a plant very appropriat to the paine of the back and the loins. The herb Chamæcypariſſos, if it be drunk in wine, is ſingular good againſt all the venomous ſtings of ſerpents and ſcorpions. * Some take it for Chamæpitys.

The herb Ampelopraſos groweth in vineyards, bearing leaues reſembling Porret: but it cauſeth them to belch ſoure that eat thereof. Howbeit, of great power it is againſt the ſting of ſerpents. It prouoketh vrine & womens monthly terms. And yet whether it be drunke or applied outwardly, it is paſſing good for them that piſſe bloud, & repreſſeth the iſſue & eruption thereof. Our midwiues vſe to giue it vnto women newly deliuered and brought to bed: likewiſe it is found to auaile much vnto them that be bitten with mad dogs.

C Moreouer, the herb called Stachys hath a reſemblance alſo to *Porret, but that the leaues be longer and more in number: it yeeldeth a pleaſant ſmell, and the leaues be of a pale colour, inclining ſomwhat to yellow. The nature of this plant is to moue the monethly purgation of women. As for Clinopodium (called otherwiſe Cleonicion, Zopyron, & Ocymoeides) like it is to running wilde Thyme, and full of branches, growing vp a ſpan or handfull high at the leaſt. It groweth in ſtony places, with a ſpoky tuft of floures ſhewing in a round compaſſe, and for all the world reſembleth the feet or pillers that * beare vp a table or bed. This herb taken in drinke is good for conuulſions, ruptures, ſtranguries, and ſerpents ſtings. So is the ſyrrup or juleb that is made thereof, by way of decoction. Thus much of thoſe herbs, which in name carry a ſhew and reſemblance of trees. * *σκόροδον i. Porri:* but it ſeems that *Pliny* ſhould haue read *σκορδιον, i. Marrubij*, or Horehound, out of *Dioſcorides*, as *Rondeletius* hath obſerued. * Wherupon it took the name Clinopodium.

D It remaineth now to write of ſome other herbs, which I muſt needs ſay are of no great name and reckoning, howbeit ſuch as be indued with wonderfull vertues. As for the famous and notable herbs indeed, I will reſerue the treatiſe of them for the bookes following. And firſt I meet with that which we in Italy call Centunculus, but the Greekes Clematis, with leaues pointed like the beak of a bird, or reſembling the cape of a cloke, growing cloſe to the ground in toiled corn fields. This herbe is moſt effectuall and ſingular aboue all other, for to ſtay a laske, if it be drunk in ſome red or green hard wine. The ſame beaten into pouder, and taken to the weight of one denier Roman, in fiue cyaths of Oxymell or hot water, ſtancheth bleeding: and yet in that ſort it is of great effect to fetch away the after-birth of women lately deliuered.

E But there be other herbes among the Greeke writers, going vnder the name of Clematides, and namely one, which ſome cal Echites, others Lagines, and there are be ſides who name it Petty Scammonie, and in very truth, branches it hath a foot long, full of leaues, and not vnlike vnto thoſe of Scammonie, but that the leaues be more black or duskiſh and ſmaller. This herbe is found as well in vineyards as corne lands. People vſe to eat this herb with oile and ſalt, as they do Beets, Coles, and other ſuch pot-herbs: and ſo eaten, it maketh the body ſoluble. And yet neuertheleſſe, thoſe who be troubled with the bloudy flix, are wont to take it in ſome aſtringent wine with Lineſeed, and find it to work with good ſucceſſe. The leaues applied to the eies with parched Barly groats, do reſtraine the wateriſh humors which fall thither, ſo there be a fine linnen cloth wet * between. The ſame applied in a pulteſſe to the wens called the kings euil, bring
F them firſt to ſuppuration, and afterwards hauing hogs greaſe put thereto, heale them throughly. Incorporat with green oile Oliue, they eaſe the hemorrhoids: and with honey, helpe thoſe that be in a Phthiſicke or Conſumption. If nources eat them with their meat, they ſhall haue good ſtore of milke in their breaſts. And if they annoint therewith the heads of their young infants, the haire will come the thicker. A collution made with them and vineger, aſſuageth the tooth-
ach, * *Suppoſito*: ſome reade contrariwiſe, *Superpoſito*.

ache, if the mouth be waſhed therewith. To conclude, it ſtirreth vp to fleſhly luſt. G

There is beſides another kind of Clematis, known by the name of the Ægyptian Clematis: howſoeuer ſome call it Daphnoeides, others, Polygonoeides. Leaued it is like the Lawrel, ſaue that the leaues be long and thin. But againſt all ſerpents, and eſpecially the Aſpides, it is a ſoueraigne counterpoiſon if it be drunk in vineger. Ægypt bringeth forth this herb in great abundance.

Chap. XVI.

¶ *Of Aron, Dracunculus, or Dracontium. Of Aris. Of Milleſoile. Of another hearbe of that name. Of Pſeudobunium. Of Myrrhis and Onobrichis: with their medicinable vertues.* H

Wake-robin. Dragon.

THere is a great difference betweene * Aron (of which herbe I haue written amongſt thoſe with bulbous roots) and * Dracontium: although writers be at ſome variance about this point, for ſome haue affirmed that they be both one. Howbeit *Glaucias* hath diſtinguiſhed them, in that the one groweth wild, and the other is planted: and hee pronounceth and calleth Dragon, the ſauage Aron: others are of opinion, that there is no other difference between them, but that the onion root is called Aron, and the ſtem of the ſame herb Dracontium: whereas indeed there is no likeneſſe at all between the one and the other, if ſo be that Dracontium of the Greeks be the ſame that we call Dracunculus in Latine. For Aros hath a black root growing broad, flat, and round, yea, and far greater, inſomuch as it is a good handful: but the root of Dracunculus is ſomwhat red, and the ſame wrythed and folded round in manner of a Dragon, whereupon it took that name. Nay, the very Greeks themſelues haue made an exceeding great difference, between Dragon, and Wake-Robin: for they affirme, That the ſeed of Dragon is hot and biting, and beſides, of ſuch a virulent and ſtinking ſmell, that the very ſent thereof is enough to driue a woman great with childe to trauell before her time, and to ſlip an vntimely birth. Contrariwiſe, they haue wonderfully commended Aron: for firſt and foremoſt, they preferre the female of this kind as a principall meat, before the male, which is harder to be chewed, and longer ere it be concocted and digeſted: moreouer, they affirm, That as well the one as the other, doth expectorat the fleam gathered in the cheſt: and whether it be dried and brought into pouder and ſo the drink ſpiced withall, or otherwiſe taken in form of a lohoch or electuary, it prouoketh both vrine and alſo womens monthly termes. Drunke with oxymell, it mundifie th and comforteth the ſtomacke: and Phyſitians haue giuen it in Ewes milke for the exulceration of the guts: & roſted vnder the embers, they haue preſcribed it to be taken with oil for the cough: Some haue ſodden it in milke, and giuen the decoction thereof to be drunke in that caſe. They haue appointed it alſo to be boiled, and then applied accordingly, to watery eies for to repreſſe the violence of rheum: likewiſe, vnto places black and blew with ſtripes: as alſo for the inflammation of the amygdales: alſo, they haue giuen direction to inject the ſame with oile by way of clyſtre, as an excellent remedy for the Hemorrhoids: and to applie it in a liniment with hony, for to take away the pimples and freckles of the skin. *Cleophantus* hath giuen it the praiſe of an excellent antidote or counterpoiſon: preſcribing alſo the vſe thereof for the pleuriſie and inflammation of the lungs, in the ſame manner, as in caſe of the cough: he appointed likewiſe to beat the ſeed into pouder, & being mixed either with common oile or oile roſat, to drop it into the eares for to aſſuage the pain. *Dieuches* ordained, to take and temper it with meale, and ſo to worke it into a paſte, & to giue the bread ſo made, vnto them that cough: to thoſe who be ſhort winded: ſuch alſo as cannot breath vnleſſe they ſit vpright: and laſtly, to as many as reach vp filthy matter out of their breſt. *Diodotus* the Phyſitian made thereof an electuary or lohoch with hony, for them to licke who are in a Phthiſick, or otherwiſe diſeaſed in the lights: and hee appointed it to be laid as a pulteſſe for fractures of bones. There is not a beaſt or liuing creature whatſoeuer, but if the ſhap or naturall parts be annointed therewith, it will fetch away the fruit of their womb. The juice drawn out of the root, if it be incorporat with Attick hony, ſcattereth the miſty clouds and filmes in the eies that trouble the ſight: the ſame alſo cureth the defects and infirmities of the ſtomack. And a ſyrrup made with the decoction thereof & hony, is good to ſtint a cough. All vlcers whatſoeuer, be they wolues, cankerous ſores, or otherwiſe corroſiue and eating forward ſtil: yea, the very ill-fauoured Polype and Noli-me-tangere in the noſthrils, the

These deſcriptiõs agree not with our wake Robin & Dragon. I K L M

20030

A the iuice of this root doth cure and heale wonderfully. The leaues ſodden in wine and oile, are good to be applied vnto any burne or place ſcalded. Being eaten in a ſalad with ſalt and vineger they purge the belly; ſodden with hony, and applied as a cataplaſme, they are good for diſlocations and bones out of ioint. Semblably, the ſaid leaues, whether they be green or dried, are excellent for the gout in any ioint, being laid too with ſalt. *Hippocrates* deuiſed a plaſter of them and hony together, which was ſingular for all impoſtumations whatſoeuer. For to bring downe the deſired ſickneſſe of women, 2 drams of the root or ſeeds (it skils not whether) taken in two cyaths of wine, is a ſufficient doſe. The ſame potion fetches away the after-birth, in caſe it make no haſt to come away after a woman is deliuered of child. And for this purpoſe *Hippocrates* appointed the very bulbous root of Aron in ſubſtance to be applied to the nature of a woman in the like caſe. It is ſaid, that in time of peſtilence it is a ſingular preſeruatiue, if it be eaten with
B meats. Certes, it is excellent to keep them for being drunke, who haue taken their liquor liberally; or at leaſtwiſe to make them ſober again. And yet the perfume or ſmoke thereof, when it burneth, chaſeth ſerpents away, and eſpecially the Aſpides; or els doth intoxicat their heads, & make them ſo drunk, that a man ſhall find them lying benummed and aſtonied, as if they were dead. The ſame ſerpents moreouer will not come neere vnto thoſe that be annointed all ouer with this herb Aros and oile of baies: hereupon it is thought, that it is a good preſeruatiue againſt their ſtings, if it be drunk in groſſe red wine. They ſay moreouer, that cheeſes will keepe paſſing well, if they be wrapped within the leaues of Aron.

To come now to Dragons, called in Latine Dracunculus, wherof I haue ſpoken before: the
C only time to dig it out of the ground, is when barly beginneth to ripen, and within the two firſt quarters of the Moon, all the while that ſhe doth increaſe in light. Let one but haue the root of this herb about him in any part of the body (it makes no matter how or where he cary it) he ſhal be ſure that ſerpents wil flie from him. And therefore it is ſaid, that the greater kind of them is ſingular to be giuen in drink vnto thoſe who are ſtung already by them, as alſo that it ſtoppeth the immoderat courſe of womens fleurs, in caſe it touched no yron inſtrument when it was gathered. The juice thereof is paſſing good for pain in the ears.

As for tht Dragon which the Greeks name Draconatium, it hath bin ſhewed & deſcribed to me in three forms: the one leaued like vnto the Beets, growing with an vpright main ſtem with a floure of a purple colour: this Dragon is like vnto Aron. Others brought to me a ſecond kind with a long root (as it were) marked forth and diuided into certaine ioints; it putteth out three
D ſmall ſtems and no more: and they declared moreouer and gaue direction to ſeeth the leaues thereof in vineger againſt the ſting of ſerpents. There was a third ſort ſhewed vnto me, bearing a leafe bigger than that of the Cornell tree, with a root reſembling thoſe of the canes or reeds: and (as they auouched) parted into as many joints and knots juſt, as it was yeares old, and ſo many leaues likewiſe it had, neither more nor leſſe. Thoſe that preſented it to me, vſed to giue the ſame in wine or water againſt ſerpents.

There is an herb alſo named Aris, growing in the ſame Egypt: like vnto Aron aboueſaid, ſaue that it is leſſe, hath ſmaller leaues, and not ſo big a root, and yet the ſame is full as great as a good round and large oliue. Of theſe, there be two kinds: the one which is white, riſeth vp with
E two ſtalks: the other puts forth but one ſingle ſtem. Both of them haue vertue to cure running ſcals and vlcers; to heale burns alſo and fiſtulous ſores, if a collyrie or tent be made thereof and put into the ſore: the leaues boiled in water, and afterwards ſtamped and incorporate with oile roſat do ſtay the ſpreading of corroſiue & eating vlcers. But mark one wonderful property that this plant hath: touch the nature or ſhap of any female beaſt therwith, ſhe wil neuer lin gadding vntill ſhe die with one miſchiefe or other.

Touching Millefoile or Yarrow, which the Greeks call Myriophyllon, & we in Latine Millefolium: it is an herb growing vp with a tender and feeble ſtalke, like in ſome ſort vnto Fenell, and charged with many leaues, whereupon it took the name: it groweth in moores and fennie grounds; vſed to very good purpoſe and with ſingular ſucceſſe, in curing of wounds. Ouer and
F beſides, it is giuen to drink with vineger for the difficulty of vrine and the ſtoppage of the blader, for thoſe that take wind thick and ſhort, and ſuch as are inwardly bruiſed by falling headlong from on high; the ſame is moſt effectuall to take away the tooth ache.

In Tuſcan they haue another herb ſo called, growing in medowes, which putteth forth on either ſide of the ſtalk or ſtem, a number of pretty leaues as ſmal in maner as hairs. The ſame alſo

is a moſt excellent wound-hearb. And it is auouched by the people of that countrey, That if an Oxe chance to haue his ſtrings or ſinews cut quite atwo with the plough-ſhare, this hearb will conglutinat and ſouder them againe, if it be made into a ſalue with ſwines greaſe. G

Concerning baſtard Navew, called in Greeke Pſeudo Bunion, it hath the leaues of Navew gentle, and buncheth to the height of a hand-bredth or ſpan. The beſt of this kind groweth in the Iſle Candy, where they vſe to drink fiue or ſix branches thereof for the wringing torments of the belly, for the ſtrangury, the pain of the ſides, midriffe, and precordiall parts.

Myrrhis, which ſome call Smyrrhiza, others Myrrha, is paſſing like vnto Hemlocke, in ſtalke, leaues, and floure; only it is ſmaller and ſlenderer, and hath no ill grace and vnpleaſant taſt to be eaten with meats. Taken in wine, it haſteneth the monthly courſe of womens fleurs if they bee too ſlow, and helpeth them in labour to ſpeedy deliuerance. It is ſaid moreouer, that in time of H a plague it is wholſom to drink it for feare of infection. A ſupping or broth made of it helpeth thoſe who are in a Phthyſicke or conſumption. This good property it hath beſides, to ſtir vp a quick appetite to meat. It doth extinguiſh and kill the venome inflicted by the ſting or pricke of the venomous ſpiders Phalangia. The juice drawn out of this herb after it hath lien infuſed or ſoked three daies together in water, healeth any ſore breaking out either in face or head.

Finally, Onobrychis carieth leaues reſembling Lentils, but that they are ſomewhat longer: it beareth alſo a red floure: but reſteth vpon a ſmall and ſlender root. It groweth about ſprings and fountains. Being dried and reduced into a floure or pouder, it maketh an end of the ſtrangury, ſo it be drunk in a cup of white wine well ſtrewed and ſpiced therwith It ſtoppeth a lask. To conclude, the juice therof cauſeth them to ſweat freely who are annointed all ouer with it. I

Chap. XVII.

¶ *The medicinable vertues of Coriaceſia, Callicia, and Menais, with three and twentie other herbes, which ſome hold to be Magicall. Moreouer, of Conſidia, and Aproxis, beſides ſome other which are reuiued and in requeſt againe, hauing been long time out of vſe.*

TO diſcharge and acquit my ſelfe of the promiſe which I made of ſtrange and wonderfull herbs, I cannot chuſe but in this place write a little of thoſe which the Magitians make ſuch reckoning of. For can there be any more admirable than they? And in very truth, *Democritus* and *Pythagoras*, following the tracts of the ſaid wiſe men and Magitians, were the firſt Philoſophers, who in this part of the world ſet thoſe herbs on foot, and brought them into a name. K

And to begin with Coriaceſia and Callicia. *Pythagoras* affirmeth, That theſe two herbes will cauſe water to gather into an yce. I find no mention at all in any other authors, of theſe hearbes, neither doth he report more properties of them.

The ſame author writes of an herb called Menais, known alſo by the name of Corinthas, the juice whereof (by his ſaying) if it be ſodden in water, preſently cureth the ſting of ſerpents, if the place be fomented with the ſaid decoction. He affirmeth moreouer, that if the ſaid juice or liquor be poured vpon the graſſe, whoſoeuer fortuneth to go thereupon, and touch it with the L ſole of the foot, or otherwiſe chance to be but daſhed or ſprinkled therewith, ſhall die therupon remedileſſe, and no way there is to eſcape the miſchiefe. A monſtrous thing to report, that this juice ſhould be ſo rank a venome as it is, vnleſſe it be vſed againſt poiſon.

The ſelfe ſame *Pythagoras* ſpeaketh yet of another herb which hee calleth Aproxis: the root whereof is of this nature, to catch fire a farre off; like for all the world to Naphtha, concerning which, I haue written ſomwhat already in my diſcourſe as touching the wonders of Nature: and he reporteth moreouer, That if a man or woman happen to be ſicke of any diſeaſe, at what time as this Aproxis is in the floure, although he or ſhe be throughly cured of it, yet ſhall they haue a grudging or minding thereof as often as it falleth to floure again yeare by yeare. And of this opinion he is beſides, That Frumenty corne, Hemlock, and Violets, are of the ſame nature and M property. I am not ignorant, that this booke of his wherein theſe ſtrange reports are recorded, ſome haue aſcribed vnto *Cleomporus*, a renowned Phyſitian: but the currant fame or ſpeech holdeth ſtil ſo conſtantly, time out of mind, that we muſt needs beleeue *Pythagoras* to be the author of the ſaid booke. True it is indeed, that the name of *Pythagoras* might giue authority and credit

20030

A dit vnto other mens books attributed to him, if haply any other had laboured and trauelled in compiling ſome worke, which himſelfe judged worthy of ſuch a man as he was: but that *Cleomporus* ſhould ſo do, who had ſet forth other books in his owne name, who would euer beleeue? No man doubteth verily, but that the book intituled * Chirocineta, was of *Democritus* his making: and yet therein be found more monſtrous things by a hundred fold, than thoſe which *Pythagoras* hath deliuered in that worke of his. And to ſay a truth, ſetting *Pythagoras* aſide, there was not a Philoſopher ſo much addicted to the ſchoole and profeſſion of theſe Magitians, as was *Democritus*.

* As one would ſay, ſuch a book as ſhould be continually occupied, & neuer laid out of hand.

In the firſt place he telleth vs of an herb called Aglaophotis, worthy to be admired & wondred of men, by reaſon of that moſt beautifull colour which it had: and for that it grew among the quarries of marble in Arabia, confining vpon the coaſts of the realme of Perſia, therefore it was alſo named Marmaritis. And he affirmeth, that the Sages or VViſe men of Perſia called Magi, vſed this herb when they were minded to coniure and raiſe vp ſpirits.

He writeth moreouer, That in a country of India inhabited by the Tardiſtiles, there is another herb named Achæmenis, growing without leafe, and in colour reſembling Amber: of the root of which herb there be certain Trochisks made: whereof they cauſe malefactors and ſuſpected perſons to drink ſome quantity with wine, in the day time, to the end they ſhould confeſſe the truth: for in the night following they ſhall be ſo haunted with ſpirits and tormented with fundry fanſies and horrible viſions, that they ſhal be driuen perforce to tel all, and acknowledge the fact for which they are troubled & brought in queſtion. The ſame writer calleth this plant
C * Hippophobas, becauſe Mares of all other creatures are moſt fearfull and waty of it.

* or *Hippophobas*.

Furthermore, he reporteth, That 30 Schœnes from the riuer Choaſpes in Perſia, there groweth an herb named Theombrotion: which for the manifold and ſundry colours that it hath, reſembleth the painted taile of a Peacocke, and it caſteth withall a moſt ſweet and odoriferous ſent. This herb (ſaith he) the Kings of Perſia vſe in their meats & drinks: and this opinion they haue of it, That it preſerueth their bodies from all infirmities and diſeaſes, yea, and keepeth their head ſo ſtaied and ſetled, that they ſhall neuer be troubled in mind and out of their right wits: in ſuch ſort, that for the powerfull maieſtie of this plant, it is alſo called Semnion.

He proceedeth moreouer to another, knowne by the name Adamantis, growing onely in Armenia and Cappadocia: which if it be brought neare vnto Lions, they will lie all along vpon
D their backs, and yawne with their mouths as wide as euer they can. The reaſon of the name is this, becauſe it cannot poſſibly be beaten into pouder.

He goeth on ſtill and beareth vs in hand, that in the realme Ariana, there is found the herbe Arianis, of the colour of fire. The inhabitants of that country vſe to gather it when the Sun is in the ſigne Leo: and they affirme, that if it do but touch any wood beſmeared and tubbed ouer with oile, it will ſet the ſame a burning on a light fire.

What ſhould I write of the plant Therionarca, which whenſoeuer it beginneth to come vp and riſe out of the ground, all the wilde beaſts will lie benummed and (as it were) dead: neither can they be raiſed or recouered again, vntill they be ſprinkled with the vrine of Hyæna.

The herb Æthiopis, by his report groweth in Meroe, for which cauſe it is called alſo Merois:
E In leafe it reſembleth Lectuce: and being drunk in mead or honied water, there is not ſuch a remedy againe for the dropſie.

Ouer and beſides, he ſpeaketh of the plant Ophiuſa, found in a country of the ſame Æthyopia, named Elephantine: of a leaden hue it is and hideous to ſee to: whoſoeuer drinke thereof, ſhal be ſo frighted with the terrors and menaces of ſerpents repreſented vnto their eies, that for very feare they ſhall lay violent hands on themſelues: and therefore church robbers are inforced to drink it. Howbeit, if a man take after it a draught of Date wine, he ſhall not be troubled with any ſuch fearfull viſions and illuſions.

Moreouer, there is found (ſaith *Democritus*) the herbe Thalaſſegle about the riuer Indus, and
F thereupon is knowne by another name Potamantis: which if men or women take in drink, tranſporteth their ſences ſo far out of the way, that they ſhall imagine they ſee ſtrange ſights.

As for Theangelis, which by his ſaying groweth vpon mount Libanon in Syria, and vpon Dicte, a mountain in Candy; alſo about Babylon and Suſis in Perſia; if the wiſe Phyloſophers (whom they term Magi) drinke of that herb, they ſhal incontinently haue the ſpirit of propheſie, and foretell things to come.

There

There is beſides in the region called Bactriana & about the riuer Boryſthenes, another ſtrange plant named Gelotophyllis, which (by his report) if one do drink with Myrrh and wine, it will cauſe many fantaſticall apparitions: and the party ſhal therupon fal into a fit of laughter without ceaſing and intermiſſion, and neuer giue ouer, vnleſſe it be with a draught of Date wine, wherein were tempered the kernels of Pine nuts together with pepper and honey.

Touching the herb of good fellowſhip Syſſitieteris, found in Perſis, it tooke that name becauſe it maketh them exceeding mery who are met together at a feaſt. They call the ſame herb likewiſe Protomedia, for that it is ſo highly eſteemed among kings and princes. And another name it hath beſides; to wit,* Acaſignete, becauſe it commeth vp alone & no other herbs neere vnto it: yea, and one more yet, namely, Dionyſonymphas, becauſe wine and it ſort ſo well together, and make as it were a good mariage.

* As one would ſay, without brother or ſiſter.

The ſame *Democritus* talketh alſo of Helianthe: an herb leaued like to the Myrtle, growing in the country Themiſcyra, and the mountains of Cilicia, coaſting along the ſea. And he giues out, that if it be boiled with Lions greaſe, and then together with Safron and Date wine reduced into an ointment, the foreſaid Magi and the Perſian kings therewith annoint themſelues, to ſeem thereby more pleaſant and amiable to the people: which is the reaſon, that the ſame herb is called Heliocallis.

Ouer and beſides, he maketh mention of Hermeſias (for ſo he termeth not an herb but a certain compoſition) ſingular for the getting of children, which ſhall proue faire, and of good nature beſides. Made it is of Pine nut kernels, ſtamped and incorporat with hony, Myrrh, Safron, and Date wine, with an addition afterwards of the hearbe Theombrotium and milke: and this confection he preſcribeth to be drunk by the man a little before the very act of generation; but by women vpon their conception, yea, and after their deliuery all the while they be nources and giue ſuck: and in ſo doing they may be aſſured, thoſe children of theirs, thus gotten, bred, and reared, ſhall be paſſing faire and well fauoured, of an excellent ſpirit and courage: and in one word, euery way good. Of all theſe herbes before ſpecified, he ſetteth down alſo the very names which the ſaid Magi call them by. Thus much for the Magicke herbes found in *Democritus* his booke.

Apollodorus, one of his diſciples and followers, comes in with his two herbs to the other before named. The one he calleth Æſchynomæne, becauſe it draweth in the leaues, if one come neare vnto it with the hand: the other Crocis, which if the venomous ſpiders Phalangia do but touch, they will die vpon it.

Cratevas writeth of an herb called Oenotheris, which being put in wine, if any ſauage beaſts be ſprinckled therewith, they will become tame, gentle and tractable.

A famous * Grammarian of late daies made mention of another herb Anacampſeros, of this vertue, That if a man touched a woman therewith, were ſhe departed from him in all the hatred that might be, ſhe ſhould come again and loue him entirely. The ſame benefit alſo ſhould the woman find therby, in winning the loue of a man. This may ſuffice for the preſent to haue written of theſe wonderfull Magick herbes, conſidering that I meane to diſcourſe more at large of them and their ſuperſtition, in a more conuenient place.

* *Apion* called alſo *Pleiſtonices.*

Chap. XVIII.

¶ *Of Eriphia, Lanaria, and Stratiotis, with the medicines which they yeeld.*

MAny writers haue made mention of Eriphia. This herb hath within the ſtraw of the ſtem a certain flie like a beetle, running vp and down, and by that meanes making a noiſe like vnto a yong kid, whereupon it took the foreſaid name. There is not a better thing in the world for the voice, than this herb, as folk ſay.

The herb Lanaria, giuen to ewes in a morning when they are faſting, cauſeth their vdders to ſtrout with milk. Lactoris likewiſe is a common herb and as well known, by reaſon that it is ſo full of milk, which cauſeth vomit, if one taſt thereof neuer ſo little. Some there be who ſay, that the herb which they cal * Militaris, is all one with this Lactoris: others would haue it to be very like vnto it; and that it ſhould haue that name, becauſe there is not a wound made with ſword or edged weapon, but it healeth it within fiue daies, in caſe it be applied thereto with oile.

* The ſoulders hearbe.

Semblably, the Greek writers make great reckoning of their * Stratiotes: but this hearbe groweth

* All one with *Militaris.*

20030

A groweth onely in Egypt, and namely in floten grounds where the riuer Nilus hath ouerflowed: and like it is vnto Sengreen or Houſleek, but that it hath bigger leaues. It is exceeding refrigeratiue; and a great healer of green wounds, being made into a liniment with vineger: moreouer it cureth S. *Anthonies* fire, and all apoſtumes which are broken and run matter: if it be taken in drinke with the male Frankincenſe, it is wonderfull to ſee how effectuall it is to repreſſe the flux of bloud from the reins.

Chap. XIX.

B ¶ *Of the herbes that grow vpon the head and chapter of Images and Statues. Of herbs found in riuers. Of the herb called Lingua. Of herbs growing through a ſiue, and vpon dung-hills. Of Rhodora and Impia, two herbs. Of Pecten Veneris. Of Nodia. Of Clauers, or Gooſe-graſſe, called otherwiſe Philanthropos. Of the little Bur named Canaria: of Tordile. Of the ordinarie Couch-graſſe, Stitchwort, or Dent-de-chien. Of the hearbe Dactylus, and Fenigrecke: with their medicinable vertues.*

IT is commonly ſaid, That the herbs or weeds growing vpon the head of any ſtatue or Image, preſently allay the head-ach (if they be gathered in the lappet or any part of ſome garment) ſo as the Patient weare them tied about the necke, by red linnen thread, or infolded within ſome red linnen clout. Any herb whatſoeuer gathered out of ſome riueret, brook, or great riuer, before the Sun-riſing, ſo as no man ſee the party during the time of the gathering, prouided alwaies that it be tied to the left arm of the ſick Patient, and he or ſhe not know what it is, driues
C away any tertian ague, if it be true which is commonly ſaid. There is an herbe growing about fountains, called Lingua, *i.* a Tongue: the root therof being burnt into aſhes, & incorporat with the greaſe of a ſwine (but you muſt look, ſay they, that the ſwine be black and barraine) cauſeth haire to come againe, in caſe the place which is bare & bald, be annointed therwith in the ſun. Caſt a ſiue or riddle forth into any beaten path or high way, the graſſe or weeds comming vp vnderneath, and growing through the ſame, if they be gathered and bound about the neck or any other part of women with childe, doe haſten their trauell and deliuery. Thoſe herbes which be found growing vpon muckhils, about country ferms, are paſſing good and effectual for the ſquinancy, if they be drunk with water. The graſſe or hearb neere vnto which a dog lifts vp his leg and piſſeth, if it be plucked out of the ground without touching knife or yron inſtrument, cu-
D reth any diſlocation or bone out of joint, moſt ſpeedily.

Touching the tree (in manner of an Opiet or Poplar) called Rumbotinus, I haue deſcribed it in my treatiſe of Hortyards and Tree-plots. Neare to one of theſe (and namely, when there is no vine coupled or maried to it) there groweth a certain herb, which in France they call Rhodora: it riſeth vp with a ſtem pointed and knotted in manner of a fig tree rod or wand; beareth leaues reſembling nettles, ſomwhat whitiſh in the mids, but the ſame in proceſſe of time become red all ouer; and a floure of ſiluer colour: this herb ſtamped and mixed with old hogs greaſe, makes a ſoueraigne liniment for all ſwellings, inflammations, and impoſtumes gathering to an head; prouided alwaies that no edge toole come neare to touch it, and that the party who is dreſſed
E or annointed therwith turn the head to the right hand, and ſpit thrice vpon the ground on that ſide. And the operation of this medicine will be the more effectual, if three ſundry men of three diuers nations, ſtand on the right hand when they annoint the Patient.

Concerning the herb Impia, which is of a hoary colour and white withall, it reſembleth in ſhew the Roſemary, riſing vp with a main ſtem, leafed and headed in manner of a Cole-ſtocke: from which principall body, there grow forth other ſmall branches, euery one bearing little tufts or heads riſing and mounting aboue the mother ſtocke (wherupon they called it in Latine Impia, for that the children ouer-topped their parents) yet there be others who haue thought it rather ſo called becauſe there is no beaſt wil touch or taſt it. This herb, if it be ground between two ſtones, waxeth as hot as fire, & yeeldeth a juice which is excellent for the ſquinancy, if the
F ſame be tempered with milke and wine. But this is ſtrange that is reported moreouer, namely, That whoſoeuer hath once taſted of this hearb, ſhall neuer be troubled with that diſeaſe; and therefore they vſe to giue it in waſh and ſwil, to ſwine: but look which of them refuſe to drinke of this medicine, ſhal die of the ſaid ſquinancy. Some are of opinion, That in birds neſts there is ſome of this hearbe commonly ſet and twiſted among other ſtickes, whereby it commeth to

paſſe that the yong birds neuer be choked, gobble they their meat as greedily as they will. G

As touching the herb called Veneris Pecten, which took that name of the reſemblance that the long cods thereof hath to combe or rake teeth: the root, if it be ſtamped with mallowes, and ſo reduced into a cataplaſme, draweth forth all ſpils, thornes, or whatſoeuer ſticketh within the fleſh. The herb * Exedum, is ſingular to cure the lethargy, and all drowſineſſe.

* It ſeemeth by name and effect, to be of ſome ſharpe and fretting quality.

As for Nodia, it is an herb well knowne in curriors ſhops. They call it alſo Mularis, & other names beſides they haue for it: but tearme it how you will, it healeth corroſiue vlcers: and I find that it is of ſingular operation againſt the poiſon of ſcorpions, if it be drunk in wine or oxycrat, (*i.*) vineger and water mingled together. There is a certaine rough and pricky herbe, which the Greeks call by a pretty name* Philanthropos, for that it ſticketh to folks cloaths as they paſſe by. A chaplet or guirland made of this herb, and ſet vpon the head, eaſeth the pain thereof. As H for the little Bur called Lappa Canaria, if it be ſtamped with Plantaine and Millefoile, and together with them concorporat in wine, it healeth all cancerous ſores, ſo it be applied vnto the place, and remoued once in three daies. The ſame herb digged forth of the ground without any ſpade or yron inſtrument, cureth ſwine, if it be put into the trough where they bee ſerued with draffe and ſwill, or giuen them in milk and wine. Some adde moreouer, that this charm muſt be ſaid in the digging, *Hæc eſt herba Argemon, quam Minerva reperit ſuibus remedium, qui de illa guſtauerint:* (*i.*) This is the herb Argemon, which *Minerva* inuented as a remedy for diſeaſed ſwine, as many as taſted thereof.

* Goose-graſſe or Cleauers.

As for Tordile, ſome haue ſaid that it is the ſeed of Seſeli, or Siler of Candy: others take it to be an herb by it ſelfe, which alſo they called Syreon: for mine own part, I find by my reading I nothing of it, but that it delighteth to grow vpon mountains; and that being burnt, it is good to be drunke for to prouoke womens monethly terms, and to expectorat the ſuperfluous fleame out of the breſt: for which purpoſes (they ſay) that the root is more effectuall in operation: alſo that the juice thereof taken in drink to the weight of three oboli, is ſingular for the reins: finally, that the root is one of the ingredients which go to the making of emollitiue plaſters or cataplaſmes.

The Quich-graſſe, otherwiſe named Dent-de-chien, or Dogs-graſſe, is the commoneſt herbe that groweth: it runneth & creepeth within the earth by many knots or ioints in the root, from which, as alſo from the branches and top-ſprigs trailing aboue-ground, it putteth forth new roots and ſpreadeth into many branches. In all other parts of the world, the leaues of this graſſe K grow ſlender and ſharp pointed toward the end: only vpon the mount Pernaſſus (wherupon it is called Gramen Pernaſſi) it brancheth thicker than in other places, and reſembleth in ſome ſort Ivie, bearing a white floure, and the ſame odoriferous. There is not a graſſe in the field whereon horſes take more delight to feed, than this, whether it be greene as it groweth, or dry and made into hay, eſpecially if it be giuen them ſomewhat ſprinckled with water. Moreouer, it is ſaid, that the inhabitants about the foreſaid mount Pernaſſus, do draw a juice out of this graſſe, vſed much to increaſe plenty of milk; for ſweet and pleaſant it is: but in other parts of the world, in ſtead therof, they vſe the decoction of the common graſſe, for to conglutinat wounds: [and yet the very herb it ſelfe in ſubſtance will do as much, if it be but ſtamped and ſo applied: and beſides, a good defenſatiue it is to keep any place that is cut or hurt, from inflammation.] To the L ſaid decoction, ſome put wine and hony: others adde a third part in proportion of Frankincenſe, Pepper, and Myrrhe: and then ſet all ouer the fire againe, and boile it a ſecond time in a pan of braſſe: which compoſition they vſe as a medicine for the tooth-ach and watering eies, occaſioned by the flux of humors thither. The root ſodden in wine, appeaſeth the wrings & torments of the guts; openeth the conduits of the vrine, and giueth it paſſage; beſides, it healeth the vlcers of the bladder; yea, it breaketh the ſtone. But the ſeed is more diureticall, and with greater force driueth downe vrine than the root. And yet it ſtoppeth a laske, and ſtaieth vomit. A peculiar vertue it hath againſt the ſting of dragons or ſerpents. Moreouer, ſome there be, who giue direction in the cure of the kings euil, and other flat impoſtumes called Pani, to take nine knots or ioints of a root of this graſſe: and if they cannot find one root with ſo many ioints, to take M two or three roots, vntill they haue the foreſaid number: which done, to enwrap or fold the ſame in vnwaſhed or greaſie wooll which is black [with this charge by the way, that the party who gathered the ſaid roots be faſting] and then to goe vnto the houſe of the patient that is to be cured, waiting a time when hee is from home: and be ready at his returne to receiue him with

theſe

20030

A theſe words three times pronounced, *Iejunus ieiuno medicamentum do*, [*i.* I being yet faſting, giue thee a medicine alſo whiles thou art faſting:] and with that, to bind the foreſaid knots & roots vnto the parts affected, and ſo continue this courſe for three daies together. Furthermore, that kind of graſſe which hath ſeuen ioints in the root, neither more nor leſſe, is ſingular for the head ach, and worketh great effects if the Patient carrieth it tied faſt about him. Some Phyſitians do preſcribe for the intollerable pain of the bladder, to take the decoction of this graſſe boyled in wine vnto the conſumption of one halfe, and giue it to drinke vnto the Patient, preſently vpon the comming out of the baine or hot-houſe.

Touching the graſſe, which by reaſon of the pricks that it beares is named Aculeatum, there be three ſorts of it: the firſt is that which ordinarily hath fiue ſuch prickes in the head or top thereof, and thereupon they call it Penta Dactylon, *i.* the fiue finger graſſe: theſe prickes when
B they be wound together, they vſe to put vp into the noſthrils, and draw them downe again, for to make the noſe bleed. The ſecond is like to* Sengreen or Houſleek: ſingular good it is for the whitflaws, and excreſcences or riſings vp of the fleſh about the naile roots, if it be incorporat into a liniment with hogs greaſe: and this graſſe they call Dactylus, becauſe it is a medicine for the fingers. *The third kind named likewiſe Dactylos, but ſmaller than the other, groweth vpon old decaied wals or tyle houſes: this is of a cauſtick & burning nature, good to repreſſe the canker in running and corroſiue vlcers. Generally, a chaplet made of the herbe Gramen or Dogs-graſſe, and worn vpon the head, ſtancheth bleeding at the noſe. The Gramen that groweth along the high waies in the country about Babylon, is ſaid to kill camels that graſe vpon it.

Fenigreeke commeth not behind the other herbs before ſpecified, in credit and account for
C the vertues which it hath: the Greeks call it Telus and Carphos: ſome name it Buceras and Ægoceras, for that the * ſeed reſembleth little hornes: we in Latine tearme it Silicia or Siliqua. The manner of ſowing it, I haue declared in due place ſufficiently. The vertues thereof, is to dry, mollifie, and reſolue: the juice drawne out of it after the decoction, is right ſoueraigne for many infirmities and diſeaſes incident to women, and namely in the naturall parts, whether the matrice haue a ſchirre in it and be hard or ſwolne, or whether the necke thereof be drawne too ſtreight and narrow: for which purpoſes, it is to be vſed by way of fomentation, inceſſion, or bath; alſo by infuſion or injection with the metrenchyte. Very proper it is to extenuat the ſcurf or ſcales like dandruffe, appearing in the viſage: being ſodden and applied together with ſal-nitre, it helpeth the diſeaſe of the ſpleen. The like effect it hath with vineger: and being boyled
D therin, it is good for the liuer: for ſuch women as haue painful trauel in child-birth, & be hardly deliuered. *Diocles* appointed Fenigreek ſeed to the quantity of one acetable, to be giuen in nine cyaths of wine cuit for three draughts: with this direction, that the woman firſt ſhould take one third part of this drink, and then go to a hot bath, and whiles ſhe were ſweating therein, to drink one halfe of that which was left: and preſently after ſhe is out of the bain, ſup off the reſt. And he ſaith there is not the like medicine to be found in this caſe, when all others will take no effect. The floure or meale of Fenigreek ſeed boiled in mead or honied water, together with barly or Lineſeed is ſingular for the paine of the matrice, either applied to the ſhare in maner of a cataplaſme, or put vp into the naturall parts as a peſſary, according as the abouenamed *Diocles*
E ſaith: who was wont likewiſe to cure the lepry or S. *Magnus* euil; to cleanſe & mundifie the skin, of freckles & pimples, with a liniment made with the foreſaid floure incorporat with the like quantity of brimſtone: with this charge, to prepare the skin by rubbing it with ſalnitre, before the ſaid ointment were vſed, and then to annoint it oftentimes in a day. *Theodorus* vſed to mixe with Fenigreek a fourth part of the ſeed of garden creſſes wel cleanſed, & to temper them in the ſtrongeſt vineger that he could come by, which he took to be an excellent medicine for the leproſie. *Damion* ordained to make a drink with half an acetable of Fenigreek ſeed put into 9 cyaths of cuit or ſheere water, and ſo to giue it ſo prouoking of womens fleurs: & no man doubts but the decoction of Fenigreeke is moſt wholſome for the matrice and the exulceration of the guts: like as the ſeed it ſelf is excellent for the ioints & precordial parts about the heart. But in
F caſe it be boiled with Mallows, it is good for the matrice & guts, ſo there be put to the ſaid decoction ſome honied wine, & then giuen in drink: for euen the very vapor or fume of the ſaid decoction doth much good to thoſe parts. Alſo the decoction of Fenigreeke ſeed rectifieth the ſtinking rank ſmel of the arm-pits, if they be waſhed therewith. The floure made of Fenigreeke ſeed, incorporat with nitre & wine, quickly cleanſeth the head of ſcurfe, ſcales, & dandruffe. But

* Some take this to be *Parosychia, Dioſc.* or rather a kinde of Aizoon Monſpeliacum, or Prickmacam.

* This is thought to be great Stonecrop, wild Purcellane, or Wall pepper.

* Or rather the cods wherein the ſeed is encloſed.

boiled in hydromell (*i.* honyed water) and brought into a liniment with hogs greaſe, it cureth the ſwelling and inflammation of the members ſeruing to generation: likewiſe it is ſingular for the broad and flat apoſtems called Pani, the ſwelling kernels and inflammations behinde the ears, the gout as well of the feet as of the hands and other ioints; alſo the putrifaction of the fleſh ready to depart from the bone: and being incorporat in vineger, it helpeth diſlocations: being boiled in vineger and hony only, it ſerueth as a good linimenr for the ſpleen: and tempered with wine, it clenſeth or mundifieth cancerous ſores; but put thereto hony, it healeth them throughly in a ſhort time. The ſaid floure of Fenigreeke ſeed taken in a broth or ſupping, is an approued remedy for an vlcer within the breſt, and any inueterat cough; but it asketh long ſeething, euen vntill it haue loſt the bitterneſſe: and afterwards hony is put thereto, and then it is a ſingular grewell for the infirmities beforeſaid. Thus you ſee what may be ſaid of thoſe hearbes which are in compariſon but of a mean account: it remaineth now to diſcourſe of thoſe which are of more account and eſtimation than the reſt.

THE TWENTY FIFTH BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

Chap. I.

¶ *The nature and properties of Hearbs growing wild and of their owne accord.*

When I conſider the excellency of ſuch hearbes, whereof now I am to treat, and which the earth ſeemeth to haue brought forth onely for the vſe of Phyſick, I cannot chuſe but grow withall into a wonderfull admiration of the great induſtry and careful diligence of our Antients before-time, who haue made experiments of all things, and left nothing vntried: neither reſerued they afterwards this hidden knowledge to themſelues, nor concealed ought, but were willing to communicate the ſame vnto poſteritie for their good and benefit: but we contrariwiſe in theſe daies, are deſirous to keep ſecret and to ſuppreſſe the labors of other men, yea and to defraud the world of thoſe commodities which haue been purchaſed by the ſweat of other mens browes: for verily we ſee, it is an ordinary courſe, that ſuch as haue attained to ſome knowledge, envie that little skil vnto their neighbours: and to keepe all forſooth to themſelues and teach none their cunning, they thinke the onely way to winne a great name and opinion of ſome deepe and profound learning. And ſo far be we off from deuiſing new inuentions, and imparting the ſame to the generall profit of mankinde, that for this long time men of great wit and high conceit haue ſtudied and practiſed to compaſſe this one point, That the good deeds of their Anceſtours might with themſelues die and be buried for euer. But certes, wee ſee and know, that the ſeueral inuentions of ſome one thing or other, haue cauſed diuers men in old time to be canonized as gods: in ſuch ſort, as their memoriall hath beene eternized by the names euen of hearbes which they found out: ſo thankefull was the age inſuing, as to recognize and acknowledge a benefit from them receiued, and by this meanes (in ſome meaſure) to make recompence. This care and induſtrie of theirs, if it had beene imployed in Domeſticall Plants neere home, which either for pleaſure and delight, or elſe for the Kitchin and Table, are ſet and ſowed, could not haue beene ſo rare and wonderfull: but they

20030

they ſpared not to climbe vp the top of high mountaines, and to rocks vnacceſſible; to trauell through blind and vnpeopled deſarts, to ſearch euery veine and corner of the earth, & all to find and know the vertues of herbs: of what operation the root was, for what diſeaſes the leaues were to be vſed; yea, and to make wholſom medicines for mans health of thoſe ſimples, which the very four-footed beaſts of the field neuer fed vpon, nor once touched.

Chap. II.

¶ *The Latine Authors who haue written of herbs, and their natures. At what time the knowledge of Simples began to be practiſed and profeſſed in Rome. The firſt Greeke writers who trauelled in this Argument. The inuention of herbs. The antient Phyſicke, and the manner of curing diſeaſes in old time. What is the cauſe that Simples are not now ſo much vſed for remedies of diſeaſes as they haue bin. Finally, of the ſweet Brier or Eglantine, and the herb Dragons, with their medicinable vertues.*

WE Romans haue bin more ſlack and negligent in this behalfe than was beſeeming vs, conſidering how otherwiſe, there was not a nation in the world more apprehenſiue of all vertues and things profitable to this life, than ours. For to ſay a truth, *M. Cato* (that famous clerke and great profeſſor, ſo well ſeen in all good Arts and Sciences) was the firſt (and for a long time the only author) who wrate of Simples: and howſoeuer he handled that argument but briefly and ſummarily, yet he omitted not the leech-craft belonging alſo to kine and oxen. Long after him, *C. Valgius* (a noble gentleman of Rome, & a man of approued literature) compiled a treatiſe of Simples which he left vnperfect; howbeit he dedicated the book to *Auguſtus Cæſar* the Emperor, as may appeare by a preface by him begun, wherein (after a religious and ceremonious manner of ſupplication) he ſeemeth to beſeech the ſaid prince, That it might pleaſe his Majeſty eſpecially, to cure all the maladies of mankind. And before his time, the only man among our Latines (as far as euer I could find) who wrot of Simples, was *Pompeius Lenæus*, the vaſſall or freed man of *Pompey* the Great. And this was the firſt time that the knowledge of this kind of learning was ſet on foot and profeſſed at Rome. For *Mithridates* (the moſt mightie and puiſſant king in that age, whoſe fortune notwithſtanding was to be vanquiſhed and ſubdued by *Pompey*) was well knowne vnto the world not only by the fame that went of him, but alſo by good proofe and euident arguments, to haue bin of all other before his time, a prince moſt addicted to the publick benefit of all mankind: for the only man he was who deuiſed to drinke poiſon euery day (hauing taken his preſeruatiues before) to the end that by the ordinary vſe and continuall cuſtome thereof, it might be familiar vnto his nature, and harmleſſe. The firſt he was alſo who deuiſed ſundry kinds of antidotes or counterpoiſons, wherof * one retaineth his name to this day: he it was alſo and none but he, as men think, who firſt mingled in the ſaid antidotes and preſeruatiues, the bloud of Ducks bred in his own realme of Pontus, for that they fed and liued there, of poiſons and venomous hearbs. Vnto him, that famous and renowned profeſſor in Phyſicke *Aſclepiades*, dedicated his books now extant: for this Phyſitian being ſolicited to repaire vnto him from Rome, ſent the rules of Phyſick digeſted into order, and ſet downe in writing, inſtead of comming himſelfe. And *Mithridates* it was (as it is for certaine knowne) who alone of all men that euer were, could ſpeake two and twentie languages perfectly; ſo as for the ſpace of ſix and fiftie yeares (for ſo long he reigned) of all thoſe Nations which were vnder his dominion, there neuer came one man to his court, but he communed and parled with him in his own tongue without any truchman or interpreter for the matter. This noble Prince (amongſt many other ſingular gifts that he had, teſtifying his magnanimitie and incomparable wit) addicted himſelfe particularly to the earneſt ſtudie of Phyſicke: and becauſe he would be exquiſite and ſingular therein, he had intelligencers from all parts of his dominions) and thoſe took vp no ſmall part of the whole world) who vpon their knowledge, exhibited vnto him the particular natures and properties of euery ſimple: by which means, he had a cabinet full of an infinit number of receits and ſecrets ſet down together with their operations & effects, which he kept in his ſaid cloſet, and left behind him with other rich treaſure of his. But *Pompey* the Great, hauing vnder his hands the whole ſpoile of this mighty Prince, & meeting in that ſaccage with thoſe notes aboueſaid, gaue commandement vnto his vaſſall or infranchiſed ſeruant the aboue-named *Lenæus* (an excellent linguiſt & moſt learned grammarian) to tranſlate the ſame into the

* i. Mithridaticum.

Latine tongue: for which act of *Pompey*, the whole world was no leſſe beholden vnto him, than G
the common-wealth of Rome for the foreſaid victorie. Ouer & beſides theſe, what Greeke au-
thors haue trauelled in Phyſicke, I haue declared heretofore in conuenient place. And among
the reſt, *Euax* a King of the Arabians, wrote a booke as touching the vertues and operations of
Simples, which he ſent vnto the Emperour *Nero*. *Crateuas* likewiſe, *Dionyſius* alſo, and *Metro-*
dorus, wrote of the ſame Argument after a moſt pleaſant and plauſible manner (I muſt needs
ſay,) yet ſo, as a man could picke nothing almoſt out of all their writings, but an infinit diffi-
cultie of the thing; for they painted euery herb in their colors, and vnder their pourtraicts they
couched and ſubſcribed their ſeueral natures & effects. But what certainty could there be ther-
in? pictures, you know, are deceitfull; alſo, in repreſenting ſuch a number of colours, and eſpe-
cially expreſſing the liuely hew of Hearbs according to their nature as they grow, no maruell if
they that limned and drew them out, did fail and de-enerat from the firſt pattern and originall. H
Beſides, they came far ſhort of the mark, ſetting out hearbs as they did at one only ſeaſon (to
wit, either in their floure, or in ſeed time) for they change and alter their form and ſhape euerie
quarter of the yeare. Hereof it came, that all the reſt labored to deſcribe their forms & colours,
by words only. Some without any deſcription at all of their figure or colour, contented them-
ſelues (for the moſt part) with ſetting downe their bare names, and thought it ſufficient to de-
monſtrat and ſhew their power and vertue afterwards, to whoſoeuer were deſirous to ſeeke after
the ſame: and verily the knowledge thereof is no hard matter to attain vnto. For mine own part,
it hath bin my good hap to ſee growing in the plant, all theſe medicinable herbs (excepting ve-
ry few) by the meanes of *Antonius Caſtor* (a right learned and moſt renowned Phyſitian in our
daies) who had a pretty garden of his own well ſtored with ſimples of ſundry ſorts, which hee I
maintained and cheriſhed for his owne pleaſure and his friends, who vſed to come and ſee his
plot, as indeed it was worthy the ſight: this Phyſitian was then aboue a hundred yeres old, & in
all his life neuer found what ſickneſſe meant; neither for all this age of his, was his wit decaied,
or memory any whit impaired, but continued as freſh ſtill as if he had bin a yong man. But to
proceed forward with our diſcourſe: Certes we ſhall not find a thing againe which our Ance-
ſtors ſo much admired and were more rauiſhed withall, than the knowledge of ſimples. True it
is, I confeſſe, that the inuention of the Ephemerides (to fore-know thereby not onely the day
& night, with the eclypſes of Sun & Moon, but alſo the very hours) is antient: howbeit, the moſt
part of the common people haue bin and are of this opinion (receiued by tradition) from their
forefathers) That all the ſame is done by inchantments, & that by the means of ſome ſorceries K
and herbs together, both Sun and Moone may be charmed, and inforced both to loſe and reco-
uer their light: to doe which feat, women are thought to be more skilfull and meet than men.
And to ſay a truth, what a number of fabulous miracles are reported to haue beene wrought by
Medea queen of Colchis, and other women; and eſpecially by *Circe* our famous witch here in I-
taly, who for her ſingular skil that way, was canonized a goddeſſe. And from hence it came (I
ſuppoſe) that *Æſchylus* a moſt antient Poet, made report of * Italy to be furniſhed with herbes
of mighty operation: and many others haue ſpoken much of the mountaine Circeios bearing
her name, wherein the ſaid Lady ſomtime dweit & kept her reſidence. And for a norable proof
of her ſingular skil in that kind, the ſame knowledge in ſome meaſure continueth vnto this day L
in the Marſians (a nation deſcended from a ſon of hers) who are well knowne to haue a naturall
power by themſelues to tame and conquer all ſerpents, and not to be ſubiect to any danger from
them. As for *Homer* verily (the father and prince of all learning & learned men, and the beſt au-
thor that we haue of antiquities) howſoeuer otherwiſe he was addicted to extoll and magnifie
dame *Circe*, yet he attributeth vnto Egypt the glory and name for good herbs; yea though in
his time there was not that baſe Egypt watered as now it is, with Nilus: for afterwards it grew
by the mud left there by the inundation of the ſaid riuer. Truly this Poet maketh mention of
many ſingular herbs in Ægypt, which the * Kings wife of that country gaue to that lady of his,
Helena, of whom he writeth ſo much; and namely, the noble Nepenthes, which had this ſingular
vertue and operation, To work obliuion of melancholy & heauineſſe, yea and to procure eaſe- M
ment and remiſſion of all ſorrowes: which, I ſay, the queene beſtowed vpon *Helena* to this end,
That ſhe ſhould communicate and impart it to the whole world for to be drunke in thoſe caſes
aboueſaid. But the firſt man knowne by all records to haue written any thing exactly and cu-
rioufly of ſimples, was *Orpheus*. As for *Muſæus*, and *Heſiodus* after him, in what admiration they
held

* Τυρίλλωνα ζώειν φαρμακευτικῶς ἐν Ἰταλίᾳ.

* Polydamna, Ἑλένης παράκοιτις, the wife of King Thon. Homer. Odyſſ. & Diodorus Siculus Antiquit. lib. 2.

20030

held,and how highly they eſteemed the herb Polion aboue the reſt,I haue ſhewed already. Certes,*Orpheus* and *Heſiodus* both haue highly commended vnto vs perfumes and ſuffumigations. And *Homer* likewiſe writeth expreſſely of certain herbs by name,of ſingular vertue,which I wil put downe in their due places. After him came *Pythagoras*, a famous Philoſopher, who was the firſt that compoſed a booke,and made a treatiſe purpoſely of ſundry herbs,with their diuers effects;aſcribing wholly the inuention and originall of them to the immortall gods,and namely, to *Apollo* and *Æſculapius*. *Democritus* compiled a volume of the ſame argument. But both hee and *Pythagoras* had trauelled before al ouer Perſis,Arabia,Æthyopia,and Ægypt,and there conferred with the Sages and learned Phyloſophers of that country,called Magi. In ſumme, ſo far were men in old time rauiſhed with the admiration of herbs and their vertues,that they baſhed not to auouch euen incredible things of them. *Xanthus* an antient Chronicler,writeth in the firſt booke of his hiſtories,of a Dragon,which finding one of her little ſerpents killed, raiſed it to life again by a certain herbe, which he nameth Balis : and with the ſaid herb,a man alſo named *Thylo*,whom the Dragon had ſlaine,was reuiued and reſtored to health againe. Alſo King *Iuba* doth report,That there was a man in Arabia,who being once dead, became aliue againe by the vertue of a certain herbe. *Democritus* ſaid,and *Theophraſtus* gaue credit to his words,That there is an herb,with which a kind of foule(wherof I haue made mention before) is able to make the wedge or ſtopple to flie out of the hole of her neaſt, into which the ſheepheards had driuen it faſt,in caſe ſhe bring the ſame herbe,and but once touch the foreſaid wedge therewith. Theſe be ſtrange reports and incredible, howbeit they draw men into a wonderfull opinion of the thing,and fil their heads with a deep conceit,forcing them to confeſſe,That there is ſome great matter in hearbs, and much true indeed which is reported ſo wonderfully of them. And from hence it is,that moſt are of this opinion and hold certainly, That there is nothing impoſſible, but may be performed by the power of herbs,if a man could reach vnto their vertues : mary few there be who haue attained to that felicity:and the operation of moſt ſimples is vnknowne. In the number of theſe,*Herophilus* the renowned Phyſitian may be reckoned:who was of this mind and gaue it out in his ordinary ſpeech, That ſome hearbs there were, which were effectuall and did much good,if a man or woman chanced but to tread vpon them vnder their feet. And verily,this hath bin knowne and found true by experience, that ſome diſeaſes would be more exaſperat and angry,yea,and wounds grow to fretting and inflammation, if folk went but ouer certain herbs in the way as they paſſed on foot. Lo what the Phyſick in old time was ! and how the ſame lay wholly couched in the Greek language,and not elſwhere to be found. But what might be the reaſon,that there were no more ſimples knowne? Surely it proceeds from this, That for the moſt part they be ruſticall peaſants,and altogether vnlettered,who haue the experience and triall of herbs,as thoſe who alone liue and conuerſe among them where they grow. Another thing there is,Men are careleſſe and negligent, and loue not to take any paines in ſeeking for them. Againe,euery place ſwarmeth ſo with Leeches and Phyſitians, and men are ſo ready to run vnto them for to receiue ſome compound medicine at their hands, that little or no regard there is made of herbs and good Simples. Furthermore,many of them which haue bin found out and knowne,haue no name at all : as for example,that herb which I ſpake of in my Treatiſe concerning the cure and remedies of corne growing vpon the lands : and which we all know, if it be enterred or buried in the foure corners of the field,will skar away all the foules of the aire, that they ſhal not ſettle vpon the corne,nor once come into the ground. But the moſt diſhoneſt and ſhamefull cauſe why ſo few ſimples in compariſon be knowne, is the naughtie nature and peeuiſh diſpoſition of thoſe perſons who will not teach others their skill, as if themſelues ſhould loſe for euer that which they imparted vnto their neighbor. Ouer and beſides, there is no certain meanes or way to direct vs to the inuention and knowledge of hearbes and their vertues : for if we looke vnto theſe hearbs which are found already,we are for ſome of them beholden to meere chance & fortune : and for others(to ſay a truth)to the immediat reuelation from God For proofe hereof,mark but this one inſtance which I will relate to you. For many a yeare vntill now of late daies,the biting of a mad dog was counted incureable : and looke who were ſo bitten,they fell into a certain * dread & feare of water : neither could they abide to drink,or to heare talk therof,and then were they thought to be in a deſperat caſe:it fortuned of late,that a ſouldier,one of the gard about the * Pretorium was bitten with a mad dog,and his mother ſaw a viſion in her ſleep,giuing(as it were)direction vnto her for to ſend the root vnto her ſonne for

* Ὑδροφοβία.

* or the prince.

to

to drink, of an Eglantine or wild roſe (called Cymorrhodon) which the day before ſhe had eſpied growing in an hortyard, where ſhe took pleaſure to behold it. This occurrent fel out in * Lacetania, the neareſt part vnto vs of Spain. Now, as God would, when the ſouldier beforeſaid vpon his hurt receiued by the dog, was ready to fall into that ſymptome of Hydrophobie, and began to feare water; there came a letter from his mother, aduertiſing him to obey the wil of God and to do according to that which was reuealed vnto her by the viſion. Whereupon he dranke the root of the ſaid ſweet brier or Eglantine, and not only recouered himſelfe beyond all mens expectation: but alſo afterwards as many as in that caſe tooke the like receit, found the ſame remedy. Before this time, the writers in Phyſick knew of no medicinable vertue in the Eglantine, but only of the ſponge or little ball, growing amid the pricky branches therof, which being burnt and reduced into aſhes, and incorporate with honey into a liniment, maketh haire to come againe where it was ſhed by any infirmity. But ſeeing I am fallen into the mention of Spain, it commeth to my mind, what I my ſelfe knew and ſaw in the ſame prouince, within the lands and domaines belonging to an hoſt of mine; namely, a certaine plant or herb there lately found called * Dracunculus, which carried a main ſtem or ſtalk an inch or thumb thick, beſet with ſpots of ſundry colors, reſembling thoſe of vipers and ſerpents: and I was told, that it was a ſingular remedy againſt the ſting or biting of any ſerpents. This Dracunculus differeth from another herb of that name, wherof I ſpake in the book going next before, for this hath a diſtinct form from that; and beſides, another ſtrange and wonderful property, namely, to ſhew two foot or thereabout aboue ground in the Spring time, when ſerpents firſt doe caſt their ſloughes or skins: & the ſame is no more ſeen, at the very time that ſerpents alſo retire into their holes and take vp their Winter harbor within the ground. Let this plant be gone once into the earth and hidden, you ſhal not ſee a Snake, Adder, or any other ſerpent ſtirring abroad. Wherby we may ſee what a kind and tender mother Nature is vnto vs (if there were nothing els to teſtifie her loue) in giuing vs warning beforehand of danger: and pointing vnto vs the very time when wee are to be afraid and to take heed of ſerpents.

* or Luſitania.

* Our common Dragons.

CHAP. III.

¶ *Of a certain venomous fount aine in Germany: of the hearb Britannica. What diſeaſes they be that put men to the greateſt paine.*

K

SO vnfortunat is our condition, and ſo much expoſed are we to manifold calamities, that the earth is not peſtered with wicked beaſts only for to doe vs harme: but alſo there be otherwhiles venomous waters and peſtilent tracts to work vs more wo and miſery. In that voiage or expedition which prince *Cæſar Germanicus* made into Germany, after he had paſſed ouer the riuer Rhene, and had giuen order to aduance forward with his army, he incamped vpon the ſea-coaſts along Friſeland, where there was to be found but one ſpring of freſh water; and the ſame ſo dangerous, that whoſoeuer drunk of that water, within two yeres loſt all their teeth, and were beſides ſo feeble and looſe iointed in their knees, that vnneth they were able to ſtand. Theſe diſeaſes the Phyſitians termed * Stomacace and Sceletyrbe: as one would ſay, the malady of the mouth, and palſie of the legs. Yet they found a remedy for theſe infirmities, and that was a certain herb called * Britannica, which is very medicinable, not only for the accidents of the ſinews and mouth, but alſo for the ſquinancy and ſtinging of ſerpents. It hath leaues growing ſomwhat long, and thoſe inclining to a browniſh or dark greene colour, and the root is blacke; out of which, as alſo from the leaues, there is a juice drawne or preſſed. The floures by a peculiar name be called Vibones: which being gathered before any thunder be heard, and ſo eaten, do aſſure and ſecure the parties altogether from that infirmity. The Friſians, neere vnto whom we lay incamped, ſhewed our men this herb. But I muſe much and wonder what ſhould be the reaſon of that name, vnleſſe the Friſians bordering vpon the narrow race of the ocean, which lieth only between them & England (called in thoſe daies Britanica) ſhould therupon for the neighborhead & propinquity of that Iſland, giue it the name Britannica. For certain it is, that it took not that name becauſe there grew ſuch plenty therof in that country of England, that it ſhould be tranſported ouer from thence to our camp; for as yet that Iſland was not wholly ſubiect to vs and reduced vnder the Roman ſeignorie. For an ordinary thing it was in old time practiſed by thoſe that found out any herbs, to affect the adoption (as it were) of the ſame, & to call them by

L

M

* Some thinke this diſeaſe to bee the Schorbuck or Scorbute, which raigneth yet at this day.

* Which is taken to be our Cochlearia, i. Spoonwort, commonly called Scorbut-graſſe or Scoruy-graſſe.

20030

A by their own names, wherein verily men took no ſmall contentment: according as I purpoſe to ſhew by the example of certain kings and princes, whoſe names liue and continue yet in their herbs: ſo honorable a thing it was thought in thoſe daies to find and it were but an hearbe that might do good vnto man. Whereas in this age wherein we now liue, I doubt not but there bee ſome who will mock vs for the pains taken in that behalfe, and think vs very ſimple for writing thus as we do of Simples; ſo baſe and contemptible in the eies of our fine fooles and delicate perſons, are euen the beſt things that ſerue for the benefit & common vtility of mankind: howbeit, for all that, good reaſon it is and meet that the authors and inuentors of them, as many as can be found, ſhould be named and praiſed with the beſt; yea, and that the operations & effects of ſuch herbs ſhould be digeſted and reduced into ſome method, according as they be appro-
B priat to euery kind of diſeaſe. In the meditation whereof, I cannot chuſe nor contain my ſelfe, but deplore and pity the poore eſtate and miſerable caſe of man: who ouer and beſides the manifold accidents and caſualties which may befall vnto him, is otherwiſe ſubject to many thouſands of maladies, which we haue much ado to deuiſe names for, euery houre of the day happening as they do, and whereof no man can account himſelfe free, but euery one is for his part to feare them. Of theſe diſeaſes ſo infinit as they be in number, to determine preciſely and diſtinctly which be moſt grieuous, might ſeem meere folly, conſidering that euery one who is ſicke for the preſent, imagineth his owne ſicknes to be worſt & fulleſt of anguiſh. And yet our forefathers haue giuen their judgement in this caſe, and by experience haue found, That the moſt extreme pain & torment that a man can indure by any diſeaſe, is the Strangury or piſſing dropC meale, occaſioned by the ſtone or grauell in the bladder. The next is the griefe and anguiſh of the ſtomak: and the third, Head-ach: for ſetting theſe three maladies aſide, lightly there are no pains that can kill a man or woman ſo ſoon. And here by the way, I cannot for mine owne part but maruell much at the Greeks, who haue publiſhed in their writings venomous and peſtilent herbs, as well as thoſe that be good and wholſome. And yet there is an appearance and ſhew of reaſon, why ſome poiſons ſhould be knowne: for otherwhiles it falleth out that men liue in ſuch extremity, as better it were to die, than ſo to lie in anguiſh and torment; inſomuch, as death is the beſt port and harbor of refuge that they haue. Certes, *Marcus Varro* reporteth of one *Seruius Clodius* a gentleman or knight of Rome who for the extreame pain of the gout, was forced to annoint his legs and feet all ouer with a narcotick or cold poiſon, whereby hee ſo mortified the
D ſpirits of the muskles and ſinews, that he became paralyticke in that part: and euer after vnto his dying day, was rid as well of all ſence, as of the paine of the gout. But ſay, that in theſe caſes it might be tollerable to ſet down in their books ſome poiſons: what reaſon, nay what leaue had thoſe Greeks to ſhew the means how the brains and vnderſtanding of men ſhould be intoxicat and troubled? what colour and pretence had they to ſet downe medicines and receits to cauſe women to ſlip the vntimely fruit of their womb, and a thouſand ſuch like caſts & deuiſes that may be practiſed by herbs of their penning? for mine owne part, I am not for them that would ſend the conception out of the body vnnaturally before the due time: they ſhall learne no ſuch receits of me, neither will I teach any how to temper & ſpice an amatorious cup, to draw either man or woman into loue, it is no part of my profeſſion. For wel I remember, that *Lucullus* a moſt
E braue Generall, and a captain of great execution, loſt his life by ſuch a loue potion. Much leſſe then ſhall ye haue me to write of Magick, witch-craft, charmes, inchantments and ſorceries, vnleſſe it be to giue warning that folk ſhould not meddle with them, or to diſproue thoſe courſes for their vanities, and principally to giue an Item, how little truſt and aſſurance there is to be had in ſuch trumpery. It ſufficeth me and contenteth my mind, yea and I think that I haue done wel for mankind, in recording thoſe herbs which be good and wholſome, found out by men of wit and learning for the benefit of poſterity.

Chap. IIII.

¶ *Of Moly, and Dodecatheos: of Pœony, otherwiſe called Pentorobus or Glycyſide. Of Panaces,*
F *Aſclepium, Heraclium, and Chironium. Of Panaces Centarium or Pharnaceum. Of Heraclium, Siderium. Of Henbane called Hyoſcyamus, Apollinaris, or Altercangenus.*

Homer is of opinion, That the principall and ſoueraigne hearb of all others, is Moly; ſo called (as he thinketh) by the gods themſelues The inuention or finding of this hearbe hee

* aſcri-

Odyſſio. * aſcribeth vnto *Mercury*: and ſheweth that it is ſingular againſt the mightieſt witchcraft & in- G
chantments that be. Some ſay, that this herb Moly, euen according to *Homers* deſcription, with a round and black bulbous root to the bigneſſe of an onion, and with a leafe or blade like that of Squilla, groweth at this day about the riuer or lake Peneus and vpon the mountain Cylleum in Arcadia: alſo that it is hard to be digged out of the ground. The Grecian Simpliſts deſcribe this Moly with a yellow floure, wheras *Homer* hath written, that it is white. I met with one phyſitian, a skilful Herbariſt, who affirmed vnto me, That this Moly grew in Italy alſo: and in verie truth he brought and ſhewed me a plant which came out of Campaine, about the digging vp whereof among hard and ſtony rocks, he had bin certain daies: but get he could not the entire root whole and ſound, but was forced to break it off, and yet the root which he ſhewed mee was thirtie foot long.

Next vnto Moly in account and reputation, is that plant which they call Dodecatheos, for H
that it doth repreſent & comprehend the maieſty of all the chiefe gods. They ſay if it be drunk in water, it is a ſoueraign medicine for al maladies. Seuen leaues it hath, reſembling very much thoſe of Lectuce, and the ſame ſpring from a yellow root.

*Pæon, who was equall in time to *Hercules*, and liued lõg before the Troian warre.

As touching Pæony, it is one of the firſt herbs that were euer known and brought to light, as may appeare by the author or inuentor thereof, whoſe name it beareth ſtill. Some call it Pentorobos: others Glycyſide. [where by the way I am to aduertiſe the Reader, of the difficulty in the knowledge of herbs by their names, conſidering that the ſame herbe hath in ſundry places diuers appellations.] But to proceed forward with our Pæony: it groweth among bleake and ſhady mountains, riſing vp with a ſtem between the leaues, * 4 fingers high, and bearing in the I
top 4 or 5 heads, faſhioned ſomwhat like to Filberds, within which there is plenty of ſeed both red and black. This herb is good againſt the fantaſticall illuſions of the * Fauni which appeare in ſleep. It is ſaid, that this herb muſt be gathered in the night ſeaſon: for if the Rainbird, woodpeck or Hickway, called Picus Martius, ſhould chance to ſpie it gathered, he would flie in the face, and be ready to peck out the eies of him or her that had it.

**Sesquipedali. Dioſc.* a foot and halfe.

* I ſuppoſe he meaneth the diſeaſes called *Ephialtes* or *Incubus*, the night Mare.

The herb * Panace, promiſeth by the very name a remedy of all diſeaſes. A number there be of herbs ſo called: and all aſcribed to ſome god or other for the inuention of them: for one of them hath the addition of *Aſclepion*, for that *Æſculapius* had a daughter named alſo *Panacea*. As touching the concret juice named Opopanax, it is drawn from the root of this plant (beeing of the Ferula or Fennell kind, ſuch as I haue heretofore ſhewed) by way of inciſion, the which root K
hath a thick rind, and of a ſaltiſh ſauor. When the root is pulled out of the ground, there is a religious ceremony obſerued to fil vp the hole again with all ſorts of corn, as it were in ſatisfaction to the earth for the violence offered in tearing it vp. As for the ſaid juice Opopanax, where and how it ſhould be made, and which is the beſt kind therof and not ſophiſticat, I haue declared already in my Treatiſe of forrain and ſtrange plants. That which is brought out of Macedony, they cal Bucolicum, becauſe the Neat-heards of the country mark when the liquor breakes forth and runneth out of it ſelfe, and ſo receiue and gather it from the plant: this wil not laſt, but of all the reſt ſooneſt loſeth the force. Moreouer, in all ſorts of it, that is rejected principally, which is black and ſoft; for theſe be markes to know that it is corrupted; and ſophiſticate with wax. A ſecond kind there is of Panaces, which they cal Heraclium: the inuention of the vertues L
and properties whereof is attributed vnto *Hercules*. Some there be who call it Origanum Heracleaticum the wild, becauſe it is like to Origan, wherof I haue heretofore written: but the root of this Panaces is good for nothing. A third kind of Panaces took the name of *Chiron* the Centaur, who was the firſt that gaue intelligence of the herbe and the vertues thereof. The leafe is like vnto the Dock, but that it is bigger and more hairy: the floure is of a golden yellow color: the root but ſmall: it loueth to grow in rich, fat, and battle grounds. The floure of this Panaces is moſt effectual in Phyſick: in which regard there is more vſe and profit thereof than of all the former kindes. A fourth Panaces there is beſides, found out alſo by the ſame *Chiron*, whereupon it hath the denomination of Centaureum: called alſo it is Pharnaceum: the occaſion of this two-fold name is this: becauſe there is ſome controuerſie in the firſt inuention thereof; whiles M
ſome attribute to it the Centaur *Chiron*; others to K. *Pharnaces*. This Panaces is vſually ſet and planted, bearing leaues indented in the edges like a ſaw, and thoſe longer than any of the reſt. The root is odoriferous, which they vſe to drie in the ſhadow, and therewith to aromatize their wine, for a pleaſant and delectable taſte it giueth vnto it. Hereof they haue made two ſpeciall kinds:

*πᾶν, and ἄκος, i. [a medicine for] all giefs; as one would ſay, All-heale.

20030

A kinds: the one with a * thicker leafe: the other with a thinner and ſmaller. * *Creſſiorũ.* πλατύφυλλον, *& Theophraſt.*

As for Heracleon Siderion, a plant it is alſo fathered vpon *Hercules*. It riſeth vp with a ſlender ſtalk to the height of foure fingers, bearing a red floure, and leaues in manner of the Coriander. Found it is growing neare to pooles and riuers: and for a wound herb there is not the like, eſpecially if the body be hurt by ſword, or any edged weapon made of yron and ſteele.

There is a wild Vine, named Ampelos Chironia, for that *Chiron* was the firſt author thereof. Of this plant I haue written in my diſcourſe of Vines [vnder the name of Vitis Nigra] like as alſo of another * herb, which hath the goddeſſe *Minerua* for the inuentreſſe. * *Matricaria* or *Parthenium*, *i.* Motherwort.

Moreouer, vnto *Hercules* is aſcribed Henbane, which the Latines call Apollinaris; the Arabians, Altercum or Altercangenon; but the Greeks, Hyoſcyamus. Many kinds there be of it: the
B one beareth black ſeed, floures ſtanding much vpon purple; and this herb is full of pricks. And in very truth, ſuch is the Henbane that groweth in Galatia. The common Henbane is whiter, and brancheth more than the other: taller alſo than the Poppy. The third kinde bringeth forth ſeed like vnto the graine of Irio. All the ſort of theſe already named, trouble the brain, and put men beſides their right wits: beſides that, they breed dizzineſſe of the head. As touching the fourth, it carieth leaues ſoft, full of down, fuller and fatter than the reſt: the ſeed alſo is white: & it groweth by the ſea-ſide: Phyſitians are not afraid to vſe this in their compoſitions, no more than that which hath red ſeed. Howbeit, otherwhiles this white kinde eſpecially, if it be not throughly ripe, proueth to be reddiſh, and then it is reiected by the Phyſitians. For otherwiſe none of them all would be gathered, but when they be fully drie. Henbane is of the nature of
C * wine, and therfore offenſiue to the vnderſtanding, and troubleth the head: howbeit, good vſe there is both of the ſeed it ſelfe as it is in ſubſtance, and alſo of the oile or iuice drawn out of it apart. And yet the ſtalks, leaues, and roots, are imployed in ſome purpoſes. For mine owne part, I hold it to be a dangerous medicine, and not to be vſed but with great heed and diſcretion. For this is certainly knowne, That if one take in drink more than foure leaues thereof, it will put him beſide himſelf. Notwithſtanding the Phyſitians in old time were of opinion, that if it were drunk in wine, it would driue away an ague. An oile (I ſay) is made of the ſeed therof, which if it be but dropped into the eares, is enough to trouble the brain. But ſtrange it is of this oile, That if it be taken in drink, it ſerues for a counterpoiſon. See how induſtrious men haue bin to proue experiments, and made no end of trying all things, inſomuch as they haue found means and forD ced very poiſons to be remedies. * *Vini.* Some read *Veneni*, *i* poiſon.

Chap. V.

¶ *Of Mercury, called Linozoſtis, Parthenium, Hermupoa, or rather, Mercurialis: of Achilleum, Panaces, Heracleum, Sideritis and Millefoile: of Scopa regia, Hemionium, Teucrium, and Splenium: of Melampodium or Ellebore, and how many kinds there be of it: of the black or white Ellebore, & their medicinable vertues: how Ellebore is to be giuen, how to be taken, to whom, and when it is not to be giuen: and how it killeth Mice and Rats.*

E THe herb Mercury, called by the Greeks Linozoſtis and Parthenion, was thought to be firſt found out by *Mercury*: whereupon many of the Greeks call it Hermu-poa: and wee all in Latine name it Mercurialis. Of it be two kinds, the male and the female: howbeit, the female Mercury is of better operation than the other. It riſeth vp with a ſtem a cubit high, which otherwhile brancheth in the top: the leaues be like vnto Baſil, but that they are narrower: full of knots or joints the ſtalk is, and thoſe haue many hollow concauities like arme-pits. The ſeed hangeth down from thoſe ioints. In the female the ſame is white, looſe, & in great plenty: in the male it ſtandeth cloſe vnto thoſe joints, but thinner: and the ſame is ſmall and as it were wreathed. The leaues of the male Mercury be of a dark and blacker green: wheras in the female they be more white. The root is altogether ſuperfluous, and very little. Both the one and the other
F delight to grow in plains and champion fields well ordered and husbanded. It is wonderful if it be true, that is reported of both theſe kinds; namely, That the male Mercury, cauſeth women to beare boies: and the female, girls. For which purpoſe the woman muſt preſently after that ſhee is conceiued, drink the juice of which Mercury ſhe will, in ſweet wine cuit, and eat the leaues either ſodden with oile & ſalt, or els greene & raw in a ſallad with vineger. Some there be who

boyle

boile it in a new earthen veſſell neuer vſed before, together with the hearbe Heliotropium or Turnſol, and 2 or 3 cloues of Garlick, vntill it be throughly ſodden. VVhich decoction they preſcribe to be giuen to women, as alſo the herb it ſelf to be eaten the ſecond day of their monthly ſicknes, and ſo to continue for 3 daies together: & then vpon the fourth day, after they haue bathed, to company with their husbands. *Hippocrates* giueth wonderfull praiſe vnto Mercury, as wel the male as the female, for all thoſe accidents which follow women: but the maner of vſing it, which he preſcribed, there is no Phyſitian hath skil of. He appointed to make peſſaries thereof with hony, oile of Roſes, oile of Ireos or Lillies, and ſo to put them vp into the ſecret parts: and in this manner he ſaith that the herb is excellent good for to prouoke the monthly termes of women, and to fetch away the after-birth. Hee affirmeth alſo, that a potion or fomentation therwith wil do as much. Moreouer, by his ſaying, the juice of Mercury infuſed into the ears, or applied by way of liniment with old wine, is ſingular for them when they runne with ſtinking matter: he ordained likewiſe a cataplaſme of Mercury to be laid to the belly, for to ſtay the violent flux of humors thither: for the ſtrangury alſo and infirmities of the bladder. In which caſes he gaue the decoction therof with Myrrhe and Frankincenſe. And verily for to looſen the belly, although the Patient were in a feuer, there is a potion of Mercury ſingular good, made in this wiſe: Take a good handfull of Mercury, ſeeth the ſame in two ſextars of water, vntill one halfe be conſumed; let the party drink the ſame with ſalt and hony mixed therwith: but the ſaid decoction if it be made with an hogs foot, with a hen, capon, or cock boiled withal, is the wholſomer. Some Phyſitians were of opinion, That for to purge the body, both Mercuries, as wel the male as the female are to be giuen, either boiled alone by themſelues or els with Mallows: they clenſe the breſt parts, and euacuat choler, but they hurt the ſtomacke. Touching all the other properties of Mercury, I will write in place conuenient.

As *Chiron* the Centaure found out the medicinable vertues of certaine herbes, ſo we are beholden to his ſcholler *Achilles* for one, which is ſingular to heale wounds, and of his name is called Achilleos. This is that wound-herb, wherewith (by report) he cured prince *Telephus*. Some haue thought that hee deuiſed firſt the ruſt of braſſe or verdegreece, which is ſo excellent for ſalues and plaſters: & therfore you ſhall ſee *Achilles* commonly painted ſcraping off the ruſt of his ſpeare head with his ſword into the wound of the ſaid *Telephus*. Others ſay, that he tooke both the ſaid ruſt or verdegreece, and alſo the herb Achilleos to worke his cure. Some would haue this Achillea to be Panaces Heracleon; and others Sideritis: we in Latine call it Millefolia. An herb it is growing with a ſtalk or ſtem to the height of a cubit, ſpreading into many branches, clad from the very root vp to the top, with leaues ſmaller than thoſe of Fenell. Others confeſſe indeed that this herb is ſingular good for wounds: but the true Achilleos (ſay they) hath a blewiſh ſtalk a foot high & no more, bare and naked without any branches at all, howbeit finely deckt and garniſhed on euery ſide with round leaues, ſtanding one by one in excellent order, and making a faire ſight. There be again who deſcribe it with a foure ſquare ſtem, bearing heads in the top in manner of Horehound, and leaued like vnto an Oke. And this they ſay is of that efficacy, that it wil conglutinat & vnite ſinews again, if they were cut quite aſunder. Moreouer, you ſhall haue ſome who take it for Achillea that kinde of Sideritis growing vpon mud walls, which if it be bruſed or ſtamped, yeeldeth a ſtinking ſent. Moreouer, there is another going vnder the name Achilleos, like to this laſt deſcribed, but that the leaues be whiter and fattier, the little ſtalks or ſprigs more tender, & it groweth in vineyards. Laſt of al, there is one more called Achilleos, which riſeth vp to the height of 2 cubits, bearing pretty fine & ſlender branches, and thoſe three ſquare, leaues reſembling Fearn hanging by a long ſtele, & the ſeed is much like to that of the Beet. In one word, they be al of them moſt excellent for healing wounds. And as for that eſpecially, which hath the largeſt leaues, our countrimen in Latine haue called it Scopa Regia. And the ſame is holden to be good for to heale the Squinancy or Gargle in ſwine.

In the ſame age wherin *Achilles* liued, prince *Teucer* alſo gaue the firſt name and credit to one ſpeciall herb, called after him Teucrion, which ſome nominat Hemionium: this plant putteth forth little ſtalks in maner of ruſhes or bents, and ſpreadeth low: the leaues be ſmall: it loueth to grow in rough and vntoiled places: a hard and vnpleaſant ſauor it hath in taſt: it neuer floureth, and ſeed it hath none. Soueraigne it is for the ſwolne and hard ſpleene: the knowledge of which property came by this occaſion, as it is credibly and conſtantly reported. It fortuned on a time when the inwards of a beaſt killed for ſacrifice, were caſt vpon the ground where this herb grew,

20030

A grew,it took hold of the ſpleen or milt,and claue faſt vnto it,ſo as in the end it was ſeen to haue conſumed and waſted it clean:hereupon ſome there be that call it Splenion, *i.* Spleenwort:and there goeth a common ſpeech of it, That if ſwine doe eat the root of this herbe,they ſhall be found without a milt when they are opened. Some there be, who take for Teucrium and by that name do call,another herb full of branches in manner of hyſſop,leafed like vnto beans;and they giue order,that it ſhould be gathered whiles it is in floure; as if they made no doubt but that it would floure. The beſt kind of this herb they hold to be that which commeth from the mountains of Cilicia and Piſidia.

Who hath not heard of *Melampus* that famous diuinor and prophet? he it was of whom one of the Ellebores tooke the name,and was called Melampodion: and yet ſome there be who attribute the finding of that herb vnto a ſhepheard or heardman of that name,who obſeruing wel
B that his ſhe goats feeding therupon,fell a ſcouring,gaue their milk vnto the daughters of king *Prætus*, whereby they were cured of their furious melancholy, and brought again to their right wits. This herb then being of ſo excellent operation, it ſhall not be amiſſe to diſcourſe at once of all the kinds of Ellebore,whereof this maketh one. And to begin withal,two principal ſorts there be of it;namely,the white and the black:which diſtinction of colour, moſt writers would haue to be meant and vnderſtood of the roots only,and no part elſe: others there be,who would haue the root of the blacke Ellebore to be faſhioned like vnto thoſe of the Plane-tree, but that they be ſmaller and of a more darke & duskiſh green, diuided alſo into more jags and cuts;but thoſe of the white Ellebore,to reſemble the yong Beet new appearing aboue the ground, ſaue
C onely that they be of a more blackiſh colour,and along the backpart of their concauitie inclining to red. Both the one and the other bringeth forth a ſtalke in faſhion like the Ferula or Fenel-geant,a ſpan or good hand-breadth high,and the ſame conſiſteth of certain tunicles or skins folded one within another in manner of bulbous plants,riſing from the like root; and the ſaid root is full of ſtrings or fringes, as is the head of an onion. The blacke Ellebore is a very poiſon to horſes,kine,oxen,and ſwine,for it killeth them; and therefore naturally theſe beaſts beware how they eat of it,whereas confidently they feed vpon the white. The right ſeaſon of gathering the Ellebores,is in harueſt time Great ſtore thereof groweth vpon the hill Oeta, but the beſt is that which is found in one only place therof neere about * Pyra. The black Ellebore commeth vp euery where;but the beſt is in Helicon, a mountaine much renowned and praiſed for other
D herbs beſide it,wherewith it is well furniſhed. As touching the white, that of the mount Oeta is counted the principall:in a ſecond degree,is the white Ellebore of Pontus: in the third place is to be ranged,that which commeth from Elæa,which (they ſay) groweth among vines: in the fourth and laſt place,for goodneſſe,is that of the mount Pernaſſus, which is ſophiſticated with the Ellebore of Ætolia neare by. The blacke Ellebore is called Melampodium,wherewith folk vſe to hallow their houſes for to driue away ill ſpirits,by ſtrewing or perfuming the ſame,and vſing a ſolemne praier withall:it ſerueth alſo to bleſſe their cattell after the ſame order. But for theſe purpoſes they gather it very deuoutly and with certain ceremonies:for firſt and foremoſt, they make a round circle about it with a ſword or knife, before they go in hand to take it forth of the ground: then the party who is to cut or dig it vp, turneth his face into the Eaſt, with an
E humble prayer vnto the gods,That they would vouchſafe to giue him leaue with their fauour to do the deed; & with that he markes and obſerueth the flight of the Egle; for lightly while they be cutting vp of this root, ye ſhall ſee an Ægle ſoring aloft in the aire:now in caſe the ſaid Ægle flie neere vnto him or her that is cutting vp Ellebore,it is a certaine preſage and foretoken, that he or ſhe ſhall ſurely die before that yeare go about. Much ado alſo there is about the gathering of the white Ellebore;for vnleſſe the party do eat ſome garlick before,and eftſoones in the gathering ſup off ſome wine,and withall make haſt to dig it vp quickly,it wil ſtuffe and offend the head. The blacke Ellebore ſome call Eutomon,others Polyrrhizon; it purgeth downward;the white,by vomit,vpward,and doth euacuat the offenſiue humors which cauſe diſeaſes. In times paſt it was thought to be a dangerous purgatiue,and men were afraid to vſe it: but af-
F terwards it became familiar and common,inſomuch as many ſtudents tooke it ordinarily for to cleanſe the eies of thoſe fumes which troubled their ſight, to the end that whiles they read or wrote,they might ſee the better or more clearly. It is wel known,that *Carneades* the Philoſopher purpoſing to anſwer the bookes of *Zeno*,prepared his wits and quickened his ſpirits,by purging his head with this Ellebore. And *Druſus* our Countrey-man, one of the moſt famous and

* Where Pliny ſaith that Pyra was ſituate in Oeta, he is deceiued, for it was ſituate in Phocis, as Strabo and other Greeke writers do teſtifie.

renowned Tribunes of the Commons that were euer knowne at Rome (a man who aboue all others woon the fauour and applauſe of the comminalty, howſoeuer the nobility charged him to haue bin the cauſe of the Marſians war) was perfectly cured of the falling ſickneſs in the Ile Anticyra, by this only medicine: and indeed thoſe Iſlanders haue away by themſelues to prepare their Ellebore with the mixture of Seſamoeides (as I haue ſaid before) whereby the taking of it is moſt ſafe. Ellebore is called in Latine * Veratrum: the pouder as well of the one as the other ſnuffed vp into the noſthrils, either alone by it ſelfe, or mixed with the pouder of the Fullers herbe Radicula, wherewith they waſh and ſcoure their woollen cloth, * prouoketh ſneezing; and yet both of them procure ſleep. Now for vſe in Phyſicke, there would be choſen the ſmalleſt roots of Ellebor, ſuch as be ſhort alſo, and as it were curtelled, and not ſharp pointed in the bottome: and the beſt part is that which is toward the nether end; for the vppermoſt part of the root which is the thickeſt and bulbous like to an onion head, is good for dogs onely, and giuen vnto them for to make them ſcummer. In old time they vſed to chuſe the Ellebore root by the bark, and took that for the beſt which had the moſt fleſhy or thickeſt rind, to the end that they might take out the finer pith or marrow within; which they vſed to lap and couer with moiſt ſpunges, and when it began to ſwell, they diuided or ſliued it longwiſe into ſmal filaments with the point of a needle or bodkin. Theſe filaments or ſtrings, they dried in the ſhade, & laid them vp to ſerue as need ſhould require. But now adaies they cut the ſmall ſhoots or ſlips branching from the root, ſuch as are moſt charged with bark, and thoſe the Phyſitians giue vnto their Patients. The beſt white Ellebore is that, which in taſt is hot and biting at the tongues end, and in the breaking ſeemeth to ſmoke or ſend duſt from it: it is commonly ſaid, that it will continue in force thirty yeres. The black is good for the palſie, for thoſe that be lunatick and beſtraught in their wits, for ſuch as be in a dropſie (ſo they be cleare of a feuer) for inueterat gouts as well of feet and hands as other joints: it purgeth downward by the belly, both choler and fleame: being taken in water, it gently mollifieth and looſeneth the body: and from foure oboli (which is a ſmall or mean doſe) you may riſe to a full dramme, ſo you exceed not that weight. Some were wont to mingle Scammonium therewith; but the ſafer way is to put ſalt only thereto: being giuen in any ſweet liquor to ſome great quantity, it is dangerous: and yet a fomentation therwith is good to rid away and diſpatch the miſtineſſe that troubleth the eies: and therefore ſome vſe to beat it into pouder, and when it is reduced into a liniment or eie ſalue, therwith to annoint them for the ſaid purpoſe. This property moreouer it hath, to bring to maturation the ſwelling wens called the kings euill, to mollifie any hard tumors, to mundifie alſo the foreſaid wens and any botches or impoſtumes that be ſuppurat and broken. It cleanſeth likewiſe the hollow vlcers called fiſtuloes, prouided alwaies that it be not taken out of the ſore in 2 daies and 2 nights, but the third day it ought to be remoued. Incorporat with the skales of braſſe and red orpiment, it taketh away warts. Made into a pulteſſe or cataplaſme with barly meale and wine, it is ſingular good for the dropſie, if it be applied vnto the belly: take a ſliuing or ſlip of the root and draw it through the eare of ſheep or horſe in manner of rowelling, and the morrow after take it forth again at the ſame houre; this healeth the gid or wood-euill in ſheep, and cureth the glandres in horſes: incorporat with frankincenſe or wax, together with pitch or oile of pitch, it is ſingular good for the farcins or ſcab in any foure-footed beaſt. Touching white Ellebore, the beſt is that which moſt ſpeedily prouoketh ſneezing: it is without compariſon far more terrible than the blacke, eſpecially if a man reade what ado and preparation there went vnto it in the old time, when they were to drink it againſt ſhiuerings and ſhakings, againſt the riſing of the mother and danger of ſuffocation: in caſe alſo of immoderate and extraordinary drowſineſſe, of exceſſiue hicquets and yexing without intermiſſion, and of continuall ſneezing: moreouer, when they were troubled with weakeneſſe and feebleneſſe of ſtomacke: in like manner in caſe of vomits, when they came either too faſt or ouer-flow, either too little or too much: for this was a rule obſerued among them, to giue with Ellebore ſome other drugs, for to cauſe it work the ſooner, and to haſten vomit more ſpeedily: alſo they vſed means to fetch away the very Ellebore again if it lay ouer-long in the body, either by other purgatiue medicines, or by clyſters: oftentimes alſo by opening a veine or bloud-letting. And ſay that Ellebore taken in manner aforeſaid, wrought very well, yet they vſed to obſerue euery vomit, the diuers colors of humors that came away, which many times were fearfull to behold: yea and when the Patient had done caſting, they conſidered alſo the ordure and excrements that paſſed away by the belly: they gaue order beſides,

* *à verando, vnde veratores & veracula:* and becauſe ſuch prophets were counted mad & out of their wits, therefore it was ſo called, for that it cured ſuch.

* *Sternutamentũ facit, amboq; ſomnũ.* I doubt whether this be true: I ſuppoſe it ſhould be read according to the old copy (*Somnum diſcutiunt*) (i.) they diſcuſſe or ſhak off ſleep, vſed to that purpoſe in lethargies & ſuch drowſie diſeaſes.

20030
copy 1

A beſides, for *bathing either before or after the taking of Ellebore, as occaſion beſt required; yea and they took great heed and regard of the whole body beſides; and yet, did what they could, the terrible name and report that went of this medicine, paſſed all their care and circumſpection whatſoeuer: for it was an opinion generally held and receiued, That Ellebore doth eat away and conſume the fleſh ſeething in the pot, if it be boiled therewith. But herein were the antient Phyſitians much too blame and greatly in fault, in that they were ouer timorous, and for feare of ſuch accidents inſuing vpon this medicine, gaue it in too ſmall a doſe: wheras indeed the greater quantity that one taketh of it, the more ſpeedily it worketh, and the ſooner paſſeth out of the body, when it hath once done the errand. *Themiſon* vſed to preſcribe two drams, and not aboue. The Phyſitians who followed after, allowed the doſe of foure drammes; grounding vpon a notable and famous apothegme or ſpeech of *Herophylus*, who was wont to ſay, that
B Elleoore was like vnto a valiant and hardy captaine: for when (quoth he) it hath ſtirred all the humors within the body, it ſelf iſſueth forth firſt and maketh way before them. Moreouer, there is a ſtrange and ſingular deuiſe, To clip the root of Ellebore with ſmall ſizzers or ſheares into little pieces; then, to ſift them through a ſercer, that the bark or rind may remain ſtill; and when it is clenſed and purged from the pith or marrow within, the ſame may fall thorow and paſſe away: which is paſſing good to ſtay vomits, in caſe the Ellebore doe worke too extreamely: furthermore, if we looke for good ſucceſſe in our cure by miniſtring of Ellebore, in any wiſe wee muſt take heed and be carefull, how we giue it in cloſe weather, and vpon a darke and cloudie day; for certainly it putteth the Patient to a jumpe or great hazard, and cauſeth moſt grieuous and intollerable pains and torments. For that it ſhould be taken in ſummer rather than in win-
C ter, no man doubteth thereof. Ouer and beſides, the bodie ought to be prepared a ſeuen-night before; during which time, the Patient is to eat tart and * ſharp meats and poignant ſauces, to abſtaine from wine altogether; and the fourth and third day before, to aſſay by little and little to vomit gently: laſt of all, to forbeare ſupper ouer-night, when hee is to take his Ellebore the morrow. As touching the manner of giuing Ellebore: the white may be drunke in ſome ſweet wine; but the beſt and chiefeſt way of taking it, is in milke, grewell, or pottage. Of late dayes there is come vp a pretty inuention, To ſlit or cut Radiſh roots, and within thoſe gaſhes to ſtick or enterlace pieces of white Ellebore, which don, to bind them cloſe vp again, that the ſtrength and vertue thereof may be incorporat in the foreſaid roots: and thus by the means of this kind
D temperature with the Radiſh, to giue it vnto the Patient. Ordinarily this medicine of Ellebore continueth not aboue foure houres within the body, but it commeth vp againe, and within ſeuen it hath done working. And thus being vſed as is beforeſaid, it is a moſt ſoueraigne remedie for the falling ſickneſſe, the ſwimming or dizzineſſe of the head: it cureth melancholicke perſons troubled in mind; ſuch as be brain-ſick, mad, lunaticke, phrantick, and furious: it is ſingular good for the Elephantie, the foule and dangerous morphew called Leuce, the filthie leproſie, and the generall conuulſion whereby the body continueth ſtiffe and ſtarke, as it were all one peece without any joynt. It helpeth thoſe that be troubled with trembling, ſhiuering, and ſhaking of their lims, with the gout, and the dropſie, and namely ſuch as bee entering into a tympanie: ſingular it is for thoſe that haue weake and feeble ſtomackes and can keepe nothing that
E they take; for ſuch as are giuen to ſpaſmes or crampes, lie * bed-rid of the dead palſie or ſuch chronicke diſeaſes, encumbered with the Sciatica, haunted with the quartaine Ague, which will not be ridde away by any other meanes; troubled with an old cough, vexed with ventoſities and griping wrings and torments which be periodicall, and vſe to come and goe at certaine ſet times: howbeit, Phyſitians forbid the giuing of Ellebore vnto old folk and yong children: *Item*, to ſuch as be of a fœminine and delicate bodie; as alſo to thoſe that be in minde effœminate: likewiſe to thoſe who are thinne and ſlender, ſoft and tender: in which regards, wee may not be altogether ſo bold to giue it vnto women as vnto men. In like manner, this is a medicine that would not bee miniſtred inwardly to fearefull, timorous, and faint-hearted perſons; neither to thoſe who haue any vlcer in the precordiall region about the midriffe, ne yet vnto
F ſuch as vſually bee giuen to ſwell in thoſe parts; and leaſt of all vnto thoſe that ſpit or reach vp bloud; no more than to ſickely and craſie perſons who haue ſome tedious and lingring maladie, as phthyſicke, &c. hanging vpon them; and namely, if they be grieued and diſeaſed in their ſides or throat. Neuertheleſſe, applied without the bodie in manner of a liniment with ſalted hogs greaſe, it cureth the breaking forth of flegmaticke wheals and pimples; as alſo healeth old

* *Hippocrates* appointeth them to bathe before, who purge not eaſily with Ellebore: & in caſe of conuulſions occaſioned by the taking therof, he preſcribeth likewiſe the bain.

* As Radiſh roots and oxymell.

* *Clinicis* ſome read *Cynicis*, & then it ſignifieth thoſe that haue their mouths drawn awrie to their eare: the diſeaſe is called *cynicus ſpaſmus*.

fores remaining after impoſthumes ſuppurate and broken: mixed with parched or fried braley- G
groats it is a very rats-bane,& killeth both them & mice. The Gauls or Frenchmen when they ride a hunting into the chaſe,vſe to dip their arrow heads in the iuice of Ellebore, & they haue this opinion,that the veniſon which they take will eat the tenderer; but then they cut away the fleſh round about the wound made by the foreſaid arrows. Furthermore it is ſaid, That if white Ellebore be beaten to pouder and ſtrewed vpon milk,all the flies that taſt thereof will die. To conclude, the ſaid milke is good to rid away lice, nits,and ſuch like vermin out of the head and other parts of the body.

Chap. VI.

¶ *Of the herbe Mithridation. Of Scordotis or Scordium. Of Polemonia,and Philetæria,otherwiſe* H
called Chiliodynama. Of Eupatorie or Agrimonie. Of great Centaurie,otherwiſe named Chironea. Of the little Centaurie,named alſo Libadion and Fel terræ. Of Trierches: and the medicinable vertues vpon theſe Simples depending.

Cratevas hath aſcribed the inuention of one herb to K. *Mithridates* himſelfe,called after his name Mithridation: this plant putteth forth no more than two leaues, and thoſe directly and immediatly from the root,reſembling the leaues of Branc-vrſin:there riſeth vp a ſtem between them both in the mids,carrying an incarnat floure in the head like a roſe.

Pompeius Lenæus (who by the commandement of *Pompey* the Great tranſlated into Latine the I
Phyſick notes and receits of K. *Mithridates*) ſaith moreouer,that the ſaid prince found out another herb named Scordotis or Scordium;and that among other his writings hee met with the deſcription of the ſaid herb,ſet down vnder the kings own hand in this manner;namely,That it grew a cubit high,with a main ſtem four-ſquare, and the ſame full of branches garniſhed with downy or furred leaues,indented and cut like to thoſe of the oke. This herb is found ordinarily growing within the region of Pontus, in battle and moiſt champian grounds, and in taſte is very bitter. There is another kind of Scordium,with larger and broader leaues, and like it is vnto wild Minth or Calamint:both the one & the other be of great vſe in Phyſicke,either by themſelues alone,or els put into opiats and antidots among other ingredients.

* Of πόλεμος, which ſignifieth,war,or debate.

Touching * Polemonia,which others call Philetæria,it tooke the name vpon occaſion of the K
ſtrife and controuerſie betweene certaine princes which debated about the firſt inuention thereof. The Cappadocians know it by the name Chiliodynama, *i.* as one would ſay, endued with a thouſand vertues. This plant hath a thicke and groſſe root,but ſmal & ſlender branches, from the tops whereof there hang down certaine berries in tufts and cluſters, incloſing within them black ſeed:in all other reſpects it reſembles rue,& groweth commonly vpon mountaines.

* *Eupator.*

As for Agrimony,called otherwiſe Eupatoria,it hath gotten credit & reputation by a*king, as it may appeare by the name. The ſtalk or ſtem of this herb is of a wooddy ſubſtance,blackiſh in colour,hairy,and of a cubit in height,or rather more. The leaues grow diſpoſed and diſtant by certaine ſpaces aſunder,much like vnto thoſe of cinquefoile or hempe, ſnipped & cut about the edges ordinarily in fiue parts;the ſame are of a blackiſh or dark green,and full of a kinde of L
plume or downe. The root is ſuperfluous for any operation that it hath in Phyſick: the ſeed of this herb drunk in wine,is a ſingular remedy for the dyſentery or bloudy flix.

Rha poſtick.

The greater * Centaury is that famous herbe wherewith *Chiron* the Centaure (as the report goeth) was cured,at what time as hauing entertained *Hercules* in his cabin, hee would needs be handling & tempering with the weapons of his ſaid gueſt,ſo long vntill one of his arrows light vpon his foot and wounded him dangerouſly:wherupon ſome there be who name it Chironion. The leaues grow large,broad,and long,indented or cut rather,like a ſaw round about the edges: neare vnto the root they come vp very thick: the ſtems run vp three cubits high, full of knots and ioints all the way:knobbed in the top like vnto Poppie heads:the root is of a mighty bigneſſe,inclining to a red colour, howbeit tender and eaſie to break or knap in ſunder: two cubits M
it beareth in length;full of a liquid iuice: bitter in taſte,and yet ſweet withal:it loueth to grow vpon banks and prety hils,where the ground is fat and battle. The beſt Centaury of this greater kinde, commeth out of Arcadie,Elis, Meſſenia, Pholoe,and mount Lycæus: and yet there is good found vpon the Alpes, and in many other places. Some there be, who out of this plant draw

20030
copy 1

A draw a juice in manner of Lycium. Of ſuch efficacy it is to incarnat wounds, that (by report) if it be put into the pot to ſeeth among many gobbets or pieces of fleſh, it wil cauſe them to grow together and vnite. The root only is to be giuen inwardly, and namely in drinke, to the weight of two drams, in ſuch caſes as I will ſhew hereafter: with this charge, That if the Patient haue an ague hanging vpon him, it be ſtamped and taken in water: others may drink it well enough in wine. Alſo the juice drawn forth of it when it is boiled, is good for the diſeaſes or rot of ſheep.

Another Centaury there is, ſyrnamed alſo in Greeke Lepton (*i.* Small) for that it hath little leaues in compariſon of the other: ſome name it Libadion, for that it loueth to grow neere to ſprings or fountains: it is ſomwhat like to Origan, ſaue that the leaues be narrower and longer: the ſtalk is cornered, riſing vp to a ſmal height; to wit, a hand-breadth or a ſpan at moſt: the
B ſame alſo putteth forth little branches: the floure hath ſome reſemblance of the * red-Roſe campion: the root is ſmall, & needleſſe for any Phyſicke vſe: but the juice of the herb it ſelfe, is of ſingular operation. This herb would be gathered in Autumne, when it is freſh, full of leaues, and floures, for then it yeeldeth beſt iuice. Some take the ſtalks and branches, ſhred them ſmal, let them lie infuſed in water 18 daies, and then preſſe forth the juice. This is that * Centaury, which we here in Italy call Fel Terræ, *i.* the Gal of the earth, by reaſon of the exceeding bitterneſſe which it hath: the Gauls terme it Exacos, becauſe if it be drunk it ſendeth downeward by ſeege out of the body, any hurtfull poiſon whatſoeuer.

* Lychnidis.

* Our cõmon Centaury.

There is a third Centaury named Centauris, knowne by the addition Triorches: whoſoeuer commeth to cut this herb, he quits himſelfe wel and eſcapeth faire, if he wound not himſelfe.
C This plant yeeldeth forth a certaine red juice like vnto bloud. *Theophraſtus* hath deliuered in his hiſtory of Plants, that the hawkes * Triorchides protect and defend this herbe, & are ready to incounter and fight with them that come to gather it; wherupon it took the foreſaid name Triorchis. But many ignorant and vnskilfull perſons there be, who write confuſedly of all theſe Centauries, and attribute this laſt property and name, to the firſt Centaurie the great.

* Our Buzzards (as *Turner* thinketh)

¶ Chap. VII.

¶ *Of Clymenos, Gentian, Lyſimachia, Parthenis or Artemiſia, Ambroſia, Nymphæa, Heraclium, and Euphorbium, with their operations in Phyſicke.*

D THe herb Clymenos beareth the name of K. *Clymenus*, the firſt inuenter and finder out thereof: Leafed it is like vnto Ivie, full of branches: the ſtalkes or ſtems be hollow and emptie within, diuided by joints and partitions: of a ſtrong and vnpleaſant ſmell: the ſeed reſembleth the grains or berries of Ivie; and it taketh pleaſure to grow in wilde woods and among mountains. As touching the operations which it hath, & namely what diſeaſes it cureth being taken in drink, I will ſhew hereafter: mean while, I will not put off any longer, but aduertiſe the Reader, euen in this place, That this herb as it doth good one way, ſo it hurteth another; for if they be men that drink it, wel may it cure them of the maladies for which it is giuen, but ſurely it killeth their naturall ſeed and diſableth them for getting children, ſo long as they vſe it. The
E Grecian writers deſcribed it to be like in leaf vnto Plantain: in ſtem four ſquare, bringeth forth certain little cods full of ſeed, infolded and interlaced one within another after the manner of the tufted and curled haires about the Pourcuttle fiſhes called Polypi. But be it what it will, the juice of the herb is refrigeratiue, and of great vſe in Phyſicke.

As for the herb Gentian, we muſt acknowledge *Gentius* king of the Illyrians for the Authour and patron therof, for he brought it firſt into name & credit: and howſoeuer it grow in al places, yet the beſt is that which is found in Illyricum or Sclauonia. The leaues come neare in faſhion and forme to thoſe of the Aſh tree, but that they be ſmall in manner of Lettuce: the ſtem is tender, of a thumb thickneſſe, hollow as a kex and void within: leafed here and there with certain ſpaces betweene, growing vp other while 3 cubits high. The root is pliable and will winde
F euery way, ſomwhat blacke or duskiſh, without any ſmell at all: it groweth in great plenty vpon wateriſh hillocks that lie at the foot of great mountains, ſuch as the Alps be. The juice of the herb is medicinable, like as the root it ſelfe alſo, which is very hot of nature and not to be giuen in drinke to women with childe.

Lyſimachia, the herbe ſo much commended by *Eraſiſtratus*, beareth the name of king *Lyſi-*

machus, who first gaue light of the vertues that it hath: greene leaues it beareth like vnto those G
of the willow: the floures be purple: giuen much it is to branch from the root, and those ſtalkes
* *Odore acri*: Surely our herb Willow or *Lyſimachia* hath a kind of ſharp coole ſent not vnpleaſant: although *Pliny* vſe the word (*acri*) for hot and biting in other places. Hereupon it might well bee called λυσιμαχία, (i.) Looſtrife, and not of K. *Lyſimachus*.
grow vpright: a * ſharp ſmell it carrieth with it, and delighteth to liue in watery places. Of ſo effectuall vertue it is, that if it be laid vpon the yoke of two beaſts which will not draw gently together, it ſtaieth their ſtrife and maketh them agree well enough.

Not men only and great kings, but women alſo and queens haue affected this kind of glory, To giue names vnto herbs. Thus queen *Artemiſia* wife to *Mauſolus* king of Caria, eternized her owne name by adopting (as it were) the herb Mugwort to her ſelfe, calling it Artemiſia, whereas before, it was named Parthemis. Some there be who attribute this denomination vnto *Diana* (called in Greek Artemis Ilithya) becauſe it is of ſpeciall operation to cure the maladies incident to women. It brancheth and buſheth thick much like to wormwood, but that the leaues
be bigger, fat and wel liking withal. Of this Mugwort there be two kinds: the one carieth broad H
leaues, the other is tender and the leaues ſmaller: this grows no where but along the ſea coaſts. There be writers who call by this name Artemiſia, another herb growing in the midland parts of the main and far from the ſea, with one ſimple ſtem, bearing very ſmall leaues and plentie of floures, which commonly break forth and blow when grapes begin to ripen, and thoſe caſt no vnpleaſant ſmel, which herb ſome thereupon name * Botrys, others Ambroſia: and of this kind there is great ſtore in Cappadocia.

* Or rather *Botryſi* oke of Ieruſalem) is of ſome called *Artemiſia*, of others *Ambroſia*, as ſaith *Dioſcorides*.
* Nenuphar is called in Greeke Nymphæa, the originall of which herb and name alſo, aroſe by occaſion of a certain maiden Nymph or yong lady, who died for jealouſie that ſhe had conceiued of prince *Hercules* whom ſhe loued: and therefore by ſome it is named alſo Heraclion, of
others Rhopalos, for the reſemblance that the root hath to a club or mace. But to come againe I
to our firſt name Nymphæa; this quality it hath alluding and reſpectiue thereunto, That whoſoeuer do take it in drink, ſhal for 12 daies after find no prick of the fleſh, no diſpoſition (I ſay) to the act of venery or company of women, as being depriued for that time of all naturall ſeed. The beſt Nemphar or Nymphæa, is found in the lake Orchomenus, and about the plain of Marathon. The people of Bœotia, who alſo vſe to eat the ſeed thereof, commonly call it Madon. It taketh great contentment to grow in waters: the leaues floting vpon the face of the water, be broad and large, whiles others put forth from the root. The floure reſembleth the Lillie, which when it is once ſhed, there be certain knobs remaining like vnto the bolls or heads of Poppie. The proper ſeaſon to cut the ſtems and heads of this plant, is in Autumne. The root is blacke,
which being gathered and dried in the Sunne, is counted a ſoueraigne remedy for thoſe that be K
* Water-roſe. vexed with the flux or fretting of the belly. A ſecond * Nemphar or Nymphæa there is, growing in Theſſaly, within the riuer Peneus, with a white root, but a yellow flour in the head about the bigneſſe of a roſe.

* Water-lilly.
No longer ago than in our forefathers daies, *Iuba* king of Mauritania, found out the herb Euphorbia, which he ſo called after the name of his own Phyſitian *Euphorbus*, brother to that learned *Muſa* Phyſitian to *Auguſtus Cæſar*, who ſaued the life of the ſaid Emperor, as heretofore I haue declared. Theſe two brethren Phyſitians, ioined together in counſell, and gaue direction for to waſh the body all ouer in much cold water, after the hot baine or ſtouve, thereby to knit and bind the pores of the skin: for before their time, the maner was to bathe in hot water only, L
as we may ſee plainly in the Poet *Homer*. But now to return vnto our herb Euphorbia, the foreſaid K. *Iuba* wrote one entire book (at this day extant) wherin he doth nothing els but expreſſely ſet forth the commendable vertues and properties of this one herb. He found the ſame firſt vpon the mountain Atlas, where it was to be ſeen (ſaith he) bearing leaues reſembling Branc-vrſin: ſo ſtrong and forcible it is, that thoſe who receiue the juice or liquor iſſuing from it, muſt ſtand a good way off; for the manner is to launce or wound it firſt, and then preſently to retire backe, and ſo at the end of a long pole to put vnder it a paile or trey made of kids or goats leather for a receptory; into which there runneth forth out of the plant, a white liquour like vnto milke: which when it is dried and growne together, reſembleth in ſhew a lumpe or maſſe of Frankincenſe. They that haue the gathering of this juice called Euphorbium, find this benefit thereby, M
That they ſee more clearly than they did before: an excellent remedy this is againſt the venom of ſerpents, for what part ſoeuer is ſtung or wounded by them, make a light inciſion vpon the
* Or the vpper part of the hurt place. * crown [of the head] and apply therto this medicinable liquor, it wil ſurely cure it. But in that country, the Getulians (who commonly do gather Euphorbium, for that they border vpon the

mount

20030
copy 1

A mount Atlas) ſophiſticate it with goats milke. Howbeit, fire will ſoon detect this impoſure of theirs, for that which is not right but corrupt, when it burneth, doth yeeld a lothſome fume and ſtinking ſent. The juice or liquor which in France is drawn out the herb Chamælea (the ſame that beareth the red grain, named by the Latines Coccum) commeth far ſhort of this Euphorbium. The ſame being grown thick and hard, if a man break it, reſembleth gum Ammoniacke. Taſt it neuer ſo little at the tongues end, it ſetteth all the mouth on a fire, and ſo continueth it a long time hot, but more by fits, vntill in the end it parcheth and drieth the chaws and throat alſo far within.

Chap. VIII.

B ¶ *Of Plantain, Bugloſſe, and Borrage. Of Cynogloſſa or Hounds tongue. Of Buphthalmus, i. Oxe eie, or Many-weed. Of Scythica, Hippice, and Iſchæmon. Of Vettonica and Cantabrica. Of * Conſiligo and Hiberis. Of Celendine the great, Canaria and Elaphoboſcos. Of Dictamnum, Ariſtolochie or Hert-wort: That fiſh are delighted ſo much therwith, that they will make haſt vnto it, and be ſoon taken. Alſo the medicinable vertues of thoſe herbs aboue named.*

* Stetterwoort, or Bears foot, as ſome think.

Themiſon, a famous Phyſitian, ſet forth a whole booke of the herbe Way-bred or Plantaine, wherein he highly praiſeth it: and challengeth to himſelfe the honor of firſt finding it out, notwithſtanding it be a triuiall and common herb, trodden vnder euery mans foot. Two kinds of it be found: the one which is the leſſer, hath alſo narrower leaues, and inclining more to a blackiſh green, reſembling for all the world theepe * or lambs tongues, the ſtalke is cornered
C bending downward to the ground, & it growes ordinarily in medows. The other is greater, with leaues encloſed (as it were) within certain ribs reſembling the ſides of our body: which being in number ſeuen, gaue occaſion to ſome herbariſts for to call it Heptapleuron, as a man would ſay, the ſeuen ribbed herb. The ſtem of this Plantain riſeth to a cubit in height, much like to that of the Naphew. That which groweth in moiſt and waterie places, is of greater vertue than the other. Of wonderfull power and efficacy it is by the aſtringent quality that it hath, for to dry and condenſate any part of the body, and ſerueth many times in ſtead of a cautery or ſearing yron. And there is nothing in the world comparable vnto it, in ſtaying of fluxes and deſtillations, which the Creeks call Rheumatiſmes.

Whereupon it ſeemeth to be called in Greeke ἐπτάπλευρον.

To Plantain may be ioined the herb * Bugloſſos, ſo called, for that the leafe is like an Oxe
D tongue. This herb hath one ſpeciall property aboue the reſt, that if it be put into a cup of wine it cheareth the heart, and maketh them that drink it, pleaſant and merry; whereupon it is called Euphroſynon.

Our Borrage.

Vnto this for affinity of name, it were good to annex Cynogloſſos, *i.* Hounds tongue, for the reſemblance that the leaues haue to a dogs tongue: a proper herb for vinet-works and knots in gardens. It is commonly ſaid, That the root of that Cynogloſſos which putteth forth 3 ſtems or ſtalks, and thoſe bearing ſeed, if it be giuen to drink, cureth tertian agues: but the root of that which hath foure, is as good for the Quartains. Another *Cynogloſſos there is like to it, which carrieth ſmall burs: the root whereof being drunke in water, is a ſingular counterpoiſon againſt
E the venome of toads and ſerpents.

This is our common Houd-tongue with little burs.

An herb there is with flours like vnto oxe eies, wherupon it took the name in Greek * Buphthalmos: the leaues reſemble Fennel: & it groweth about town ſides: it ſhutteth forth ſtalkes from the root plentifully, which being boiled, are good to be eaten. Some there be who call it Cachla. This herb made into a ſalue with wax, reſolueth all * ſchirrous and hard ſwellings.

Some cal them Moones. *Schirrhomata*, otherwiſe *Stocomata*, which be bunches or ſwellings in the fleſh full of a greaſie matter.

Other plants there be, which beare the names not of men but of whole nations, which firſt found them and their vertues out. And to begin withall, beholden we are to Scythia for that which is called Scythica. It groweth notwithſtanding in Bœotia, and is exceeding ſweet in taſt. Alſo there is another of that name, ſingular good for the cramps, called by the Greeks Spaſmata. An excellent property it hath beſides, for that whoſoeuer holds it in their mouth, ſhall for
F the time be neither hungry nor thirſty. Of the ſame operation there is another herb among the Scythians or Tartars, called * Hippice, becauſe it workes the like effect in horſes, keeping them from hunger and thirſt. And if it be true that is reported, the Scythians with theſe herbs wil endure without meat or drink for twelue daies together.

* *Theophraſtus* writeth the like of the ſweet root or Liquorice and Hippace, that is, cheeſe made of mares milk; but not of any herb Hippice

Touching the herbe Iſchæmon, the Thracians firſt found out the rare vertue that it hath in ſtanching

ſtanching bloud, according as the very name implies. For (ſay they) it wil ſtop the flux of bloud running and guſhing out of a veine not only opened, but alſo if it were cut through. It coucheth and creepeth low by the ground, and is like vnto Millet, but that the leaues be rough and hairy. The manner is to ſtuffe the noſthrils therewith for to ſtay the bleeding at noſe. And that which groweth in Italy ſtancheth bloud, if it be but hanged about the neck, or tied to any part of the body. G

Betony: The people in Spaine named Vettones, were the firſt authors of that herb, which is called in France *Vettonica, in Italy Serratula, and by the Greeks Ceſtron or Pſychotrophon: Surely an excellent herb this is, and aboue all other ſimples moſt worthy of praiſe. It commeth forth of the ground, and riſeth vp with a cornered ſtalke, to the heigh of two cubits, ſpreading from the very root leaues of the bigneſſe of Sorrell, cut in the edges, or toothed in manner of a ſaw, with H floures of a purple color growing in a ſpike, & ſeed correſpondent therto. The leaues dried and brought into pouder, be good for very many vſes. There is a wine and vineger made or condite rather with Betony, ſoueraign for to ſtrengthen the ſtomack, and clarifie the eieſight. This glorious prerogatiue hath Betony, that look about what houſe ſoeuer it is ſet or ſowed, the ſame is thought to be in the protection of the gods, and ſafe enough for committing any offence, which may deſerue their vengeance and need any expiation or propitiatory ſacrifice.

A kind of wild Gilloflo. In the ſame Spain groweth *Cantabrica, lately found by the people Cantabri, and no longer ſince than in the daies of *Auguſtus Cæſar*. This herb is to be ſeen euery where, riſing vp with a benty or ruſhy ſtalk a foot high, vpon which you may behold ſmall long floures, like to cups or beakers, wherein lie encloſed very ſmall ſeeds. Certes, to ſpeak the truth of Spain, it hath bin I alwaies a nation curious in ſeeking after ſimples. And euen at this day in their great feaſts Much like to the Welch Metheglin. where they meet to make merry Sans-nombre, they haue a certain waſſell or Bragat, which goeth round about the table, made of honied wine or ſweet mead, with a hundred diſtinct herbs in it: and they are perſuaded that it is the moſt pleaſant and wholſomeſt drinke that can be deuiſed: yet there is not one amongſt them all who knoweth preciſely what ſpeciall herbs there be in all that number, in this only they be all perfect, that there go a hundred ſeuerall kinds therto, according as the name doth import.

In our age we remember well, that there was an herb diſcouered in the Marſians country: and yet it groweth alſo amongſt the people named Æquiccole, neare vnto the borough Neruesia, Beare-foot: and they cal it *Conſiligo: this is a ſoueraigne plant, as we ſhall ſhew hereafter in place conK uenient, for thoſe that be ſo farre gone in a Phthiſicke or conſumption, as no man would hight them life and recouery.

Of late daies *Seruilius Damocrates*, a famous practitioner in Phyſick, brought to light an herb which he termed Hiberis, a deuiſed and fained name for his own pleaſure, and nothing ſignificant, as may appeare by a certain *Poem that he made as touching the diſcouery of that herbe. Written in Iambicke verſes as appeareth in *Galen.* It commeth vp moſt willingly about old tombes and ſepulchres, decaied wals, and ruinat buildings, in vntoiled and neglected places, and namely, common high waies. It beareth floures at all times, and is leaued like to Creſſes: the maine ſtalke is a cubit high: but the ſeed ſo fine and ſmall, that hardly they can diſcerne it. The root alſo hath the very ſmel of Creſſes: it ſerueth to many good purpoſes, but with moſt ſucceſſe in Summer time, & neuer but when it is green and L freſh gathered. Much ado and trouble there is about the punning and ſtamping of it. Being tempered and incorporate with a little hogs greaſe, it is ſingular to be applied to the paine of the hucklebone called Sciatica, as alſo to the gout of any ioints whatſoeuer. If the patient be a man it muſt lie bound faſt vnto the place four houres at the moſt: but women may abide it but half ſo long, prouided alwaies, that preſently vpon this medicine they go down into an hot bain, and after they haue bathed, annoint their bodies all ouer with wine and oile. Thus muſt the patient doe once euery 20 daies, ſo long as there remaineth any grudging or minding of the foreſaid pain. And ſurely in this ſort it drieth vp and cureth all inward and ſecret rheums running neare vnto the bones. Howbeit, this caueat would be giuen, not to lay this plaſter too in the very heat and fury of the pain or diſeaſe, but the time muſt be waited when the extremity is ſomwhat ſla- M ked and ouer paſt.

Moreouer, other liuing creatures alſo there be beſides men, to which we are to attribute the our Celendine inuention of herbs: as firſt and principally, the great *Celendine, called in Greek Chelidonia, for that the old Swallows with the helpe of this hearb helpe their young ones to ſee again, yea though

20030
copy 1

A though their eies were plucked out of their head, as ſome are of opinion. Of this herb there be two kinds: the greater, which putteth forth many ſtems, & thoſe full of branches, beareth leaues like vnto the wild * Parſnep, but that they be larger. The herb it ſelfe groweth vp to the height of two cubits. The leaues be whitiſh or hoary, like as the whole plant it ſelfe, al ſaue the floure, which is yellow. The whole herb yeeldeth a biting and fretting juice, of the colour of Safron: and it bringeth forth ſeed reſembling that of Poppy. The leſſe * Celendine is ſeen with leaues faſhioned much after the Ivy, but that they be rounder. Both Celendines do floure in the ſpring about the time that the ſwallows come abroad and ſhew themſelues vnto vs, and thoſe floures begin to fade again vpon the departure of that bird from vs. The onely time to draw or preſſe their juice from them, is whiles they be in the floure: which if it be put into a braſen pan, and
B ſeeth gently vpon hot embers or aſhes only, together with the beſt Atticke honey, is a ſingular medicine to diſcuſſe and ſcatter the cloudy films that dim the eie-ſight. The ſaid juice alone without any other preparations, goeth to the making of many collyries or eyeſalues, which be called Chelidonia, by reaſon of that ingredient.

Touching the Dogs graſſe Canaria, it took that name in Latin, becauſe dogs vſe therwith to diſcharge their gorge & whet their ſtomackes when their appetite to meat is gone. A ſtrange thing of theſe dogs: we ſee them chew this herb in our ſight ordinarily euery day, yet ſo, as wee neuer can tel which * herb it is that they haue bitten: for we may perceiue it only when it is eaten down. But no maruel if this creature be ſo ſpightful as to conceale from vs a purgatiue herb, conſidering a greater malice that he ſheweth in another: for it is ſaid, that if a dog be bitten by a
C ſerpent, he hath recourſe by and by to a certaine herb that cureth him preſently; but he will be ſure that no man ſhall ſee him when he croppeth that herb.

Yet the poore hinds (ſimple and harmleſſe creatures they) are not ſo coy and dainty of their knowledge, for they haue ſhewed vs the plant * Elaphoboſcon, whereof I haue already written: like as the herb * Seſeli alſo, which preſently after they haue calued, they feed vpon in our ſight, & make it not ſtrange. Nay, they haue not thought much to impart to vs the vertue of the herb Dictamnus (as I haue partly declared heretofore) for we may euidently ſee them after they bee ſhot or wounded, to go forthwith vnto this hearb, and no ſooner haue they eat of it, but immediatly the arrows or darts wherewith they were hurt and ſticking in them, fall out of their bo-
D dies. This plant is found growing no where but in the Iſland Candy. The branches be exceeding fine and ſlender: it reſembleth in ſome ſort Penyroial. At the tongues end hot it is and biting. And the leaues only are in vſe: for * neither floure nor ſeed it hath, ne yet any ſtem or ſtalk. As for the root, as it is ſmal and little, ſo is it * needleſſe for any good it doth in Phyſick: a rare plant this Dictamnus is, for euen in Candy, the naturall place therof, it grows not euery where, but within ſome ſmall compaſſe of ground within that Iſle: and there Goats haue a wonderful deſire to be feeding vpon it. Mary in lieu of this true Dictamnus, there is a baſtard kind found
* in many countries, called Pſeudodictamnum: in leafe it reſembleth the other, the branches be leſſe: and ſome there be who name it Chondris. That it is of weaker operation, and nothing ſo effectuall as the former, a man ſhall ſoone find by the taſte: for take neuer ſo little of the right Dictamnum into the mouth, it ſetteth it preſently on a fire. They that vſe to gather theſe Di-
E ctamnes, beſtow them cloſe ſirapped within the ſtems of Ferula or reeds, & then bind them faſt together, for feare that their vertue & ſtrength ſhould exhale & vaniſh away. Writers there be who affirm, that both the one & the other Dictamnum do grow in many countries: but the worſt is that which commeth vp in rich and fat grounds: therfore they that would meet with the right Dictamnum, muſt ſeek it in rough places, for no where els it loues to grow. A third kind there is of Dictamnum, and ſo called: but neither in ſhape anſwerable, nor in effect comparable to the other. In leafe it reſembleth water Mints, but that the branches be greater. Moreouer, this ſetled and deep perſuaſion men haue of Candy, that what Simples ſoeuer grow there, they be infinitly better than all others of the ſame kind what ſoeuer. Next vnto which Iſland there goeth a great name and opinion of the mountain Pernaſſus, for excellent herbes: how ſoeuer otherwiſe
F mount Pelius in Theſſaly, the hil Telechrius in Eubœa: and generally, al Arcadia, & the country of Laconica throughout, be renowned much for plenty of good ſimples. And yet the Arcadians verily vſe no other Phyſicke but milke onely, and that about the ſpring, at what time all herbs there, be in their beſt verdure and fulleſt of ſap; ſo as the vdders of beaſts be their Phyſitians, yeelding them medicines out of their paſtures. But aboue all, they vſe to drink cow milk,

for

* *Paſtinaca ſerratula.* Some read *Ranunculi*: Crowfoot, or rather *Dioſcor.*

* *Scrophularia*, i. Pilewort or Figwort. This floureth ſooner, to wit, in February.

* With vs they doe eat the common Quich graſſe.

* *Gratia Dei.*

* Which the old Romanes called *Silit*: whereof *Feſtus* thinketh that *Siluiti* (i. a break faſt, tooke the name: becauſe they vſed before dinner or nooner refection, to drinke a draught of wine aromatized with this hearbe.

* In *Dioſcor.* whom *Pliny* ſeemeth here to tranſlate, it ſhould be read thus, οὐτε ἄνθος, οὐτε καρπὸς σύμφορα ἐστι, not ſpica, that is, neither floure nor ſeed is medicinable: for that it hath floures, appeareth by *Virgil* 12 *Æneid.* in theſe verſes: *Dictamni genetrix Cretæa carpit ab Ida, puberibus caulem foliis, & florе comantem Purpureo, &c.*

* Yet *Dioſcor.* ſaith, that it helpes women to ſpeedy childbirth.

for that thoſe kind of cattell, feed indifferently in manner of all kind of herbs. Certes, of what power and efficacy herbs are, and namely, what effects they may work euen by the milk of four-footed beaſts graſing and paſturing thereupon, appeareth manifeſtly by two notable examples which I will report vnto you. About Abdera, and along the ſtreet or high way called *Diomedes* cauſey, there lie certain paſtures, wherein all the horſes that feed, become inraged, & ſtark wood thereby. Semblably, the herbage belonging to Potniæ, a towne in Magneſia, driueth Aſſes to a kind of madneſſe. G

Leauing now thoſe herbs which took their appellations of beaſts, let vs proceed to others. Among which, Ariſtolochia deſerueth to be ranged with the beſt and principall: an herb which ſeemeth to haue had that name giuen it by great bellied women, for that it is * ἄριστα λοχείαις. Our Countreymen of Italy call this herbe in Latine Malum terræ, which is as much to ſay, as the * Apple of the earth: and they do make foure kinds thereof. The firſt hath a round root ſwelling and bunching out: leaues reſembling the Mallow, and partly thoſe of Iuy, but that they be of a more browne and duskiſh colour, and withall, ſofter in the hand. The ſecond Ariſtolochia or Birthwort is taken to be the male, and hath a root as thicke as a good Baſton or ſtaffe, growing longwiſe to the length of foure fingers. The third, which by ſome is called Clematis, by others, Ariſtolochis of Candy, hath a root exceeding long and ſlender, like to that of a young Vine: and this is reputed of all others for the beſt and moſt effectuall. The roots of them all be of a Box colour, the ſtalks ſmall, and the floures purple. They beare little prety berries, much like to capers. But it is the root alone which is medicinable. A fourth kinde there is alſo, which they call Piſtolochia, ſmaller and ſlenderer than the laſt before, named Clematis. A root it hath diuided into many fibers or ſtrings, growing thick one by another, to the thickneſſe of big and well growne rushes: whereupon ſome haue giuen it the name of Polyrrhizon. All the ſort of theſe Ariſtolochies yeeld an aromaticall odour: but the long and ſmaller root is that which is moſt pleaſant to ſmell vnto: for it hath a fleſhie rind, and is one of the principall ingredients which enter into thoſe odoriferous perfumes and ointments which ſtand moſt vpon Nard: theſe Birth-woorts delight all of them to grow vpon plaines and battle grounds. The right ſeaſon to digge or draw them out of the earth, as in harueſt time: and then after they be rid and ſcaled as it were, from the earth or mould ſticking vnto them, they vſe to lay them vp ſafe. Howbeit the beſt ſimply are thoſe which come out of Pontus. And take this for a generall rule, That in euery kind, the weightieſt is alwaies moſt medicinable. The round rooted Ariſtolochie hath a ſpeciall property againſt the poiſon of ſerpents. Yet there goeth the greateſt name of the long, for this excellent qualitie, if it be true, that is reported thereof: namely, that if a woman newly conceiued with childe, applie the root thereof to her naturall parts within a morcell of raw bœufe, it will cauſe her to breed and forme in her wombe a man childe. Our Fiſhers heere by in Campaine, doe tearme the round root, The poyſon of the earth. In very truth I haue ſeene them with mine owne eyes to ſtampe the ſaid root, and incorporat it with lime into a paſte, and ſo to caſt it into the ſea in ſmall pellets or gobbets, for to catch fiſhes: and I aſſure you they will skud amaine, and make haſte to this bait, and be very eager of bit: but no ſooner haue they taſted thereof, but they will turne vp their bellies, and lie floating aloft vpon the water ſtarke dead. As for that Ariſtolochie, which for the manifold rootes that it hath is called Polyrrhizos, it is thought to be ſoueraigne for conuulſions or crampes, contuſions, or bruiſes; for ſuch alſo as haue fallen from ſome ſteepe and high place, if the root be drunke in water. Likewiſe, the ſeed of this kinde, is ſuppoſed ſingular good for the pleuriſie: and to corroborate, ſtrengthen and heat weake and diſtempered ſinewes. The ſame likewiſe may be reckoned for a * Satyrion. H I K L

It remaineth now to knit vp this diſcourſe with a rehearſall of all the operations and effects of the plants before named. To begin then with the moſt dangerous accident of al other; to wit the ſting of ſerpents, theſe hearbes following are very medicinable and effectuall in that caſe: namely, Brittannica, and the roots of all the kinds of Panaces taken in wine. The floure & ſeed beſides (of Chironium eſpecially) if it be drunk, or otherwiſe applied as a liniment with wine and oile. Alſo the wild Origan or Marjeram called Cunila Bubula, hath a ſingular property by it ſelf that way: like as Polomonia, otherwiſe called Philetœria, if one take 4 drams weight of the root in wine. Semblably, Teucrion, Sideritis, & Scordotis giuen in wine. But more particularly againſt ſnakes, aders, & the like, the ſaid herbs be right ſoueraign, either inwardly taken or M

out-

*i. Excellent good for women in child-bed. Wherein Pliny is ſomewhat ouerſeen but his error is not great, ſeeing that women with child vſe ordinarily alſo to be brought a bed and lie in.

* Meant by Ariſtolochie or Birthwort the round.

* Any herbe good to prouoke filthy luſt. For although there be a ſpeciall herb of that vertue ſo called, yet by a kind of Synecdoche, all others of like operation may be termed Satyria.

20030
copy 1

A outwardly applied vpon the wound,be it in iuice,ſubſtance of leaſe,or decoction,it skilleth not whether:for which purpoſe a dram weight of the root of great Centaurie drunk in three cyaths of white wine is excellent:as for Gentian,it ſerueth properly againſt ſnakes,if it be taken to the poiſe of two drams with Pepper and Rue, in 6 cyaths of wine,green or dry, it makes no matter. Touch herbe Willow or Lyſimachia, ſerpents cannot abide the very ſmell thereof, but flie from it. If any body chance to be ſtung alreadie by them, there is not a better medicine than to giue Celendine in drinke. But of Betonie aboue all the reſt there is made a moſt ſoueraigne ſalue to be laied vnto the place that is ſtung. And ſuch a contrarietie in nature or Antipathie there is)by folks report)between them and this herb, that if the leaues thereof be ſtrewed in a circle round about them,the ſerpents within wil neuer giue ouer flapping with their tailes,and
B beating their own ſides,vntill they haue killed themſelues. Now for their ſting, it is an vſuall practiſe to giue inwardly one dram weight of the ſeed of Betonie in three cyaths of wine,or els to incorporate 3 drams of the pouder in one ſextar of water, and lay it as a cataplaſme to the ſore. Cantabrica, Dictamnum,and Ariſtolochia,ſerue likewiſe for good counterpoiſons,in caſe a dram weight of their root be giuen in one hemine of wine. But then the Patient muſt vſe to drink it often. And verily Ariſtolochia worketh the ſame effect,if it be reduced into a liniment and ſo applied:ſo doth Piſtolochia, which herb is ſo aduerſatiue vnto ſerpents, that if you doe but hang it vp in the chimney ouer the hearth, it will chaſe away all kind of ſerpents out of the houſe.

C

Chap. IX.

¶ *Of Argemonie, Agarick,and Echium. Of Henbane and Vernaine. Of Blattaria and Lemonia. Of Cinquefoile, Carot, and the Clot or great Bur. Of Cyclaminus or Sow-bread, and Harſtrang : hearbs all ſingular againſt the ſting of Serpents.*

THe root of Argemonia taken to the weight of one Roman denier in 3 cyaths of wine,is ſingular againſt the ſting of ſerpents. And ſince I am come to mention this herbe,I thinke it conuenient to diſcourſe farther thereof: like as of other ſimples alſo, which I meane to name firſt,before that I treat of their vertues and effects. And in this courſe of ſetting downe medicines,euer as I meet with any herb of any ſingularity,I will range it there whereas I know
D it to be moſt ſoueraigne and effectuall. Wel,this * Argemony aforeſaid hath leaues like to Anemony,*i.* Roſe Perſly or Windfloure:jagged they be in maner of garden Parſly. Heads it beareth in the top of euery ſtalke or branch,reſembling thoſe of wild Poppy or Corne-roſe : and a root alſo not vnlike to that of the ſaid herb. A juice it yeeldeth,yellow as Safron,hot,ſharp,and biting in taſt. With vs here in Italy it groweth vpon corn lands. Our countrymen haue deſcribed three kinds therof,but they allow and commend that only,which hath a root ſenting much of Frankincenſe.

* An hearbe like to the wild Poppie.

Touching Agaricke, it is a fungous excreſcence growing out of certain trees neare vnto the ſtraits of Boſphorus,much like vnto a white Muſhrum. The ordinary doſe or receit thereof, to be giuen,bruiſed,and beaten ſmall into pouder, is to the weight of two drams in two cyaths of
E Oxymel or honied vineger. That which is found in Gaule or France, is thought to be weaker in operation. Moreouer,that Agaricke is counted the male which is more maſſiue or compact, and bitterer withall:but one ill quality it hath,namely,to make the head to ake. The female is of a more looſe and ſofter ſubſtance:which at the firſt when you taſt it ſeemeth ſweet,but within a while it turneth to be bitter.

Echium is of two kinds. One of them is like to Peniroyall,garniſhed & crowned (as it were) with tufts of leaues in the head : which being giuen to the weight of two drams in 4 cyaths of wine,is ſingular good for the venome of ſerpents,inflicted by their ſting. The like effect hath the other alſo,which is diſtinctly knowne from the other by the rough and prickie downe that the leaues do beare,and it carieth in the top little knobs reſembling vipers heads:and this may
F be taken either in wine or in vineger,chuſe you whether.

The great Clot-bur,called in Greek Arcion,ſome haue named in Latine Perſonata. There is not a plant in the field that carieth a broader leaſe,and beſides, furniſhed it is with as big Burs. The root of this hearb boiled, the Phyſitians preſcribe to be giuen in vineger to drinke againſt the ſting offerpents.

Hen-

Henbane, ſtamped leaues and all, is ſingular to be taken in wine, eſpecially againſt the ſting of the Aſpides. G

*i. Vervaine. But of all other herbs, there is none more honored among the Romans than * Hierobotane, called alſo otherwiſe in Greek Periſtereon: which we in Latine name Verbenaca. This is that hearb, which (as I haue declared heretofore) our Embaſſadors vſe to cary with them when they go to denounce war, and to giue defiance vnto our enemies. VVith this herbe the feaſtiuall table of * *Iupiter* is wont to be ſwept and clenſed with great ſolemnitie; our houſes alſo be rubbed and hallowed, for to driue away ill ſpirits. And hereof be two kinds. That which they take to be the female, is ſtored well with leaues; the male hath them growing but thin: yet both of them put forth many ſmall and ſlender branches, commonly a cubit long, and cornered. The leaues be leſſer and narrower than thoſe of the Oke, but deeper they be indented, and the partition wider: the floures be of a * gray colour, the root long and ſmall. It groweth euery where vpon plains ſubiect vnto waters. Some writers make no diſtinction at all of male & female, but hold them all to be of one and the ſame kind, becauſe they work the ſame effects. In France the Druidæ vſe them both indifferently, in caſting lots, telling fortunes, & foreſhewing future euents by way of propheſie. But the wiſe men or ſages called Magi, ouerpaſſe themſelues mightily in this herb, and ſhew their foolery and vanity without all ſence and reaſon: They would beare vs in hand forſooth, that whoſoeuer be rubbed all ouer the body therewith, ſhall obtaine whatſoeuer their heart deſireth, be able to cure and driue away all manner of agues, reconcile them that be fallen out, make friendſhip between whom they liſt, and in one word, giue remedy to any diſeaſe whatſoeuer: they giue moreouer expreſſe order, that it be gathered about the riſing of the great dog-ſtar, but ſo, as neither Sun nor Moon be at that time aboue the earth to ſee it; with this eſpeciall charge beſides, that before they take vp the herbe, they beſtow vpon the ground where it groweth, honey with the combes, in token of ſatisfaction and amends for the wrong and violence done in depriuing her of ſo worthie an hearbe. They reſt not ſo, but when theſe ceremonious circumſtances be performed, they inioine them alſo who are to dig it vp, for to make a circle round about the place with ſome inſtrument of yron and then to draw and pluck it vp with the left hand in any wiſe & ſo to fling it aloft ouer their heads vp into the aire: which done, they appoint preciſely that it be dried in the ſhade, leaues, ſtalkes, and roots, euery one apart by themſelues. To conclude, they adde moreouer and ſay, that if the hall or dining chamber ſprinckled with the water wherein Veruaine lay ſteeped, all that ſit at the table ſhall be very pleaſant, and make merrie more jocundly. VVell, to leaue theſe toies and fooleries, the truth is this, ſtamp and beat it, giue the juice or pouder therof in wine, it is a good defenſatiue againſt the poiſon of ſerpents.

*Dapalis. Arnob. lib. 2.

*Flos Glaucus,

H

I

K

An herb there is much reſembling Mullen or Langwort, and indeed ſo like as oftentimes one is taken for the other, howbeit, the leaues be not altogether ſo white, and more little branches it putteth forth, bearing likewiſe a pale yellow floure: caſt this herb or ſtrew it in any place all the moths thereabout will gather to it, whereupon at Rome they call it Blattaria.

The herbe Lemonium yeeldeth a white juice, much like vnto milke, which will harden and grow together in manner of a gum: and it groweth in moiſt places. The weight of one denarius giuen in wine, is a ſingular preſeruatiue againſt the dangerous ſting of ſerpents. L

As for Cinque ſoile or fiue leaued graſſe, there is not one but knoweth it: ſo common it is, and commendable beſides for the * ſtrawberries which it beareth. The Greeks call it Pentapetes, Chamæzelon, or Pentaphyllon: the Latines Quinquefolium. The root when it is new digged, looketh red: but as it beginneth to drie aboue ground, ſo it waxeth black, and becommeth alſo cornered. It tooke the common name both in Greeke and Latine, of the number of leaues which it beareth. This herb herein is of great affinitie with the vine, that they both bud, ſpring leaſe, and ſhed the ſame together. It is vſed alſo about purging & bleſſing of the houſe, againſt naughtie ſpirits or inchantments.

*Pliny herein erreth groſſely. Indeed the leaues of Cinque ſoile are much like to the Strawberrie leaſe: but as the one hath no fruit or berry at all, ſo the other (to wit the ſtrawberrie wire) puts forth but three leaues.

*The tame and the wilde.

As for Sparganium, an herb ſo called by the Greeks, the root thereof is good to be giuen in white wine againſt venomous ſerpents. M

Of Carrots, *Petronius Diodotus* hath ſet downe 4 ſeueral kinds. But what need I to go through them all foure, ſeeing they may be reduced well enough into * twaine, and doe require no other diſtinctions. The beſt and moſt approued Carrots be thoſe of Candy: the next to which in goodneſſe come out of Achaia. But generally in what countrey ſoeuer they grow, the better

be

20030
copy 1

A be ſuch as come vp in the ſounder and drier grounds. As touching the Candy Carot, it reſembleth fennel, but that the leaues ſtand more vpon the white; they be ſmaller alſo and hairy withall. The ſtem groweth vpright a foot high, and hath a root odoriferous to ſmell vnto, and of a moſt pleaſant taſt: this ioieth in ſtony places expoſed to the South quarter of the world. As for the other Carots of a wild nature, In what countrey grow they not? you ſhall finde them vpon earthie bankes and hils, you ſhall haue them about high waies, but neuer ſhal a man meet with them in a leane and hungry ground; they loue a battle and fat ſoile: their leaues come neare to the Coriander: their ſtem ariſeth to a cubit heigth, bearing round heads, three ordinarily, and otherwhiles more: the root is of a wooddy ſubſtance, and being once dried, it ſerueth to no purpoſe. The ſeed of this kind is like vnto Cumin; but of the former, to Millet grain, white, quick, and ſharp; and they be all odoriferous and hot in the mouth. The ſeed of the ſecond is more æ-
B gre and biting than the former, and therefore ought to be taken in leſſe quantitie. As for the third kind (if we liſt to make ſo many) it is much like to the wild Parſnep, called in Greek Staphylinos, and in Latine Paſtinaca Erratica: the ſame beareth a ſeed ſomwhat long in form, and a ſweet root. All the ſort of theſe Dauci or Carots, are ſafe enough from the bit of four-footed beaſts both winter & ſummer, vnleſſe it be after they haue caſt their abortiue fruit before-time [for then they ſeek therto to be cleanſed of their gleane.] Of all Carots, the ſeeds be vſed only: but that of Candie affordeth the root alſo, which is ſweet: but both the ſeed of the one ſort and the root of the other, be moſt appropriat remedies againſt ſerpents: a dram weight in wine is a ſufficient doſe at a time: which alſo may be giuen in a drench to foure-footed beaſts that be ſtung by them.

C Touching the herb Therionarca (I mean not that which the Magitians vſe) it groweth alſo in this part of the world here with vs in Italy: many branches it putteth forth, and ſprings thick with diuers ſhoots from the root: the leaues be of a light green, and the floure of a red roſe colour: it killeth ſerpents outright; beſides, it hath this property, That if it be brought neere vnto any wild beaſt what ſoeuer, it benummeth their ſences [whereupon it took that name.]

Perſolata, which the Greek writers call * Arcion, there is not one but knoweth: large leaues it hath, and bigger than the very Gourds; more hairy, blacker alſo and thicker; a white root and a great: this root taken in wine to the weight of two deniers Roman, is good likewiſe againſt the venom of ſerpents. In like manner, the root of Cyclaminus or Sow-bread is as effectual againſt them all: leaues it hath ſomewhat reſembling thoſe of Ivy, but that they be of a more duskiſh
D and ſad greene, ſmaller alſo and without corners, wherein a man may perceiue certaine whitiſh ſpecks. The ſtem is little, and hollow within: the flours of a purple colour; the root broad (ſo as a man would take it to be a Turnep) and couered ouer with a black rind: it groweth in ſhadowy places. Our countrymen here in Italy call it in Latine Tuber terræ, that is to ſay, The knur or bunch of the ground. Sowne and planted it would be in euery garden about an houſe, if ſo be it be true that is reported of it; namely, that whereſoeuer it groweth, it is as good as a countercharm againſt al witchcraft and ſorceries: which kind of defenſatiue is called properly Amuletum. Moreouer, this root (they ſay) if it be put into a cup of wine, turneth the brain preſently, and maketh as many drunk as drink therof. For the better keeping and preſeruing of this root,
E it muſt be ordered after the manner of Squilla or Sea-onion roots, (*i.*) cut into thinne ſlices or roundles, then dried, and ſo laid vp: the ſame alſo is vſually ſodden to the conſiſtence or thickeneſſe of hony. As good as this root is in thoſe former reſpects, yet it is not without ſome venomous quality; for it is commonly ſaid, That if a woman with child chance to ſtep ouer it, ſhee will fall preſently to labour before her time, and loſe the fruit of her wombe. A ſecond kind of Cyclaminus or Swine bread I finde, ſyrnamed by the Greekes * Ciſſanthemos, growing with ſtems full of knots or joints, hollow within and good for nothing; far different from the former, winding and claſping about trees; bearing berries much like to thoſe of Ivy, but they are ſoft; a white floure faire and louely to ſee too, but a needleſſe root for any goodneſſe in it: the berries that it beareth be only in vſe, and thoſe are of a ſharp and biting taſt, & yet they be viſcous and
F clammy to the tongue: theſe being dried in the ſhadow and ſtamped, are afterwards reduced into certain bals or troſches. My ſelf haue ſeen a third kind alſo of Cyclaminos, carying the name beſides of Chamæciſſos, which brought forth but one only leafe: the root was much forked & diuided into branches, wherwith folk vſed to kil fiſhes. But among al other herbs of name, Peucedanum is much talked of and commended: principally, that which groweth in Arcadie: next

* Some take it to be the Clot bur, or Butterbur.

* κιανόρυπος. *Dioſcor. ideſt,* I cafed like to Ivie.

to it, moſt account is made of that in Samothrace: a ſlender ſtalk it carrieth and a long, reſembling the ſtem of Fennell: neere vnto the ground it is repleniſhed well with leaues: the root is black, thick, full of ſap, and of a ſtrong and vnpleaſant ſmell: it delighteth to come vp and grow among ſhady mountains. The proper time to dig it out of the ground, is in the later end of Autumne: the tendereſt roots and thoſe that run deepeſt downe into the earth, are moſt commendable. The manner is to cut theſe roots ouerthwart into certaine cantels or pieces of foure fingers in length, with kniues made of bone; whereout there iſſueth a juice which ought to be dried & kept in the ſhade: but the party who hath the cutting of them, had need firſt to annoint his head all ouer and his noſthrils with oile roſat, for feare of the gid; and leaſt he ſhould fall into a dizzineſſe or ſwimming of the braine. There is another juice or liquor found in this plant lying faſt within the ſtems therof; which they yeeld forth after inciſion made in them. The beſt juice is knowne by theſe marks; It carieth the conſiſtence of honey, the colour is red, the ſmell ſtrong, and yet pleaſant, and in the mouth it is very hot and ſtinging. Much vſe there is of it in many medicines, as alſo of the root and decoction thereof: but the juice is of moſt operation; which being diſſolued with bitter almonds or rue, people vſe to drink againſt the poiſon of ſerpents; & in caſe the body be annointed all ouer with oile, it preſerueth them ſafe againſt their ſtings. G H

Chap. X.

¶ *Of ground Elder or Wallwoort. Of Mullen or Taper wort. Of the Aconit called Thelyphonos. Of remedies againſt the pricke of Scorpions, the venome of Hedge-toads, the biting of mad Dogs: and generally againſt all poyſons.* I

THe ſmoke or perfume alſo of VValwort (a common herb and knowne to euery man) chaſeth and putteth to flight any ſerpents. The juice of * Polemonia, is a proper defenſatiue eſpecially againſt ſcorpions, if one haue it tied about him or hanging at his neck: likewiſe it reſiſteth the prick of the ſpiders Phalangia, and any other of theſe venomous vermins of the ſmaller ſort. Ariſtolochia hath a ſingular vertue contrary vnto ſerpents: ſo hath Agaricke, if foure oboli thereof be drunke in as many cyaths of ſome artificiall or compound aromatized wine. Vervaine is a ſoueraigne herb alſo againſt the venomous ſpider Phalangium, being taken in wine or oxycrat, *i.* vineger and water: ſo is Cinqueſoile, and the yellow Carrot.

*Sauge de bois.

That herb which the Latines call Verbaſcum, *i.* Lungwort or Hightaper, is named in Greek Phlomos. Two ſpecial kinds there be of it: the one is whiter, which you muſt take for the male; the other black, & that may go for the female. There is a third ſort alſo, but it is found no where but in the wild woods. The leaues of all the former, be broader than thoſe of the Colewort, and hairy withal: they beare a mainvpright ſtem, a cubit in height with the vantage: the ſeed is black and of no vſe in Phyſicke: a ſingle root they haue, of a finger thicknes. Theſe grow alſo vpon plains and champian grounds. The wild kinde beareth leaues reſembling ſauge: the branches be of a wooddy ſubſtance, & the ſame grow high. There be moreouer of this kind two other herbs named * Phlomides, both of them hairy; their leaues be round, and they grow but low. A third ſort there is beſides, named by ſome Lychnitis, and by others Thryallis: it ſheweth 3 leaues or foure at the moſt, and thoſe be thick & fat, good to make wyks or matches for lights. It is ſaid, that if figs be kept in the leaues of that which I named the female, they will not rot. To diſtinguiſh theſe herbs into ſeuerall kinds, is a needleſſe peece of work, conſidering they agree all in the ſame effects: their root together with rue, is to be drunk in water againſt the poyſon of ſcorpions: true it is, that the drinke is very bitter, but the effect that it worketh maketh amends. K L

*Some take theſe for the Cowſlip and Primroſe.

There is an herbe called by ſome * Thelyphonon, by others Scorpion, for the reſemblance that the root hath to the Scorpion; and yet if Scorpions be but touched therwith, they will die thereupon: no maruell therefore if there be an ordinary drinke made of it againſt their poiſon: [and here commeth to my mind that which I haue heard; namely, that if a dead ſcorpion be rubbed with the white Ellebore root, it wil reuiue and quicken again.] The ſaid Thelyphonon hath ſuch a ſpightful nature againſt the four-footed beaſts [of the female ſex] that if the root be laid to their ſhap or naturall place, it killeth them: and if the leafe, which is like vnto the Cyclamin or Sowbread leafe aboue named, be applied in that maner, they will not liue one day to an end. This herb is parted and diuided into knots or joints, taking pleaſure to grow in coole and ſhady places. To conclude and knit vp theſe remedies againſt ſcorpions; the juice of Betonie, and of

*Aconitum Pardalianches, Libard-baine. M

20030
copy 1

A of Plantaine likewiſe, is a ſingular remedie for their poiſon.

Moreouer, Frogs (ſuch eſpecially as keep in buſhes and hedges, and be called in Latine Rubetæ, *i.* toads) are not without their venom: I my ſelf haue ſeen theſe vaunting Montebanks calling themſelues Pſylli, as comming from the race of thoſe people Pſylli who feared no kind of poiſon; I haue ſeen them (I ſay) in a brauery (becauſe they would ſeem to ſurpaſſe all others of that profeſſion) to eat thoſe toads baked red hot between 2 platters; but what became of them? they caught their bane by it, and died more ſuddenly than if they had bin ſtung by the Aſpis: but what is the help for this rank poiſon? ſurely the herb * Phrynion drunk in wine. Some cal it Neuras, others Poterion: pretty flours it beareth: the roots be many in number, full of ſtrings like vnto ſinews, and the ſame of a ſweet & pleaſant ſent. Likewiſe Aliſura is counted another
B remedy in this caſe: an herb it is, called by ſome Damoſorium, by others Liron: the leaues might be taken for Planta in, but that they be narrower, more iagged and plaited, bending alſo toward the ground; for otherwiſe ribbed they be and full of veins, as like as may be to Plantain. As for the ſtalk, it is likewiſe one and no more, plain and ſlender, of a cubit in heigth; in the head whereof it hath knobs; roots growing many and thick together, and thoſe but ſmall, like vnto thoſe of the blacke Ellebore, but they be hot and biting, of a ſweet and odoriferous ſmell, and of a fatty ſubſtance withall: it groweth ordinarily in watery and moiſt places. And yet there is a ſecond kind of it which commeth vp in woods, of a more duskiſh and blacker colour than the former, bearing bigger leaues: the root of both is of ſingular operation againſt the venomous frogs or toads aboueſaid: alſo againſt the ſea-hare, if it be taken in wine to the weight of one dram. And
C ſince we haue mentioned the ſea-hares, take this withall, That Cyclaminos alſo is ſoueraigne againſt their venom. Moreouer, a mad dog letteth in a dangerous poiſon by the wound that his tooth maketh, againſt which there is not a better thing than dog-roſe of the Eglantine called Cynorrhodon, as I haue before declared. Plantain is a ſingular herb againſt the biting of any venomous beaſt whatſoeuer, whether it be taken inwardly in drink, or outwardly applied. Betonie is likewiſe good therfore if it be drunk in old wine. Veruain, which the Greeks call Periſtereos, is an herb bearing one main ſtalk of a good heigth, furniſhed well with leaues, ſpreading forth toward the head into other branches, much ſought to by doues and pigeons, whereupon it took the foreſaid name Periſtereos. They ſay, whoſoeuer carry this herb about them, there dare not a dog bark at them. Thus much as touching the dangers proceeding from venomous beaſts.

D What remaineth now but in the next place, to treat as well of ſuch ſorceries and maleficiall poiſons, as men haue deuiſed and practiſed to the miſchiefe of their own kind, as of their remedies? where in the firſt place there preſenteth it ſelf vnto vs that noble herb Moly, ſo much commended by the Poet *Homer*, as a ſoueraigne preſeruatiue not only againſt all thoſe wicked inventions, but alſo againſt the ſecret and diueliſh practiſes; to wit, charmes and inchantments, wrought by Art magick and witchcraft. Next vnto which, the herbs * Mithridation, Scordotis, and Centaury: alſo the ſeed of Betony drunk in honied wine or ſweet cuit: the pouder alſo of the dried herb it ſelfe, to the weight of one dram taken in 4 cyaths of old wine, doth expell out of the body & euacuat by the ſeege any poiſon whatſoeuer; but the patient muſt be forced to vomit vp the firſt potion, and then to recharge again & take another draught of the foreſaid me-
E dicine. And verily it is a common ſpeech, That whoſoeuer vſe to taſt euery day a little of Betony, ſhall neuer catch harm by any poiſoned cup. If a man or woman chance to haue drunk down any poiſon, the root of Ariſtolochia is a preſent remedy, vſed in that order as I haue preſcribed before in caſe of ſtinging by venomous ſerpents. The like effect hath the iuice of Cinquefoile. Semblably Agarick, if it be taken to the weight of one denier Roman in three cyaths of honied water or mead, is of the ſame operation; with this charge, That the party do lay vp his ſtomack or caſt before. There is an herb called Calves-ſnout, in Greeke Antirrhinon or Anarrhinon, a kind of wild Lichnis like vnto Line or flax, with little or no root at all, carying a floure reſembling the Hyacinth or Crowtoes, and the ſeed much like a calues ſnout or muzzle: the Magitians haue a great opinion of this herb, That whoſoeuer be rubbed all ouer with it, or annointed
F throughly with the iuice thereof, ſhall looke more beautifull, louely, and amiable: and whoſoeuer weareth it in a bracelet about the wreſt or arme, ſhall take no harme by charme, ſorcerie, witchcraft, or poiſon. The like conceit they haue of another herb called * Euploea; and they affirme, That if any man or woman be annointed therewith, they ſhall grow in great credit and reputation with the people. Moreouer, they ſay, that the herb Artemiſia or Mugwort will preſerue

* Some take it for *Ruta muraria*, or *Saluia vita*, a kind of Saxifrage: or rather Maiden-haire.

* Whereof he writeth in the beginning of the ſixt chapter of this booke.

* *Euploea* indeed ſignifieth in *Homer*, a bon-voiage, or proſperous nauigatiō: but what is that to this place? No doubt *Plinie* ſhould haue read in *Theophraſtus* εὐωδία which is no herb, but the happineſſe of a good name among men, whereof *Pliny* ſpeaketh here, & which *Theophraſtus* attributeth to Antirrhinon, as one of the effects of that herb. But lay the fault (I pray you) as well here as elſewhere, vpō *Plinies* Anagnoſts or Readers, who either read wrong, or pronounced not their words diſtinctly and plainly vnto him.

all thoſe who haue it about them, from witch-craft, ſorceric, and poiſon, from danger by venomous beaſts, yea and from the hurtfull and maligne aſpect of the very Sun. The ſame, if it be taken in wine, helpeth and ſaueth thoſe that are poiſoned with Opium: being either drunke, or worn about the neck, or but tied to any part of the body, it hath a peculiar vertue againſt the venom of todes. There is an herb of the bulbous or onion-root kind named * Pericarpum: whereof be two ſorts, the one hath a red bark or rind [about the root;] the other a black, and is like vnto the Poppy; of greater operation this is than the former; but both of them be very hot: which is the reaſon, they ſerue to good purpoſe for to be giuen vnto them that haue drunk Hemlock: againſt which venomous herb, Frankincenſe, and Panaces (eſpecially that which they call Chironium) be counted ſingular: and this Panaces alſo laſt named, is an excellent antidote for them that are poiſoned with venomous Muſhroms.

* So called, becauſe the fruit claſpeth round about the ſtem or ſtalke of the heabe.

Chap. XI.

¶ *Proper receits and remedies for the diſeaſes of the head.*

SInce wee are waded ſo far into the deep ſecrets of Phyſick, it will not be amiſſe to proceed forward and to ſet downe many good medicines for all the maladies incident either in generall to the whole body, or particularly to euery ſpeciall part and member thereof, beginning firſt at the head.

There is an vnſeemely accident happening otherwhiles to the head, and diſgraceth it much, called * Alopecia, when as the haire vnnaturally falleth off. The cure of this inconuenience, is to make a liniment with the roots of Nymphæa and Hemlocke ſtamped together, and therwith to annoint the bald and naked places, for it will cauſe the haire to come vp again & grow thick. Polytricha & Callitrica [both capillare herbs] differ one from another; for that Polytrica hath white benty filaments or threds, the leaues be alſo more in number & greater with all: beſides, the very plant it ſelfe ſpreadeth and brancheth more than the other: this herb is ſingular to faſten the haire of the head at the root, and to make it buſh and grow thick, being otherwiſe ready to ſhed. In like manner, there is an herb called in Latine * Lingulaca, which loueth to grow about ſprings or fountains, & is ſingular for the ſame imperfection of ſhedding haire: if the root together with the leafe burnt and beaten to pouder, be incorporate with the greaſe of a blacke ſow (but in any wiſe ſhe muſt be a yong guilt that neuer farrowed or had pigs) and ſo brought into a liniment, and the head rubbed and annointed therwith: with this charge beſides, That after the annointing, the Patient ſit bare headed in the ſun; for that helps forward the cure verie much. And in the ſame caſe there is the like vſe of the Cyclamine or Sowbread root.

* Becauſe foxes are much ſubiect vnto it, who are called in Greeke *Alopekes*.

Capillus veneris, or Maiden-haire.

* Adders tongue.

Touching the ſcurfe or brannie ſcales called Dandruffe, the root of Veratrum or Ellebore, ſodden either in oile or water, maketh a moſt excellent medicine to rid it away, & to cleanſe the head thereof.

As for head-ache, the roots of all the kinds of Panaces, ſtamped and tempered with oile, doe cure the ſame: ſo doth Ariſtolochia and Iberis, if they be applied in manner of a frontall and bound to the forehead, the ſpace of an houre or longer if the Patient can abide it, ſo that a bath be vſed preſently vpon it. The yellow carot alſo called in Latine Daucum, is a good remedy for the pain in the head. Moreouer, the foreſaid herb or root Cyclaminos, if it be mixed with hony and put vp as an errhin or naſal into the noſthrils, purgeth the brain, & the ſame brought into an ointment, healeth the ſcalls and ſores in the head. Of the like operation is Veruain, which they cal in Greek Periſtereos. The wild Caraway, named Cacalia or Leontine, beareth certain grains reſembling ſmal ſeed pearls, which a man ſhal ſee hanging betweén the leaues, which be big & large: and it groweth lightly vpon hils: take 15 of theſe grains or ſeeds, ſteep them well in oile, and make therof a liniment, it is paſſing good to rub and annoint the head withall, ſo it be done vpward againſt the haire. Furthermore, the herb Callitriche, is ſingular good [illegible] prouoke ſneezing; it beareth leaues much like vnto thoſe of Lentils or Ducks meat: the ſt[illegible] very ſmall like fine bents, and the root is as little: it delighteth to grow in coole, ſhady, and moiſt grounds, and is of a ſharp and hot taſt.

For the lowſie diſeaſe, wherein lice and ſuch vermin crawle in exceeding abundance all ouer the head, there is not a better medicine than an ointment made of hyſſope and oyle ſtamped and incorporat together: the ſame likewiſe killeth the itch in the head. Now the beſt hyſſop is

that

20030
copy 1

A that of Cilicia, growing vpon the mountaine Taurus: and in a ſecond degree, there is reckoning made of that which commeth out of Pamphylia and Smyrna. An herb this is, nothing friendly to the ſtomack: being taken with figs, it purgeth downward; with hony, by vomit: howbeit, ſtamped with hony, ſalt, and cumin, and ſo reduced into a plaſter, it is thought to be a proper remedy for the ſting of ſerpents.

Lonchitis is not the ſame herb (as moſt men haue thought) that Xiphion or Phaſganion, although the ſeed be pointed like to a ſpeare head; for it beareth leaues reſembling leeke blades, which toward the root be red, and more in number than about the ſtem it ſelfe: it carrieth little heads in the top, made after the faſhion of maskes or viſors, ſuch as players in Comœdies are wont to weare, lilling out pretty little tongues, and the roots be exceeding long, & yet it grow-

B eth in drie grounds far from water. Contrariwiſe, * Xiphion or Phaſganion delighteth in wateriſh and moiſt places: at the firſt comming vp, it maketh a ſhew of a ſword blade: the ſtem riſeth vp to the heigth of two cubits: the root hath beards or fringes as it were hanging about it, and is in faſhion ſhaped to a filberd nut: which ought to be digged out of the ground before harueſt, and to be dried in the ſhade: the vpper part of this root (for it groweth double) ſtamped with Frankincenſe and mixed with wine of equal weight, and ſo made into a ſalue, draweth out the ſpills or broken ſcales in the brain-pan or ſcull: the ſame is good likewiſe to draw any impoſtume that is broken, and to fetch out corruption in any part of the body: and it is ſingular for the bones that be broken and cruſhed * vnder cart or waggon wheels: laſtly, the ſame is an effectuall remedy againſt poiſons.

* Our Glader or Flags.

* Carpentis.

C But to returne againe to the head-ach; the ſaid Ellebore boiled either in common oile, or els in oile roſat, and applied in manner of a liniment, doth aſſuage the ſame; ſo doth Peucedanum [*i.* Hare-ſtrange] being incorporat in oile of roſes and vineger. The ſame alſo being laied vnto the head warm, doth mitigat the pain called the migram, when as the one half of the head doth ake; and it cureth beſide, the dizzineſſe of the braine. The root of Peucedanum made into an ointment and vſed accordingly, prouoketh ſweat, by reaſon of the hot nature that it hath, which is burning and cauſticke. The herb Fleawort, which ſome cal Pſyllion, others Cynoides, Chryſtallion, Sicelion, and Cynomyia, hath a ſmall root, whereof there is little or no vſe in Phyſick. The branches that it bringeth forth, be ſlender and pliable in manner of vine ſhoots, bearing in the top certain big berries or knobs like vnto beans; the leaues not vnlike to * dogs heads; the

* Whereupon it is called *Cynoides.*

D ſeed reſembleth dogs fleas, whereupon it hath that name Cynomyia, and the ſame lieth within the foreſaid berries. The herb it ſelfe is ordinarily growing in vineyards: of great vertue it is to refrigerat and to diſcuſſe or reſolue withall: but the ſeed it is which yeeldeth moſt vſe in Phyſicke; and the ſame is applied in a frontall to the forehead and temples, with vineger and oile of roſes, or elſe with vineger and water together, for to allay the paine of the head. For other accidents, when it is applied in forme of a liniment, the manner is to take the meaſure of one acetable, and to infuſe it in a ſextar of water vntill it gather together into a thicke and clammie ſubſtance; then it would be ſtamped, and the mucilage or ſlime drawne out thereof ſerueth for any paine, impoſtume, and inflammation. Ouer and beſides. Ariſtolochia is a ſingular herb for the wounds of the head: it draweth forth broken bones and ſpils in any part of the head; and ſo

E doth Piſtolochia. To conclude, there is an herb called * Thyſſelium, not vnlike to garden Parſley: the root whereof if it be but chewed in the mouth, purgeth the head of phlegmaticke humours.

* *Hydroſelynū, Dodonæi, id eſt* Water-parſley

Chap. XII.

¶ *Receits for the diſeaſes of the eies, made of Centaurie, Celendine, Panaces, Henbane, and Euphorbium.*

IT is thought that the Rha-pontick (which is the greater Centaurie) helpeth the eie-ſight verie much, if a fomentation be made therewith and water together. The juice of the leſſe Cen-

F taurie tempered with hony and applied, helpeth the imperfections of the eies; namely, when there ſeeme gnats to flie before them, or when they are ouer-caſt with a cloud; for it ſcattereth the dimneſſe and web which darkeneth the ſight, and doth ſubtiliate the cataract or cicatrices that ouergrow the ball or apple. The herbe Sideritis is ſo appropriate vnto the eies, that it cureth the verie haw that groweth in horſes eies. But ſo excellent is the herbe Celendine, that it

paſſeth them all,and is a ſoueraigne medicine for all ſuch imperfections. The root of Panaces G
mixed with parched or fried barly meale,maketh a good cataplaſme for to repreſſe the rheume
of watery and weeping eies. And there is a ſingular drink commended for the ſtaying of ſuch
humors,made of Henbane ſeed one obulus,of Opium or the juice of Poppy and wine as much:
Some put therto the like quantity of the juice of Gentian,which alſo they vſed to mingle with
collyries and eie-ſalues (that require ſome ſharpneſſe and acrimony) * in ſtead of the foreſaid
* Pro Meconio: & yet in Dioſcorides it is μηκωνίου. Opium or Poppy juice. Moreouer, Euphorbium clarifies the eie-ſight, if there be an inunction
made therewith. For bleered eies,it is good to drop the juice of Plantain into them. As for the
thick miſts that hinder the eie-ſight,Ariſtolochia doth diſcuſſe and reſolue them. The herb I-
beris bound vnto the forehead,together with Cinquefoile,ſtoppeth the fall of humors into the
eies,and cureth all other maladies incident vnto them. Mullen or Lungwort is likewiſe a great H
defenſatiue againſt the foreſaid rheums which haue taken a courſe to the eies and cauſe them
to water; ſo is Veruain,if it be applied with oile roſat or vineger: For the cataract or ſuffuſion of
the eies,for the pin and web which offend the eie-ſight, the Troſches of Cyclamine being diſ-
ſolued and ſo applied,are ſoueraigne. As for the juice of Peucedanum,(*i.* Hare-ſtrange) it is (as
I ſaid before) a notable medicine for to cleare the ſight, and rid away the muddy miſts before
the eies, if it be laid to with Opium and oile roſat. Finally, Flea-woort ſtaieth and keepeth vp
the flux of humors into the eies,if the forehead be annointed with the mucilage thereof.

Chap. XIII.

¶ *Of Pimpernell,named Anagallis and Corchoros. Of Mandragoras or Circeium. Of Hemlocke, Creſtmarine or Sampire,named in Greeke Crithmos Agria. Of the herbe Molybdæna. Of Fumiterre. Of Acorus or Galangale. Of Floure-de-lys. Of Cotyledon or Venus navill. Of Sengreen, and Purcellane. Of Groundſwell. Of Ephemeron. Of the Taxill,and of Crowſoot: with the medicinable vertues of the ſaid hearbes, appropriate to the diſeaſes of the eies, eares, noſthrils, teeth and mouth.* I

THe herbe Pimpernell,ſome call Anagallis,others Corchoros. Of it be found two kindes;
the male with a red floure,the female with a blew: neither of them both be taller than the
hand-bredth or a ſpan at moſt: tender they be likewiſe in all parts: the leaues be very ſmal,
round,and lying vpon the ground: they grow as well the one as the other in gardens and watery
places: that with the blew floure bloweth firſt: the juice of them both tempered with hony,diſ- K
patcheth the miſt and dimneſſe of the eies, conſumeth the redneſſe occaſioned by a ſtripe or
bruiſe,and taketh away the red ſpots in the white of the eie; and ſo much the ſooner,if the hony
be of the beſt, and made about Athens, wherewith the eies be annointed. The ſaid medicine
likewiſe is good for to extend and dilate the tunicles that make the ball or apple of the eie: and
therefore it is an ordinary courſe that their eies be annointed therewith beforehand,who are to
be pricked with a needle for couching of a cataract. Theſe herbs be ſingular good likewiſe for
the haw in horſes or beaſts eies. The iuice of Pimpernell conueyed vp into the noſthrils, clean-
ſeth the braine by the emunctory of the noſe,ſo that afterwards the Patient do draw vp wine in-
to the noſthrils,for a collution to waſh them. A dram of the ſaid iuice drunk in wine, is a coun- L
terpoiſon againſt the venom of ſnakes. But this is ſtrange,and I cannot chuſe but maruell of it,
that ſheep ſhould ſo much hate and abhor the female Pimpernell as they do: howbeit,in caſe
they ſhould miſtake the one for the other becauſe they are ſo like (for in flour only they differ)
and taſt the Pimpernel with the blew floure,preſently they haue recourſe (by a natural inſtinct)
to an herbe for remedy called in Greeke Aſyla,and by vs in Latine Ferus oculus [*i.* the wild and
cruell eie,or Margellane.] Some there be,who ſet down certain ceremonies and circumſtances
to be obſerued by them who are to dig or plucke vp this hearbe; namely,That they goe to this
buſineſſe before the Sun-riſing, and ſalute or bid good morrow to it three times,before they
ſpeak any other word that morning; and then to take it vp and caſt it on high: which don, to
preſſe forth the iuice of it. Thus ordered forſooth,they ſay it is of better operation,and will do M
the deed ſurely.

Touching Euphorbium,what it is I haue ſufficiently ſpoken. The iuice thereof is ſingular
for bleered eies,eſpecially if they be ſwelled withall: likewiſe wormwood ſtamped and incor-
porat with hony: as alſo the pouder of Betony. There groweth many times a fiſtulous vlcer be-

tweene

20030
copy 1

A tweene the corner of the eie and the noſe, called Ægilops; for to heale which ſore, there is a ſoueraigne herbe of that * name growing among Barly: in blade or leaſe it reſembleth that of wheat: the ſeed or graine whereof, beaten into pouder and mixed with meale or floure, or the juice drawne out of the herbe, they vſe for the ſaid purpoſe to applie vnto the affected place in manner of a ſalue or liniment. Now the ſaid juice muſt be preſſed out of the ſtalke and leaues thereof, whiles they be freſh and fulleſt of ſap: but then the haw or eare that it beareth, ought to be taken away, which being incorporat with the floure of three moneths corn, is made vp into bals or troſches. Some were wont in this cure to vſe the juice alſo of Mandragoras, but they gaue it ouer afterwards. Howbeit, for certain, the root of Mandragoras bruiſed or ſtamped, and tempered with the oile of roſes and wine, cureth weeping and watering eies; yea, and aſſuageth their pain: & the ſaid juice, how ſoeuer it be rejected in the former caſe, goeth into many collyB ries or eye-ſalues.

* Ægilops. Some take it for wild Otes; others for Darnell.

This herbe Mandragoras, ſome writers cal Circeium; and two kinds there be of it: the white which is ſuppoſed the male; and the black, which you muſt take for the female: the leaues of this female reſemble thoſe of the * Lectuce, but that they be narrower: hairy alſo they are, and al of an * equall bigneſſe. Two or three roots it hath, and thoſe of a reddiſh or ruſſet colour without, but white within: of a fleſhy ſubſtance and tender, running downe into the earth almoſt a cubit in length. A certain fruit or apple they beare, of the bigneſſe of Filberds or Hazel-nuts, within which there be ſeeds like vnto the pippens or Pears. The white Mandrage ſome name Arſen, (*i*) the male; others * Morion: and there be again who cal it Hypophlomos. The white leaues of this Mandrage be broader than the other, and indeed equall to the garden Docke or Patience:
C In the digging vp of the root of Mandrage, there are ſome ceremonies obſerued: firſt they that goe about this worke, looke eſpecially to this, that the wind be not in their face, but blow vpon their backs: then with the pont of a ſword they draw three circles round about the plant which don, they dig it vp afterwards with their face into the Weſt. There is a juice preſſed forth both of the fruit, and alſo of the leaues ſhred and minced: of the * ſtem likewiſe being firſt headed or the top cut off; and alſo of the root, which ſomtime they do pounce and prick for to let out the liquor, otherwhiles they boile it: and the root ſo prepared, is as good as the juice. The ſame alſo being cut into certain thin rundles they vſe to * preſerue in wine. Howbeit, Mandrage is not found alwaies and euery where full of juice: but in what place ſoeuer ſuch may bee gotten, the right ſeaſon to ſeek for it is about vintage time: the ſent therof is ſtrong, but the root and fruit
D do ſmell the ſtronger. The apples of the white, when they be ripe, the maner is to dry in the ſhadow; but the juice drawn out of them, is permitted to ſtand in the Sun for to gather and harden. In like ſort, the juice of the root whether it be bruiſed and ſtamped, or ſodden in groſſe red wine to the conſumption of a third part. The leaues moreouer of Mandrage are commonly kept and condite in a kind of pickle or ſalt brine: for otherwiſe the juice of them whiles they be freſh and green, is peſtiferous and a very poiſon. And yet order them ſowel as you can, hurtfull they be euery way: the only ſmell of them ſtuffeth the head, and breedeth the murre and the poſe. Howbeit, in ſome countries they venture to eat the apples or fruit thereof; but thoſe that know not how to dreſſe and order them aright, loſe the vſe of their tongue thereby, and proue dumbe for
E the time, ſurpriſed and ouertaken with the exceeding ſtrong ſauor that they haue. And verily if they be ſo bold as to take a great quantity therof in drinke, they are ſure to die for it. Yet it may be vſed ſafely enough for to procure ſleep, if there be a good regard had in the doſe, that it be anſwerable in proportion to the ſtrength and complexion of the patient; one cyath thereof is thought to be a moderat and ſufficient draught. Alſo it is an ordinary thing to drink it againſt the poiſon of ſerpents: likewiſe before the curting or cauterizing, pricking or launcing of any member, to take away the ſence and feeling of ſuch extreme cures. And ſufficient it is in ſome bodies to caſt them into a ſleep with the ſmel of Mandrage, againſt the time of ſuch Chirurgery. There be that drink it in lieu of Ellebore, for to purge the body of melancholick humors, taking two oboles therof in honied wine. Howbeit, Ellebore is ſtronger in operation for to euaF cuat black choler out of the body, and to prouoke vomit.

* Whereupon it is called *Thridacias*.
* *Æqualibus*, not *caulibus*, for Mandrage bears no ſtems
* *i. Membrum virile, vel Genitale.*

As touching Hemlock, it is alſo a ranke poiſon, witneſſe the publicke ordinance and law of the Athenians, wherby malefactors, who haue deſerued to die, were forced to drink that odious potion of Hemlock. Howbeit, many good vertues hath this herb, and would not be reiected and caſt aſide for the ſundry vſes therof in Phyſicke. The ſeed is euery way hurtfull and venomous.

* Other Herbariſts deſcribe Mandrages without a ſtem or ſtalke.
* *Seruator in vino*, according to *Crateuas*, ἐνβάπτων οἴνῳ, whereas *Dioſcorides* ſaith, διαπλέκεις λίνῳ, *i. traycitur lino*, that is to ſay, they file them vp hanging by little threds drawne through them.

As

As for the ſtems and ſtalks, many there be that do eat it both green & alſo boiled or ſtewed be- G
tween two platters. Light theſe ſtems be as kexes, and full of ioints like Reeds and Canes: of a darke gray or ſullen colour, riſing vp many times aboue two cubits high: and toward the top they ſpread and branch. The leaues in ſome ſort reſemble Coriander, but that they be more tender, and a ſtrong ſtinking ſmell they haue with them. The ſeed is thicker and groſſer than that of the Anniſe. The root likewiſe hollow, and of no vſe in Phyſicke. The leaues and ſeed are exceeding refrigeratiue: which if they haue gotten the maſtery and vpper hand of any that hath taken them, ſo as there is no way but one without help, they ſhal feele themſelues begin to wax cold in their extream or outward parts, & ſo to die inward: howbeit there is a remedy euen then, before the cold haue taken to the vital parts: namely to take a good draught of wine, which may ſet the body in a heat, and chaufe it again: mary if they drinke it with wine, there are no meanes H
in the world to ſaue their liues. There is a juice preſſed out of the leaues and floures both toge-ther, for that is the right reaſon, namely whiles it is in flour: the which is preſſed out of that ſeed ſtamped, being afterwards dried in the Sun and made into bals or troſches, kils them that take it inwardly, by congealing & cluttering their bloud; for this is a ſecond venomous and deadly quality that it hath: which is the cauſe, that whoſoeuer die by this means, there appear certain ſpots or ſpecks in their bodies after they be dead. And yet there is a vſe of this juice, to diſſolue hot and biting medicines therin in ſtead of water: moreouer, there is made of it a very conueni-ent cataplaſme to be applied vnto the ſtomack, for to coole the extreame heat thereof. But the
* *Epiphoras æſtiuas*, or rather *æſtuoſas*, i. hot rheumes. principal vertue that it hath, is to repreſſe and ſtay the flux of hot humors into the eies* in ſum-mer time, and to aſſuage their pains if they be annointed therewith. It entreth beſides into col- I
lyries or medicines deuiſed to eaſe pain: and verily there is no rheumatick flux in any part of the body but it ſtoppeth it. The leaues alſo of Hemlocke doe keepe downe all tumors, appeaſe paines, and cure watering eies. *Anaxilaus* mine Author ſaith, That if a pure maiden doe in her virginity annoint her breſts with this juice, her dugs will neuer grow afterwards, but continue ſtill in the ſame ſtate. True it is indeed, that beeing kept vnto the paps of women in child-bed, it drieth vp their milk: as alſo extinguiſheth naturall ſeed, if the cods and ſhare be annointed therwith. What remedies they ſhould vſe to ſaue themſelues who are adiudged by law to drink it, I for my part purpoſe not to ſet down. The ſtrongeſt Hemlocke and of ſpeedieſt operation is that which growes about Suſa in the confines of Parthia. Next to it for fearful working, is that which commeth out of Laconica, Candy, and Natolia. In Greece the Hemlocke of Megara is K
counted the quickeſt, and then that of Attica.

Creſtmarine or Sampier, called the wild Crethmos, riddeth the eies of the gummy & viſcous water that ſticketh in them, if it be applied thereto: and if it be made into a cataplaſme with fried Barly meale, it aſſuageth alſo their ſwelling.

There groweth commonly an herbe named in Greeke Molybdæna, that is to ſay in Latine, Plumbago, euen vpon euery corne land; in leaſe reſembling the Dock or Sorrell, with a thicke root, and the ſame rough and pricky. Let one chew this herb firſt in his mouth, & then eftſoons
* Some take it for a Cataract. lick with his tongue the eie, it conſumeth and taketh away the * Plumbum, which is a kinde of diſeaſe or infirmity incident to the eies.

* This *Fuchſius* thinketh to be Piſtolochia or our Ariſtolochia the rounder. As touching the firſt * Capnos, which in Latine is commonly called Pedes Gallinarei, *i.* hens L
feet: it groweth about decaied wals and ruinat buildings, among rubbiſh, & in hedges: the bran-ches be very ſmal, & ſpread looſely or ſcattering, the floure of a purple colour, the leaues green, the juice wherof diſcuſſeth the dimneſſe and thickneſſe about the eies, and clarifieth the ſight:
* It ſeemes to be our Fumitory, called in Greek Capnos. and therefore it is vſually put into eie-ſalues. There is another herb of the ſame * name, & like in effect, but different in form from it, which doth branch thicke, and is of a tender ſubſtance: the leaues for ſhape reſembling Coriander, and thoſe of a wan or aſhie colour, but it beareth a purple floure: it groweth in Gardens, Hort-yards, and Barly-lands. If the eies be therewith an-nointed, it cleanſeth and cleareth them: but it cauſeth them to weepe and water, like as ſmoke doth, whereupon it tooke the name Capnos in Greek. If the haire of the eie-lids be once pulled forth, and then the edges or brims be annointed therewith, it will keep them for euer comming M
vp againe.

* *Galangale.* * Acorus hath leaues like to the Flour-de-lis, but that they be only narrower, & growing to a longer ſtele or taile: the roots be black & not ſo full of veins nor grained, otherwiſe they agree well with the Ireos root, hot & biting at the tongues end. To ſmel vnto they are not vnpleaſant:

and

20030
copy 1

A and being taken inwardly, they do gently moue rifting, and cauſe the ſtomack to breake winde vpward. The beſt Acoros roots be thoſe which co ne from Pontus: then they of Galatia: and in a third rank are they to be ſet which are brought out of Candy. Howbeit, the principall and the greateſt plenty are thoſe eſteemed which grow in the region Colchis neere to the riuer Phaſis: and generally in what countrey ſoeuer, they that come vp in watery grounds be chiefe: the freſher that the roots be and more newly drawn, the ſtronger ſent and leſſe pleaſant taſte they haue with them, than after they haue bin long kept aboue ground. Thoſe of Candy be whiter than the other of Pontus. They vſe to cut them into gobbets as big as a mans finger, and then hang them within bags or pouches of leather a drying in the ſhade. I find in certain writers, that the root of Oxymyrſine is called Acaros, and therfore ſome (alluding to the name of Acoros) chuſe rather to call this plant Acaron the wild. Well, the root of Acorus is of great operation and ef-
B fect to heat and extenuat: and therefore the juice thereof taken in drinke, is ſingular againſt catarracts or any accidents of the eies that cauſe dimneſſe. Soueraigne likewiſe it is taken to be againſt the venome of ſerpents.

Cotyledon, named in Latine Vmbilicus Veneris, is a pretty little herb, hauing a tender and a ſmal ſtem, a leafe thick & fatty, growing hollow, like to the concauity wherin the huckle-bone turneth, and therupon it took the foreſaid name in Greek. It groweth by the ſea ſide and in rocky or ſtony grounds: of a liuely green colour, and the root round, much like to an Oliue. The juice is thought to cure the eies. Another kind there is of Cotyledon, with groſſe and * fattie leaues likewiſe, but broader than the former. Toward the root they grow thicker, which they
C ſeem to compaſſe and incloſe, as it were an eie. A moſt harſh & vnpleaſant taſt it hath: the ſtem is high, but very ſlender. This herb hath the ſame properties which the Flour-de-lis.

* λιπαρῆς, out of *Dioſcor.* not ἰυπαρῆς, as *Pliny* ſeemeth to read, when hee tranſlated it (*Sordidis.*)

Of Sengreen or Houſleek, which the Greeks call Aizoon, there be two kinds. The greater is ordinarily planted in earthen pans or veſſels ſet out before the windows of houſes: which ſome name Buphthalmon, others Zoophthalmon, and Stergethron, becauſe it is thought ſo good in loue drinks or amorous medicines: others again giue it the name Hypogeſon, for that it is ſeen to grow vnder the eaues of houſes. There are alſo who loue to term it Ambroſia & Amerimnos. Here in Italy they call it Sedum the greater, Oculus alſo, and Digitellus. For the ſecond kinde is ſomewhat leſſe, which the Grecians diſtinguiſh by the name * Erithales or Trithales (be-
D cauſe it beareth floures thrice in the yeare;) others Chryſothales; and ſome again, Iſoetes. But both the one and the other they call Aizoon, becauſe they be alwaies freſh and green: according to which name in Greek, ſome giue it the Latine name Sempervivum. The greater kind beareth a ſtem a cubit high and more, and the ſame of the thickneſſe of a mans thumb, with the better. The leaues in the head or top whereof, be like vnto a tongue, fleſhy and fat, full of juice, a good inch broad; ſome bending downe and coping toward the earth, others ſtanding vpright, but ſo, as if a man mark their round circle or compaſſe wherein they lie couched, he ſhal obſerue the very proportion of an eie. The leſſe Sengreen or Iubarb groweth vpon walls, and ſpecially ſuch as be ruinat and broken down: likewiſe vpon the tiles of houſe-roofs. This herb is tufted with leaues from the very root euen to the top of the branches. The leaues be narrow and ſharp pointed, and full of juice. The ſtalk groweth a good hand-breadth or ſpan high. The root is not me-
E dicinable nor of any vſe.

* Which ſome take to be Prick-madame of the French Trique-madame.

Much like to this is that herb which the Greeks call Andrachne Agria, *i.* wilde Purcellane; the Italians, Illecebra. The leaues be but ſmall to ſpeake of, howbeit broader than thoſe of the herb before named, and ſhorter toward the top. It groweth vpon rocks and ſtony places: & folke vſe to gather it for to eat. All theſe laſt rehearſed haue the ſame operation, for they be exceeding cold and aſtringent withall. Good they be to ſtay the rheum that falleth into the eies and cauſeth them to water; whether the leaues be applied to them, or the juice in manner of a liniment: moreouer, they cleanſe and mundifie the vlcers of the eies, they do alſo incarnat, heale, and skin them vp: ſingular good beſides to looſe and open the eie-lids, when they are glued and cloſed vp with viſcous gum. The ſame do allay the head-ache, if either the temples be annointed
F with the iuice therof, or the leaues be applied to them. Moreouer, they mortifie or kil the poyſon inflicted by the prick of the venomous ſpiders Phalangia: but the greater Sengreene hath this peculiar vertue, to reſiſt the deadly poiſon of the herb Aconitum. Furthermore it is ſayd, that whoſoeuer carry it about them, ſhal not be ſtung by ſcorpions.

All the kinds of them are proper remedies for the pain in the eares. Like as the iuice of Hen-

bane

bane alſo, if it be applied moderatly, of Achillea and the beſt Centaury; of Plantaine and Harſtrang, together with oile roſat and Opium: finally, the iuice of Acorns or Galangale vſed with Roſes, is much commended in that caſe. But this would be noted, that the manner of preparing of all theſe iuices, is to heat them firſt, & then to conuey or infuſe them into the ear by a * pipe for the purpoſe [called an Orenchyte.] Semblably, the herb Vmbilicus Veneris or Cotyledon is much commended for mundifying the ears, when they run with filthy matter eſpecially, if it be tempered with deere ſewet, and namely of a Stag or Hind, and ſo inſtilled hot. The iuice of the Walwort root clarified and ſtrained through a fine linnen cloth, and ſoon after dried & hardened in the Sun, healeth the ſwelling impoſtumations vnder the ears, if as need requireth, it be diſſolued in oile of Roſes, and ſo applied hot. The like effect in that caſe hath Veruain & Plantain; Sideritis alſo being incorporat in old Hogs greaſe.

*Stilla.

G

H

After the ſame manner Ariſtolochia together with Cyperus, healeth the ſtinking and ilfauored vlcer of the noſe, called Noli-me-tangere.

The root of Panaces, eſpecially that which is called Chironia, if it be chewed in the mouth, aſſuageth the tooth-ach: ſo doth the iuice thereof, if there be a collution made therewith. The root of Henbane hath the like vertue, if one chew it with vineger, as alſo of Polemonia or ſauge de bois: for which purpoſe it is paſſing good to chew the Plantain root, or to waſh the mouth and teeth with the iuice or decoction thereof boiled in vineger. And the very leaues of Plantain be ſingular for the pain of the teeth; yea, though the gums were putrified with rank & corrupt bloud, or in caſe there owſed or iſſued out of them filthy bloudy matter. And the ſeed of Plantain cureth the impoſtumations of the gums, albeit they gathered to ſuppuration and ran matter. Moreouer, Ariſtolochia doth knit and conſolidat the gums; yea, and faſteneth the teeth in the head. For theſe infirmities of gums and teeth, the root of Veruain is highly commended if it be chewed: or if it be boiled in wine or vineger, and the mouth waſhed with that decoction. The roots of Cinque-foile ſodden likewiſe either in wine or vineger to the conſumption of a third part, worke the ſame effect. But looke that before you boile them, they be wel rinced and waſhed either in ſea water or ſalt water at the leaſt: and when you vſe this collution, ſee you hold the liquor or decoction in your mouth a long time. But ſome there be who thinke it better to rub the teeth with the aſhes of Cinquefoile burnt, leaues, root, and all. Moreouer, the root of Mullen or Taperwort ſodden in wine, maketh a ſingular collution for the teeth. Likewiſe if the teeth be waſhed with the decoction of Hyſſop or the iuice of Harſtrang, together with Opium or Poppie iuice, much good and eaſe will inſue thereupon. As alſo by the iuice of a Pimpernell root: and the rather of that which is counted the female, if the ſame be conueighed vp into the noſthril of the contrary ſide to the tooth that aketh. There is an herb called Groundſwel, which the Greeks name Erigeron, and we the Latines Senecio: they ſay if a man make a circle round about it with ſome inſtrument of yron, and then dig it out of the ground, and therewith touch the tooth that is pained, three ſeueral times, and between euery touching ſpit vpon the ground, and then beſtow the ſaid herb, root and all, in the very ſame place where he drew it, ſo as it may liue and grow again, the ſaid tooth ſhall neuer ake afterwards.

I

K

This Groundſwell is an hearbe much like in ſhape vnto Germander, as ſoft alſo and tender as it, the ſmall ſtalkes or braunches whereof incline to a reddiſh colour: and it loueth to grow vpon tiled houſes or VValles. The Greekes impoſed that name Erigeron, becauſe in the Spring it looketh hoarie, like an old gray beard: in the top it diuideth it ſelfe into a number of heads, betweene which there commeth forth a light plume, much like vnto Thiſtle-downe: VVhich is the reaſon that *Callimachus* calleth it Acanthius; and others, Pappos. But in the farther Deſcription of this Hearbe, it ſeemeth that the Greekes agreed not: for ſome haue ſayd that it is leafed like to Rocket; others to an Oke, but that they bee much leſſe. There bee VVriters alſo who hold the root to bee good for nothing in Phyſicke: and there bee againe that commend it to bee ſingular for the ſinewes: beſides, ſome others are of opinion, That it ſtrangleth and choaketh as many as drinke it. Contrariwiſe, certaine Phyſitians preſcribe it for the Iaundiſe to bee taken in Wine: for all the diſeaſes likewiſe of the bladder, and againſt the infirmities of the Heart and Liuer. And they aſſure vs, That it ſcoureth the Reines or Kidneies of all grauell. In caſe of the Sciatica they haue ordayned it to bee drunke to the weight of a dramme with Oxymell, preſently after ſome exerciſe by walking: giuing out, that there is not a better thing in the World for the gripes and tor-

L

M

ments

20030
copy 1

A ments of the guts, if it be taken in ſweet wine cuit: eſteeming it a ſingular herbe for the griefe of the midriffe and precordiall parts about the heart, if it be eaten with meat in a ſallad with vineger: and in regard of theſe manifold commodities, they ſow and nouriſh it in their gardens for to be alwaies ready at hand. And ſome authours I find who haue made a ſecond kind thereof: but they haue not deſcribed what manner of herbe it is, only they appoint it to be giuen in water againſt the ſting of ſerpents, and to be eaten for the falling ſickneſſe. For mine own part, I will ſet down the vſe thereof in ſome caſes, according as I haue found it by experience to work in the practiſe here at Rome. The plume or downe which it beareth, if it be ſtamped and reduced into a liniment with Saffron and a few drops of cold water, and ſo applied, cureth the inordinat flux of wateriſh humors into the eies. The ſame dried and parched againſt the fire, or o-
B therwiſe fried with ſome cornes of ſalt, and laid to the ſwelling wens called the Kings euil, healeth them.

The May-Lillie (called in Greeke Ephemeron) is leafed like vnto the Lillie, but that the leaues be leſſe: the ſtem is ſemblable and equall vnto it, vpon which it beareth a * blew floure. The ſeed which it carrieth is nothing medicinable. One ſingle root it hath of a finger thickneſſe, which is ſoueraigne for the teeth, if it be cut and minced ſmall, and afterwards ſodden in vineger for a collution to waſh the teeth with it warme. The very ſubſtance alſo of the root is ſingular good to confirme the teeth ſtanding looſe in the head: and to be put into thoſe that be hollow and worme eaten. Moreouer, the root of Celendine is good for the teeth, if it be bruiſed or ſtamped, and ſo with vineger held in the mouth. If teeth be rotten and corrupt, the black
C Ellebore is ſingular to be put into their concauities. And both of them (as well the blacke as the white) ſerue in a collution to ſtrengthen and keep them faſt in their ſockets, if they be boyled in vineger. As touching the Tazill (which is called in Latine Labrum Veneris) it grows in riuers and * waters: within the heads or burs which it beareth, there is found a little worme or grub, which for the tooth-ache they vſe to binde about the teeth, or to put it in their holes and cloſe them vp with wax. But when that herbe is pulled out of the ground, great heed muſt be taken that it touch not the earth. The herbe Crowfoot is called in Latine Ranunculs, in Greeke Batrachion; whereof be foure kindes: The firſt beareth leaues like vnto Coriander, but that they be farter, and as broad as thoſe of the Mallow, of a ſwert colour: the ſtalke is whitiſh, or griſled and ſlender, the root alſo white: it groweth ordinarily along great rode waies, eſpecial-
D ly in cold, ſhadowie, & moiſt places. The ſecond is better furniſhed with leaues, and thoſe more cut and indented than the former, and riſeth vp with greater and higher ſtalks. The third is the leaſt, hauing a ſtrong ſent, and bearing a yellow floure like vnto gold. The fourth is like to this, and hath likewiſe a yellow floure. They be all of them of a cauſticke and burning qualitie. For lay but the leaues raw and greene (as they grow) vpon any place, they will raiſe bliſters in the skinne, as well as a light coale of fire: which is the reaſon, that they bee much vſed for lepro-ſies and foule ſcabs; alſo to take out any markes imprinted in the skinne, or vnſeemely ſcarre. In ſumme, it is one of the ingredients that go to the making of all potentiall cauteries or cauſticke medicines. VVhere the haire is gone, and the place bare and naked, they vſe commonly to applie theſe hearbes for to recouer the haire againe: but they muſt be ſoone remooued. For
E tooth-ache alſo it is an ordinary thing to chew of their roots, but if one continue ſo long, it will burſt their teeth in pieces. The ſame beeing cut into roundles, and dried, and ſo beaten into pouder, ſerueth to prouoke ſneezing. Our Herbariſts here in Italy call this hearbe Strumea: becauſe it helpeth and cureth the wens named Strumæ or the Kings euill, and the flat biles or puſhes called Pani, if the ſame be hanged vp afterwards in the chimney to take ſmoke. For this opinion they haue, and be verily perſuaded, that if it be ſet again into the ground, the wens and biles aforeſaid which were healed, wil return and be ſore again. The like ſorcery and witchcraft they vſe with Plantaine: but in truth, the juice of Plantaine is ſingular good for the cankers or vlcers within the mouth: ſo are the leaues and roots, if they be only chewed, yea though the patient or diſeaſed perſon were troubled with the ſpitting rheume; for they intercept all
F thoſe defluctions, which take a courſe into the mouth. Cinque-foile is a very ſoueraigne herb for the ſores of the mouth, and for ſtinking breath. Pſyllium, *i.* Fleawort, is good for the vlcers thereof.

But ſince I haue named a ſtinking breath, which is a foule and naſtie diſeaſe, putting man or woman to ſhame, as no infirmitie more; I will ſet downe one or two compound receits for

that

* *Dioſcorides* ſaith white.

* It containes water indeed within the concauities or arme-pits (as it were) of the leaues where they ioine to the ſtem, but ſurely in riuers it growes not.

Lacteo-Dioſc. i. white.

that imperfection. Take Myrtle & Lentisk leaues, of each a like weight; of the Gal-nuts growing in Syria, halfe as much in quantity; stamp them all together, and in the stamping, sprinckle them with good old wine: giue the patient this composition in bole to chew and eat in the morning, there is not the like medicine vnto it for a sweet breath. Also take Ivy beries, Casia or Canell, and Myrrhe, of each an equall weight, incorporat them with wine in manner aforesaid, and vse this confection accordingly. For the sores that be incident to the nose, the seed of dragons made into pouder, and tempred with hony, is singular to be applied therunto, yea though they were very cankers, and had eaten deep. Where the skin looketh blacke and blew, whether it be vnder the eies, or otherwise in any part of the visage, a salue made of Hyssope applied therto, restoreth it to the fresh and natiue colour. To conclude, a liniment of Mandragoras taketh out the markes or prints that be branded or seared in the face [if it be applied presently while they be fresh.]

THE TWENTY SIXTH BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

The Proeme.

CHAP. I.

¶ Of medicines appropriate and respective to all other parts and members of the body. Of certaine new maladies: and namely, of the illfauored tetter called Lichenes: what kinde of infection it is, and when it first entred into Italy. Of the blain or sore called the Carbuncle. Of the filthy leprosie or wild scab named Elephantiasis. And of the Collicke.

LOng is it not since the face and visage of men began to be annoied with certaine new and strange diseases, vnknowne in our forefathers daies, and neuer heard of before in Italy, nor almost in any part of Europe. And euen of late daies when these maladies first set foot in these parts, they were not seene for to spread throughout all Italy, ne yet to range greatly in Illyricum, France, or Spain, although some little sprinckling there was in those countries: but about Rome only and those quarters adioining, as they raigned first, so they raged most. These new-come diseases verily were nothing painfull to the Patients, nor dangerous any waies and deadly; but so foule and filthy, so loathsome and ougly, that a man would haue chosen rather to die any death, than to be so disfigured. But of them all, the worst and most detestable was that, which by a Greeke name they called Lichenes, and in Latine (becausе ordinarily it began about the chin)* Mentagra. A terme giuen vnto it (I assure you) at the first by way of jeast and in a meriment (as commonly we see many are disposed to play and make good game at other mens miseries) but afterwards it went currant in euery mans mouth: and by no other name than Mentagra was it known, notwithstanding the disease possessed not the chin alon, but in many that had it, took vp the whole visage, all saue the eies, yea, and ran downward to the neck & breast, spreading also to the armes and the very hands: and in such sort was the skin of the poore wretches bepainted

*For *Mentum* in Latine is a chin.

20030
copy 1

A bepainted and beraied with foule ſcurfe and filthy ſcales,as it would haue pittied one at the heart to ſee them. This contagious diſeaſe,our fathers and anceſtors in times paſt neuer heard of,nor knew what it meant:for the firſt time that it crept into Italy,was in t he daies of *Tiberius Claudius* late Emperor of Rome,euen a bout the middle of his raigne;and that was by the means of a certain knight or gentleman of Rome borne at Peruſium,who being ſecretary or clerke vnto the Treaſurer vnder the Romans in Aſia,and giuing attendance according to his place,chanced there to be infected, and ſo hee brought the diſeaſe ouer with him to Rome. But will you heare the ſtrange nature of this foule euil?women were not ſubiect vnto it;no more were ſlaues, baſe and poore commoners,no nor citizens of mean ſtate and condition:the greateſt gentlemen and thoſe of the nobility, it made choiſe of, and picked them from among the reſt: very catching it was,and ſoone paſſed from one to another,eſpecially by the mouth,and*by the means B of a kiſſe were it neuer ſo ſhort: foule and ill-fauored enough was the diſeaſe it ſelfe, but the ſcar, remaining after it was healed(for many there were who came vnder the Chirurgians hand and indured the cure) looked a hundred times worſe: and why? no way there was to rid it, but by cauſtick medicines or potentiall cauteries;and vnleſſe the fleſh were eaten away to the very bones,it was not poſſible to kill and root it out clean,but it would reuiue and ſpring again: and verily there came Phyſitians and Chirurgions out of Egypt (a countrey apt to breed the like, diſeaſes and where they be common) ſuch as profeſſed only the skill in this kind of cure, who filled their purſes well,and mightily enriched themſelues by their practiſe at Rome: for well known it is,that *Manlius Cornutus* (late L. Pretor, and lieutenant general for the ſtate in the prouince of Guienne or Aquitane in France) dealt with one of theſe Egyptian leeches for to be cu- C red of this diſeaſe, and agreed to pay him 200000 Seſterces for his paine. And thus much of Mentagra.

* *Veloci transitu ſe ſaluta-bant.* men vſed to ſalute one another by a kiſſe.

Moreouer,what a wonderfull thing is this obſerued in theſe new kind of maladies,that many times(contrary to the courſe of other ſickneſſes) they come together in troupes; that ſome of them ſhould all on a ſudden light vpon a particular country;that they ſhould take to one certaine member of mans body;aſſaile thoſe of ſuch an age and no other, haue a ſpight to perſons of this or that quality, and ſpare the reſt; as if they made choice, ſome to plague young children,others elder folk; ſome to puniſh none but the rich and mighty, others to be doing with the poore and needy? In our Annals or Chronicles we find vpon record,That while *Lucius Paulus* and *Q. Marcius* were Cenſors of Rome, the peſtilent carbuncle(a diſeaſe appropriat to Pro- D uance and Languedoc in France) came firſt into Italy. Of which maladie,there died within the compaſſe of one yeare(about that very time when I compiled this worke and hiſtory of mine) two noble men of Rome and late Conſuls;to wit,*Iulius Rufus* and *Q. Lecanius Baſſus*: of which two,the former was cut for it by the counſell of vnskilfull Phyſitians, and * by that means loſt his life. As for the other,hauing it vpon the thumb of his left hand, he chanced * to pricke it himſelfe with a needle;and although the wound was ſo ſmall, that hardly it could be ſeene and diſcerned,* yet it coſt him his life. This carbuncle riſeth ordinarily in the moſt hidden and ſecret parts of the body,and for the moſt part vnder the tongue:it is hard and red in manner of the ſwelling veines called in Latine Varices: and yet in the head it looketh blackiſh;the skin alſo E about it ſeemeth ſwert and dead: it ſtretcheth the skinne and the fleſh in ſome ſort ſtiffe, but without any great ſwelling; no paine at all,no itching no other ſymptome but ſleepe, wherewith it ſo poſſeſſeth the Patients,that in three daies it will make an end of them. Otherwhiles it cauſeth the party to fall into a quiuering and ſhaking as it were for cold,and raiſeth certaine bliſters or angry pimples round about it; and verie ſeldome cauſeth an Ague: but looke in whom ſoeuer it taketh to the ſtomacke or throat, it quickely diſpatcheth and maketh an end of them.

* Either by ſome mortification or effuſion of bloud. * *Pollicis acu impuſa.* * It ſeemeth by a gangrene. *Moſt of theſe ſigne ſhew a gangrene and canker, rather than our carbuncle.

As touching the white leproſie,called Elephantiaſis (according as I haue before ſhewed) it was not ſeen in Italie before the time of *Pompey* the Great. This diſeaſe alſo began for the moſt part in the face, and namely it tooke the noſe firſt, where it put forth a little ſpecke or pimple F no bigger than a ſmall Lentill;but ſoone after,as it ſpread farther and ran ouer the whole body, a man ſhould perceiue the skin to be painted and ſpotted with diuers and ſundry colors, & the ſame vneuen,bearing out higher in one place than another,thicke here, but thin there, and hard euery where;rough alſo, like as if a ſcurfe or ſcab ouerran it,vntil in the end it would grow to be blackiſh, bearing downe the fleſh flat to the bones, whiles the fingers of the hands, and toes of

the feet were puffed vp and ſwelled againe. A peculiar malady is this, and naturall to the Egyptians; but look when any of their kings fell into it, wo worth the ſubjects and poore people: for then were the tubs and bathing veſſels wherein they ſat in the bain, filled with mens bloud for their cure. But ſurely this diſeaſe continued not long in Italy, before it was quite extinguiſhed: like as another before it, and in old time * Gemurſa, which began between the toes: and ſo long agoe it is ſince any haue bin troubled therwith, that the very name alſo is forgotten and grown out of vſe. Where by the way, this is to be noted as a ſtrange and wonderfull thing, That ſome of our diſeaſes ſhould haue an end and loſe their courſe for euer; and others againe continue ſtill: as for example, the cholique paſſion; which came among vs no longer agoe than in the daies of *Tiberius Cæſar* the Emperor: and the firſt that euer felt it, was the prince himſelfe; whereupon aroſe no ſmall queſtion throughout the whole city of Rome: for when as the ſaid Emperour publiſhed à certain proclamation, wherein he excuſed himſelf for not comming abroad to manage the affaires of the State, becauſe he was ſick of the cholique; the Senat and people reading this ſtrange name of an vnknowne maladie, entred into a deep diſcourſe with themſelues, what to thinke and make of it? But what ſhould we ſay of all theſe kinde of diſeaſes? and what an anger and diſpleaſure of the gods is this, thus to plague and puniſh vs? Was it not enough to haue ſent amongſt men into the world a certaine number of maladies otherwiſe, and thoſe not ſo few as three hundred, but we muſt be in feare and danger ſtill euery day of new? and yet ſee! as many as there be of them comming by the hand of God, yet men thorow their owne exceſſe and diſorders, bring as many more vpon themſelues, and be cauſes ſtill of farther troubles & miſeries. Well, thus you ſee by that which I haue written in the former bookes, what was the old Phyſicke in times paſt; namely, conſiſting of the ſimples onely found in dame Natures garden, and how ſhe alone at the firſt and for a long time, was our Phyſitian and furniſhed vs with remedies for all diſeaſes.

* Some thinke it was an inflammation reembling our Carbuncle or Anthrax.

Chap. II.

¶ *The praiſe of Hippocrates, and other Phyſitians meere Simpleſts.*

Hippocrates verily had this honor aboue all men, That he was the firſt who wrote with moſt perſpicuity of Phyſicke, and reduced the precepts and rules thereof into the bodie of an art: howbeit, in all his bookes wee find no other receits, but herbes. Semblably, the writings of *Diocles* the Caryſtian, were no leſſe ſtored with the like medicines, and yet a famous Phyſitian he was, and both in time and reputation next and ſecond to *Hippocrates*. *Praxagoras* alſo, and *Chryſippus*, yea and after them *Eraſiſtratus* held on the ſame courſe. As for *Herophylus*, although he was the firſt that went more exquiſitly to work and brought in a more ſubtill and fine method of Phyſick, yet none eſteemed better of ſimples than hee. But ſurely, practiſe and experience (which as in all things elſe is found to be moſt effectuall, ſo in the profeſſion of Phyſick eſpecially) began in his daies by little and little to ſlake, vntil in the end al their Phyſicke proued nothing but words and bibble babbles; for beleeue me, his ſchollers and diſciples thought it more for their eaſe and pleaſure to ſit cloſe in the ſchooles and heare their doctours out of the chaire diſcourſe of the points of Phyſicke, than to go a ſimpling into the deſarts and forreſts to ſeeke and gather herbs at all ſeaſons of the yere, ſome at one time, and ſome at another.

Chap. III.

¶ *Of the new practiſe in Phyſicke · of Aſclepiades the Phyſitian: and what courſe he tooke to alter and aboliſh the old Phyſicke for to bring in the new.*

WHat cunning means ſoeuer theſe new Phyſitians could deuiſe to ouerthrow the antient manner of working by ſimples, yet it maintained ſtill the remnants of the former credit, built ſurely vpon the vndoubted grounds of long experience; and ſo it continued till the daies of *Pompey* the Great, at what time *Aſclepiades* a great Oratour and profeſſor of Rhetoricke went in hand to peruert and reiect the ſame: for ſeeing that he gained not by the ſaid Art ſufficiently, & was not like to ariſe by pleading cauſes at the bar, to that wealth which he

20030
copy 1

A he deſired (as he was a man otherwiſe of a prompt wit and quick ſpirit) he reſolued to giue ouer the law, and ſuddenly applied himſelfe to a new courſe of Phyſick. This man hauing no skill at all, and as little practice, conſidering he neither was well ſtudied in the Theoricke part of this ſcience, nor furniſhed with knowledge of remedies which required continuall inſpection & vſe of ſimples, wrought ſo with his ſmooth and flowing tongue, and by his daily premeditat orations gained ſo much, that he withdrew mens mindes from the opinion they had of former practiſe, and ouerthrew all. In which diſcourſes of his, reducing all Phyſick to the firſt and primitiue cauſes, he made it a meere coniecturall Art; bearing men in hand, that there were but fiue principall remedies which ſerued indifferently for all diſeaſes; to wit, in Diet, Abſtinence in meat, Forbearing wine otherwhiles, Rubbing of the body, Walking, and the * Exerciſe of ge-
B ſtations. In ſum, ſo far he preuailed with his eloquent ſpeech, that euery man was willing to giue eare & applauſe to his words: for being ready enough to beleeue thoſe things for true, which were moſt eaſie; and ſeeing withall, that whatſoeuer he commended to them, was in each mans power to perform, he had the general voice of them: ſo as by this new doctrine of his, he drew al the world into a ſingular admiration of him, as of a man ſent & deſcended from heauen aboue, to cure their griefs and maladies. Moreouer, a wonderfull dexterity and artificiall grace he had to follow mens humors, and content their appetites, in promiſing and allowing the ſick to drink wine, in giuing them eftſoons cold water when he ſaw his time, and all to gratifie his patients. Now for that *Herophylus* before him had the honor of being the firſt Phyſitian who ſearched into the cauſes of maladies: and becauſe *Cleophantus* had the name among the Antients, for bring-
C ing wine into requeſt and ſetting out the vertues thereof: this man for his part alſo, deſirous to grow into credit & reputation by ſome new inuention of his own, brought vp firſt the allowing of cold water beforeſaid, to ſick perſons; & (as *M. Varro* doth report) took pleaſure to be called the Cold-water Phyſitian. He had beſides other pretty deuiſes to flatter & pleaſe his patients, one while cauſing them to haue hanging litters or beds like cradles, by the mouing & rocking whereof too and fro, he might either bring them aſleep, or eaſe the pains of their ſicknes; otherwhiles ordaining the vſe of bains, a thing that he knew folk were moſt deſirous of: beſides many other fine conceits very plauſible in hearing, and agreeable to mans nature. And to the end that no man might think this ſo great alteration and change in the practiſe of Phyſick, to haue bin a blind courſe and a matter of ſmal conſequence, one thing aboue the reſt that woon him-
D ſelfe a great fame, and gaue no leſſe credit and authority to his profeſſion, was this, that meeting vpon a time by chance with one he knew not, carried forth as a dead corſe in a biere for to be burned, he cauſed the body to be carried home from the funerall fire, and reſtored the man to health again. Certes, this one thing, wee that are Romanes may be well aſhamed of and take in great indignation, That ſuch an old fellow as he, comming out of Greece (the vaineſt nation vnder the ſun) & beginning as he did of nothing, ſhould only (for to inrich himſelf) lead the whole world in a ſtring, and on a ſudden ſet down rules and orders for the health of mankind, notwithſtanding many that came after him, repealed as it were, and annulled thoſe lawes of his. And verily, many helps had *Aſclepiades*, which much fauored his opinion and new Phyſick; namely, the manner of curing diſeaſes in thoſe daies, which was exceeding rude, troubleſome, & pain-
E full; ſuch adoe there was in lapping and couering the ſicke with a deale of cloaths, and cauſing them to ſweat by all meanes poſſible: ſuch a worke they made ſometime in chafing and frying their bodies againſt a good fire, but euery foot in bringing them abroad into the hot Sunne, which hardly could be found within a ſhadie and cloſe citie as Rome was. In lieu whereof, not onely there, but throughout all Italy (which now commanded the whole World, and might haue what it liſt) hee followed mens humours in approouing the artificiall baines and vaulted ſtouves and hot houſes, which then were newly come vp and vſed exceſſiuely in euery place by his approbation. Moreouer, he found means to alter the painefull curing of ſome maladies, and namely of the Squinancie; in the healing whereof other Phyſitians before him went to worke with a certain inſtrument which they thruſt down into the throat. He condemned alſo (& wor-
F thily) that dog-phyſick which was in thoſe daies ſo ordinary, that if one ailed neuer ſo little, by and by he muſt caſt and vomit. He blamed alſo the vſe of purgatiue potions, as contrary and offenſiue to the ſtomack; wherein he had great reaſon and truth on his ſide: for to ſpeake truely, ſuch drinks are by moſt Phyſitians forbidden, conſidering our chiefe care and drift is in all the courſe of our phyſick, to vſe thoſe means which be comfortable and wholſom for the ſtomack.

* i. Riding on horſebacke, carrying in a coach, litter, barge, &c.

Chap. IIII.

¶ *The fooliſh ſuperſtition of Art-Magicke, which here is derided. Of the tettar called Lichen: remedies proper for it, and the diſeaſes of the throat.*

ABoue all other things, the ſuperſtitious vanities of Magitians made much to the eſtabliſhing of *Aſclepiades* his new Phyſicke; for they in the heigth of their vanity, attributed ſo ſtrange and incredible operations to ſome ſimples, that it was enough to diſcredit the vertues of them all. Firſt, they vaunted much of Æthyopus, an hearbe which (by their ſaying) if it were but caſt into any great riuer or poole, it would draw the ſame dry; and was of power (by touching onely) to open lockes, or vnbolt any dore whatſoeuer. Of Achœmenis alſo another herb, they made this boaſt, That beeing throwne againſt an armie of enemies ranged in battel array, it would driue the troups and ſquadrons into feare, diſorder their ranks, and put them to flight. Semblably, they gaue out and ſaid, that when the king of Perſia diſpatched his Embaſſadors to any forrein ſtates and Princes, he was wont to giue them an herb called Latace, which ſo long as they had about them (come where they would) they ſhould want nothing, but haue plenty of all that they deſired: beſides a number of ſuch fooleries wherewith their bookes bee peſtered. But where, I beſeech you, were theſe herbs when the Cimbrians and Teutons were defeated in a moſt cruell and terrible battell, ſo as they cried and yelled again? What became of theſe Magitians and their powerfull herbs, when *Lucullus* with a ſmall army conſiſting of ſome few legions, ouerthrew and vanquiſhed their owne kings? If herbs were ſo mighty, what is the reaſon (I pray you) that our Romane captaines prouided euermore aboue all things how to be furniſhed with victuals for their camp, and to haue al the waies and paſſages open for their purueiours? In the expedition of Pharſalia, how came it to paſſe that the ſouldiers were at the point to be famiſhed for want of victuals, if *Cæſar* by the happy hauing of one hearbe in his campe, might haue injoied the abundance of all things? Had it not bin better think ye, for *Scipio Aemilianus* to haue cauſed the gates of Carthage to flie open with the help of one herbe, than to lie ſo many yeres as he did in leaguer before the city, & with his engins & ordinance to ſhake their wals, & batter their gates. Were there ſuch vertue in Ethiopius aforeſaid, why dowe not at this day dry vp the Pontine lakes, and recouer ſo much good ground vnto the territory about Rome? Moreouer, if that compoſition which *Democritus* hath ſet downe and his bookes maketh prayſe of, to be ſo effectual, as to procure men to haue faire, vertuous, and fortunat children, how happeneth it that the kings of Perſia themſelues could neuer attaine to that felicity? And verily wee might maruell well enough at the credulity of our Anceſtors in doting ſo much vpon theſe inuentions (howſoeuer at the firſt they were deuiſed and brought in, to right good purpoſe) in caſe the mind and wit of man knew how to ſtay and keepe a meane in any thing els beſides: or if I could not proue (as I ſuppoſe to doe in due place) that euen this new leech-craft brought in by *Aſclepiades* which checketh thoſe vanities, is growne to farther abuſes and abſurdities than are broched by the very Magitians themſelues. But this hath beene alwaies and euer will bee, the nature of mans mind, To exceed in the end and go beyond all meaſure in euery thing which at the beginning aroſe vpon good reſpects and neceſſary occaſions.

But to leaue this diſcourſe: let vs proceed to the effects and properties remaining behind of thoſe herbs which were deſcribed in the former booke; with a ſupplement alſo and addition of ſome others, as by occaſion ſhall be offered and preſented vnto vs. Howbeit, to begin firſt with the remedies of the ſaid Tettars (ſo foule and vnſeemly diſeaſes) I mean to gather a heape of as many medicines as I know appropriat for that maladie, notwithſtanding I haue ſhewed alreadie of that kind not a few. Well then, in this caſe, Plantaine ſtamped is very commendable: ſo is Cinquefoile and the root of the white Daffodill, punned and applied with vineger. The young ſhoots or tender branches of the fig-tree boiled in vineger: likewiſe the root of the * Marſh-Mallow ſodden with glew in a ſtrong and ſharpe vineger to the conſumption of a fourth part. Moreouer, it is ſingular good to rub tettars throughly with a pumiſh ſtone firſt, to the end that the root of Sorrell ſtamped and reduced into a liniment with vineger, might be applied afterwards therupon with better ſucceſſe; as alſo the floure of * Miſelto tempred & incorporat with quick-lime: the decoction likewiſe of Tithymale together with roſin, is much praiſed for this cure: but the herb Liuerwort excelleth all the reſt, which therupon tooke the name Lichen: it groweth

* *Hibiſci*, ſome take it for the Hollyhocke.

* *viſci*, ſome read *Hibiſci*.

20030
copy 1

A groweth vpon ſtony grounds, with broad leaues beneath about the root, hauing one ſtalke and the ſame ſmall, at which there hang downe long leaues: and ſurely this is a proper herb alſo to wipe away all marks and cicatrices in the skin, if it be bruiſed and laid vpon them with hony. Another kind of * Lichen or Liuerwort there is, cleauing wholly faſt vpon rockes and ſtones in manner of moſſe, which alſo is ſingular for thoſe tettars, being reduced into a liniment. This herb likewiſe ſtancheth the flux of bloud in green wounds, if the iuice be dropped into them: and in a liniment, it ſerueth well to be applied vnto apoſtumat places: the iaundiſe it healeth, in caſe the mouth and tongue be rubbed and annointed with it and hony together: but in this cure the Patients muſt haue in charge, To bathe in ſalt water, to anoint themſelues with oile of almonds, and in any caſe to abſtain from all ſalads and pothearbs of the garden. For to heale tettars, the root of Thapſia ſtamped with hony is much vſed.

* Our common Liuerwort.

B As for the Squinſie, * Argemonia is a ſoueraigne remedy if it be drunk in wine: Hyſſop alſo boiled in wine and ſo gargarized: likewiſe Harſtrang with the rennet of a Seale or Sea-calfe, taken both of them in equall portion: moreouer, Knot-graſſe ſtamped with the pickle made of Cackrebs and oile, and ſo gargled, or els but held only vnder the tongue: Semblably, the iuice of Cinquefoile, being taken in drink to the quantity of three cyaths: this iuice beſides, in a gargariſme, cureth all other infirmities of the throat. And to conclude with Mullen; if it be drunk in water, it hath a ſpeciall vertue to cure the inflammation of the amygdals or almond kernels of the throat.

* Which ſome take to be wild Poppy, called *Rœas*.

C

Chap. V.

¶ *Receits for the ſcrophules ar wens called the Kings-euill: for the paines and griefes of the fingers: for the diſeaſes of the breaſt, and namely for the Cough.*

PLantaine is a ſoueraigne herb to cure the Kings euill: alſo Celendine applied with honey and hogs lard: ſo is Cinquefoile. The root of the great Clot-bur ſerueth for the ſame purpoſe, if it be incorporat with hogs greaſe, ſo that the place after it is annointed therewith, be couered with a leafe of the ſaid Bur laid faſt vpon it: in like manner Artemiſia or Mugwort: alſo a Mandrage root applied with water, is good for that purpoſe. The broad leafed Sideritis or Stone-ſauge, being digged round about with a ſpike of yron and taken vp with the left hand, and ſo applied vnto the place, cureth the kings euill; prouided alwaies, that the Patients when they be healed, keep the ſame herbe ſtill by them, for feare leaſt it being replanted againe by theſe Herbariſts (ſuch is the malicious ſorcerie of ſome of them as I haue already ſhewed) the malady returne and be as bad as it was before: the like caueat I find giuen vnto them, who are cured of this diſeaſe either by Mugwort or Plantaine. The herb Damaſonium, called likewiſe * Aliſma, if it be gathered about the Summer ſolſtead, applied vnto the foreſaid wens with rain water, is ſingular good for them; for which purpoſe, the leaues are to be ſtamped, or the root bruſed and incorporat with hogs greaſe, and ſo applied in a liniment; with charge, That the place be couered with a leafe of the ſame: in which manner prepared and vſed, it ſerueth to allay all

D

K

* *Alcea* in ſome readings.

g pains in the nape of the neck, and to keep downe or diſſipat the ſwelling in any part of the body. There is an herb growing commonly in meadows, called the Daiſie, with a white floure, & partly inclining to a red, which if it be ioined with Mugwort in an ointment, is thought to make the medicine far more effectual for the kings euil. Condurdum is an herb of ſmal continuance, for about the Summer Solſtice it ſheweth a red floure and ſoon ſheddeth the ſame: which (as they ſay) if it be hanged about the neck, repreſſeth and keepeth vnder the foreſaid diſeaſe: the like doth Veruaine together with Plantaine, vſed and worne in the ſame manner.

L

Touching all the accidents happening to the fingers, and namely the excreſcences & riſings of the skin about the roots of the nailes, called in Greeke Pterygia, Cinquefoile is a ſingular good herb for them.

M

F Amongſt all the infirmities of the breaſt, the cough is moſt troubleſome and grieuous, for which, the root of Panaces in ſweet wine is a ſoueraigne remedie. The iuice of Henbane is excellent for them alſo that reach vp bloud out of the breaſt: and the very ſmoke therof as it burneth, is as proper for them that cough. In like manner, Scordotis beeing dried and made into pouder, afterwards mingled with creſſes and roſin, and ſo reduced into a liquid confection or

lohoch,cureth the cough. The ſaid herb taken ſimply by it ſelf alone, raiſeth tough flegme out of the breſt,and cauſeth it to break from the Patient with eaſe. The like effect hath Centaurie the greater, yea though a man did bring vp bloud: for which infirmity,the juice of Plantain alſo is thought to be ſingular. Betony taken in water to the weight of three oboli,is of great force againſt the ſpitting of bloud, and raiſing vp of filthy matter out of the cheſt. The root of the great bur hath the like vertue, if it be eaten to the weight of one dram with 11 Pine-nuts. The juice of Harſtrang,as alſo Galangale,is good for the pain in the breſt;and therfore they go both of them into preſeruatiues and antidots which ſerue for counterpoiſons. The Carot likewiſe helpeth thoſe that cough;like as the herb Scythica (which is the wild Caraway;) for beeing drunk to the weight of 3 cyaths in ſweet wine cuit, it is generally good for all diſeaſes of the breſt,for the cough,and helpeth ſuch as fetch vp filthy and rotten matter. G H

Chap. VI.

¶ *Of Mullen or Lungwort: of Cacalia: of Folefoot called Tuſſilago or Bechium; and of Sauge: herbs all appropriate for the cough.*

MVllen or Lungwort with the yellow golden floure,being in like maner taken to the ſame quantity,eaſes the foreſaid infirmities. Certes this herb is of that efficacy in theſe caſes, that if a drench thereof be giuen to horſes, which not onely haue the cough,but alſo bee broken winded,it wil help them:the ſame effects I find attributed to Gentian. The root of Cacalia ſoked in wine and chewed,is good not onely for the cough but alſo for the infirmities in the throat. Take 5 branches or ſlips of hyſſop,and two ſprigs of rue,with 3 figs, ſeeth theſe together,it is an excellent drink for to diſcharge the breſt of flegme that ſtuffeth it. Folefoot,called in Greek Bechion,that is to ſay in Latin*Tuſſilago,doth appeaſe the violence of the cough. Two kinds there be of this herb: the wild, which whereſoeuer it is ſeene to grow, ſheweth that there is water vnder it:a thing that they know well enough who ſeek for ſprings, for they take it to be an aſſured ſign and direction to water: it beareth leaues like to Iuy, but ſomwhat bigger, either 5 or 7 in number,which vnderneath or toward the ground be ſomwhat whitiſh,but aboue in the vpper ſide,of a pale colour,without floure,ſtem,or ſeed,and the root is but ſmall. Some would haue it and Chamæleuce both, to be one and the ſame herb called by diuers names:take this herb,leaſe and root together,when they be dried, ſet all on fire and receiue the ſmoke by a pipe,as if you would ſuck or drinke it downe,it is (they ſay)a notable medicine to cure an old cough;but between euery pipe you muſt ſip a pretty draught of ſweet wine. The ſecond Bechion ſome would haue to be called Saluia,an herb like vnto Mullen: ſtampe the ſame,and let the juice run through a ſtreiner;which being made hot,drink it for the cough and pain in the ſides. This herb likewiſe is very effectuall againſt ſcorpions & ſea-dragons. Alſo an inunction made therwith and oile together,is commended much for the ſting of ſerpents. A bunch of hyſſope ſodden with three ounces of hony,is a fine medicine for the cough. I K

*i. Cough-wort.

Chap. VII.

¶ *For the paine of the ſides and breaſt: for thoſe that cannot draw their wind but ſitting vpright: for the paine of the liuer: the heart ach: for the lights: difficulty of vrine: the cough: the breaſt: vlcers: for the eies: for the flux of the belly, occaſioned by a feeble liuer: againſt immoderat vomits: for the yex, the pleuriſie,and all griefes of the ſide.* L

LVngwort or Mullen drunke in water with Rue,is very good for the pain of the ſides and the breſt: for which purpoſe alſo, they ſay, that pouder of Betony is as good, if it be taken in water wel warmed. The juice of Scordotis is holden to be a great corroboratiue of the ſtomack: ſo is Centaury alſo & Gentian,drunk in a draught of water. Plantain either eaten alone by it ſelfe,or with a gruell & broth of Lentils,or els with a frumenty potage made with wheat, is comfortable to the ſtomack. Betony,although otherwiſe it lie heauy in the ſtomacke; yet if one either chew the leaues,or drink them in ſome broth,it helpeth much the defects & infirmities thereof. In like caſe Ariſtolochia if it be taken in drinke. Alſo Agaricke chewed drie, ſo as betwixt whiles the patient ſup a little of pure wine of the grape,hath like vertue: as for Nymphæa M

20030

A phœa or Nemphar ſyrnamed Heraclia, it ſtrengtheneth the ſtomacke, applied outwardly in a liniment: euen ſo doth the juice of Harſtrang. For the hot diſtemper of the ſtomacke, it is good to lay vnto it the herbe Flea-wort or Cotyledon, otherwiſe called Vmbilicus veneris, ſtamped with fried Barly meale into a cataplaſme: or els to take Iubarb, *i.* Sengreen, to the ſame effect. The herbe Molon hath a ſtem * chamfered or channelled along: ſoft leaues, & thoſe ſmall: a root foure fingers long, in the * end whereof it beareth an head like vnto Garlicke. Some call it Syron. Taken in wine, it helpeth the ſtomack and difficulty of drawing breath: In which caſes the greater Centaury is ſingular, if it be reduced into a lohoch or liquid electuary. Plantain alſo eaten any way, either in a green-ſauce or ſallad. This compoſition is reputed a ſoueraign me-
B dicine, Take of Betony ſtamped the weight of one pound, of Atticke hony as much, incorporat them together, and hereof drinke euery day the quantity of halfe an ounce in ſome conuenient liquor, or in water warm. Ariſtolochia or Agarick are ſoueraigne meanes to be vſed in theſe infirmities, if one drinke the weight of three oboli thereof, either in warme water or aſſes milke. The herb Ciſſanthemos is good to be drunk for thoſe that be ſtreight winded, and muſt ſit vpright when they draw their breath. In the like caſe Hyſſop is commended: as alſo for purſiuenеſſe and ſhortneſſe of wind. The juice of Harſtrang is an ordinary medicine for the griefe of the liuer, the pains alſo of breſts and ſides, in caſe the Patient be cleare of the ague. As for Agarick, it helpeth all ſuch as ſpit bloud, if the pouder thereof, to the weight of one Victoriat, be giuen in fiue cyaths of honied wine. Of the ſame operation is Amomum. But particularly for the liuer, the herb Teucria is thought to be ſoueraign, if it be taken freſh & green to the weight
C of foure drams in one hemine of water and vineger mixed together. One dram of Betony giuen in three cyaths of warm water, or in tw ain of cold, is thought to be a ſingular cordiall. The iuice of Cinquefoile helpeth all the imperfections of the liuer and lights, it cureth them that voyd or reach vp bloud, and generally it ſerueth for al inward corruptions and diſtemperatures of the whole maſſe of bloud. Both Pimpernels be wonderfull medicinable for the liuer. Fumiterre the herb whoſoeuer do eat, ſhal purge choler by vrine. Galangale is helpfull likewiſe rō the liuer, to the cheſt alſo, and the midriffe or precordial parts. The herb Caucon, named alſo *Ephedra, and by ſome Anabaſis, groweth ordinarily in open tracts expoſed to the wind: it wil clime vpon trees, and hang down from their boughs and branches. Leafe it hath none, but is garniſhed with a number of haires, which are no other but ruſhes indeed full of ioints and knots: the
D root is of a pale colour. Let this herb be beaten to pouder, and giuen in red wine that is greene and hard, it is good for the cough, for the ſhortneſſe of wind, and the wrings of the belly: it may be taken alſo in ſome other ſupping, whereto it were conuenient to put wine. In like ſort the infuſion of one dram of Gentian which hath lien ſteeped the day before, may be very wel taken in three cyaths of wine for thoſe purpoſes. Herb Benet or Auens hath a ſmall root of a blackiſh colour, which hath a good ſent: this herb not only cureth the pains of the breſt and ſide, but alſo diſcuſſeth all crudities proceeding of vnperfect digeſtion, by reaſon of the pleaſant ſauour that it hath. As for Veruaine, it is medicinable vnto all the prncipall and noble parts within the body: good for the ſides, the lungs, the liuer, and the breaſt: but moſt properly it reſpecteth the lungs; and namely, when the patient is in a phthyſick or conſumption, by the means of their
E vlcer. The root of Bearfoot, an herb which I ſaid was but lately found out, is a preſent remedie for ſwine, ſheep, goats, & all ſuch cattel, in caſe they be diſeaſed in the lights, if it be but drawn croſſe through any of their eares. The ſame ought to bee drunke in water, and a piece thereof continually held vnder the tongue. As for any other part of this hearbe aboue ground, be it leafe, ſtalke, floure or ſeed, it is not yet certainly knowne, whether it be good or no for any purpoſe in Phyſicke. As for the kidneies, the hearbe Plantaine is good to be eaten; Betonie to be drunke; Agaricke alſo to be taken in drinke, like as for the cough. * Tripolium groweth vpon the rocks by the ſea ſide, on which the ſea-water beateth: ſo as a man cannot ſay, that it is either in the ſea or the drie land: in leafe it reſembleth woad, but that it is thicker: the ſtemme is a
F ſpan or hand-breadth high, forked, and diuided at the point: the root white, odoriferous, groſſe, and hot in taſte: when it is ſodden in a frumenty pottage of wheat, they giue it with good ſucceſſe to thoſe that be diſeaſed in the liuer: this is thought of ſome to be all one with Polium, whereof I haue ſpoken in due place. Symphonia or Gromphena, an herbe hauing leaues, ſome red, others greene, growing to the ſtem in order, one red and another greene, is a ſoueraigne medicine for ſuch as reach and void vp bloud, if it be taken in oxycrat, or vineger & water mingled together.

*Striato haply for ſtricto, *i.* ſlender, as *Oribaſius* deſcribeth it. ῥαβδοειδῆ λεπτὸν. * *Dioſcorides* deſcribeth his Moly with ſuch a head vpon the top of the ſtem.

*By theſe names he calleth alſo Horſtaile.

* A kind of Turbit.

together. Melandryum is an herb found growing in corn-fields & medows, with a white floure, and the ſame of a ſweet and pleaſant ſent: the ſmal ſtems therof be commended for the liuer, in caſe they be ſtamped & giuen in old wine. Chalcetum commeth vp in vineyards: which if it be punned, ſerueth for a good cataplaſme to be applied vnto the region of the liuer. The root of Betony taken to the weight of foure drams in wine cuit or honied wine, prouoketh vomit readily, as well as Ellebore. But for this purpoſe Hyſſope is better, being beaten in pouder, and giuen with honey: but order would be giuen before vnto the Patient, to eat Creſſes or Irio. * Molemonium alſo is of the like effect, if it be taken to the weight of one denier. Moreouer, the herb Silybum hath a white juice like vnto milke: which after it is thickened to the ſubſtance of a gum, is vſually taken to the foreſaid weight, with hony, for a vomitorie; and doth euacuat cholericke humors eſpecially. On the contrary ſide, wild Cumin and the pouder of Betony, if they be drunk with water, do ſtay vomiting. For to digeſt the crudities of the ſtomack, and to rid away the loathing to meat, Carrot is thought to be very good: ſo is the pouder of Betony, if it be taken in honied water. And Plantain alſo boiled in potage after the manner of Coleworts or ſuch like potherbs. * Hemonium ſtaieth the painful yex or hocquet. In like ſort Ariſtolochia. Clymenos giues liberty to draw the wind more freely. The greater Centaury and Hyſſop are ſingular in drink for the pleuriſie and inflammation of the lungs. The iuice of Harſtrang principally is a proper remedy for thoſe that haue the pleuriſie. Touching that Plant, which the French cal * Halum: the Venetians Cotonea: it is holden excellent for the griefe of the ſides, for the reines, thoſe that be plucked with the cramp, and burſten by any inward rupture: this herb ſomwhat reſembleth wild Origan or Marjeram, ſaue that in the head it is like rather vnto Thyme: ſweet it is in taſt, and quencheth thirſt: a ſpungeous and light root it hath, in one place white, in another black. Of the ſame operation for the paires, of the fide, is Chamærops, an herbe which hath leaues growing double about the ſtalk, and thoſe like vnto the Myrtle leaues: and bearing certain buttons or heads, much after the manner of the Greciſh Roſe; and the way to take it is in wine. Agarick drunk in that order as it was preſcribed for the cough, doth aſſuage the paine of the Sciatica and the back bone. Semblably, doth the pouder of dried Stœchas or Betony, if it be taken in mead or honied water.

* Or Polemonium.

* Ceterach.

* Bigle, or *Symphytum Petræum.*

Chap. VIII.

¶ *Of all the infirmities and remedies of the belly, and thoſe parts that either be adioining to it, or within contained. The means how to looſen and bind the belly.*

TOuching the panch or belly, much ado there is with it: and although moſt men care for nothing els in this life, but to content and pleaſe the belly, yet of all other parts it putteth them to moſt trouble: for one while it is ſo coſtiue, as that it will giue no paſſage to the meat; another while ſo ſlippery, as it will keep none of it: one time you ſhal haue it ſo peeuiſh, as that it can receiue no food; and another time ſo weake and feeble, that it is able to make no good concoction of it. And verily now adaies the world is growne to that paſſe, that the mouth and panch together are the chiefe meanes to worke our death. The wombe (I ſay) the wickedeſt veſſell belonging to our bodies, is euermore vrgent, like an importunat creditour, demanding debt, and oftentimes in a day calleth vnto vs for victuals: for the bellies ſake eſpecially we are ſo couetous to gather good; for the belly we lay vp ſo many dainties and ſuperfluities; to content the belly, we ſtick not to ſaile as far as the riuer Phaſis; and to pleaſe the belly, we ſeek & ſound the bottome of the deep ſeas: and when all is done, no man euer thinketh how baſe and abject this part of the body is, conſidering that filthy ordure and excrement which paſſeth from it in the end. No maruell then if Phyſitians be much troubled about it, and be forced to deuiſe the greateſt number of medicines for the help and cure thereof. And to begin with the ſtaying and binding of it: a dram of Scordotis the herbe, ſtamped greene and taken in wine, doth the feat; ſo doth the decoction thereof, if it be drunke. Alſo Polemonia is a ſoueraigne herb to be giuen in wine for the bloudy flix. The root of Mullen or Lungwort, taken to the quantity of two fingers in water, worketh the ſame effect. The ſeed of Nymphæa Heraclea drunk in wine, is of the like operation: ſo is the vpper part of the double root of Glader or the Flagge, miniſtred to the weight of two drams in vineger. To this purpoſe alſo ſerueth Plantaine ſeed, done into pouder

and

20030

A and put into a cup of wine: or the herb it ſelfe boiled with vineger, or els frumenty pottage taken with the juice thereof. Plantaine ſodden with Lentils, or the pouder of the dry herb ſtrewed like ſpice into drinke, together with the pouder of ſtarched Poppie. The iuice alſo of Plantain or of Betony put into wine that hath bin heat with a red hot gad of ſteele, either miniſtred by clyſtre or drunk, in the ſaid caſe is very commendable. Moreouer, the ſame Plantain or Betony is ſingular to be giuen in ſome green or auſtere wine, for thoſe who are troubled with the lask proceeding from a weake ſtomack: and for that purpoſe Iberis may be applied vnto the region of their belly, as I haue before ſaid.

In the diſeaſe Tineſmus (which is an inordinat quarrell to the ſtool, and a ſtraining vpon it, without doing any thing) the root of Nemphar or Nymphæa Heraclia, is ſingular good to bee
B drunk in wine: likewiſe Fleawort taken in water, & the decoction of * Galangale root: the juice of Houſleeke or Sengreene ſtoppeth the flux of the womb, ſtaieth the bloudy flix, and chaſeth out of the body the round worms. The root of Comfrey and of the Carot, ſtoppeth likewiſe the bloudy flix. The leaues of Houſleeke ſtamped and taken in wine, are ſingular good againſt the wringing torments of the belly. The pouder of dried Alcæa drunk, cureth the ſaid wrings. Aſtragalus, *i.* Peaſe Earth-nut, an herb bearing long leaues, indented with many cuts or jags, and thoſe which be about the root made bias: riſeth vp with three or foure ſtems full of leaues: carieth a floure like to the Hyacinth or Crow toes: the roots are bearded and full of ſtrings, enfolded one within another, red of colour, and exceeding hard in ſubſtance: it groweth in rockes and ſtonie grounds expoſed to the Sun, and yet charged or couered with ſnow the moſt part of
C the yeare, ſuch as is the mountain Pheneus in Arcadia. This herb hath an aſtringent power: the root if it be drunk in wine, bindeth the belly, by which means it prouoketh vrine, namely, by driving backe the ſerous and watery humors to the reines; like as moſt of thoſe ſimples that be aſtringent that way, are diureticall. The ſame root ſtamped and taken in red wine, healeth the exulceration of the guts, & thereby ſtaieth the bloudy flix: but ſurely hard it is to bruiſe or ſtamp it: the ſame is ſingular for the apoſtumation of the gums, if they be fomented therwith: the right ſeaſon to draw and gather thoſe roots, is in the end of Autumne, when the herb hath loſt the leaues, and then they ought to be dried in the ſhade. Both ſorts of Ladanum growing among corne, be excellent for to knit the belly, if they be ſtamped and ſearced. The manner is to drink them in mead, likewiſe in wine * to repreſſe choler. Now the herb whereof Ladanum is made
D is called Lada, & groweth in the Iſland Cypros, the liquor wherof ſticketh commonly to goats beards. The excellent Ladanum commeth out of Arabia. There is a kind of it made now adaies in Syria and Africke, which they call Toxicon: for that in thoſe countries the people vſe to take their bowſtrings lapped about with wooll, & trail the ſame after them among thoſe plants which beare Ladanum, and ſo the * tattie dew cleaueth therto. Of this Ladanum I haue written more at large in my treatiſe of ointments & redolent compoſitions: but this later kind is ſtrongeſt in ſauor & hardeſt in hande; and no maruell, for it gathereth much groſſe and earthy ſubſtance, whereas indeed the beſt Ladanum is commended and choſen, when it is pure, clear, odoriferous, ſoft, green, and full of roſin. The nature thereof is to ſoften, to drie, to concoct, and to procure ſleep: it retaineth the haire of the head being giuen to ſhed, and maintaineth the ſame
E blacke ſtill, that it turne not hoary: wholſom it is for the eares, if it be inſtilled into them with Hydromel (that is to ſay, mead or honied water) or els with oile Roſat. It cleanſeth the skin of dandruffe, and when it ſeemeth to pill: and withall, healeth the running ſcals of the head, if ſalt be mixed therewith. And being taken with Storax [Calamita] it cureth an inueterat cough but moſt proper it is for thoſe who belch ſoure and ſtrong. Moreouer, Chondris, which alſo is called baſtard Dictamnum, is a great binder of the belly: ſo is Hypociſthis, named by ſome Orobathion, much reſembling a green or vnripe Pomegranat. This plant growes (as I haue ſaid) vnder Ciſthus, whereupon it took the name. Both kinds of it (for twaine there be, to wit, the white and the red) being dried in the ſhade, ſtay a lask, if they be drunk in thick, auſtere, or green wine: the
F iuice only is vſed in Phyſick, the which is aſtringent and deſiccatiue: and the red kind is of the twaine more appropriat for the ſtaying or drying vp of rheumes; which if it be drunke to the weight of three oboli, is ſoueraigne for them that reach and raiſe vp bloud. Either drunke or clyſterized with Amyl, it cureth the bloudy flix. The like effects hath Veruaine giuen in water, yea, and in Amminean wine, if the Patient haue no ague hanging vpon him: with this proportion, that there be the quantity of fiue ſpoonefulls of the herb put to three cyaths of wine. Moreouer,

* *Acorũ*, which ſome take for our *Calamus Aromaticus*.

* *Ad bilẽ*: ſome read *nouile*.

* *Pinguedine roſcida*.

ouer, the herb Lauer, which loueth to grow in brooks and riuers, being either condite and preſerued, or els ſodden, allaieth the wrings of the belly. Water-ſpecke or Pondweed, called in Greek Potamogeton, is ſingular good for the dyſentery or bloudy flix; for the flux alſo which proceedeth from a weak ſtomack. This herb beareth leaues like to Beets, but that they be leſſe only and more hairy, or furred with a downe. A little it beareth aboue the water, and hath a peculiar property, which is refrigeratiue and aſtringent: the leaues alone be medicinable, & thoſe be good for the morimals in the legs: for cankerous and corroding vlcers, if they be applied in a cataplaſme with hony or vineger. *Caſtor* the Phyſitian deſcribeth this herb * Potamogeton after another ſort, namely with a ſmall ſlender long leafe like vnto horſe-haires, putting forth a long ſtem likewiſe, and the ſame ſmooth, growing alſo in waters. He vſed with the root of this herb to cure the Kings euill, and heale all hard tumors. This Potamogeton hath an aduerſatiue nature to Crocodiles alſo, and therfore they who hunt after them, carry this herbe ordinarily about them. In like maner Achillea ſtoppeth a lask. And the ſame effects worketh Statice, an herb running vp commonly in ſeuen ſtems, in the top bearing buttons or heads reſembling Roſes. * Ceratia beareth but one leafe, and hath a knotty and great root, which is good to be eaten for to cure the lask, occaſioned by the feeble ſtomacke, and the bloudy flix, proceeding from the vlcer of the guts. Lions-paw, commonly called * Leontopodion, by ſome Leuceoron, by others Dorypetron, and Thorybetron, hath a root which *bindeth the belly, and yet notwithſtanding purgeth choler: if it be taken to the weight of two denarij Roman, in mead or honied water. This herbe groweth in light and lean champian grounds. It is ſaid, that if the ſeed thereof be taken in drinke, it cauſeth ſtrange viſions and fantaſticall dreames. Harefoot, which the Greekes name Lagopus, drunke in wine, bindeth the belly: but if the Patient be in an ague, it would be taken with water: beeing applied and bound vnto the ſhare, it repreſſeth the tumors and riſings in thoſe parts: an herbe this is growing vſually among corne. Many there be, who for the dangerous bloudie flixe that is thought incureable, commend highly aboue all other herbes, Cinquefoile, in caſe the Patient drinke the roots thereof boiled in milke: and the like opinion they haue of Ariſtolochia, in caſe there be taken of the root to the weight of one victoriat in three cyaths of wine. Now this would be noted by the way, that in theſe caſes of aſtringency and binding, all the medicines before named which are to be taken warme, ought to be heat with a gad of ſteele, quenched in the liquor. Thus much of thoſe Simples that bind the belly.

C H I K

Contrariwiſe, the juice of Centaury the leſſe is a purgatiue, if a dram thereof bee taken in one hemine of water, together with ſome few cornes of ſalt and drops of vineger; for it doth euacuate choler. The greater Centaurie, commonly called Rhapontick, ſtilleth the wrings and griping paines of the belly. Betonie maketh the body looſe and ſoluble, taken to the weight of foure drams in nine cyaths of Hydromell or Mead. In like manner Euphorbium is laxatiue, & ſo is Agaricke, if two drammes thereof be drunke in water with a little ſalt, or to the weight of three oboli in mead or honied water. Sowbread alſo, named by the Greeks Cyclaminos, taken inwardly with water, or put vp by ſuppoſitories, prouoketh to the ſeege: ſo doth a ſuppoſitory made with the root of * Chamæciſſus. Take a good bunch or handfull of Hyſſope, ſeeth it in water with a little ſalt to the conſumption of a third part: it ſerueth to euacuat fleagme, if it be but applied as a liniment to the belly: or ſtamped and incorporat with oxymel and ſalt, in which maner vſed, it driueth worms out of the body. The root of Harſtrang purgeth both flegmatick and cholerick humors alſo. Pimpernel taken in mead, is a good purgatiue: ſo is Epithymum, which you muſt take to be the * floure of a kind of Thyme that reſembleth Sauery: here is the difference only, that this floure is of a graſſe green colour, but that of the other Thyme is white. Some call this Epithymum, Hippopheon: a ſimple not very wholſome for the ſtomack, ne yet good to prouoke vomit; howbeit, ſingular to appeaſe the wringing paines in the belly, and to carminate or diſſolue ventoſities. The ſame may be taken alſo by way of lohoch or liquid electuarie, confected with honey, and ſometimes with the Ireos root, for the ſtuffing and other imperfections of the breaſt. Epithymum looſeneth the belly, if it be taken from foure drammes to ſix, with honey, a little ſalt and vineger. Some Herbariſts deſcribe Epithymum otherwiſe, namely, that it groweth without any root, and that it reſembleth a little ſmal ſtring or thread like vnto haire, of a red colour: which if it bedried in the ſhade and drunke in water to the weight and meaſure of halfe an acetable, purgeth downeward fleagme and choler both.

* *Dalechampius* maruelleth how this may ſtand: and yet we ſee it ordinarie in the cure of dyſenteries and outragious Diarrhæs, to purge choler with Rubarbe, Myrabolanes, &c. and withthem alſo to bind.

* Which ſome take for groũd Iuie.

* Here *Pliny* is deceiũd: for it is a kind of lace winding about Thyme, as Doder about Flax.

20030

A Nemphir taken in ſome hard aſtringent or wine, * gently purgeth the belly. Alſo, Pycnocomon is laxatiue: an herb this is like vnto Rocket, but that the leaues be thicker in ſubſtance, and * grow more thin: it hath a round root, and the ſame yellowiſh, and ſenting much of the earth: the ſtem is foure cornered, of a mean height, ſmall and ſlender, and the floure much like to that of Baſill. Found it is ordinarily in ſtony grounds. The root of this hearb drunk in mead, to the weight of 2 deniers, doth euacuat downward by the belly, both cholericke and alſo flegmatick humors. The ſeed cauſeth troubleſome and vnquiet dreams, if one drinke a dram therof in wine. Fumiterre alſo * conſumeth and diſpatcheth the kings-euill. Polypodium (which wee cal in Latine Filicula) becauſe it is like vnto Fearn, purgeth choler. The root, which is only medicinable and in vſe, is ful of hairs, of a greeniſh colour within, as big commonly as a mans little finger: full of hollow concauities it is, repreſenting thoſe holes that the fiſhes called Polypi haue about their feet or clees: ſweetiſh it is in taſt, and groweth either vpon rocks, or * elſe at the foot of old trees. After that this root hath bin wel ſoked in water, they vſe to preſſe the iuice forth of it; or the ſame may be ſhred & minced ſmal, ſtrewed among pothearbs either of Beets or Mallows; yea, and put into the pot with them: or els tempered in ſome ſalt ſauce, or ſodden in broth: a fine medicine and a ſafe, gently looſing the belly, though the patient were in an ague: it doth euacuat choler and flegme both: but ſomwhat offenſiue it is to the ſtomack. The pouder of it dried, conueighed vp into the noſthrils, conſumeth the ill-fauoured ſore within, called Polypus or Noli-me-tangere. It * floureth, but ſeedeth not. Moreouer, Scammonie alſo ouerturns and hurteth the ſtomack, vnleſſe two drams of Aloe be put vnto as many oboli of it: for then it purgeth choler, and ſendeth it down by the belly. Now this Scammonie is the juice of a certain herb (called likewiſe Scammonea) which brancheth and tufteth immediatly from the root: the leaues be fat, white, and made triangle wiſe: the root thick, moiſt, and in handling wil make ones ſtomack to riſe, and be ready to heaue. It loueth to grow in battle grounds, and thoſe of a white leere. About the riſing of the great Dog-ſtar they vſe to make an hollow trough in the root as it groweth; to the end, that all the moiſture thereof may fall and gather into it: which liquor beeing dried in the Sun, is wrought and made into bals or trochisks. The root it ſelfe alſo is commonly dried, or at leaſtwiſe the rind thereof. In regard of the countrey where it groweth, that is commended moſt which commeth from Colophon, Myſia, and Priene: but if you reſpect the form, and look of it, chuſe that which is neat and clean, reſembling as neare as poſſibly may be, ſtrong Oxe glue, ſpungeous or fiſtulous, full of holes or paſſing ſmall pipes. If you go by other qualities, take that which wil ſoon diſſolue or melt: which alſo hath a ſtrong and ſtinking ſmel, clammy and gummy, turning into a whitiſh liquor like milk, if you taſte it at the tongues end, exceeding light in the hand, and when it is reſolued, growing to a whitiſh colour. And yet this property you ſhall ſee in that Scammonie which is ſophiſticate: and that ywis may ſoone be done, for do but take the meale or floure of Eruile and the iuice of the ſea Tithymal (& ſuch is that commonly which commeth from Iudæa) it wil counterfeit the right Scammony: but ſuch ſtuffe as this offendeth the throat, and is ready to choke or ſtrangle as many as vſe it. Howbeit this may be ſoon found by the very taſt only: for the Tithymall ſetteth the tongue in a heat as if it were a bulb root: and is not good to purge, whether a man take it faſting or full. As for the true and ſincere Scammony, they were wont to exhibit it for a purgation euen ſimply by it ſelf alone in a draught of mead with ſome ſalt, and the doſe was four oboli. But it was found to do the deed beſt, and moſt effectually taken with Aloe: ſo that the patient, when it began once to worke, took a prety draught of ſweet honied wine. Furthermore, the root if it be boiled in vineger to the conſiſtence of hony, maketh a ſingular liniment for to annoint the leproſie; yea, and in caſe of head-ach it is found good to annoint the head with it & oile together. As for the Tithymall aforeſaid, our countrymen here in Italy, ſome call it Lactaria, as one would ſay, the Milke herb; other Lactuca caprina, *i.* Goats Lectuce. It is commonly ſaid, that with the milke or juice of theſe Tithymals, a man may write vpon the skinne of the body: for draw any letters therewith and ſtrew aſhes or duſt thereupon, when they be drie, they will appeare very legible. And this is a tricke practiſed by thoſe that make court vnto other mens wiues their miſtreſſes, deliuering their minds ſecretly vnto them by this means, which they dare not ſet down in paper or miſſiue letters. Many kinds there be of theſe * Tithymals. The firſt is known by the addition of Characias, which alſo is called the male Tithymall: the * branches be of a finger thicknes, red, * riueled, 5 or 6 in number, running vp to the height of a cubit: and leaued they be immediatly

B

atly from the root,which hang downward inclining to the earth : but in the top it hath an hairy G
tuft or head in manner of ruines. This groweth in rough places and rocks by the ſeas ſide. The ſeed together with the hairy buſh that it hath, they vſe commonly to gather in Autumn:which after it be dried in the Sun,they ſtamp and then lay vp againſt their need. As for the iuice,men draw it about the time that Quinces begin to ripen and gather a downe about them: for then they breake the ſprigges and tender crops of the plant, out of which there iſſueth the iuice or milk,which they receiue either in Eruile floure,or els vpon figs, that it may dry with them together. Now it is ſufficient to let fiue drops fall vpon euery ſuch fig:for this opinion they haue, that looke how many drops light vpon a fig,ſo many ſtooles ſhall hee haue who taketh that fig in a dropſie,to purge wateriſh humors. But in the gathering of this iuice or liquour, great heed muſt be taken,that no drop of it touch the eyes. There is a iuice alſo preſſed out of the leaues H
being bruiſed and ſtamped,but not ſo effectuall as the former. The decoction of the branches alſo is vſed to the ſame purpoſe. And the ſeed being ſodden,ſerueth to the making of certaine pils confected with hony,which are highly commended for purgatiues:the ſame ſeed * enclo-
ſed within wax,is good to be put into hollow teeth when they ake: in which caſe alſo,a colluti-
on made of the root boiled in wine or oile,is ſingular good,if they be waſhed therewith: With the iuice of this herb there is a liniment made for tettars and ringworms:and ſome there be who drink the ſame for to purge both vpward and downward,for otherwiſe an enimy it is to the ſto-
mack : in which potion if there be put ſome ſalt,it doth euacuat fleagme, but with ſalt petre it voideth cholerick humors. If the patient haue a mind to purge by ſeege,he ſhal do wel to drink
the iuice of Tithymall in water and vineger mingled together : but if he be diſpoſed to vomit, I
it is better to drink it in cuit or mead. The ordinarie doſe is three oboles thereof in a potion. But the better way is to take the figs prepared as is beforeſaid,after meat : and euen ſo taken,in ſome ſort the iuice doth ſting the throat and ſet it on fire. For to ſay a truth, of ſo hot a nature it is, that alone of it ſelfe,being applied outwardly vnto any part of the body, it raiſeth pimples and bliſters no leſſe than fire; in which regard,it is vſed for a cauſtick or potentiall cauterie:the ſecond kind of the Tithymall,is knowne by the name Myrſinites, which others call Caryites: The reaſon of the one name is this, for that it beareth ſharp pointed and prickie leaues in man-
ner of the Myrtle,but that they be ſomwhat more tender : and the ſame groweth in rough pla-
ces like as the former. The buſhy heads or tufts of this Tithymall, would be gathered when Barly beginneth to ſwell in the eare : & ſo they be let to take their drying in the ſhade 9 daies K
together : for in the Sun they wil be withered in that ſpace. The fruit which this plant beareth doth not ripen all together in one ſeaſon,but ſome part thereof remaineth againſt the next yere: and the ſaid fruit is called the Tithymal nut;which is the cauſe,that the Greeks haue impoſed vpon it that ſecond name Caryites. The proper time to gather and cut down this herb,is when corn is ripe in the field, and ready to be reaped or mowed. Which beeing waſhed, muſt after-
wards be laied forth a drying:& ſo they vſe to giue it with two parts or twice as much of black Poppie,yet ſo as the whole doſe may not exceed one acetable. This Tithymall is nothing ſo ſtrong a vomitory as the former,no more be the reſt,whereof I will ſpeak anone. Some there be who giue the leaues alſo with black poppy after the foreſaid proportion:& the very nut or fruit it ſelfe alone in mead or cuit,or els if they put any thing thereto,it muſt be Seſama : and truely L
in this maner it ſendeth flegmatick & chollerick humors away by ſeege. This Tithymal is ſin-
gular for the ſores in the mouth. But for cankerous and corroſiue vlcers indeed which corrode deep into the mouth,it is good to chew and eat the ſame with honey. The third kind of Tithy-
mall is called Paralius or Tithymalis. This herb puts forth round leaues: riſeth vp with a ſtalk a ſpan or handfull high : the branches be red and the ſeed white, which ought to be gathered
Ex Theophraſt. when the grape beginneth to ſhew [blacke] vpon the vine. And being dried and made into pou-
der, is a ſufficient purgation,ſo it be taken inwardly to the meaſure of one acetable : the fourth, kind is named Helioſcopium:the leaues wherof reſemble Purcellane, and from the root it puts forth 4 or 5 ſmall vpright branches,which be likewiſe red and half a foot high:the ſame alſo be
ful of iuice or milk. This herb delighteth to grow about town ſides,bearing a white ſeed,wher- M
in Doues & Pigeons take exceeding great pleaſure : which alſo is ordinarily gathered when the grape maketh ſome ſhew of ripening. It took this name Helioſcopium,for that it turns the heads which it beareth,round about with the Sun. Halfe an acetable thereof taken in Oxymel, purgeth choller downeward. And in other caſes vſed it is, like as the former Tithymall named
Characias.

* or rather the ſeed or milk is to be put into the hollow teeth: and the reſt which be ſound are to be defended with wax,according to *Dioſcorides.*

20030

A Characias. The fifth, men call Cypariſſias, for the reſemblance that the leaues haue to thoſe of the Cypreſſe tree: it riſeth vp with a double or threefold ſtem, and loueth to grow in champian places: of the ſame operation and vertue it is, that Helioſcopium and Characias beforenamed. The ſixth Tithymal, is commonly called Platyphyllos, although ſome name it Corymbites, others Amygdalites, for the reſemblance that it hath to the almond tree: there is not a Tithymal hath broader leaues than it, which is the reaſon of the firſt and vſuall name Platyphyllos: it is good to* kil fiſh: it purges the belly, if either the root, leaues, or iuice, be taken in honied wine or in mead, to the weight of foure drams: a ſpeciall vertue it hath to draw water downward from all other humors. The ſeuenth is called commonly Dendroides, and yet ſome giue it the name Cobion, others Leptophyllon: ordinarily it is found growing vpon rocks, and of all others car-

B rieth the faireſt head: likewiſe the ſtems be reddeſt, and the ſeed ſheweth in moſt plenty: the effects be all one with thoſe of Characias: as touching the plant called Apios Iſchas or Rhaphanos-agria, *i.* the wild Radiſh: it putteth forth two or three ſtalkes like bents or ruſhes, ſpreading along the ground, and thoſe be red, and the leaues reſemble rue: the root is like an onion head, but that it is larger, which is the reaſon that ſome haue called it the wild Radiſh: this root hath a white fleſhie ſubſtance within, but the skin or rind thereof is blacke: it groweth vſually vpon rough mountains, and otherwiſe in faire greens * full of graſſe. The right ſeaſon to dig vp this root, is in the Spring; which being ſtamped and ſtrained, they vſe to put in an earthen pot, where it is permitted to ſtand, & look what it caſteth vp and ſwimmeth aloft, they ſcum off and throw away: the reſt of the iuice thus clarified, purgeth both waies, if it be taken to the weight

C of one obolus & a half in mead or honied water: and in that maner prepared, it is giuen to thoſe that be in a dropſie, the ful meaſure of one acetable: the pouder alſo of the root dried, is good to ſpice a cup for a purgation: and (as they ſay) the vpper part of the root purgeth * choler vpward by vomit, whereas the nether part doth it by ſeege downward.

Now for the pains and wrings which oftentimes torment the poore belly: all the kinds of Panaces and Betony are ſingular to aſſuage and allay them plain, vnleſſe they be ſuch as are occaſioned by crudity and indigeſtion. As for the iuice of Harſtrang, it diſſolueth ventoſities, for it breaketh wind vpward and cauſeth one to rift: ſo doth the roots of * Acorus: alſo carots, if they be eaten in a ſalad after the maner of * Lettuce. For the infirmities proper to the guts, & name-

D ly the worms there breeding, Ladanum of Cypreſſe is ſoueraigne to be taken in drinke: in like maner the pouder of Gentian drunk in warm water, to the quantity of a bean: Plantain likewiſe hath the ſame effect, if there be taken of it firſt in a morning to the quantity of 2 ſpoonfuls, and of Poppy one ſpoonfull, in 4 cyaths of wine not very old: the ſame medicine may be giuen alſo laſt at a night to bedward; with ſome addition of ſal-nitre or fried barly meale, if it be long after meat: and one hemine of the iuice thereof is ſingular for the cholique, if it be miniſtred in a clyſtre, though the patient were in an ague. In caſes of the ſpleene, it is good to drink 3 oboles weight of Agarick in one cyath of old wine, for it cureth the ſpleen: and of the ſame operation is the root of all ſorts of Panaces, taken in honied wine: but for the accidents of the ſpleen, Teu-

E crion hath no fellow, if it be taken either dry in pouder, or boiled, to the quantity of one handfull in 3 hemines of vineger: and the ſame herb maketh a ſoueraigne ſalue for green wounds to be applied with vineger; or if the patient cannot indure it, with a fig or water in ſtead of vineger. Polemonia likewiſe is a good herb for the ſpleen, to be drunk in wine: ſo is Betony, taken to the poiſe of one dram in 3 cyaths of oxymell: and Ariſtolochia is likewiſe reſpectiue to this part, in caſe it be giuen vnto the patient as againſt the poiſon of ſerpents. If the Patient continue the eating of Argemonia ſeuen daies together with his meat, it will (as they ſay) in that time conſume and waſt the ſwelling ſpleen: & Agarick taken to the weight of 2 oboli in oxymell, is effectuall that way. The root of Nymphæa Heraclia or Nenuphar drunk in wine, is able of it ſelfe to conſume the ſame. Ciſſanthemos is an excellent herb for the ſpleene or milt: if a man take a dram of it twiſe a day in two cyaths of white wine, and hold on that courſe for fortie daies together, it wil (by report) rid away the diſeaſed ſpleen by vrine; to which purpoſe, the de-

F coction of hyſſop with figs ſerueth very well: euen ſo doth the decoction of Lonchitis, if it bee taken before it ſpindle and run vp to ſeed: alſo the root of Harſtrang boiled, is good for ſpleene and kidnies. Acorum, if it be taken in drink, conſumeth the milt.

For the Midriffe and Hypochondriall parts, or the ſmall guts lying in the flanke vnder the ſhort ribs, * Radiſh roots be ſingular. The ſeed of water Betony, if it be drunke thirty daies to-

* If it be punned into pouder & ſtrewed on the water, as ſaith *Dioſc.*

* *Herbofis: Theophraſtus* hath κατχναιώδη: that is to ſay, cragge or flintie: it ſeemeth that *Plinie* tranſlated χλωδη

* Which ſome take for Galangale, others for our Calamus.

* *i.* With vinegre and oile.

Radices.

gether, the weight of one denarius at once in white wine, is ſingular in that caſe: the pouder of Betony taken in drink with hony and vineger of Squilla, is commended for that purpoſe: as alſo the root of Lonchitis drunk in water; and Feucrium applied as a liniment. G

Scordum incorporat with wax, and Agarick with the pouder or floure of Fenigreek, help the infirmities of the bladder, and namely, the intollerable pains of the ſtone and grauell, as I haue beforeſaid. Polemonia drunk in wine; and in like manner Agaricke, is good for that purpoſe: the root or leaues of Plantaine taken in ſweet wine cuit; alſo Betonie, prepared in that manner as it was appointed for the diſeaſe of the liuer, be remedies for the infirmities of that part. Betonie alſo giuen in drink and applied in a liniment, healeth a rupture; and the ſame is moſt effectuall in curing the ſtrangury: ſome preſcribe and giue counſell to drink Betony, Veruaine, Yarrow, or Millefoile, of each a like portion in water, as an excellent remedy for the ſtone and grauel. And well knowne it is, that for to eaſe the ſtrangury and remoue the cauſe thereof, Dictamnus is an approued medicine: ſo is the decoction of Cinquefoile, if it be boiled in wine to the conſumption of a third part, found by experience to be an vndoubted remedy in that infirmity: the ſame alſo is ſingular good to be applied in that rupture where the guts be falne downe. The vpper root of Glader or Flags, cauſeth young infants to make water, if it be laid to the bottom of the belly: the ſame giuen inwardly with water, cureth thoſe that are burſt and haue their guts ſlipped downe; and helpeth the infirmities of the bladder in an outward liniment. The iuice of Harſtrang healeth little children who are burſten; and of Fleawort there is made a good ointment to annoint their Nauell, when it beareth out ouermuch. Both the Pimpernels do prouoke vrine: ſo doth the decoction of Acorus root: the very root it ſelfe alſo beaten into pouder, and taken in drink, worketh the like effect; and beſides, healeth all the accidents of the bladder. Cotyledon or Vmbelicus Veneris, both herb and root, breaketh the ſtone, and expelleth it by grauell; being otherwiſe ſingular good for all inflammations of the genitall parts or members of generation, if the ſtalks and ſeed be taken with Myrrhe, of each a like quantity: Walwort ſtamped together with the tender leaues thereof, and ſo drunk in wine, driueth out the ſtone: the ſame applied outwardly cureth the * accidents befalling to the cods. Ground ſwell, with the pouder of Frankincenſe and ſweet wine reduced into an ointment cureth the inflammation of the ſayd cods. The root of Camfrey brought into a liniment, ſtaieth the rupture whereby the guts come downe: and white Hypociſthis, repreſſeth the cancerous ſores in thoſe parts. Semblably Mugwort is ſingular to be giuen in ſweet wine, for the ſtone and ſtrangur'. The root of Nenuphar or Nymphæa Heraclia taken in wine, aſſuageth the paine and griefe of the bladder: of the ſame power is * Sampier, ſo highly commended by *Hippocrates*: now is this one of the wild woorts which are vſually eaten in ſalads: and certes, this is that very herbe which the good countrey wife *Hecale* forgat not to ſet vpon her boord in a feaſt that ſhe * made (as we may read in *Callimachus* the Poet:) And what is it but a kind of garden Batis? It groweth vp with one ſtem halfe a foot high, or a ſpan at moſt: the ſeed is exceeding hot, round and odoriferous like vnto Roſemary: if it be dried, it burſteth, and hath within a white kernell, which ſome call Cachrys. The leaues be fatty, and of a grayiſh white in manner of the oliue leafe, but that they be thicker, and ſaltiſh in taſt: roots it hath three or foure, of a finger thickneſſe: it groweth vpon the ſea coaſt among rocks and clifts. This herbe may be eaten, raw or boiled, it skilleth not how, with Beets, Coles, and other ſuch woorts; and in taſt likewiſe it is aromaticall and pleaſant: it is vſually preſerued and kept condite in a kinde of pickle: and the principall vſe that it hath, is to cure the ſtrangury, if either leafe, ſtalk, or root, be drunk in wine: alſo, beeing thus taken, it maketh folke look with a more louely, & cheerful colour: but if one be too bold with it, & vſe it not with moderation, it breedeth ventoſities. The decoction of Sampier maketh the body ſoluble, and is diureticall, for it mightly draweth water from the kidnies. In like manner, the pouder of dryed Althæa or Marſh-Mallow, drunk in wine, cureth the ſtrangury, and eaſeth them that piſſe dropmeale; which it wil do more effectually, if the Carot be ioined withall: the ſame is wholeſome for the ſpleen; and a counterpoiſon againſt ſerpents, if it be taken in drink. If the pouder thereof be ſtrewed and mingled among the barley which is giuen in Prouander vnto cart horſes and ſuch like, it helpeth them when they run at noſe with the glanders, and ſtale drop by drop. Touching the herb Anthyllion, it is as like as may be to Lentils, which if it be drunk in wine, cureth all the infirmities of the bladder; and namely, when there iſſueth forth bloud with vrin: there is another hearbe comming neare to it in name; to wit, Anthyllis, like vnto Iua Muſcata, or Chamæpitys, H I K L M

*To wit, when they be hard or ſwolne.

* Or *Creſtma-rine.*

* To prince *Theſeus.*

20030

A mæpitys,carrying purple flours,ſenting ſtrong, and hath a root like to Cichory,which is good in theſe caſes. But it ſeemeth that * Brooklime, called otherwiſe Cepæa (an herbe reſembling Purcellane,but that the root is blacker,and good for nothing in Phyſick,growing vpon the ſandy ſhore,and hauing a bitter taſte) is better for the ſaid infirmities than the former named Anthyllis; for if it be taken in wine with the root of Sperage, it is excellent for the diſeaſes of the bladder:of the ſame operation is * Hypericon,which ſome call Chamæpitys, others Corion. This herb * ſhooteth forth many branches,which be ſmall and ſlender,of a cubit in length,and red withall:in leafe it reſembleth rue; the ſmel is quick,hot,and piercing:the ſeed which it beareth within certain cods,is black,and the ſame ripeneth together with barly. The nature of the ſeed is aſtringent: it doth incraſſat and thicken humors,and ſtoppeth a lask:vrin it prouoketh; and being drunk in wine,ſcoureth away the ſtone and grauell in the bladder. A ſecond Hyperi-

B con there is, which ſome call Coris, in leafe it reſembleth * Tamarix, vnder which it gladly groweth,but that the leaues be more fat,and not ſo red:it groweth not aboue a *ſpan high:odoriferous to ſmell vnto,and of a mild ſweet taſt,and yet * ſharp withall. The ſeed is hot,and therfore cauſeth ventoſities,and * inflation in ruptures:howbeit,vnto the ſtomack it is not hurtful: and ſingular good for the ſtrangury, in caſe the bladder be not exulcerat:drunk in wine,it cureth the pleuriſie. Moreouer,for the bladder and the diſeaſes thereof, Maiden-haire made into pouder together with Cumin,and giuen in white wine,is a ſoueraigne remedy; alſo Veruaine, ſodden leaues and all,vntill the third part of the liquor be conſumed or the very root only thereof taken in honied wine hot,expelleth the ſtones and grauel in the bladder. In like maner the herb

C Perpreſſa,which groweth at Aretium and in Sclauonia, being boiled in water from 3 hemines to one,and ſo taken inwardly as a drink, is an appropriate medicine for the bladder. Clauer or three leafed graſſe taken in wine; Camomile likewiſe * drunk,is good for the ſame. Moreouer, Anthemum expelleth the ſtone;an herb this is,which putteth forth immediatly from the root fiue ſmall leaues,and two long ſtems,with a red roſe colour floure: the roots ſtamped alone,are as effectual in this caſe as green* Lauer. As for Silaus,it groweth along thoſe riuers which run continually and be neuer dry,eſpecially ſuch as glide vpon ſand & grauel:it riſeth to the height of a cubit,and reſembleth garden Parſley:they vſe to ſeeth it after the maner of * Soure-docke, and ſo prepared,it doth much good to the bladder,which,if it be excoriat and ſcabbed,the root of Panaces will heale it; for otherwiſe it is hurtful to that part. The herb called * Malum Erra-

D ticum[*i.*as one would ſay,the wandring poiſon,or apple]it expelleth the ſtone, if one pound of the root be throughly ſodden in a congius or gallon of wine,vnto the conſumption of the half, ſo that the patient take thereof for three daies together one hemine at a time; and that which remaineth of the decoction,in wine,with Lauer & ſea-nettles. Alſo Carots and Plantaine ſeed taken in wine,drueth down ſtone and grauell. The nettle called Fulviana(an herb well knowne to them eſpecially that handle it,and which took that name of him who firſt found out the vertue thereof) if it be ſtamped and drunk in wine,prouoketh vrine.

Scordium is ſingular for the ſwelling of the genetoirs or cods. Henbane is good for the diſeaſes of the members ſeruing to generation. The iuice of Peucedanum [*i.* Harſtrang] incorporate with hony,like as the ſeed alſo taken inwardly, helpeth thoſe who are pained with the ſtrangu-

E rie; likewiſe Agaricke, if three oboli thereof be drunk in one cyath of old wine: the root of Trifoile or Clauer giuen to the poiſe of two drams in ſweet wine: and one dram of Daucum, *id eſt*, Carot]either the herb,root,or ſeed,haue the like effect.

Such as be troubled with the Sciatica or gout in the huckle-bone,finde remedy by a plaſter or cataplaſm,made with the ſeed and leaues both,of Madder; alſo with a drink of Panaces:likewiſe if the place be well rubbed with Polemonia, and bathed with the decoction of the leaues of Ariſtolochia,it finds much eaſe thereby. The broad ſinew or cord at the end of the muſcles which is called in Greek Platys;likewiſe the ſhoulders if they be pained,feele ſenſible alleviation,by Agaricke,if the weight of three oboli be drunk in one cyath of old wine. Cinquefoile both taken in drinke,and alſo applied as a plaſter,allaieth the paine of the Sciatica: ſo doth the

F herb Scammony boiled with barley meale. The ſeed of both the Hypericons drunke in wine,is proper for that malady.

The accidents of the ſeat or fundament,eſpecially when that part is fretted or galled,a ſalue of Plantaine healeth moſt ſpeedily.

The ſwellings or blind piles appearing like bigs or knuckles within the fundament,are cured

with fiue-leafe graſſe: & if the ſaid part be turned the inſight outward, or diſplaced, there is not a better thing to ſettle and reduce it to the former ſtate, than a fomentation with the Cyclamin or Sowbread root and vineger together. Pimpernell with the blew floure, reſtoreth the tiwill or fundament into the right place, if it be falne downe and hang out of the body: and contrariwiſe, that with the red floure driueth it downe. Vmbilicus Veneris is of wonderfull operation in the cure both of the blind piles, and the running hæmorrhoids. The root of Acorus, [*i.* Galengale] ſodden in wine, ſtamped and brought into a liniment, aſſuageth the tumors or ſwellings of the cods. And *Cato* affirmeth. That whoſoeuer haue the Ponticke wormwood about them, ſhall not be galled betweene their legs.

* Or *Calamus Aromaticus.*

Chap. IX.

¶ *Of Penyroiall and Argemone.*

OThers adde moreouer Penyroiall to the foreſaid wormwood, & ſay, that if a man gather Peniroyall faſting and bind it faſt to the reins and ſmal of the back, he ſhal feel no griefe in the ſhare, or if he were pained already in that part, ſhall find eaſe thereby. * Inguinaria, which ſome name Argemony, is an herb growing euery where amongſt buſhes, briers, and brambles, which if it be but held in the hand, is thought to be excellent good for the accidents that befall the groin. Panaces made into a cataplaſme with hony, healeth the flat biles and botches that ariſe in the emunctories of the ſhare: and the like effect hath Plantaine, applied with ſalt, fiue-leafe, & the root of the great clot-bur, like as in caſe of the kings euill: euen ſo is * Damaſonium to be vſed. As for Taperwort or Mullen, if leafe root and all be ſtamped, with ſome ſprinckling of wine among, and be afterwards lapped within a leafe of the own, and ſo heat vnder the embers & laid to the grieued place hot, it is very good for the ſame purpoſe: & ſome affirm vpon their own knowledge, by the experience that they haue ſeen, that this cataplaſme wil work much more effectually, if a yong maiden all naked haue the applying of it to the ſaid bile; prouided alwaies, that both ſhe and he the patient be faſting: alſo that ſhe touch the ſore or impoſtume with the back-ſide of her hand, & in ſo doing ſay theſe words following, *Negat Apollo peſtem poſſe creſcere quam nuda virgo reſtinguat : (i.) Apollo* wil neuer ſuffer, that a botch which a naked virgin thus cureth ſhall poſſibly grow farther: which charm ſhe muſt pronounce thrice, after ſhe hath withdrawn her hand backe; and withall, both he and ſhe are to ſpit as often vpon the floore, that is to ſay, euery time that ſhe repeateth the foreſaid ſpell. Furthermore, the root of Mandragoras being applied with water, healeth theſe botches: ſo doth the decoction of the Scammonium root, reduced into a pulteſſe with hony. Alſo the herb Sideritis laid too, with old hogs greaſe: laſt of all, Chryſippea, incorporat with fat figs: where, by the way note, that this herb retaineth the name of him who firſt brought it to light.

* Some call it Shar ewort or Codwort, o. thers take it to be wild Tanſie, and ſome for *Rhœas.*

* Some take it for *Fiſtula paſtoris.*

* *Peſtem*, haply *hominem peſtilentialem*, a plague ſore.

Chap. X.

¶ *Of the water-Roſe, otherwiſe called Nenuphar. Of ſuch herbs as either heat or coole the aptite to luſt and venery. Of Satyrion or Ragwort,* * *with the red roots of Crategis and Sideritis.*

* Erythraick.

NYmphæa, which alſo is named Heraclea, if it be but once taken in drinke, diſableth a man altogether for the act of generation (as I haue ſaid before) 40 daies after: the ſame if a man drink faſting, or eat with his meat, freeth him from the dreams of imaginary *Venus*, which cauſe pollution. The root applied in a liniment to the genetoirs, doth not onely coole luſt, but alſo keep down and repreſſe the abundance of natural ſeed: in which regard, it is thought good to nouriſh the body and maintain a cleare voice. On the contrary ſide, the vpper root of Glader giuen to drink in wine, kindleth the heat of luſt: like as the herbe which they call Sampier Sauage: as alſo wild Clarie, being ſtamped and incorporat with parched barly meale. But in this caſe wonderfull is the herb Orchis both male and female, and few be like vnto it, for two kinds there be of it: the one beareth leaues like vnto the oliue, but that they are longer, riſeth vp with a ſtem foure fingers high, carrying purple floures, a double bulbous root formed like to a mans genitoirs, whereof the one ſwelleth and the other falleth by turns ech other yeare; and ordinarily it groweth neere the Sea ſide. The other is knowne by the name of Orchis Serapias, and

* Satyrions.

is

20030

A is taken to be the female: the leaues reſemble leeke blades, the ſtalke is a ſpan or hand-breadth high, and the flours be purple; the root likewiſe is bulbous & twofold, fathioned like to a mans ſtones or cullions; of which, the bigger, or (as ſome ſay) the harder, drunk in water, prouoketh the deſire to venery: the leſſer or the ſofter taken in goats milk, repreſſeth the foreſaid appetite. Some ſay it is leafed after the maner of Squilla or ſea-onion, ſaue that the leaues be ſmoother and ſmaller, and it putteth vp a ſtalk ful of pricks or thorns: the roots wherof, do heale the ſores in the mouth, and diſcharge the cheſt of fleame; but drunk in wine, do ſtop a laske. A power it hath alſo to ſtir vp fleſhly luſt, like as Satyrion: but this herb differeth from the other, in that it is diuided by joints or knots, and beſides buſheth more, and is fuller of branches: the root is thought to be good for ſorcery and witchcraft: the ſame alſo, either by it ſelfe alone reduced in-
B to pouder, or els ſtamped & incorporat with fried barly groats into a liniment, is ſingular good for the tumors and other riſings and impoſtumes in the ſaid priuie parts or members of generation. The root of the former Orchis giuen to drinke in the milke of an ewe bred vp at home of a cade lambe, cauſeth a mans member to riſe and ſtand; but the ſame taken in water, maketh it to go down againe and lie. As for the Greekes, they deſcribe Satyrion with leaues like vnto the red Lilly, but that they be ſmaller, & no more in number than three, which ſpring directly from the root: the ſtem ſmooth, a cubit high, naked and bare without leaues, and it hath withall two bulbous roots; of which the nethermore, which alſo is the bigger, ſerueth to get boies; the vpper (and that is the leſſe) is as good to engender girles. They haue likewiſe another kinde of Satyrion, which they name Erythraicon, and it beareth certain grains or ſeeds reſembling that of
C * Chaſt-tree, or Agnus Caſtus, but that they be bigger and ſmooth: the root is hard and white within, the rind wherof is red, and in taſt is ſomwhat ſweetiſh: an herb ordinarily found (as they ſay) vpon mountains: and by their ſaying, the root is of that vertue, that if it be held onely in a mans hand, it wil cauſe the fleſh to riſe & incite him to the company of women; but much more will it ſet him in a heat if he drink it in ſome hard and green wine: in regard of which propertie, the manner is to giue it in drinke to goats and rams, if they be vnluſty and nothing forward to leape the females. The Sarmatians likewiſe miniſtred a drench made with this herb vnto their ſtone-horſes or ſtallions, when by reaſon that they are ouertrauelled and tired out of heart by continuall labour, they perceiue them to be ſlow and vnapt to couer mares, which defect the Greekes call by a proper and fit term Proſedamon. But ſay that one by taking of this root is o-
D uer luſty and too much prouoked that way, the means to abate and quench the heat & ſtrength thereof, is to drink mead or the juice of lettuce. In ſum, the Greeks generally when they would ſignifie any extraordinary wanton luſt or appetite to venery, haue a pretty name for it and call it Satyrion. And euen ſo they haue giuen a denomination to Cratægonon, which is an herbe diuided by knots or joints, buſheth and ſpreadeth with a number of branches, the ſeed whereof is hot, and the root of no validity or vſe in Phyſick: likewiſe they impoſed vpon other the names of Arrhenogonum and Thelygonum; the ſeeds or graines of which reſemble cods or cullions. Moreouer, it is ſaid, That whoſoeuer haue about them the marow or pith of the Tithymal branches, ſhall be very prone and forward to the ſports of *Venus*. *Theophraſtus*, a renowned author, and otherwiſe a graue and modeſt writer, exceedeth in this point, and telleth vs of ſtrange and in-
E credible wonders; and namely, of a man who was able to company with women ſeuenty times together, by touching or handling one only herb; but he hath not put downe either the name or portraiture of that herb.

Sideritis the herb, if it be bound to the ſwelling and painfull veins called Varices in Latine, doth not only diminiſh their tumor, but alſo appeaſe and take away their dolour.

Touching the gout, the time hath bin when it was not ſo common a diſeaſe as now it is; and not only in our fathers and grandſires daies, but euen in our age and within my remembrance it was no ordinary ſickneſſe here in Italy, as being a forrain malady and come out of ſtrange countries hither to vs: for certainly if it had bin known to the Italians in old time, I doubt not but it would haue found a Latine name to be called by. Neither is the gout a diſeaſe incureable, as
F ſome haue beleeued, for known it hath bin in ſome to haue worne away of it ſelfe without any medicines; but in many more, to haue been cured by the meanes of Phyſicke. Among the appropriat remedies for this malady, are to be ranged the roots of Panaces, applied in a cataplaſm with raiſins; the juice of Henbane or the ſeed, with the floure or pouder of Seſama; Scordium laid too in a pulteſſe with vineger; and the hearbe Iberis, as hath beene ſayd before: alſo

How ſoeuer *Dalecampius* and others haue laboured to reſtore this place after this manner, yet there remaineth ſome confuſion: by intermingling *Orchis* and *Satyrion* together, both in their deſcriptions and properties.

Vitex, *Dioſc.* hath *λίνῳ ἰδιάζει*, Line or Flax; not *ἄγνῳ*.

Podagra (vſed ordinarily in Latine for the gout, is a Greeke name, and ſignifieth the griefe or maladie of the feet.

Veruaine ſtamped and incorporat with hogs greaſe, is good for the gout: ſo is the root of Sow- G
bread, the decoction wherof healeth kibed heels, if they be bathed therin: the root of * Xiphion
cooleth the hot gout; the ſeed of * Pſyllium doth the ſame: Hemlock alſo, incorporat with Li-
tharge or hogs greaſe: but aboue all other, Houſleek or Sengreen is right ſoueraigne to be ap-
plied at the firſt aſſault or fit of the red gout (*i.*) when it is occaſioned by a flux of hot humors:
and whether it be hot or cold gout, Groundſwell tempered into a liniment with ſwines greaſe,
and ſo applied, is a very fit and conuenient medicine: as alſo Plantain leaues ſtamped, with a lit-
tle ſalt mixed among: and Argemonia punned in a mortar & applied with hony: moreouer, Ver-
uain reduced into an vnguent, is ſingular in that caſe; yea and if the goutie feet be well ſoked in
the decoction therof, much eaſe wil inſue thereupon: alſo Lappago, an herb reſembling * Pim-
pernell, but that it is fuller of branches, and tufted more with leaues, which alſo be rough, rug- H
ged, and wrinckled, yeelding a juice in taſt more harſh, and in ſmell ſtrong and vnpleaſant: as for
that of this kind which is * ſoft, they call Mollugo: like vnto which (but for the leaues that be
more rough in handling) is Aſperugo, whereupon it took the name. Now for the gout, let the
Patient take euery day 11 deniers weight of the juice preſſed forth of the former Lappago in
two cyaths of wine: but for this diſeaſe the moſt excellent remedy and that which rids it quite,
is the ſea-weed, which in Greeke they call Phycos Thalaſſion, and in Latine Fucus Marinus; an
herb like vnto Lettuce, & commonly Murets & other ſhel-fiſhes lye bedded vpon theſe weeds,
which being applied before they are dried, do cure not the gout of the feet onely, but alſo any
diſeaſe of all other joints. Now of this Sea-graſſe ſo named, there be found three kinds: the firſt
is broad and large; the ſecond longer, and ſomwhat red; the third hath curled and frizled leaues, I
which in Candy they do vſe in dying of their clothes; but all are of one and the ſame operation
in Phyſick. *Nicander* was wont to giue them in wine, as a counterpoiſon againſt the venome of
ſerpents. Moreouer, the ſeed of that herb which I named Pſyllium, is ſingular good for the gout,
if the ſame be well ſteeped in water; ſo that in euery hemine of the ſeed there be mingled the
quantity of two ſpoonfuls of Colophonian roſin, and one of frankincenſe. Finally, the leaues of
Mandragoras be highly commended in this caſe, if they be ſtamped and incorporat with fried
Barly groats into a cataplaſme.

* Glader or Flags.

Chap. XI.

¶ *Generall medicines and receits for all the infirmities incident to the Feet, the Ankles, Ioints, and Sinews: Item, the remedies for thoſe diſeaſes which poſſeſſe and trouble the whole body. Of the herbe Mirthrida. Medicines for thoſe that cannot ſleep: and for the Palſie. Of cold feuers: and the ague that is incident to horſes: of the Phrenſie. Of the herbs Walwort and Houſleek. Laſt of all of the Shingles or S.* Anthonies *fire.*

IF the feet be ſwoln about the ankles, the mud that is found in the bottom of waters, wrought and concorporat together with oile, is of wonderful operation to allay the ſame. For the pain in the ioints, or griefe of ſinews, the juice drawn out of Centaury is paſſing good: in like maner, the herb Centauris. As for Betony, it is comfortable vnto the nerues, which run and ſpread behind ouer the ſhoulder-blades, the ſhoulders, the back-bone, the loins and hanches, if it bee L
taken in * drink, after the manner as it was ordained for the liuer. Cinquefoile, is ſoueraign for
the pain of the joints, if it be applied outwardly: likewiſe the leaues of Mandragoras made into
a pulteſſe with parched barly meale; or the root it ſelfe newly drawn out of the ground & ſtam-
ped with the wild Cucumber; or els boiled in water; for the chaps that appeare in the feet or vp-
on the elbows, the root of Polypodie is ſingular good; for the griefe of the joints, the juice of
Henbane reduced into an ointment with ſwines greaſe, is a proper remedy: likewiſe the iuice
of the herb * Amomum, together with the decoction: alſo Cotton-weed or Cudwort, boiled
in water: or freſh gathered moſſe ſoked in water and bound to the grieued place, and there kept
faſt without remouing, vntill it be drie: as alſo the root of the Bur called Lappa Boaria, drunke
in wine. Sow-bread ſodden in water, cureth the eluiſh & angry kibes beginning to riſe vpon the M
heels, and all other chilblanes and bloudy fals occaſioned by cold. Semblably, Vmbilicus Ve-
neris applied with hogs greaſe, healeth the foreſaid kibed heels: ſo do Crowfoot leaues; and
the juice of Epithymum. Ladanum made into a ſalue with Caſtoreum, and ſo applied, fetcheth
out the core of agnels or corns by the roots: the like effect hath Vervaine, if it be laied too with
wine.

* Rose of Iericho.

20030

A wine. And now that I haue run through thoſe maladies which are offenſiue to euery particular member, I purpoſe to write in the next place of ſuch as occupy the whole body; and of the remedies common to them all, which I find to be theſe enſuing.

And firſt there preſenteth it ſelfe vnto me the noble herb * Dodecatheos, wherof I haue ſpoken before as a ſoueraigne remedy for thoſe vniuerſal diſeaſes, if it be taken in drink. Next to it are the roots of all kinds of the Panaces, which are thought to be excellent, and principally for long and languiſhing maladies: like as their ſeed for the obſtructions of the bowels and the inward accidents of the guts: for the pains generally of the whole body, the iuice of Scordium is right commendable, and ſo is that of Betony: which herb taken in drink, hath a peculiar pro-
B perty to mend the wan and leaden hew of body, reducing it to a more freſh and pleaſant color. The herb * Geranion, which ſome call Myrrhis, others Merthrys, is like vnto Hemlocke, ſaue that it hath ſmaller leaues, and a ſhorter ſtem, which alſo is round, of a ſweet ſent to the noſe, and good ſauor in the mouth; for ſo we Latines doe deſcribe it: but according to the deſcription of the Greeks, the leaues rather reſemble the Mallow, but that they are whiter ſomwhat, the ſtalks ſlender and hairy: * it brancheth out big at the diſtance of euery two handbredths, howbeit, full of leaues between: and among the leaues are to be ſeen in the top of the branches and ſprigs little buttons or heads like vnto Crane-bils. Another kind there is of them leafed after the maner of paſſe-floures, or wind-floures, but that they be intailed or indented deeper: and a round root it hath faſhioned like an apple, which is ſweet in taſt, and is an excellent reſtoratiue for all ſuch as haue bin weakened and decaied in nature by long ſickneſſe: and this I take to be the true
C Geranion, which is a rare herb. A dram weight thereof drunk twice a day [firſt and laſt] in three cyaths of wine, is a ſingular medicine for the phthyſicke. And in that order it is good for ventoſities: and hath the ſame effect though it be taken raw. The iuice of the root is ſoueraigne for the infirmities of the ears. The ſeed giuen in drink to the quantitie of 4 drams with pepper and Myrrh, cureth the cramp which pulleth the head and body all backward. The iuice of Plantain if it be drunk, or the herb it ſelfe boiled and ſo eaten, is wholſome for thoſe that be in a Phthiſick. Plantain eaten with ſalt and oile in a morning, ſo ſoon as a man is awakened, is a great cooler. The ſame is an ordinary medicine for thoſe that miſlike, and whoſe meat is not ſeene vpon them, if they take it each other day. Of Betony and hony there is a liquid confection or lohoch made, which being licked and let down leiſurely, to the quantity at a time of a good big beane,
D helpeth thoſe that are in a Phthyſick or conſumption of the lungs. Alſo Agarick, if it be drunk to the weight of 2 oboli in wine cuit, is good in the like caſe: ſo is Daucum alſo taken in wine with Rhapontick. For the hungry worms Phagedænæ (a name in this place ſignifying an inordinat * diſpoſition, to be alwaies eating and neuer ſatisfied, although otherwiſe I vſe it for cankerous and corroding vlcers) the Tithymalls or Spurges taken inwardly with Seſama ſeed, is counted ſoueraigne. Among the maladies which affect & infeſt the whole body, want of ſleep, or an indiſpoſition thereto, is by moſt Phyſitians counted one: for which defect, they ſhew vs theſe herbs following; to wit, Panaces, water Betony, and Ariſtolochia, which they preſcribe to the patient both for to ſmel too, and alſo to annoint his head al ouer withal. Likewiſe Houſleek called Aeizoon & alſo Sedum, giuing direction to wrap it within a blacke cloth, and ſo to lay it
E vnder the pillow or boulſter of the ſick perſon, but in no wiſe to let him or her know ſo much. Likewiſe Oenothera, otherwiſe named Onuris, is effectuall for this purpoſe: an herb good alſo in wine to make the heart merry. It groweth with leaues reſembling thoſe of the Almond tree, and beareth floures like vnto Roſes. Store of branches it putteth forth, and hath a long root, which being dried, ſenteth much of wine. Of ſuch vertue is this herb, that if it be giuen in drink to the wildeſt beaſt that is, it will tame the ſame and make it gentle. As for the crudities or raw humors lying in the ſtomack, which cauſe loathing and abhorring of meat, Betony is ſingular to digeſt them: the ſame drunk immediatly after ſupper, helps concoction, namely, if one dram weight of the herb be taken in 3 cyaths of oxymel: and ſo it reſolueth and ſcartereth the fumes
F ariſing vp into the head, occaſioned by ſtrong wine. Of the ſame operation is Agaricke, drunke at the end of a meale in hot water. The foreſaid Betony hath the name of a ſpeciall remedie for the palſie: ſo is Iberis alſo reputed, as I haue ſhewed once before; the ſame hearbe reviueth the lims which are benummed and in manner dead. And verily, Argemon is of that vertue, that it diſcuſſeth all thoſe cold humors which mortifie any member, and put them in danger to be cut off or launced. The root of that Panaces which I named Heraclia, drunke with the ren-

net

So called, for that it repreſenteth the maieſty of the twelue principall gods and goddeſſes, called *Maiorum gentium*, or *Conſentes*, whom the Painims imagined to ſit in counſell together with *Iupiter* their Preſident: and theſe hath *Ennius* compriſed in this Diſtichon. *Iuno, Veſta, Minerua, Ceres, Diana, Venus: Mars, Mercurius, Iouis, Neptunus, Vulcanus, Apollo.*

* Herbe Robert, as ſome thinke, or the firſt kind by *Dodonæus.*

* Doues foot or Momordica

The Carot. * βύνιας.

net of a Seal, ſo as there be in proportion 3 parts of the ſaid root to one of the rennet, cureth the falling ſickneſſe. And of the ſame effect is Plantaine, taken in drink. The ſaid diſeaſe is healed by Betony, if a dram therof be taken in oxymell: by Agarick alſo, to the quantity of 3 oboli: and by a drinke made with Cinquefoile. Moreouer, Brionium called likewiſe Archezoſtis, wariſheth this infirmitie, but it muſt be giuen in Amminean wine. Furthermore, the root of Baccharis dried and beaten into pouder, taken with Coriander in 3 cyaths of hot water, is a ſoueraigne mean to help that malady.* Cudweed made into pouder, and taken with vineger, hony, or hot water: Veruain drunk in wine: three beries of Hyſſop ſtamped and drunk in water for 16 daies together: Harſtrang, and the rennet in the maw of a Seale, of each a like quantity taken in drink: the leaues of Cinquefoile, if they be ſtamped and drunk in wine for 31 daies: the pouder of Betony to the weight of 3 deniers, concorporat with one cyath of Squillitick vineger, & an ounce of Atticke hony: laſtly, two oboles of Scammonie, with foure drams of Caſtor, be all appropriat medicines for the falling ſickneſſe. G H

In all * cold agues, if the Patient drink Agarick in hot water, the fits will be the lighter. And more particularly, the herb Sideritis drunk with oile, ſhortneth the cold fit in a tertian: ſo doth that * Ladanum which groweth among corne, if it be ſtamped and ſo giuen. Likewiſe, Plantain, if the patient drink the weight of two drams in mead two hours before the fit; or the verie juice of the root either after it hath lien a time infuſed, or ſimply ſtamped without any ſuch preparation; yea, and the ſubſtance of the root reduced into pouder, and giuen in a draught of water, made hot with a gad of ſteel quenched in it. Some haue appointed in this kind of ague 3 of thoſe roots, and 3 cyaths of water preciſely: and the ſame Phyſitians for a Quartaine haue preſcribed foure of either: and by their ſaying, if when Borage beginneth to fade vpon the ground, one take out the pith or marow within the ſtem, and whiles he is ſo doing, name withal the ſick party, and ſay hee doth it for to rid him or her from the ague; and withall beſtow it in 7 leaues neither more nor leſſe of the ſaid herbe, and hang all tied faſt about the patient before the time that the fit ſhould come, the feuer wil neuer returne again. Alſo a dram of Betony or Agaricke taken in three cyaths of mead, driueth away any intermittent ague, eſpecially thoſe that begin with * quiuering and quaking. Some are wont to giue of Cinquefoile three leaues in a tertian, and foure in a quartan, and ſo riſe to more according to the period or type of the * reſt: others ordain indifferently for all agues the weight of 3 oboli, with ſome pepper, in mead or honied water. Veruaine verily giuen in wine as a drench to horſes, cureth them of their feauers: but in Tertians it muſt be cut juſt aboue the third joint where it brancheth: but for Quartanes at the fourth. The ſeed of both kinds of Hypericon is good to be drunk in Quartans. And the pouder of Betony dried, is ſingular for the quaking fits: and in very deed the herb it ſelfe repreſſeth all ſhiuering and whatſoeuer proceeding of cold. In like maner, Panaces is of ſo hot a nature, that Phyſitians giue direction to them who are to trauell ouer high mountains couered with ſnow, for to drink it, & annoint their bodies all ouer with it. Semblably, Ariſtolochia doth withſtand all chilling and through colds. The beſt cure of thoſe who be in a frenſie, is by ſleepe: and that may be procured eaſily by the juice of Peucedanum & vineger together infuſed vpon the head by way of imbrocation, or by rubbing the ſame with it: likewiſe with the juice of both the Pimpernels. Contrariwiſe, there is more adoe with thoſe that are in a lethargy, to awaken them and keep them from drowſineſſe: and yet may that be affected ſome ſay by rubbing their noſthrils with the juice of the ſaid * Harſtrang in vineger. For thoſe that be out of their right wits or beſtraught, Betony is ſingular good to be giuen in drink. Panaces breaks the Carbuncle: alſo the pouder of Betony in water, healeth it: or the Colewort with Frankincenſe, if the patient drinke often therof hot. Some take a burning cole of fire, and when it is extinguiſhed or gon out in the preſence of the patient, with their finger gather vp the cindres or light aſhes which ſettle therupon, and apply them vnder the carbuncle: others ſtamp Plantain and lay it to the ſore: the Tithymall called Characites, cureth the dropſie. Alſo Panaces and Plantaine taken as a meat in bole, with this regard, That the patient haue eaten ſome dry bread before, without any drinke at all. In which caſe Betony likewiſe is ſingular, if two drams thereof be giuen in as many cyaths of wine ſimply, or wine honied. Moreouer, Agaricke, or the ſeed of Lonchitis, drunke to the quantitie of two Ligulæ or ſpoones full, in water. Flea-woort beeing vſed with wine: the juice of Pimpernels, both the red and the blew: the root of Vmbilicus Veneris in honied wine: the root of Walwoort newly drawne out of the ground, ſo that the earth bee onely ſhaken off without I K L M

* *Centunculus.*
* *Baccæ.* Some read *faſces, i.* bunches: but in mine opinion, *cymæ, i.* tops or ſpikes, agree beſt to the ſence.
* He meaneth intermittent, ſuch as begin with cold fits more or leſſe.
* Taken for *Herba Iudaica*
* *Horrore*, as Quartanes.
* namely quintans, ſextanes, Septimanes, & Nonanes, &c.
Harſtrang.
or rather with Euphorbium, as ſome haue corrected the place.

20030

A without any waſhing at all: in caſe as much thereof as two fingers will comprehend, be taken in one hemine of old wine hot: the root of Clauer or Trefoile drunke in wine to the weight of two drams: Tithymall, named Platyphillon: the ſeed of Hypericon, and namely that which otherwiſe is called Coris: Chamæacte, which ſome think to be Wall-wort, if either the root be beaten to pouder and miniſtred in three cyaths of wine, ſo the patient haue no feuer hanging vpon him, or the ſeed giuen in thick red wine; be appropriat remedies euery one, for a dropſie. In like maner Vervaine, if a good handfull thereof be boiled in water vnto the conſumption of the one halfe. But principally the juice of Wall-wort is thought to be the meeteſt medicine for to fit this malady. *i.* Broad leafed

B For the bleach or breaking out in wheales, for ſmall pocks, ſwine pocks, and ſuch like eruptions of flegmatick humors, Plantain is a proper remedy to rid them away: ſo is the root of ſowbread applied with hony. The leaues of Walwort or ground Elder ſtamped, incorporat in old wine and ſo laid too, doe heale the meazels, purples, or red bliſters, which ſome call Boa. The juice of Night ſhade or pety Morell, vſed as a liniment, killeth the itch. The ſhingles and ſuch hot pimples called S. *Antlonies* fire, are cured by nothing better than by Houſleek, by the leaues of Hemlock ſtamped into an vnguent, or the root of Mandragoras. Now the manner of pr paring and ordering it thus: take the ſaid root, drie it abroad in the open aire, like as they do Cucumbers; but principally let it hang firſt ouer new wine; afterwards in the ſmoke: this don, ſtamp it and temper it with wine or vineger. Good it is alſo in this caſe to make a fomentation with
C wine of Myrtles, and therwith to bathe the grieued place. Alſo take of Mints two ounces, of ſulphur-vif one ounce, pouder them both, and mingle them together with vineger, vſe this mixture for the ſaid S. *Anthonies* fire. And ſome take ſoot & vineger tempred together for the ſame purpoſe. Now of this diſeaſe which we terme * S. *Anthonies* fire, there be many kindes, whereof *Eriſypelas.*
there is one more daungerous than the reſt, which is called * Zoſter, for that it coueteth to goe round about the middle of a man or woman in manner of a girdle; and in caſe both ends meet together indeed, it is deadly and incureable. To meet with it therefore by the way & to preuent this extremity, Plantaine is thought to be a ſoueraign remedy, if it be incorporate with Fullers earth. Alſo Veruaine alone by it ſelfe, and the root of the great Bur. Now for other corroſiue vlcers and tettars, it is very good to vſe the root of Vmbilicus veneris with honied wine: Sen-
D green: the juice of Mercurie alſo with vineger. *i.* A girdle, and it is our ſhingles.

Terra Cimolia.

Chap. XII.

¶ *For diſlocations or members out of ioint. Againſt the Iaundiſe, Felons, hollow ſores called Fiſtula's. Tumors, Burnes, and Scaldings. Againſt other diſeaſes. For to comfort the ſinewes, and ſtanch blond.*

THe root of Polypodium brought into a liniment, is a proper remedy for any diſlocation. The ſeed of Fleawort: the leaues of Plantaine punned with ſome few cornes of ſalt put therto: the ſeed of Mullen boiled in wine, ſtamped and reduced into a cataplaſme: Hem-
E locke, incorporat with hogs greaſe. All theſe applied accordingly, do aſſuage paine and bring down any ſwelling, occaſioned by diſlocation. The leaues of Ephemerum brought into a liniment, are good for any bunches or tumors cauſed by thoſe accidents, if they be taken betimes whiles they may be diſcuſſed and reſolued. Some take it for the May Lillie or Lilly convally.

As touching the Iaundiſe, I cannot but wonder at it, eſpecially appearing as it doth in the eies; namely, how the gall ſhould get vnder thoſe fine membranes and tunicles, lying ſo cloſe couched as they do. *Hippocrates* hath taught vs a rule, That if the jaundiſe ſhew in a feuer * after the ſeuenth day from the beginning thereof, it is a deadly ſigne. Howbeit, I my ſelf haue known ſome to haue eſcaped and liued ſtil, notwithſtanding that deſperat ſigne. But this is not alwaies
F a ſymptome incident to an ague, but happeneth otherwhiles without a feuer: and then a drinke made of the greater Centaurie, as I haue before ſhewed, doth withſtand & ſtay the courſe therof. Alſo Betony riddeth away the iaundiſe, if the patient do drink three oboli therof in one cyath of old wine. The leaues of Veruaine likewiſe haue the like effect, if the ſame quantity be drunke foure daies together in one hemine of wine hot. But the ſpeedieſt cure of this diſeaſe, is by Cinque-foile or fiue leaued graſſe, if three cyaths of the juice be taken with ſalt and hony in drink. The root of Sowbread is a ſoueraigne medicine for this infirmity, if the Patient drinke

* Nay rather before the 7 day for then it is Symptomaticall, and ſignifieth irregular humours: whereas vpon the 7, 9, 11, and ſuch Decretorie daies it is criticall, and giueth hope of recouery. As *Hippocrates* himſelfe teacheth. *Aphoriſ.* 62 and 64, *li.* 4.

the

the weight of three drams: but this care ought to be had, that the roome be hot, and ſo cloſe that no winde may come in, for feare of catching cold: and then it will driue out the jaundiſe by ſweat, luſtily. The leaues of Fole-foot taken in water: the ſeed of Mercuries, both the male & female, if a cup of drink be ſpiced therewith, or if it be ſodden with Wormewood or cich peaſe: the * berries of hyſſop drunk with water: the herb Liuerwort, ſo that the patient abſtain from all worts or potherbes, ſo long as he taketh it: Capillus veneris giuen in wine: and the Fullers herb in wine honied, be all of them good medicines for the jaundiſe. G

Baccæ, rather *cymæ*, i. the tops, as before.

As for the ſores called Fellons or Cats-hairs, they will breed euery where in any part of the body, and put folk to great anguiſh and trouble who haue them, yea, and otherwhiles indanger their life, eſpecially if they meet with lean and worn bodies. But what remedy? Take the leaues of the herb Pycnocomos, let them be ſtamped and incorporate with fried Barley meale, and ſo applied, in caſe the ſaid fellons are not drawne to a pointed or ſharpe head. The leaues alſo of * Ephedros brought into a liniment and laid too, do diſcuſſe & diſſolue them, if they be taken in the beginning. H

Hippuris, Horſe-taile.

Moreouer, you ſhall not ſee a part of the body but it is ſubiect to the Fiſtulaes, which creepe inwardly and hollow as they go: but eſpecially, when by the vnskilfull direction of Phyſitians, or the lewd hand of chyrurgions there be an inciſion vntowardly made in the body. The help is to make tents of Centaurie the leſſe, with honey boiled, and put them into the concauity. Alſo to vſe an injection of Plantain juice. To apply Cinquefoile with ſalt and hony. Ladanum alſo with Caſtoreum: to lay vnto the ſore, Vmbilicus veneris, with deere Marow, eſpecially of Stag or Hind, hot. The ſtring or pith of a Mullen root faſhioned ſlender to the form of a tent put into the vlcer, or the root of Ariſtolochia in that manner vſed, or the juice of Tithymall conueied into it, ſerue all to cure the Fiſtula. I

Al inflammations, biles, & impoſtumes, are healed by a liniment made of Argemony leaues So be all hard and ſchirrous tumors, occaſioned by the gathering of humors, with Veruaine or Cinquefoile ſodden in vineger: with the leaues and roots of Mullen: with hyſſope applied in wine: with the root of Acorus, ſo that there be a fomentation withall made of the decoction of the ſaid herb: and finally with Houſleek. In like manner, theſe herbs before rehearſed do heale bruiſes, hard tumors, or bunches and hollow ſores. The leaues of * Illecebra draw forth any arrow heads and whatſoeuer ſticketh within the body: ſo do the leaues of Folefoot: the Carot alſo, and the leaues of * Lions paw, ſtamped and incorporat with fried Barly meale in water. The leaues of Pycnocomos punned, or the ſeed beaten to pouder, & with Barly meale parched, and ſo reduced into a cataplaſm, are good to be applied to biles and impoſtumes broken & running matter. In like manner the Ragworts are to be vſed. K

A kind of Houſleeke.

Our Ladies Mantle.

As touching the accidents that happen in the bones, the root of Satyrion if it be laid outwardly vpon them, are thought to work a moſt effectual & ſpeedy cure. Al cankerous & eating ſores, likewiſe impoſtumes growing to ſuppuration, are healed with the ſea weeds, if they be applied before they be dried & withered. Alſo the root of marſh Mallow, doth diſſipate and ſcatter all gatherings of humors to an impoſtume, before it be come to an head and to ſuppurat.

Plantain and the Clot Bur are ſingular for burns or ſcalds, healing them vp ſo cleanwithout a skar, that a man ſhall not perceiue the place: the maner is to take the leaues, ſeeth them in water, ſtamp them into a liniment, and ſo to apply them. Likewiſe the roots of Sowbread, together with Houſleek: the herb it ſelfe Hypericon, which I called before * Corion, haue the like effect. L

* Or *Coris*.

For the infirmities incident to ſinews and joints, Plantain is a ſoueraigne herb, if it be ſtamped with ſalt: ſo is Argemonia punned and incorporat with hony. The juice of Harſtrang is ſingular to annoint thoſe that be ſprained, ſuch alſo as be ſtretched with an vniverſall cramp as if they were all of a peece. For to mollifie the hardneſſe of ſinews that be ſhrunk vp, there is not a better thing than the juice of Ægilops: and to aſſuage their pain, a liniment made with groundſwell and vineger, is excellent. For thoſe that be ſprained and troubled with that crampe which draweth their necke backward, it is good to rub and annoint them well with Epithymum; with the ſeed of S. *Iohns* woort, which alſo is called Coris, and to drinke the ſame. As for the hearbe Phrynion, they ſay it hath vertue to conglutinat and vnite ſinews again, if they were cut in ſunder, if it be laied too preſently, either ſtamped or chewed in the mouth. For ſuch likewiſe as be ſpaſmatick, pjucked backward with the cramp, or troubled with trembling and ſhaking of the lims, it is good to giue them the root of the marſh Mallow to drink in mead: and in that maner M

Darnell, as ſome thinke.

taken

20030

taken, it healeth thoſe that be ſtiffe and ſtark for cold. Finally, the red ſeed of the herbe Pæony ſtancheth any flux of bloud, the root thereof hath the like operation. As for Cyclaminos, that is to ſay Sowbread, it ſtaies any bleeding, whether it be at the mouth raught vp from out of the body, or at the noſthrils, whether it run by the fundament, or guſh from the matrice of women. Likewiſe Lyſimachia ſtancheth bloud either in drink, liniment, or Errhin put vp into the noſe. The like effect hath Plantain ſeed. Cinquefoile alſo both taken inwardly and applied outwardly. Moreouer, if the noſe bleed, take the ſeed of Hemlocke, beat it into pouder, mixe it with water, and ſo put it vp handſomly into the noſthrils. Alſo Sengreene and the root of Aſtragulus. To conclude, wild Hirſe called in Greek * Iſchæmon and Achillæa, do ſtay any iſſue of bloud.

*i S anchbloud, a kind of Yarrow.

CHAP. XIII.

¶ *Of the herbe Equiſetum: of Nenuphar, Harſtrang, Sideritis, and many more effectuall to ſtanch bloud. Of Stephanomelis and Eriſithale. Alſo remedies againſt wormes and vermine.*

HOrſe-taile, named in Latine Equiſetum, and by the Greeks Hippuris, an herb which heretofore I diſallowed to grow in any medows (and it is eſteemed the very haire, proceeding out of the earth, like for all the world to the haire of an Horſe-taile) if it bee boiled in a new earthen pot neuer occupied before, ſo as the pot be brim full when it is ſet on the fire and ſo to continue ſeething, vntill a third part be conſumed, doth waſt the ſpleen of lackies & footmen, if for 3 daies together they drink one hemine of the decoction at a time: and beſides, this charge they ought to haue in any wiſe, to forbeare all fat and oily meats for 24 houres before they begin this diet drink. In deſcribing of this herb, the Greeks do not agree, but are of diuers opinions: ſome giue that name to a certain herb with blackiſh leaues reſembling thoſe of the Pine tree: and they report a wonderfull vertue thereof; and namely, that if it doe but touch a man, it wil ſtanch any iſſue of bloud. And as ſome name it Hippuris, ſo others called it * Ephedros, and there be again who giue it the name Anabaſis: becauſe forſooth, as they ſay, it climes vpon trees, and hangeth down from thence, with many blackiſh ſlender haires in manner of riſhes, reſembling horſe tailes. Small branches it hath ful of joints, and few leaues, which be alſo fine and ſmall. The * ſeed that it beareth is round, like vnto Coriander; and the root of a woody ſubſtance: this kind, ſay they, groweth principally in thickets and groues. An aſtringent and binding power it hath. The juice if it be conueighed vp into the noſthrils, ſtenteth bleeding at noſe, though it guſhed out from thence: it knitteth alſo the belly, and ſtoppeth a lask. Taken in * ſweet wine to the quantity of 3 cyaths, it helpeth the bloudy flix. Vrine it prouoketh, the cough it ſtaieth, and cureth ſtraitneſſe of winde when the patient is forced to ſit vpright for to draw his breath. It healeth ruptures, and repreſſeth thoſe ſores that loue to ſpread and run ouer the body. The leaues are good to be drunk for the infirmities that offend guts & bladder: a ſpeciall vertue it hath to cure thoſe that be burſten bellied and haue their guts ſlipping downe in the bag of their cods. The ſaid Greek writers deſcribe alſo another Horſe-taile, by the name of Hippuris, with ſhorter, ſofter, and whiter haires than the former; and they commend it as a ſouereigne herb for the ſciatica and for wounds, to be applied vnto the place with vineger; & namely for to ſtanch bloud: in which caſe the root of Nenuphar ſerueth very well, if it be ſtamped and laid vpon a green wound. If a man or woman void bloud at the mouth, which doth riſe from the parts below, there is not a better thing than Harſtrang taken in drinke with the ſeed or berries of the Cypreſſe tree. And as for Sideritis the herb, it is ſo powerfull that way, that it ſtancheth bloud out of hand, if it be applied & kept faſt to the wounds of theſe ſword-fencers that fight at ſharp, bleed they neuer ſo freſh: the which effect we may ſee in the aſhes and coles of Fennell-geant: but the toad ſtoles or Muſhrums growing about the root of the ſaid plant, doth the feat more ſurely: in caſe the noſe guſh out with bloud, Hemlock ſeed alſo beaten to pouder, tempered with water and ſo put vp, is counted very effectuall to ſtay the bleeding: in like maner *Stephanomelis, if it be applied with water. The pouder of Betonie dried and drunk in Goats milk, ſtancheth bloud iſſuing out of womens breſts by the nepples. The ſame doth Plantaine bruiſed and laid too in a pulteſſe. The juice of Plantaine is good to be giuen them that vomite bloud. For a bloud that runneth vp and downe, breaking out one while here and another while there, a liniment made of a Burre root and a little ſwines greaſe, is commended to be excellent.

Or rather *Ephydros*.

And that is juſt none.

* *Dulci*: rather *auſtero*, i. hard or green wine.

Which ſome take to be *Argentina*, i. white Tanſey.

For

For ſuch as be burſten or haue any rupture within, be plucked with convulſions, or haue faln from on high; Centaury the greater, the root of Gentian being ſtamped into pouder or boiled, the iuice of Betonie, be counted ſingular means to recouer: and more than that, if a vein be broken by ouermuch ſtraining the voice, or the ſides. Likewiſe, Panaces, Scordium, and Ariſtolochia taken in drinke, ſerue well for the ſame purpoſe. Moreouer, if any be bruiſed within the body, or haue bin ouerturned backeward and throwne downe, it is good for them to drinke the weight of two oboli of Agarick in three cyaths of honied wine; or in caſe an ague follow them withall, in honied water: for which purpoſe ſerueth alſo that kind of Verbaſcum or Mullen, the floure whereof reſembleth gold: the root alſo of Acorus. All the kindes of Houſleeke, to wit, Prick-madam, Horſe-taile, or Stone-crop: but indeed the iuice of the biggeſt is moſt effectuall. In like manner the decoction of Comfrey root and Carot taken raw. There is an herbe called Eriſithales, with a yellow floure, and leafed much after the manner of Brankvrſine: the ſame ought to be drunk in wine, as alſo Chamerops in the ſame caſe. As for Irio, it would be giuen in ſome ſupping: and Plantain may be vſed any way, it matters not how: which herb hath this good property ouer and beſides, to cure the lowſie diſeaſe, whereof *Scylla* the Dictatour died, who was eaten with lice. A wonderfull thing, that in the very maſſe of bloud there ſhould be ingendered ſuch creatures to conſume mans body. But the iuice of the wild vine called * Vva Taminia, as alſo of Ellebore, is ſoueraigne againſt this foule and filthy maladie, in caſe the body be annointed all ouer with a liniment made of it and oile together. As for the ſaid Taminia, if it boyled in vineger, it killeth ſuch vermine breeding in clothes or apparell, ſo they be waſhed or rubbed therewith.

* He meaneth *Staphiſagre*, although he attribute vnto it this wrong name.

Chap. XIIII.

¶ *For vlcers and wounds. To take away warts. Of the herbe Polycnemon.*

VLcers as they be of many ſorts, ſo they are cured after diuers manners. If they be ſuch as run and yeeld filthy matter, a liniment or ſalue made of the root of all kinds of Panaces, & wine together, are thought to be a ſoueraigne means to heale them. But that Panaces, which they call Chironia, hath a ſingular property aboue the reſt to drie vp ſuch ſores: the ſame root beaten to pouder and incorporat with honey, breaketh and openeth any ſwelling impoſtumes. This herb tempered with wine, it makes no matter whither you take floure, ſeed, or root ſo it be applied with Verdegreaſe or the ruſt of braſſe, healeth any ſores, be they neuer ſo deſperat, and principally ſuch vlcers as be corroſiue and eat as they go. The ſame if it be mingled with fried Barly meal, is good for old feſtered vlcers. Alſo Heraclion, Siderion, Henbane, Fleawort, Tragacanth, and Scordotis, incorporat accordingly with hony, cleanſe the ſaid ſores. As for this laſt named, the very pouder of it alone ſtrewed vpon vlcers, eateth away the excreſcence of proud fleſh. * Polemonia healeth thoſe malignant ſores which be called morimals, and are hard to be cured. Centaury the greater reduced either into a pouder, and ſo caſt vpon the ſore, or brought into a liniment and applied accordingly: the tops alſo of the leſſe Centaurie either ſodden or beaten to pouder, do mundifie and heale vp all inueterate and cankered vlcers. The * tender crops or husks of * Clymenos, are good to be laid vnto freſh & green wounds. Moreouer, the root of Gentian either ſtamped or boiled in water to the conſiſtence of hony, or the very iuice thereof, ſerueth very well to be applied vnto corroſiue and eating vlcers: like as a kind of Lycium made of it is as appropriat for wounds. Lyſimachia is an excellent wound herb, and healeth wounds ſpeedily, if they be taken whiles they be new. Plantain is a great healer of any ſore whatſoeuer, but principally of ſuch vlcers as be in the bodies of women, children, and old folk. If it be * made ſoft & tender at the fire firſt, it doth the cure ſo much the better: and being incorporat in ſome ordinary cerot, it mundifieth and cleanſeth the thicke edges and ſwollen brims of any ſore, and ſtaieth the canker of corroding vlcers. But when Plantaine is thus reduced into a pouder & ſtrewed vpon the ſore, you muſt not forget to couer the ſame with the own leaues. Moreouer, Celendine is ſingular for all impoſtumes and botches, whether they be broken or no, yea, it mundifieth and drieth vp hollow vlcers called Fiſtulaes: and for wounds is is ſuch a ſingular deſiccatiue, that Chirurgions vſe it in ſtead of Spodium. The ſame being incorporat with hogs greaſe, is excellent to be applied vnto them when they be in manner paſt cure, and giuen ouer by the Chirurgion. The herbe Dictamnus taken in drinke, thruſteth out arrowheads:

* *Sauge de bois.*

* *Colicuſi.*

* Some take it for water Betony.

* *Mollita.* Why not *Molita*, (i. ground to pouder againſt the fire) ſince that he vſeth *farina* ſo commonly for the pouder of drie hearbs?

20030

A heads: and in a liniment outwardly, draweth forth the ends of darts, and any ſpils whatſoeuer ſticking within the body: for which effect, the leaſe would be taken to the weight of one obolus in one cyath of water. Next to this in operation, is the other baſtard kind therof, call'd Pſeudodictamnum: and there is neither of them both, but is good for to draw all biles & impoſthumes that are broken & do run matter. Moreouer, Ariſtolochia is an excellent herb to eat and conſume putrified vlcers full of dead fleſh: it mundifieth alſo thoſe that be foule and filthie, if it be applied with honey; yea and draweth out the vermin bred of the corruption within them: the calloſities likewiſe and hard excreſcences ariſing in ſores, it fetcheth away: alſo it drawes forth any thing ſticking in the fleſh, eſpecially arrows and the ſpils of broken and ſcaled bones, if it be laid too with roſin. Of it ſelfe alone without any thing els, it is a good incarnatiue and
B filleth vp hollow vlcers with good fleſh: but mixed with the pouder of the Flour-de-lis root, and ſo incorporat with vineger, it is ſingular for to heale vp green wounds. Moreouer, for old ſores, Veruaine and Cinquefoile medled together with ſalt and hony, do make a ſoueraign ſalue. The roots of the great Clot bur are good to be laid vnto freſh wounds, made by the ſword or any edged tooles: but the leaues are better for old wounds, if the ſame be tempered with hogs greaſe: howbeit this charge ought to be giuen, That as well the one as the other, haue a leaſe of the own laid ouer them to couer the whole place. As for * Damaſonium, it would be vſed in theſe caſes, prepared in that manner as it is ordained for the Kings euill. And the leaues of Mullen ſerue wel for the ſame purpoſe, if they be applied with vineger or wine. Veruaine is a good herbe for all ſorts of wounds and ſores, were they ouergrowne with calloſities and ful of putrefaction: the
C root of Nymphæa Heraclea, healeth perfectly all running and filthy vlcers. In like manner, the root of Cyclamin [*i.* Sowbread] either alone of it ſelfe, or incorporat with vineger or hony: The ſame is ſingular good for thoſe wens or impoſtumes that ingender within them a certaine matter like vnto * fat or tallow. Like as Hyſſop is an appropriat herb for running vlcers. Semblably
* Peucedanum, which is of that efficacy for the healing of green wounds, that it will draw corruption from the very bone. The ſame effects haue both the Pimpernels: and beſides, they doe repreſſe thoſe cancerous ſores that eat deepe: they ſtay alſo the flux of a rheume to any ſore, which hindereth the healing thereof: they be good alſo for green wounds, but eſpecially in old bodies. The freſh leaues of Mandragoras newly gathered, incorporate with the maſſe of ſome cerot, are ſingular for impoſtumes and maligne vlcers: like as the root healeth wounds beeing
D made into a plaſter with honey or oile. Likewiſe Hemlocke tempered with the floure of fine white wheat, and wrought into a paſte with wine. Houſleeke cureth ſhingles, ringwormes, and ſuch like wild-fires, yea if they grow to be wolues, and begin to putrifie: like as Groundſwell healeth thoſe vlcers which be giuen to ingender vermin: but the roots of the mountaine Cich, or peaſe earth-nut, are ſoueraign for green wounds: and both kinds of Hypociſthis, do mundifie inueterat vlcers. The ſeed of Pied-de-lion, ſtamped with water, and reduced into a liniment with parched Barley groats concorporate all together, draweth forth arrow heads: ſo doth the ſeed of Pycnocomon, in the ſame ſort vſed and applied. The iuice of the Spurge called Tithymalus Characias, healeth gangrens, cankers, and putrified ſores tending to mortification. The decoction alſo of the branches ſodden in oyle, with fried barley meale. As for * Ragworts, they
E cure morimals alſo, either drie or greene, ſo they be applied with vineger and honey: and Oenothera by it ſelfe, healeth thoſe vntoward and fretting vlcers, which are the worſe and more angry for the handling. The Scythians are woont to heale wounds with their hearbe Scythica. And for cancerous ſores, the herb Argemonia incorporat with honey, is knowne to be moſt effectuall. When any wound or ſore is * ouer healed, an Aſphodill root boiled, as I ſaid before, then ſtamped together with parched barley, and ſo applied, is ſingular good to rectifie that default: but for any ſore or wound whatſoeuer, Henbane leaues be ſingular. The root of Aſtragalus beaten into pouder, are ſoueraigne for ſuch vlcers as do water much, and be alwaies moiſt: likewiſe the common * Maidenhaire boiled in water: but more particularly, if the ſkin be newly fretted off by wearing ſome vneaſie ſhoes, there is not a better thing to heale and skin the
F place, than a ſalue made with Veruain: alſo with herb willow ſtamped; or Nenuphar dried, made into pouder, and ſo ſtrewed vpon the gall. As for the other Maidenhaire, it is counted better to heale the ſame raw excoriations, if they haue continued ſome time, and are growne to be exulcerat. There is as an herb named Polycnemon, like vnto wild Origan, how ſoeuer the ſeed reſemble that of Peniroyall: it ſhooteth forth many branches, and thoſe knotted and iointed in di-

* *Fiſtulæ paſtoris*, or, water Plantaine.

* *Steatomatæ.*

* Harſtrang.

* *Orchis.*

* *Sanatis*, that is to ſay, when the ſkar riſeth above the fleſh & is not euen with the reſt of the skin: or, if you reade *Præſanatis*, skinned too ſoon & healed onely in ſhew and apparance outwardly.

* *Callitrix*, which is *Trichomanes*, or *Capillus Veneris.*

uers places: it beareth in the head certain berries as it were in bunches and cluſters, odoriferous, and as they ſent ſomwhat ſtrong and hot, ſo the ſmel is not vnpleaſant: take this herbe, chew it with your teeth, and then lay it to any wounds made by the edge of the ſword or ſuch like weapon, and ſo let it lie and remoue it not vntill the fifth day, you ſhal ſee it to heale excellent wel. Camfrey applied vnto a green wound, skinneth it moſt ſpeedily: ſo doth Sideritis; as for this herb, it ſhould be applied with honey. The ſeed and leaues of Mullen, ſodden in wine, & ſtamped to the form of a cataplaſme, draweth forth all thorns, ſpils, and arrow heads, which ſticke within the body. The like effect work the leaues of Mandragoras, incorporat with parched barley meale; and Sowbread roots ſtamped and mixed with honey. The leaues of Germander punned with oile, are excellent to be applied vnto thoſe vlcers which doe corrode the fleſh vnder them and eat forward; like as the Reiks or ſea-weeds. Betonie is a ſoueraigne herbe for cancerous vlcers: alſo for the blacke ſploches that haue continued a long time vpon the skin, if there be ſalt put thereto. Argemonia tempered with vineger, taketh away warts: ſo doth the root of Crowfoot, which alſo is ſingular good to fetch off with eaſe, the ragged and fretted nailes that be offenſiue. The leaues of Mercurie, the male and female both, or the iuice thereof brought into a liniment, haue the like operation. Al the ſorts of the Tithymals take away any warts whatſoeuer: ſo do they rid the troubleſome riſings and impoſtumations like whitflawes about the naile roots, and all flecks, ſpots, whelks, and ſpecks whatſoeuer. Ladanum reduceth any ſcars to look faire and freſh coloured againe.

Chap. XV.

¶ *Many experiments and approued receits, for the prouoking or ſtaying of womens monethly tearmes: for curing the diſeaſes of their matrice: for ſending out the birth, or retaining the ſame within the bodie the full time. Alſo ſundry deuiſes for to amend the faults that blemiſh the skin of the face: to colour the haire of the head, or to fetch it off. Laſt of all, diuers medicines for the farcines or ſcab in foure-footed beaſts.*

IT is ſaid, That if a traueller or wayfaring man weare faſt tied about him, Mugwort or Sauge, he ſhall neuer be weary nor thinke his journey long. But to come now vnto the infirmities of women: the black ſeed of the herb Pæony, is generally good for all their * maladies, if it bee taken in mead: the root alſo is of the ſame operation, and beſides prouoketh the ordinary courſe of their months. The ſeed of Panaces drunk with wormwood, moues their fleurs, & procureth them to ſweat: the like effect hath Scordotis either in drink or liniment. A dram of Betony giuen to women in 3 cyaths of wine, helps all the maladies incident to their natural parts, * but eſpecially thoſe that inſue vpon their deliuery of childbirth. Achillæa being applied accordingly, ſtaieth the exceſſiue flux of their monthly termes: for which purpoſe alſo, it is good for them to ſit in a bath made with the decoction of the ſaid herb: & in this caſe, to their breſts or paps * there would be laid a plaſter of Henbane ſeed tempered with wine: the root alſo applied in manner of a cataplaſme to their ſecret parts, is counted ſoueraigne for that infirmitie: like as Celendine the greater laid vnto the foreſaid breſts. If the after birth, when the childe is borne, be loth to come away; or if the infant be dead within the mothers womb, the roots of Panaces applied accordingly to the priuy parts, fetch forth both the one and the other. The very herb it ſelf Panaces drunk in wine, or outwardly vſed to the region of the matrice, * cleanſeth the ſame. Sauge de bois taken with wine, expelleth the after-birth; and by a ſuffumigation, mundifieth the matrice. The iuice of Centaury the leſſe, bringeth women to their deſired ſickneſſe, if they drink it, or foment the parts beneath, therewith. Likewiſe the root of the bigger Centaury vſed after the ſame maner, appeaſeth the pains of the mother. If the ſame be ſcraped ſmooth, & put vp into the right place as a peſſary; it draweth away the dead child within her body: for the griefe and anguiſh which women feele in their womb, there is no better thing than to apply the iuice of Plantaine in a locke of wooll: and in danger of ſuffocation by riſing of the mother, to giue it in drinke. But Dictamnus is ſoueraigne and hath no peere: it prouoketh monthly fleurs: it ſendeth out the dead childe, yea though it lay ouerthwart and ſtuck croſſe in the birth: for which purpoſe, the woman muſt drink to the weight of one obolus, in water: and verily of ſuch power is this herb in ſuch caſes, that ſo long as women go with child, it muſt not come within the chamber where they are, for feare it put them to trauell before their time. And not onely in drinke

* In their matrice, as namely, the riſing of the mother, &c

* To wit, the ſtay of the after burden, after-throwes, ſuppreſſion of their purgatiõ, or immoderat ſhifts, &c.

* Swelled and hard.

* *Purgat*, ſome read better (in mine opinion) *corrigit*, i. reduceth it into the right place being vnſetled and peruerted.

20030

A drink is it thus effectual,but alſo in a liniment; yea and the very perfume and ſmoke therof receiued in the body,will do the deed. Next to it,there is not a more ſoueraigne herb than the baſtard Dictamne, called Pſeudodictamnus: but it muſt be boiled to the weight of one denier, with pure wine and ſtrong of the grape,and then taken in drinke, it prouoketh womens deſired ſickneſſe. And yet Ariſtolochia is many waies good for the infirmities of women: for if there be myrrh and pepper put thereto,and then either taken in drink or put in a peſſarie,it draws downe their fleurs,bringeth forth the after-birth,and fetcheth away the dead infant: it keepeth vp and ſtaieth the matrice ready to fall and ſlip out of the body,either in fomentation,perfume,or peſſary,eſpecially the * ſmall kind thereof. But in caſe a woman be in danger of ſuffocation by the aſcent of the mother,or otherwiſe diſeaſed for want of her monethly purgation, let her drinke * *clematis.*

B Agaricke to the weight of three oboli in one cyath of old wine: make a peſſarie of Veruain incorporat with freſh hogs lard,and applie Calues-ſnout,otherwiſe called Snap-dragon with oile roſat and hony,ſhe ſhall haue eaſe,and be cured ſpeedily. Semblably the root of Nenuphar, eſpecially that which groweth in * Theſſalie, applied vnto the naturall parts of women, eaſeth the paines thereof: and if it be drunke in groſſe red wine, it ſtaieth their ſhirts or immoderat flux of the moneths. Contrariwiſe,the Sow-bread root,both taken in drinke and alſo outwardly vſed,prouoketh the ſame, if they do ſtay vpon a woman. Alſo a decoction thereof, if a women do ſit therein,helpeth the accidents of the bladder. Ciſſanthemos taken in drinke, ſendeth out the after-birth,and healeth the maladies of the matrice. The vpper root of the Flag or Gladder, drunke in vineger to the weight of one dramme,bringeth women to the ordinary courſe of their * With the yellow fleure.

C fleures. The fume of Harſtrang burnt,fetcheth women againe when they lie as it were ſtrangled and dead in a fit of the mother. Flea-wort taken to the weight of a dram in three cyaths of honied water,prouoketh their monthly terms,but eſpecially it maketh them ſoluble if they were coſtiue. The ſeed of Mandragoras cleanſeth the matrice,if a woman take it in her drinke: the iuice whereof applied to the naturall parts,prouoketh her moneths and fetcheth away the dead child within her body. Againe,the ſeed taken with wine and brimſtone, ſtaieth the immoderat flux of the monethly terms. Crowfoot either drunk or eaten with meat, knitteth the belly and ſtoppeth a lask: an herb otherwiſe (as I haue ſaid) of a cauſticke and burning nature,if it be vſed raw; but certainly,beeing boyled with ſalt,oyle,and cumine,a commendable meat. Yellow Carots taken in drinke, doe exclude the after birth, and prouoke womens fleurs with exceeding

D great facilitie. A perfume of Ladanum,ſetteth ſtreight the matrice when it is out of the right place,and turned to a ſide: and for the paine and exulceration thereof,it is of great force either applied outwardly or iniected inwardly. Scammonie,either in drink or cataplaſm,ſendeth forth of the body the dead fruit of the wombe. Both kinds of S. *Iohns* woort, ſtirreth the iſſue of womens fleurs,onely by an outward application. But aboue all (in the iudgement of *Hippocrates*) * Crithmos paſſeth for that, if either the ſeed or the root be taken in wine. As for the pill or rind thereof,it fetcheth away the after-birth alſo: and drunk in water, it helpeth the ſuffocation occaſioned by the riſing of the mother. The root of * Geranium likewiſe more particularly,is a very conuenient remedy for to bring away the after-birth, and to cure the inflammation of the matrice. Horſetaile hath a ſecret vertue to mundifie the naturall parts of women, either * Sampier or Creſſes. * Herb Robert.

E drunke, or applied outwardly. Knot-graſſe giuen in drinke, * ſtaieth the inordinate and exceſſiue voidance of the fleurs: ſo doth the root of Marſh Mallow. The leaues of Plantain, * driue downe the ſame: ſo likewiſe Agaricke in honied water. Mugwort ſtamped and incorporat with oile of Ireos,Figges,and Myrhe,hath the ſame effect, if it be applied accordingly: The root of which hearbe,if a woman take in drinke,is ſo purgatiue and will bring her to ſuch a laske, that ſhee ſhall withall exclude the dead infant within her bodie. A decoction made with the branches of Mugwoort,bringeth downe womens monethly ſickneſſe, and fetcheth away the after-birth,if they ſit therein: a dramme weight of the leaues taken in drinke, is of the like vertue and operation: if they be but laied vnto the belly in manner of a cataplaſme, eſpecially with barley meale, they will doe as much. Moreouer, Acoron, both the kindes of Conyza, as alſo * *Siſir.* * I marueil how that ſhould ſtand, conſidering they are a meere garden weede, vnleſſe we haue receiued it for ſome *propriétatem*, & to ſome ſecret vertue.

F Sampier, are ſingular good for all the inward griefes and maladies whatſoeuer of women. Alſo both kinds of Anthyllis drunke in wine,are ſoueraigne for the accidents of the matrice,namely to aſſwage the throws and wrings thereof, and to bring away the after-birth when it ſtaieth behind. A fomentation made with Maidenhaire, is comfortable to the naturall parts of women: like as it hath vertue to clenſe the ſcurfe and dandruffe,to rid away the white patches appearing

in the skin or haire,and to color the ſame black,if it be brought into pouder,& with oile made G
into a liniment.Herb Robert drunk in white wine,and Hyociſthis in red,do ſtay the flux of reds
or whites.Hyſſop is a ſoueraign herb to open and relax the obſtructions of the matrice cauſing
ſuffocation.The root of Veruaine taken inwardly with water, is the beſt thing in the world for
all the maladies incident to women,either in their trauell or after their deliuerance. To which
effect,ſome there be,who together with Harſtrang mix the grains of the Cypreſſe tree beaten to
pouder,and giue it to drink in groſſe red wine.For the ſeed of Fleawort,boiled in water,and laid
too warme,doth moderate and qualifie all the violent fluxes of the matrice. Camfrey ſtamped
and giuen in groſſe wine or allegant,bringeth down the ſickneſſe of women when it ſtaieth vp-
on them. The iuice of Scordotis taken to the quantity of one dram in foure cyaths of honied
water,giueth women ſpeedy deliuerance in childbirth: and for that purpoſe, the leaues of Di- H
ctamnus are excellent,if they be taken in water:and knowne it is for certain, that the weight of
one obolus of thoſe leaues giuen to a woman in hard trauell,wil preſently cauſe her to be deli-
uered with eaſe,yea though the infant were dead in the belly. The like operation hath the ba-
ſtard Dictamnum,but that it worketh more ſlowly: and in this caſe, they vſe to tie the root of
Cyclamin about the woman in labour; to cauſe her alſo to drinke Ciſſanthemos; yea and the
pouder of Betony in honied water. As for Arſenogonon and Thelygonon, they be two herbes,
bearing certain grapes or berries like to oliue bloſſomes,but that they be more pale; and white
ſeeds or kernels within,reſembling thoſe of white Poppy.If a woman drink Thelygonum,ſome
ſay,ſhe will therupon conceiue a maid child. Arſenogonon differeth from the other in nothing
but in the ſeed,which commeth neare vnto that of the oliue: and (forſooth) if ſhe take this herb I
in drink,ſhe ſhall haue a man-child;beleeue it who that liſt. Others there be,who ſay,that both
the one and the other be like vnto Baſill ;and that Arſenogonon carrieth a double ſeed knit to-
gether like as they were two genitors.

That kind of Houſleek which I called Digitellus,is ſingular for the diſeaſes incident to wo-
mens Breſts. Groundſwell bringeth abundance of milke into womens paps, if they drinke it in
wine cuit:ſo doth Sowthiſtle ſodden in frumenty.The grape called Bumaſtos, taketh away the
* haires about the nipples of nources breſts, which ſpring ſometime after they haue once born
children:which alſo otherwiſe is very good to cleanſe the skales and ſcurfe in the face, and to
ſcoure away other ſpots and pimples ariſing vpon the skin. Gentian, and Nymphæa called He-
raclea,the root alſo of Cyclamin,riddeth all ſuch cutanean ſpecks and blemiſhes. The graines K
of wild Carawaies,called Cacalia, incorporate in wax melted and made liquid, lay the skin of
the face plain and euen,and ſmooth all wrinkles. The root of Acorum, ſerueth likewiſe to pu-
rifie the skin from all outward deformities. Herb Willow giueth the hair of the head a yellow
colour. Hypericon,which alſo is named Corion,dieth it black: likewiſe doth Ophrys,an herbe
growing with two leaues and no more,like vnto jagged Beets or Colewoorts. Alſo Polemonia
ſetteth a black colour vpon haire,if it be boiled in oile. As for depilatorie medicines,which are
to take away the haire from any part, the proper place to treat of them is indeed among thoſe
that pertain eſpecially to women: but now adaies men alſo are come to it, and vſe ſuch deuiſes
as well as women. The moſt effectuall of all others be they accepted,that are made of the herbe
Archezoſtis. The iuice of Tithymall is likewiſe very good to fetch off haires: and yet there be L
ſome,who pluck them out firſt with pinſers,and then with the ſaid iuice incorporat with oile,
rub the place often in the hot ſun. Finally,Hyſſop tempered with oile into a liniment, is excel-
lent to heale the mange or ſcab in four-footed beaſts:and Sideritis hath a peculiar vertue for to
cure ſwine of their ſquinſies or ſtrangles. Now is it time to purſue all other kindes of hearbes
which remaine behind.

* Some think this is meant of hairs within the paps, which ſhould be ſwallowed downe by c ā e in a cup of d inke, and ſo rankle in the br ſt, &c. a diſeaſe called by *Ariſtotle* Tyſchia. And *Rondeletius* is of an opinion, that ſome ſuch thing reſembling an haire may breed w thin the breſt, of putrified humours or corrupt milke. But it ſeemeth by that whi h foloweth, that *Pline* meant no ſuch matter, but rather ſome outward eye-ſore.

THE

THE TVVENTY SEVENTH BOOK OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIVS SECVNDVS.

The Proeme.

CHAP. I.

CErtes, the farther that I proceed in this diſcourſe & hiſtory of mine, the more am I forced to admire our forefathers and men of old time: for, conſidering as I do, what a number of ſimples there yet remain behind to be written of, I cannot ſufficiently adore either their carefull induſtry, in ſearching and finding them out; or their liberal bounty, in imparting them ſo friendly to poſterity. And verily, if this knowledge of Herbes had proceeded from mans inuention, doubtleſſe I muſt needs haue thought, that the munificence of thoſe our anceſtors had ſurpaſſed the goodneſſe of Nature her ſelfe. But now apparent and well knowne it is, That the gods were authors of that skil and cunning, or at leaſtwiſe there was ſome diuinitie and heauenly inſtinct therein, euen when it ſeemed to come from the braine and head of man: and to ſay a truth, confeſſe we muſt, That Nature (the mother and nource of all things) both in bringing forth thoſe ſimples, and alſo in reuealing them with their vertues to mankind, hath ſhewed her admirable power as much as in any other work of hers whatſoeuer. The herbe Scythica is brought hither at this day out of the great fens & meers of Mœotis, where it groweth. Euphorbia commeth from the mountain Atlas, far beyond *Hercules* pillars & the ſtraits of Gibralter, and thoſe are the very vtmoſt bounds of the earth: from another coaſt alſo, the herbe Britannica we haue, tranſported vnto vs out of Britaine, and the Iſlands lying without the continent, and diuided from the reſt of the world; like as Æthiopis out as far as Æthyopia, a climat directly vnder the Sun, and burnt with continuall heat thereof: beſides other plants and drugs neceſſary for the life and health of man, for which merchants paſſe from all parts too and fro, and by reciprocall commerce, impart them to the whole world; and all by the meanes of that happy peace which (through the infinite maieſty of the Roman Empire) the earth inioieth: in ſuch ſort, as not only people of ſundry lands and nations haue recourſe one vnto another in their traffick & mutual trade, but high mountains alſo & the cliffes ſurpaſſing the very clouds, meet as it were together, & haue means to communicat the commodities, euen the very herbs which they yeeld, one to the benefit of another: long may this bleſſing hold, I pray the gods, yea and continue world without end: for ſurely it is their heauenly gifts, that the Romans as a ſecond Sun ſhould giue light and ſhine to the whole world.

CHAP. II.

¶ *Of the poiſon Aconite, and the Panther which is killed thereby.*

AConite alone, if there were nothing els, is ſufficient to induce any man to an endleſſe admiration and reuerence of that infinit care and diligence which our antients imployed in ſearching out the ſecrets of Nature; conſidering how by their means we know there is no poiſon in the world ſo quicke in operation as it, inſomuch as if the ſhap or nature of any liuing

creature of female sex be but touched therewith, it will not liue after it one day to an end. This G
was that poison wherewith *Calphurnius Bestia* killed two of his wiues lying asleep by his side, as
appeareth by that challenge and declaration which *M. Cæcilius* his accuser framed against him.
And hereupon it was, that in the end of his accusatory inuectiue, he concluded with this bitter
speech, That his wiues died vpon his finger. The Poets haue feined a tale, That this herb should
be ingendered first, of the fome that the dog *Cerberus* let fall vpon the ground, frothing so as he
did at the mouth for anger when *Hercules* pluckt him out of hell: and therefore it is forsooth,
that about Heraclea in Pontus (wher is to be seen that hole which leadeth into hel) there grow-
eth Aconit in great plenty: howbeit, as deadly a bane as it is, our forefathers haue deuised means
to vse it for good, and euen to saue the life of man: found they haue by experience, that being gi-
uen in hot wine, it is a counterpoison against the sting of scorpions: for of this nature it is, that H
if it meet not with some poison or other in mens bodies for to kill, it presently sets vpon them
and soon brings them to their end: but if it incounter any such, it wrestleth with it alone, as ha-
uing found within, a fit match to deale with: neither entreth it into this fight, vnlesse it find this
enemy possessed already of some noble and principall part of the body, and then beginneth the
combat: a wonderfull thing to obserue, that two poisons, both of them deadly of themselues
and their own nature, should die one vpon another within the body, and the man by that mean
only escape with life. Our ancestors in times past staied not thus, but found out and deliuered
vnto vs proper remedies also for wilde beasts; and not so contented, haue shewed meanes how
those creatures should be healed which are venomous to other: for who knoweth not, that scor-
pions if they be but touched with Aconite, presently become pale, benummed, astonied, and I
bound, confessing (as it were) themselues to be vanquished and prisoners: contrariwise, let them
but touch the white Ellebore, they are vnbound and at liberty again; they recouer (I say) their
former vigor and vertue: whereby we may see, that the Aconite also giueth the bucklers to ene-
mies twaine, pernicious poisons both; the one to it selfe, and the other to all the world. Now if
happely any man should say, That the wit and head alone of man could possibly compasse the
knowledge of these things; surely he should shew therein his ingratitude and impiety vnto the
gods, in not acknowledging their beneficence. The people about Heraclea, to kil the Panthers
which breed in those parts, vse to rub with Aconite certain gobbets of flesh, which they doe lay
about the mountains as a bait and bane for them: and vnlesse by this meanes they did destroy
them, no doubt they would fill the whole countrie; which is the cause that some call it Pardali- K
anches, *i.* libard-bane: but they again on the other side, presently haue recourse to the excrements
of a man, as I haue before declared, the only counterpoison whereby they saue themselues: who
doubteth now, but the knowledge of this secret came first to them by meere chance? and con-
sidering that it is not possible to render a reason of the nature and vsage of such wild beasts (and
whensoeuer we see the like to fall out, we count it still a new & strange accident) we must needs
attribute the finding thereof to Fortune.

Chap. III.

¶ *That of all Creatures and Inuentions in this life, the author is a god.* L

THis Chance and Fortune then, by means wherof we attaine to so many inuentions that we
haue, is a diuine power, and no lesse indeed than a God: by which name also we vnderstand
and call that great mother and mistresse of all things, dame Nature: and surely consider-
ing that conjecturall it is and doubtfull, Whether these wild beasts come by this knowledge
day by day at a venture, or were indued naturally at the first with that perceiuance? we haue as
great reason to attribute a diuinity and godhead to the one, as the other. Well, be it Chance,
or be it Nature, that hath thus ordered the matter, certes a great shame it had bin, that all other
creatures should haue knowne thus (as they do) what is good and profitable for them, and man
only remain ignorant. But such was the industrie and goodnesse of those ancestours of ours in
times past, that they not only deuised means, but also deliuered to posterity, how this venomous M
herbe Aconitum might be most safely and commodiously mingled in those collyries and me-
dicines which be ordained for the eies: an euident argument and plaine proofe, I assure you,
that there is nothing so bad but it hath some goodnesse in it, and may be vsed wel. And therfore
dispensed withall I looke to be, if I who hitherto haue written of no poisons, put downe the de-

scription

20030

A ſcription thereof; to the end that a man may know it, and by knowing, take heed and beware. This herb hath leaues, reſembling Cyclamin or the Cucumber, in number no more than foure, and thoſe toward the root in ſome ſort rough and hairy. The root but ſmall, and the ſame like vnto a ſea crab fiſh: and therfore ſome haue named it Cammaron; whereas others, for the reaſon before ſhewed, call it * Theliphonon. And for that the root doth turn and crook inward in maner of a ſcorpions taile, there be that giue it the name Scorpion. There wanted not others who choſe rather to call it * Myoctonon, becauſe with the very ſent it is able to kill mice and rats a great way off. It groweth naturally vpon bare and naked rocks, which the Greeks cal * Aconas: which is the reaſon (as ſome haue ſaid) why it was named Aconitum. And for that in the place B where it groweth or neare vnto it, there is no mould, nor ſo much as any duſt found for to giue it nouriſhment, ſome haue thought it took the name therupon. Yet there be others who aſſigne another cauſe of that denomination, to wit, for that it is as forcible and as ſpeedy in working the death of thoſe whom it toucheth, as the hard ſtone or rag in turning or wearing the edge of any yron toole; for no ſooner commeth it neere vnto the body and is applied vnto it, but the quicke operation is ſenſibly found.

*i. Femalbane.

*or *Myophonon* * *Ab α. priuati-ua particula, & μυὶς, i.* duſt: whereupō bare ſtones without any mould vpon them, be alſo called in Greek ἀκόνη, & ſo be whetſtones likewiſe: Yet *Theophraſtus* is of opinion, That it tooke the name *Aconitū* of Aconæ, a certain towne, neer to which it groweth abundantly.

Chap. IIII.

¶ *Of Æthiopis, Ageraton, Aloe, Alcea, Alypon, Alſina, Androſace, Androſæmon, Ambroſia, Anonis, Anagyron, and Anonymon.*

C THe leaues of Æthiopis are great and many in number, hairy alſo neere vnto the root, and otherwiſe correſpondent to thoſe of Mullen. It riſeth vp with a four cornered ſtem, rough in handling, and after the maner of the main ſtem of the Clot-bur, hauing many concauities or holes like arm-pits in the grafting of the branches to the ſaid ſtem. It beareth ſeeds like vnto Eruile, which ordinarily grow double two by two, and are white. The roots be many, and thoſe long, ful and well nouriſhed, ſoft, and clammy in taſt: being dried, they wax black & grow hard withal; in ſuch ſort, as a man would take them for horns. They grow ordinarily in Æthyopia, alſo vpon the mountain Ida in the region of Troas, and in Meſſenia. The right ſeaſon to gather theſe roots, is in Autumne; and then they ought to be laid a drying in the Sun for certain daies together, to keep them from moulding. Being taken in white wine, they help the infirmities of D the matrice; and the decoction therof drunk, is good for the Sciatica, the pleuriſie, & the hoarſneſſe in the throat. But that which commeth out of Æthyopia is counted beſt and hath no fellow, for it worketh preſently.

As for Ageraton, it is an herb of the Ferula kind, growing vp to the height of 2 ſpans like to Origanum, but that the floures reſemble buttons or brooches of gold. The ſume of this herbe when it burneth, prouoketh vrin and mundifieth the matrice, eſpecially if a woman ſit in a bath thereof, and do foment the natural parts therewith. The reaſon of the name Ageraton, is this, becauſe the floures continue very long before they ſeem to fade and wither.

*Ab α. ſteretica, & γῆρας, old age.

Aloe is an herbe which hath the reſemblance of the ſea-onion, but that it is bigger and the leaues be more groſſe and fat, chamfered or channelled biais all along: the ſtem that it beareth, E is tender, red in the middeſt, not vnlike to Anthericon: one root it hath and no more, which runneth directly deep into the ground in manner of a big ſtake: ſtrong it is to ſmell vnto, and bitter in taſt. The beſt Aloe is brought out of India: but there groweth good ſtore thereof in Aſia, howbeit of no vſe, but that they lay the leaues freſh vnto green wounds; for they do incarnat and heale wonderfully, like as their juice alſo. And for that it is ſuch an excellent wound-herbe, folk vſe to ſet and ſow it in barels or pipes pointed beneath, and broad aboue; like as they do the greater Houſleek. Some there be who for to draw a juice or liquor out of it, ſtay not vntill the ſeed be ripe, but cut the ſtem for that purpoſe: others make inciſion alſo in the leaues: moreouer there is otherwhile found in Aloe a certain liquid gum iſſuing out of it ſelf, and ſticking faſt to F the ſtem thereof: and therefore they hold it good to paue or ram the ground hard all about the place where Aloe groweth, that the earth ſhould not drink vp the liquor which diſtilleth from it. *Some haue written that in Iury aboue Ieruſalem, higher into the country, there is a certain minerall Aloe to be found, growing in manner of a mettal within the ground: but there is none worſe than it, neither is there any blacker or moiſter. If you would know the * beſt, chuſe that which is fat and cleare, of a red colour, brittle and apt to crumble, cloſe compact in manner of a liuer,

*Petronius Niger, as Dioſcorides ſaith in his preface.

* It ſeemeth that he means here the concreted iuice thereof, which we alſo do call Aloe.

a liuer,eaſie alſo to melt and reſolue. If you ſee any that is black,hard, ſandy, or grittie (a thing G
which may ſoone be knowne betweene the teeth in taſting of it) the ſame is to be rejected for naught. Many there be who do ſophiſticat it with other gums and the juice Acacia. Aloe is of an aſtringent nature,ſeruing to make thick, to cloſe faſt, and gently to heat any part of the body. Much vſe there is of it in many caſes, but principally to looſen the belly: being the onely purgatiue medicine that is comfortable to the ſtomack and ſtrengtheneth it,ſo farre is it from offending the ſame by that laxatiue vertue or any contrary qualitie that it hath: & for this purpoſe the ordinary doſe to be giuen in drinke,is one dram. But when the ſtomacke is feeble and wil keep nothing, the manner is to take the quantity of one ſpoonfull thereof, in two cyaths of water either warm or cold,twice or thrice in a day by turns,pauſing ſome ſpace between as need requireth,and as the patient ſhall find expedient. Moreouer, if occaſion be to purge the bodie H
throughly,Phyſitians vſe to giue three drams thereof,and not aboue. And the better wil it work if it be taken preſently before meat. If the head be rubbed or annointed therewith and ſome auſtere and aſtringent wine,againſt the haire and in the Sunne, it retaineth the haire that is ready to fall. A liniment made of it together with vineger and oile Roſat, applied vnto the forehead and temples in maner of a frontall,eaſeth the head ach: ſo doth it alſo,if by way of embrochation it be diſtilled from aloft vpon the head in a more thin and liquid ſubſtance. A very conuenient and ſingular medicine it is to heale all the diſeaſes incident to the eies,but eſpecially for the itch and ſcab riſing in the eie-lids. Alſo when the skin looketh blacke and blew vnder the eies,or otherwiſe be marked by occaſion of ſome bruiſe,it taketh them all away,if it be applied thereto with hony: and namely that which commeth out of Pontus. It is a proper remedy for I
the amygdals,the gums,and all the vlcers of the mouth. Taken to the weight of a dram in water,it ſtaieth the ſpitting and voiding of bloud vpward,if it be not exceſſiue: but in caſe it bee violent & immoderat,it ought to be drunk in vineger. The flux of bloud in wounds,or the bleein any part whatſoeuer,it ſtancheth,either applied by it ſelf alone or els with vineger. In other reſpects alſo it is right ſoueraign for wounds,a great healer,and that which vniteth & skinneth quickly. A ſingular remedy it is to be either caſt vpon the vlcers of a mans yard, the ſwelling piles,the riſts & chaps of the ſeat; in plain dry pouder by it ſelf alone,or els to be applied therto with wine or with cuit,according as the griefe requireth to be mitigated or repreſſed. Moreouer,it gently ſtaieth the immoderat flux of bloud by the hæmorrhoids. And in a clyſter it is
excellent to heale the exulceration of the guts in the bloudy flix. Alſo it is very good & whol- K
ſom for thoſe who hardly digeſt their meat,to drink it a pretty while after ſupper. And for the Iaundiſe it is ſingular to take the weight of 3 oboli thereof in water. It is good to ſwallow pils of Aloe either with boiled hony or Turpenttne for to purge the guts and inward bowels: and a ſalue made therewith,taketh away the whitflaws and impoſtumations about the naile roots: for eie-ſalues,and other ocularie medicines,it ought to be waſhed, that the moſt ſandy and groſſe parts therof may ſettle to the bottom and be ſeparated from the purer ſubſtance: or els it ought to be torrified in an earthen veſſell, and plied continually with ſtirring with a quill or feather, that it may be burnt and calcined equally.

Touching Alcæa,it is an herb bearing leaues like vnto Veruain,which alſo is called Periſtereon,riſing vp with three or foure ſtems,well garniſhed with leaues,and carrying floures in ma- L
ner of Roſes: it putteth forth for the moſt part ſix white roots,and thoſe a cubit long,not directly,but crooked and bending bias. It groweth ordinarily in battle grounds, and ſuch as ſtand ſomwhat vpon water. The roots chiefely do ſerue in Phyſick, which being taken with wine or water,do cure the dyſentery or bloudy flix,ſtop a lask,and knit thoſe that are burſt inwardly vpon ſome violent ſtrain or convulſion.

As for Alypon, a pretty herbe it is, ſhooting vp with a ſlender ſtem adorned with little ſoft and tender heads,not vnlike to the Beet,quick and ſharp in taſte, biting exceedingly and burning,howbeit clammy to the tongue. Taken in mead with a little ſalt,it maketh the body ſoluble. The leaſt doſe that is giuen thereof is two drams, from which they ariſe to foure,which is
counted a reaſonable & indifferent potion: but neuer exceed the weight of ſix. And ordinarily M
this purgation is taken by them that haue occaſion to vſe it,in broth of a cock,capon or pullet.

* Alſine,which ſome call * Myoſoton, is an herbe growing among * groues, whereupon it tooke that name Alſine. It begins to put forth and appeare aboue ground about midwinter,and by midſummer it is dried away: when it traileth and creepeth vpon the ground, the leaues doe repreſent

* Chickweed.
* i. Mouſe ear.
* ἄλσος, a groue.

20030

A repreſent the ears of little mice. But another herb there is, as I will ſhew hereafter, which more fitly and properly in that regard may be called * Myoſotis. Surely this might be taken well enough for * Hexine, but that the leaues be ſmaller, and thoſe leſſe hairy. It groweth vſually in gardens, and moſt of all vpon walls: when it is ſtamped or bruiſed, it ſenteth of a Cucumber. Commonly vſed it is in cataplaſmes for to be applied vnto impoſtumes and inflammations: and emploied it may be in all thoſe caſes whereunto Parietary ſerueth. For the ſame effect they haue both, but that Chickweed is weaker in operation. And this particular property it hath by it ſelfe beſides, to ſtay the flux of waterie humors into the eies: alſo to heale all vlcers, and thoſe eſpecially which are in the priuy parts, being applied thereto in a pulteſſe with Barly meale: the

* The right Mouſe eare.
* Parietarie of the wall.

B juice thereof is good to be dropped or poured into the ears.

Androſaces is a * white hero, bitter in taſte, without any leaues, but in ſtead thereof it hath certain little husks or cods hanging by ſmall bents, and thoſe containing ſeed within them. It groweth along the ſea ſide, and moſt of all vpon the coaſts of Syria. The cods being ſtamped or boiled in water, vineger, or wine, are good to be giuen (to the weight of 2 drams) to them that are in a dropſie, for they prouoke vrine mightily. It ſerueth alſo in the cure of the gout, either taken by the mouth, or applied outwardly in a liniment. Of the ſame operation is the ſeed alſo.

* *Alba.* Hiply *Plinie* hath tranſlated λευκάκαρφος for λεπτόκαρφος in *Dioſcor.* which is, hauing ſlender ſtalkes like ruſhes.

Androſæmon, or as ſome call it Aſcyron, is not vnlike to Hypericon, whereof I haue already ſpoken: but that the ſtalks be bigger, ſtand thicker together, and are more inclining to red: the leaues be white or grey, faſhioned like vnto thoſe of Rue: and the ſeed reſembleth that of black Poppie: cruſh or bruiſe the vpmoſt crops or heads therof, they yeeld from them a bloudy iuice:

C in ſmel it ſenteth like vnto roſin: and is found ordinarily growing in vineyards. The proper time to gather this herb is in mid Autumne, and ſo to hang it vp a drying. The manner is to ſtampe the herb, ſeed and all, for to purge the belly: wherof they drink either firſt in the morning or laſt after ſupper, the weight of two drams in mead, wine, or ſheere water, ſo that the whole draught of the potion be a full ſextar and not aboue. Properly it doth euacuat choler: and is principally good for the Sciatica: but the morrow after the patient ought to ſwallow down a dram weight of the Capers root mixed with roſin: and then after pauſing foure daies between, to do the like againe: after which courſe of purging, if the patient be of a ſtrong complexion, he may drinke wine; otherwiſe, thoſe of a weaker conſtitution ought to forbeare, and drinke water. Excellent good it is for all gouts of the feet, and for burns, if it be applied vnto the place, and a good vul-

D nerary herb beſides, and ſtancheth the bleeding of wounds.

Ambroſia is a name that keepeth not to any one herb, but is common to many. Howbeit, the true Ambroſia runneth vp from the root into one ſmall ſtem, which notwithſtanding brancheth thick, riſeth to the height of three ſpans or thereabout, and ordinarily is one third part, ſhorter than the root: and the leaues be like Rue. Toward the foot of the ſaid ſtem it bringeth forth certain little grapes with grain or ſeeds within, and thoſe haue a ſent of wine, and hang down from the branches of the ſaid herb: for which cauſe ſome there be who cal it Botrys, although others giue it the name Artemiſia. The people of Cappadocia vſe therwith to make themſelues chaplets to weare vpon their heads. This herb is much vſed in thoſe accidents that require to be diſſolued and ſent out by the pores of the skin.

E Anonis (which ſome chuſe rather to call Ononis) is an herbe full of branches like vnto Fenigreek, but that it ſpringeth thicker from the root, brancheth more, and is more hairy: of a pleaſant ſmell, and pricky, after the ſpring. Many vſe to keep it condite in pickle. Beeing applied to any vlcer whiles it is freſh and greene, it eateth away and conſumeth the excreſcence of proud fleſh in the brims or edges thereof. The root is good for the paine of the teeth, if it be ſodden in vineger and water mingled together, and the mouth waſhed withal: the ſame taken in drink with hony, expelleth grauell and ſtone: boiled in Oxymell to the conſumption of the one halfe, it is a ſingular drink for the falling ſickneſſe.

Reſta bouis. Reſt-harrow or petie Whin

Anagyros, which ſome call Acopos, is an hearbe which brancheth thicke, of a ſtrong and

F ſtinking ſmell: it beareth floures like vnto thoſe of Beets: in certaine cods like horns, which be of a good length: it bringeth forth ſeed reſembling kidnies in ſhape, the which in harueſt time becommeth hard: the leaues are ſingular good to be laid vpon impoſtumat ſwellings: they ſerue alſo for women which be in hard trauell with child, to be hanged or tied faſt about them; with this charge, that preſently they be remoued after they are deliuered. But if the child be dead & ſtick ſtil in the matrice, or in caſe the afterbirth tarry behind, & wil not come away after the in-

fant

fant is born: or if a woman deſire to ſee her monthly ſicknes, it is good to drink a dram weight of the leaues in wine cuit. And in that maner they are giuen to thoſe who be ſhort winded: but in old wine againſt the ſting of the venomous ſpiders Phalangia. The root is ſingular to be put to thoſe plaſters which either do reſolue or maturat any impoſtumed place. The ſeed chewed, ſtaieth immoderat vomits. G

* Some take it for Bugle or Sel c heale.

* Anonymos, finding no name to be called by, got therupon the name * Anonymos. a Plant this is brought out of Scythia to vs; highly commended by *Hiceſius* a Phyſitian of great name and authority, alſo by *Ariſtogiton*, for an excellent vulnerary, if it be bruiſed or ſtamped in water, and ſo applied; but taken inwardly in drinke, it is good for womens breaſts and the precordiall parts about the heart, if they haue gotten a ſtripe, or be bruiſed: alſo for ſuch as reach vp bloud. Some haue ordained a vulnerary drink to be made therof for thoſe that be wounded. But what is ſaid moreouer as touching this herb, I hold meere fabulous: and namely, that if two pieces of yron or braſſe be put into the fire and burn together with this herbe, freſh and new gathered, they will ſouder and joine againe. H

* Nameleſſe.

Chap. V.

¶ *Of Erith or Gooſe graſſe. Of the Clot-bur. Of * Ceterach: of Aſclepias and Aſter or Bubonium. Of Aſcyrum or Aſcyroides. Of Aphace, Alcibium, and Alectorolophus.*

* or *Scolopendrium.*

ERith is by ſome called in Greeke Aparine, by others Omphalocarpos and Philanthropos. An herb giuen to be full of branches, rough and prickly, carrying fiue or ſix leaues growing round together about the ſaid branches in order like a ſtar, and a prety diſtance there is between euery of theſe roundles. The ſeed is round, hard, hollow, and ſweetiſh. It groweth in corn fields, in gardens and medows: rough it is, that it is ready to * catch hold of folkes clothes as they paſſe by, and to ſtick vnto them. An effectuall herb againſt ſerpents, if a dram of the ſeed be drunk in wine: alſo for them who are pricked with the ſpiders Phalangia. The leaues haue a ſingular vertue to repreſſe the abundant flux of bloud out of wounds, if they be outwardly applied: like as the juice hath a ſpeciall property to help the infirmities of the ears, being dropped or poured into them. I

* Whereupon they cal it *Philanthropos*, i. a louer of man.

Arction, which ſome rather name Arcturus, is like in leaſe to the great Mullen or Taperwort, but that it is more rough: the ſtem tall and ſoft, and the ſeed reſembling Cumin. It grows ordinarily in ſtony grounds, with a root tender, ſoft, & ſweet. Being ſodden in wine, it eaſeth the tooth-ach, ſo that the patient hold the decoction in his mouth. For the Sciatica and ſtrangurie it is good to be taken at the mouth in wine; and outwardly applied, it healeth burns and cureth kibed heeles: in which caſes the root is much commended, if together with the ſeed it be ſtamped with wine, and a fomentation made with the decoction thereof. K

As touching Aſplenum, ſome there be who call it Hemionion: an herbe putting forth many leaues * foure inches long: the root is giuen to haue cranks and holes, and thoſe full of mud or durt: much-what do the leaues grow like to Fearn: the root is white and rough. It beareth neither ſtalk, ſtem, nor ſeed. It delighteth to grow among rockes and ſtones, vpon walls ſtanding in the ſhade, and in moiſt grounds. The beſt is that which we haue out of Candy. It is commonly ſaid, that if the decoction of the leaues boiled in vineger be drunke forty daies together, it waſteth the ſwelled ſpleen. The ſame may be applied in a liniment for that purpoſe, & ſo alſo they do ſtay the exceſſiue yex or hocket. This herb would not be giuen to women, for it cauſeth them to be barren. L

* *Trientalibus.*

Aſclepias beareth leaues reſembling Iuie, long branches, many ſmall roots, and thoſe odoriferous; howbeit the flours haue a ſtrong and rank ſtinking ſmell with them, the ſeed much like to the Axvitch. It loueth to grow vpon mountains. The roots of this herbe not only taken inwardly in drinke, but alſo applied outwardly in a liniment, do eaſe the wrings of the belly, and reſiſt the ſting of ſerpents. Aſter, is by ſome named Bubonium, for that it is a preſent remedy for the tumours ariſing in the ſhare. This herbe putteth vp a ſmall ſtemme, with two or three leaues ſomewhat long. In the top thereof it beareth certaine little heads inuironed with ſpokie leaues, and thoſe diſpoſed round in manner of a ſtarre. Taken in drinke, it is thought to be a preſeruatiue againſt the venom of ſerpents. But to make a medicine for the ſhare beforenamed, M

it

20030

A it muſt (they ſay) be gathered with the left hand: nd then kept faſt bound neere vnto the middle or girding place of the patient. And ſurely it helpeth the Sciatica, in caſe it be tied ſure to the affected place.

Aſcyron and Aſcyroides, be herbes reſembling one another, and both like vnto Hypericon: howbeit that which is named Aſcyroides, hath the bigger branches, and thoſe ſtreight and direct, much after the manner of Fenell and ſuch like, red throughout: and in the top thereof appeare little heads or knobs, of a yellow color. The ſeed contained in certain pretty cups, is ſmal, black, and gummie: bruiſe the ſaid tops or knobs between your fingers, they ſeem to ſtain them with bloud; which is the cauſe that ſome cal this herb * Androſæmon. The ſeed is ſingular for *i. Mans bloud*
B the Sciatica, namely if the patient drink two drams weight thereof in a ſextar of Hydromel, that is to ſay, mead or honied water: for it looſeneth the belly and purgeth choler. A liniment made therewith, is much commended for a burne.

Apace is an herb which hath very fine and ſmall leaues: and a little taller it is than the Lentill; but larger cods it beareth, wherin lie three or foure ſeeds, blacker, moiſter, and ſmaller than the grains of the ſaid Lentill. It groweth vpon corn lands. More aſtringent it is by nature than the Lentill, and bindeth ſtronger; for all other matters it worketh the ſame effects. The ſeed boiled, ſtaieth vomits and lasks.

Touching * Alcibion, what manner of herb it ſhould be, I neuer could yet finde in any wri- * *Pliny* hath forgotten himſelfe, conſidering that in the 22 booke, & 21 chapter, he deſcribes it (according to *Dioſcorides*) to be like in root and leafe to Orchanet, &c. and there hee nameth it *Arctbion.*
ter. But they giue direction to ſtamp the roots and leaues thereof, and ſo in a cataplaſme to ap-
ply them vnto any place ſtung with ſerpents, and to drink them alſo. Now they preſcribe for the
C drink, to take of the leaues one good handfull, and to ſtamp them, and ſo to giue them in three cyaths of meere wine ful of the grape: or of the root three drams weight, with the like meaſure of wine.

Alectorolophos in Greek, called by vs in Latine Criſta Galli, *i.* Cocks-comb, hath leaues for all the world reſembling the creſt or comb of a cock, and thoſe in number many: a ſlender ſtem and black ſeed, incloſed within certain cods. A ſoueraign herb it is for them that cough, if it be boiled with bruiſed beans, and taken in maner of an electuary with hony. It ſcattereth the clou-
dy films that trouble the eie-ſight; & the maner is to take the ſeed whole and ſound as it is, and to put it into the eie: it is nothing offenſiue nor troubleth that part one whit, but gathereth to it ſelfe all thoſe groſſe humors which impeached the ſight. And in very truth, this ſeed whiles
D it is within the eie changeth colour, and being black before, beginneth to wax white; it ſwelleth withall, and in the end commeth out of the eie by the owne accord.

Chap. VI.

¶ *Of Alum.*

THe herb which we name in Latine Alum, the Greeks call Symphytum Petræum, as if one would ſay, Comfrey of the rock: and verily like it is to wild Origan. The leaues be ſmall, and three or foure branches ſpring immediatly from the root: the tops whereof reſemble thoſe of Thyme. Much branched it is otherwiſe, odoriferous in ſmel, and ſweet in taſt: it draws
E down water into the mouth and cauſeth ſpitting. The root which it putteth forth is long & red. This herb taketh pleaſure to grow in ſtony places among rocks: in which regard it took the addition of the name Petræum. Singular good it is for the ſides and flanks, the ſpleen, reines, and wrings of the belly: for the breaſt, the lights, for ſuch as reject or caſt vp bloud, and are troubled with the aſperity and hoarſneſſe in the throat: for which infirmities, the root is to be ſtamped, boiled in wine, and ſo drunk; yea, and otherwhiles to be reduced into a liniment, and ſo applied. Moreouer, the chewing of it only, quencheth thirſt, and hath a principal vertue to coole the lungs. Being applied outwardly in the form of a cataplaſm, it knitteth diſlocations, helpeth convulſions, is comfortable to the ſpleen, & the bowels or guts, if they be fallen by any rupture.
F The ſame root roſted or baked vnder the aſhes, ſtaieth a lask, in caſe it be firſt ſhrigged from the hairy ſtrings thereof and pilled; and then after it is beaten into pouder, be drunk in water with nine Pepper corns. And for healing of wounds, ſo ſoueraigne it is, that if it be put into the pot and ſodden with pieces of fleſh, it will ſouder and reioine them, whereupon the Greekes impoſed vpon it the name Symphytum, *i.* Conſound: finally, it ſerueth to vnite again broken bones.

CHAP.

Chap. VII.

¶ *Of Reits or sea-grasse, and Wallwort. Of the wild vine, and Wormewood.*

The sea-weed that looketh red, named in Latine Alga, is very proper for the prick and sting of Scorpions.

Touching Wallwort, it hath leaues carrying a strong and stinking smell with them: the stems be rough and parted into ioints: the seed black like to that of the Iuy, saue that the berries containing the same be soft. This herb delighteth in shady, cool, rough, and watery places. Beeing giuen to the full quantity of one Acetabulum, it is singular for the inward maladies which be proper to women.

The wild Vine, called by the Greeks Ampelos-Agria, is an herbe (as I haue sufficiently described already in my Treatise of Vines planted and wel ordered by mans hand) which putteth forth hard leaues of Ash-colour, long branches and winding rods clad with a thicke skin, and the same be red, resembling the floure Phlox, which in the chapter and discourse of Violets, I called Iouis Flamma; and a seed it beareth much like vnto the graines within a Pomegranate. The root boiled in three cyaths of water and two cyaths of the wine comming out of the Island Coos, is a gentle emollitiue of the belly, and maketh the body soluble, in which regard it is giuen with good successe to such as be in a dropsie. A very good herb for women, as well to rectifie the infirmities of the matrice, as also to scoure and beautifie the skin of their face. Moreouer, for the sciatica it is good to stamp it leafe and all, and to annoint the grieued place with the juice thereof.

As for Wormewood, there be many kindes thereof. One is named Santonicum of a city in France called Saints: another, to wit Ponticum, taketh that name of the kingdome Pontus; where the sheep feed fat with it, which is the cause that they be found without gall: neither is there a better Wormwood than it: much bitterer than that of Italy, and yet the marow or pith within of that Ponticke Wormwood, is sweet to ours. Meet and requisite it is that I should set down the vertues and properties thereof, an herb (I must needs say) as common as any, and most ready at hand, howbeit, few or none so good and wholesome: to say nothing of the especiall account which the people of Rome make of it about their holy sacrifices and solemnities: for in those festiuall holydaies named Latinæ, at what time as there is held a great running with chariots for the best game, he that first attaineth to the goale and winneth the prise, hath a draught of VVormwood presented vnto him. And I beleeue verily, that our forefathers and ancestors deuised this honourable reward, for the good health of that victorious charioteer, as judging him worthy to liue still. And in truth, a right comfortable herb it is for the stomack, and doth mightily strengthen it: In which regard, there is an artificiall wine that carieth the strength and taste thereof, named Absinthites, according as I haue shewed heretofore: moreouer, there is an ordinary drinke made of the decoction of Wormwood boiled in water: for the right making whereof, take six drams weight of the leaues and sprigs together, seeth them in three sextars of raine water, and in the end put thereto a small quantity of salt; which done, the liquor ought to stand a day and a night afterwards to coole in the open aire, and then is it to be vsed: Certes, there is not a decoction of any herbe of * so great antiquitie as it, and knowne to haue beene vsed so long. Moreouer, the infusion of VVormewood is in great request, and a common drinke: for so we vse to call the liquor wherein it lay steeped a certain time. Now this would be considered, that be the proportion of water what it will, the said infusion ought to stand close couered for three daies together. Seldome or neuer is there any vse of wormewood beaten to pouder, ne yet of the juice drawn by way of expression. And yet those that presse forth a iuice, take the Wormwood when the seed vpon it beginneth to swell and wax full, and being newly gathered, let it lie soking in water three daies together: but if it were drie before, to steep it a whole seuen night: which done, they set it ouer the fire in a brasen pan, with this proportion, namely, ten hemines of the herbe, to fiue and fortie sextars of water, and suffer it to boyle vntill a third part of the liquor be consumed: after this the decoction must run through a strainer, with hearbe and all well pressed: then ought it to be set vpon the fire againe, and suffered to seeth gently and leisurely to the height or consistence of honey, much after the order of the syrrup made of Centaurie the lesse. But when all is done, this juleb or syrrup of VVormewood

* *Vetustissime in vsu est.* Some read *Vetus siue vsu est*, that is, If this drink be stale, and not vsed presently, it is good for nothing.

20030
copy 1

A wood,is offenſiue to the ſtomack and head both;whereas that decoction firſt aboue-named, is moſt wholſome: for aſtringent though it be,and binding the mouth of the ſtomack aloft,yet it doth euacuat choler downward, it prouoketh vrine, keepeth the body ſoluble, and the belly in good temper,yea and if it be pained,giueth great eaſe:the worms ingendered therein, it expelleth:and being taken with Seſeli,and Celticke nard, ſo there be a little vineger put thereto, it diſpatcheth all ventoſities in the ſtomacke,and cureth women with child of that inordinat deſire and ſtrange longing of theirs: it clenſeth the ſtomack of thoſe humors which cauſe lothing of meat,bringeth the appetite againe and helpeth concoction:if it be drunke with Rue,Pepper, and ſalt,it purgeth it of raw humors & crudities occaſioned by want of digeſtion. In old time, Phyſitians gaue wormwood for a purgatiue;but then they tooke a ſextar of ſea water that had
B bin kept long,ſix drams of the ſeed,with three drams of ſalt,and one cyath of hony:and the better will this purgation worke,in caſe the poiſe of ſalt be doubled;but it would be puluerized as fine as poſſibly may be, to the end that it might paſſe away the ſooner, and worke more eaſily. Some vſed to giue the weight beforeſaid in a gruell of Barley groats,with an addition of Peniroyall:others againſt the Palſie:and others againe had a deuiſe to put the leaues of wormwood in figs,and make little children to eat them ſo,that they might not taſt their bitternes. Wormwood being taken with the root of Floure-de-lis, diſchargeth the breſt of tough fleagme, and clenſeth the pipes. For the iaundiſe,it would be giuen in drinke raw,with * Parſley or Maiden-
C haire. Supped hot by little and little in water,it breaketh wind and reſolueth ventoſities:and together with French Spikenard, it cureth the infirmities of the liuer: and taken with vineger, or ſome gruel,or els in figs,it helpeth the ſpleen: giuen in vineger, it helpeth thoſe that haue eaten venomous Muſhrums,or be poiſoned with the gum of Chamælion called Ixia. In wine if it be taken,it ſaueth thoſe who haue drunk Hemlock: it reſiſteth the poiſon inflicted by the ſting of the hardiſhrow,the ſea dragon, and ſcorpions. It is holden to be ſingular for the clarifyng of the ſight: if the eies be giuen to watering,it repreſſeth the rheum or flux of humors thither, ſo it be applied with wine cuit: and laid vnto contuſions, and the skin blacke and blew vnder the eies,with hony,it reduceth the place to the natiue colour againe. The vapour or fume of the decoction of wormwood receiued into the eares,aſſuageth their paine:or if they run with corrupt matter,it is good to apply the ſame,reduced into pouder and incorporat in hony. Take three or foure ſprigs of wormwood,one root of Nardus Gallicus,boile them in ſix cyaths of water, it is
D a ſoueraigne medicine to drinke for to prouoke vrine, and bring downe the deſired ſickneſſe of women: or beeing taken ſimply alone with hony, and withall put vp in a peſſarie made with a locke of wooll,it is of ſpeciall operation to procure their monthly terms: with honey and ſalnitre,it is ſingular for the Squinancie: it healeth chill-blanes,if they be bathed with the decoction thereof in water: applied vnto freſh or green wounds in a cataplaſme,before any cold water come vnto them,it healeth them: and beſides,in that manner,it cureth the ſcals in the head: being incorporat with * Cyprian wax or figges,and ſo applied to the flankes or hypochondrial
E parts,it hath a particular vertue by it ſelfe to helpe their griefes. Moreouer, it killeth any itch. Howbeit,this would be noted,that wormewood in no caſe muſt be giuen to thoſe that haue an ague. Let a man or woman vſe to drinke wormewood, they ſhall not be ſea-ſicke nor giuen to heauing, as commonly they be that are at ſea. If wormewood be worne in a truſſe to the bottome of the bellie, it allayeth the ſwelling in the ſhare. The ſmell of wormewood procureth ſleepe;or if it be laid vnder the pillow or bolſter, prouided alwaies that the patient be not ware of it. Either baſted within cloaths,or ſtrewed vpon them,it keepeth away the moth. If one rub his body therewith and oile together,it driueth gnats away ſo doth the ſmoke therof alſo when it burneth. If writing inke be tempered with the infuſion of wormewood, it preſerueth letters and bookes written therewith, from being gnawne by mice. The aſhes of wormewood burnt,
F and incorporate with oile Roſat to an ointment,coloureth the haire of the head black. There is yet another kinde of Sea-wormewood,which ſome call Seriphium: and excellent good is that which groweth about the city * Taphoſitis in Ægypt. Of this wormewood it is, that the prieſts of Iſis in their ſolemne marches and proceſſions, vſe to beare branches before them. The leaues be ſomewhat narrower than thoſe of the former, and the bitterneſſe not altogether ſo much. An enemy it is to the ſtomacke: howbeit, the belly it looſneth,and chaſeth worms out of the guts;for which purpoſe,it is good to drink it with oile and ſalt:or elſe the infuſion ther-
M of in a * ſupping or grewell made with the floure of the three moneth corne. To make the de-

coction of wormwood well, there would be taken a good handfull of wormwood, and ſodden in G
a ſextar of water to the conſumption of the one halfe.

Chap. VIII.

¶ *Of ſtinking Horehound: of Mille-graine, or Oke of Ieruſalem: of Brabyla, Bryon, Bupleuros, Catanance: of Calla, Circæa, and Cerſium: of Crataogonon and Thelygonum: of Crocodilium and Cynoſorchis: of Chryſolachanon, Cucubalon, and Conſerua.*

STinking Horehound, which ſome Greeks call Ballote, others Melampraſion, *i.* Black Horehound, is an herbe tufted full of branches: the ſtems be black and cornered; the leaues wher- H
with they be clad and garniſhed, are ſomewhat hairy, reſembling thoſe of ſweet or white
* *Perri*: but it ſhould be *Marrubij*, according to the Greeke word μαρρ'ις not μαρρ. * Horehound, but that they be bigger, blacker, and of a ſtinking ſauor: but the leaues ſtamped and applied with ſalt, be very effectuall againſt the biting of a mad dog: alſo, if they be wrapped in a Colewort or Beet leafe, and ſo roſted vnder the embers, they are commended for the ſwelling piles in the fundament. This Horehound made into a ſalue with honey, clenſeth filthie vlcers.

Botrys is an herb ful of branches, and thoſe of a yellowiſh colour, and beſet round with ſeed: the leaues reſemble Cichorie. Found it is commonly growing about the banks of brookes and riuerets. Good it is for them that be ſtreight winded and cannot draw their breath but ſitting vpright. The Cappadocians call it Ambroſia, others Artemiſia.

As for * Brabyla, they be aſtringent in manner of Quinces. More than ſo, I find not any Au- I
thor to write thereof.

* Some take them for Damaſcen plums, or rather for Bullois, Skegs, or ſuch like wilde Plums. Bryon no doubt is a Sea-herbe, like in leaues to Lettuce, but that they be riuelled and wrinkled as if they were drawne together in a purſe: no ſtem it hath, and the leaues come forth at the bottom from the root: it groweth ordinarily vpon rockes bearing out of the ſea: and ye ſhall find it alſo ſticking to the ſhels of certaine fiſhes, eſpecially ſuch as haue gathered any mud or earth about them. The herbe is exceeding aſtringent and deſiccatiue, by vertue whereof it is a ſingular repercuſſiue in all impoſtumes and inflammations of the gout eſpecially, & ſuch as require to be repreſſed or cooled.

Touching Bupleuros, I read that the ſeed thereof is giuen againſt the ſting of ſerpents: and K
that the wounds inflicted by them, are to bee waſhed or fomented with the decoction of the herb, putting thereto the leaues of the Mulberrie tree, or Origan.

Catanance is a meere Theſſalian herb, and growing no where els but in Theſſalie; and foraſmuch as it is vſed only in amatorious matters, and for to ſpice loue drinks withall, I meane not to buſie my ſelfe in the deſcription therof: howbeit, thus much it would not be amiſſe to note, for to detect and lay open the folly and vanities of Magitians; namely, that they went by this conjecture onely, that it ſhould be of power to win the loue of women, becauſe forſooth when
* As if it would catch women and hold them faſt perforce. * χαμὸς or χαμὸς in Greeke ſignifieth a bridle or bit: and it is thought to be *Leontopodium*, *Dioſcor.* though others take it for Doder. it is withered, it draweth it ſelfe inward * like a dead Kites foot. For the ſame reaſon alſo, I will hold my tongue and ſay neuer a word of the herb * Cemos.

* Cala is of two ſorts: the one like to Aron, which loueth to grow in toiled and ploughed L
grounds: the time to gather this herb is before it begin to wither: the ſame operation it hath that Aron, and is vſed to the like purpoſes: the root thereof is commended to be giuen in drink for a purgation of the belly, and to prouoke the monethly termes of women: the ſtalkes boyled leafe and all together with ſome pulſe or other into a pottage, and ſo taken, cure the inordinate prouocations to the ſtoole, and ſtreinings therupon without doing any thing. The ſecond kind ſome call Anchuſa, others, * Rhinochiſia: the leaues reſemble Lettuce, but that they be longer, ful of plume or down; the root red, which being applied with the floure of barly groats, healeth ſhingles, or any other kind of S. *Anthonies* fire: but drunke in white wine, cureth the infirmities of the liuer.
* Or rather *Calix*.
* Rather *Orocleia*, out of *Dioſcorides*.

Circæum is an herb like to winter Cherry or Alkakengi, but for the flours which are black: M
the ſeed ſmall, as the graine of Millet, and the ſame groweth in huskes or bladders reſembling little hornes: the root is halfe a foot long, forked for the moſt part into three or foure grains or branches: the ſame is white, odoriferous and hot in the mouth: it loueth to grow vpon rockes and ſtonie grounds lying pleaſantly vpon the Sun. The infuſion of this root in wine, is good to

be

20030
copy 1

A be drunke for the paine and other diſeaſes of the matrice: but of the ſaid root there ought to be taken three ounces ſtamped, and the ſame to ſteepe a day and night in 3 ſextars of wine, for to make the infuſion aboue-named. This portion alſo ſerues to ſend down the after-birth, if it ſtay behind. The ſeed of this herbe drieth vp milke, if it be drunke in wine or mead.

Cirſion commeth vp with a ſlender ſtalke two cubits high, and ſeemeth to be made 3 cornered triangle-wiſe: the ſame is beſet round about with prickie leaues: howbeit, the ſaid prickes are but tender and ſoft. The leaues in forme reſemble an oxe tongue or the herb * Langue-de-bœufe, but that they be ſmaller and ſomewhat white; in the top whereof there put forth purple buttons or little heads, which in the end turne to a plume like thiſtle down. Some writers hold,
B that this herb or the root onely, bound vnto the ſwelling veines called Varices, doth allay the paine thereof.

* Or Borage, called in Greeke *Bugloſſon.*

Cratæogonos ſpindleth in the head like vnto the eare of wheat, and out of one ſingle root ye ſhall haue many ſhoots to ſpring and riſe vp into blade and ſtraw, and thoſe alſo ful of ioints. It gladly groweth in coole and ſhadowie places: the ſeed reſembleth the grain of the Millet, which is very ſharp and biting at the tongues end. If a man & his wife before they company together carnally, drink before ſupper for 40 daies together the weight of three oboli of this ſeed, either in wine, or as many cyaths of water, they ſhall haue a man childe betweene them, as ſome ſay. There is another * Cratæogonos, called alſo Thelygonos; & the difference from the other may ſoon be known by the mildneſſe in taſte. Some authors affirme, that if women vſe to drinke the floures of Cratæogonos, they ſhal within 40 daies conceiue with child. But as well the one as
C the other applied with hony, do heale old vlcers: they incarnat and fill vp the hollow concauities of fiſtulous ſores: and ſuch parts as do miſlike and want nouriſhment, they cauſe to gather fleſh and fill the skin again: foule and filthy vlcers they mundifie, the flat biles and riſings called Pani they rarifie and diſcuſſe: gouts of the feet they mitigat; & generally all impoſtumations, in womens breſts ſpecially, they reſolue and aſſuage. *Theophraſtus* would haue a kind of tree to be called Cratægonos or Cratæogon, which here in Italy they call * Aquifolia.

* Some take this for our *Perſicorie*, or Arſ-mert.

Crocodilion doth in ſhape reſemble the thiſtly herbe or Artichoke called the blacke Chamæleon: the root is long and thicke in all parts alike, of an hard and vnpleaſant ſmel: it groweth ordinarily in ſandy or grauelly grounds. If one drinke of it (they ſay) it will ſet the noſe a bleeding, and ſend out a deale of thicke and groſſe bloud, that the ſpleene will diminiſh and
D weare away by that means.

* *i.* Holly or Huluer: nay rather, *Aquifolia* is *Agrid* in Greeke: and the *Cratægus* of *Theophraſtus*, which he meaneth here, is a kinde of Ceruoiſe tree now called *Torminalis.*

As touching Teſticulus Canis or Dogs-ſtones, which the Greeks cal Cynoſorchis, & others ſimply Orchis, it hath leaues like vnto thoſe of the oliue; ſoft & tender they are, and about halfe a foot long, and therfore no maruell if they lie ſpred vpon the ground: the root is bulbous and growing long-wiſe, in a double ranke, or two together: the one aboue, which is the harder, the other vnder it, and that is the ſofter: when they be ſodden, folke vſe to eat them after the manner of other bulbs: and lightly a man ſhall find them growing in vineyards. Of theſe two roots, if a man eat the bigger, it is ſaid, that he ſhal beget boies; and if the woman eat the ſmaller, ſhe ſhal conceiue a maiden childe. In Theſſalie, men vſe for to drinke in goats milke, the ſofter of theſe roots, to make themſelues luſtie for the act of generation; but the harder, when they would
E coole the heat of luſt: whereby we may ſee, that they be contrarie, and one hindereth the operation of the other.

Chryſolachanon commeth vp like a Lettuce, and commonly groweth in plots of ground ſet with Pines: the vertue of this herbe is to heale wounds of the ſinewes though they were cut quite aſunder, if it be preſently laied too. There is another kinde of * Chryſolachanon, bearing floures of a golden colour, and leafed like vnto the Beet: when it is boiled, folke vſe to eat it in ſtead of meat, and it looſeneth the belly as well as Beets, Coleworts, and ſuch like: and if it be true that is reported, whoſoeuer beare this hearbe tied faſt about any place of their bodies which is euer in their eie, ſo as they may ſee the ſame continually, it wil cure them of the jaun-
F diſe. Touching this hearb Chryſolachanum, well I wot that I haue not written ſufficiently, that men might know it by this deſcription, and yet could I neuer meet with any author who hath ſaid more, or deſcribed it better. This verily hath been the fault and ouerſight euen of our moderne Herbariſts of late daies, To write ſleightly of thoſe herbes and ſimples which they themſelues knew and were acquainted with, as if forſooth they had been knowne to euery man; ſetting downe onely their names and no more: which is euen as much as to tell vs a tale and ſay,

* I thinke he meaneth Otach.

that with the * rennet or rundles of the earth, one might stay a laske, or giue free passage to the vrine in the strangury, so it be drunke in wine or water. G

As for Cucubalum, they write of it, That if the leaues bee stamped with vineger, they heale the stings of serpents and scorpions. Some of them cal this herb by another name, Strumus, and others giue it the Greeke name Strychnos: and black berries (they say) it hath. The iuice thereof taken to the quantity of one cyath, with twice as much honied wine, is soueraigne for the loins or small of the back: likewise if it easeth the head-ache, if together with oile of roses it bee distilled vpon the head by way of embrochation. The herb it selfe in substance made into a liniment, healeth the wens called the kings euill.

Concerning the fresh water Spunge (for so I may more truly terme it, than either mosse or herbe, so thicke of shag haires it is and fistulous withal) it groweth ordinarily within the riuers that issue from the root of the Alpes, and is named in Latine * Conferua, for that it is good to conglutinat, in manner of a souder. Certes, I my selfe know a poore labourer, who as he was lopping a tall tree, fell from the top down to the ground, and was so pitiously bruised thereby, that vnneth he had any sound bone in all his body that was vnbroken: and in very truth, lapped he was all ouer with this mosse or spunge (call it whether you will) and the same was kept euermore moist and wet with sprinckling his owne water vpon it, whensoeuer it began to drie vpon him with the heat of his body: seldome was it vndone or remooued, and neuer but when of necessity for verie change fresh was laied too for default of the other: and by this manner of cure and no other, the poore wretch recouered perfectly, in so smal a time, that it was wonderful and almost incredible. H I

Coagulo terræ Some thinke in place vnperfect, but I gueſſe rather, that *Pliny* herein alludeth at the obſcuritie of their writings in theſe matters of ſimples, who put downe that herbe many names, which no man can make any ſenſe of no more than of *Coagula terræ*.

* *Conſerua quaſi conſolidando.*

¶ *Of the berrie called Coccum Gnidium. Of the Tazill, and Oke ferne. Of Dryophonon, and Elatine. Of Empetrum, otherwise named Calcifraga. Of Epipactis, or Elleborine. Of Epimedium, Cuneaphyllon, and Ferne. Of the herbe named Oxe-thigh. Of Galeopsis, otherwise Galeobdolon. Of Glaux, or Eugalactum.*

THe berrie Coccum Gnidium, in colour resembleth the Scarlet graine; in quantity a pepper corne, but that it is bigger: of an ardent and caustick quality it is, and therefore they vse to lap it in the soft crum or pith of a loaf of bread, and to swallow it, for feare it should burn the throat as it passeth down. A present remedy this is for those who are impoisoned with Hemlocke; and it hath a good propertie to stop a laske. K

* *Virga paſtoris* The Tazill, called in Greeke * Dipsacos, hath leaues much resembling Lectuce, sauing that in the mids of the back-part, there are to be seen certain bubbles as it were, or rifings, and those be prickly: the main stem which it beareth, is two cubits high, and the same armed with pricks: at euery ioint and knot whereof, it putteth forth two leaues which do compasse and inclose the same round about in maner of wings, making thereby a certaine * concauitie or hollow receptacle, wherein alwaies there standeth a * saltish dew or water. In the top of this maine stem and other branches proceeding from it, it beareth certaine burry heads, beset all ouer with sharpe pricks, like those of an Vrchin: and it loueth to grow in waterie places. This herb closeth vp and skinneth the fissures or chaps in the fundament: also the root boiled in wine, healeth fistuloes; but the same ought to be so tender sodden, as it may be wrought like wax, that a colyrie or tent made of it may be put into the concauitie of the sore. Moreouer, it cureth werts of all sorts: and some there be, who to take away werts, wash them with the liquor found in the hollow pith of the foresaid wings. The Oke fern named in Greek Dryopteris, is like to other fern, & groweth vpon trees, hauing leaues finely slit, and those somewhat sweet in tast: the root is rough and hairy: of a caustick and fiery nature is this herb; and therefore the root being punned, is a depilatory and fetcheth off haire: for which purpose, the manner is to apply it in manner of a liniment, vntill it procure sweat: which course would be re-iterated twice or thrice, during which time the sweat must not be wiped away. L M

* Thereupon it is called *Labrum Veneris*, *Venus* lauer.

* This water is not saltish: but because the name *Dipsacos* in Greek alludeth to thirst, & salt things cause thirstinesse. *Plinie* guessed this humour to be saltish.

Dryophonon is an herb much like to Dryopteris: the stems wherof be small, yet growing to the length of a cubit, & those be inuironed on both sides with leaues an inch broad: in shape much like to Bruscus or butchers-broom, called in Greek Oxymyrsine, but they be whiter and softer,

20030
copy 1

A ſofter,bearing a white floure likewiſe in manner of the Elder. The young crops and tendrils of this herb,may be eaten when they are ſodden:and the ſeed is commonly vſed in ſtead of pepper.

Running Buckwheat or Bindweed,named in Greek Elatine,putteth forth ſmal leaues,round and hairy,much like to thoſe of Parietary of the wal;and immediatly from the root there ſpring fiue or ſix prety branches halfe a foot long,furniſhed well with leaues. This herb grows among corn: ſoure it is and harſh in taſt,wherupon it is taken to be very effectuall to repreſſe the fluxe of humors which cauſe watering eies, if the leaues be ſtamped with barley groats, and applied with a fine linnen cloath vnderneath. The ſame boiled together with Lineſeed,cureth the bloudy flix, in caſe the patient drinke the broth or decoction thereof.

B As for Empetron,which our countrymen in Latine name Calcifraga,it groweth vpon mountains regarding the ſea,and commonly vpon rocks and ſtony cliffes: the nearer it is to the ſea, the ſalter taſt it hath,by which means if it be taken in drink,it purgeth choler & fleam:the farther off that it groweth from the ſea,and the more terrene and earthly ſubſtance that it hath,the bitterer is it found to be,and this doth euacuat wateriſh humors:but the manner of taking it,is in ſome potage,or els in mead. Being long kept,it loſeth the force:if it be freſh and new gathered,and then either ſodden or ſtamped,it is diureticall and breaketh the ſtone. And verily they that promiſe thus much in the behalfe of Empetron,and would ſeem to juſtifie and make good their word,do affirme for the better credit thereof, That if ſtones doe boile with it in the ſame pan,they will burſt in pieces. * This *Empetrō* is thought to be our *Saxifrage.*

Epipactis,named by ſome Elleborine,is a little herb bearing ſmall leaues: ſoueraign for the
C diſeaſes of the liuer,and againſt all poiſons,if it be taken in drinke.

Epimenidion putteth forth no great ſtem,bearing ten or twelue leaues reſembling the Iuie, but it neuer ſheweth floure:the root is ſmal,black,and of a ſtrong and ſtinking ſmel:it groweth vpon moiſt grounds:of an aſtringent nature it is,and cooleth mightily: an hearbe that women * muſt beware of. The leaues ſtamped and applied to the paps of maides, keep them down that that they ſhall not grow. * For it hindreth conception.

Enneaphyllon hath long leaues, in number nine,neither fewer nor more, and thoſe be of a burning or cauſticke nature: a ſingular hearbe for the paines of loines,and the Sciatica, but it ought to be applied enwrapped well in wooll,for feare leaſt it burne the flankes, for preſently it raiſeth bliſters.

D Of Ferne be two kinds,and they beare neither floure nor ſeed. Some of the Greekes call the one Pteris,others Blechnon: from one root whereof there ſpring many branches repreſenting wings,and thoſe exceed two cubits in length,yeelding * no vnpleaſant ſauor;and this they ſuppoſe to be the male. The ſecond kind,the ſaid Greeks ſome call Thelypteris, others Nymphæa Pteris: this groweth ſingle, and brancheth not into many ſtems; ſhorter it is than the former, ſofter alſo,and thicker of leaues,and thoſe toward the root guttered and ſomwhat hollow:there is neither of them both,but their roots will feed ſwine fat: and the leaues of the one as well as the other,are diſpoſed on both ſides ſo,as they do repreſent birds wings,wherupon the Greeks gaue them the name * Pteris. The roots of both Fernes be long,and thoſe growing bias: in colour blacke,eſpecially when they be drie: and dried they ought to be in the Sunne. Fern grow-
E eth euery where,but their moſt delight is in a cold ſoile. The due time of digging them vp, is about the ſetting of the ſtar Virgiliæ. There is no vſe in Phyſicke of their roots,but when they be iuſt two yeres old;for both before & after the time,they ſerue for no purpoſe. Taken in this their ſeaſon,they do expell all kind of vermin out of the guts;with honey, if they be broad and flat wormes;but in ſome ſweet wine, for all the reſt,whether they be round or ſmall, ſo that the Patient continue this drink three daies together. Neither of them both, but are very contrarie and offenſiue to the ſtomack: howbeit,they purge the belly,and firſt euacuat choler,then ſoon after,wateriſh humors: but the better do they chaſe the foreſaid flat wormes out of the body in caſe they be quickened with the like quantitie of Scammonie. The root of Ferne taken to the
F weight of two oboli in water,cureth all rheums;but the Patient ought to faſt one whole day before,and likewiſe eat a little hony ſomewhat before that he take the ſaid drink. As for women, neither the male nor the female Fern would be giuen vnto them;for if they be with child,it wil driue them to trauell before their time,and ſlip an vntimely birth;and if they be cleare, it hindereth conception and cauſeth them to be barren. The pouder of Ferne roots, is ſingular to be ſtrewed or caſt vpon maligne vlcers;yea,and the farcins and ſores in horſe necks. The leaues of * *Non graui odore*: *Dioſcor.* ſaith, *Sub graues odore*, ſomwhat vnpleaſant in ſmell. * And in *Columella*, *Filix* is called *Auia.*

Ferne kill punaiſes or wallice, and a ſerpent they will not harbor; and therefore it is good for G
thoſe who are to lie in ſuſpected places, to make them pallets of Ferne leaues, or at leaſtwiſe to
lay them vnder their beds: the very ſmoke alſo of them when they be burned, do chaſe away ſer-
pents. Moreouer, Phyſitians haue made ſome difference and choice euen in this herbe alſo; for
the beſt is counted that of Macedony: and the next to it in goodneſſe, commeth from Caſſiope.

As touching the herb called in Latine Femur bubulum (*i.*) Ox-thigh, it is very good for the
ſinews, if being new gathered, it be ſtamped and incorporat in vineger and ſalt.

* Many take it for Archangell.

* Galeopſis, otherwiſe called by ſome Galeobdolon or Galion, hath a ſtem and leaues like to
the nettle, but that they are more ſmooth and mild in hand; which being bruiſed or ſtamped,
yeeld a ſtinking ſmell; and it beareth a purple floure; it groweth euery where about hedges and
path-waies. The leaues and ſtalks both, ſtamped and applied with vineger, heal all hard tumors H
and cancerous ſores: likewiſe the wens called the kings euill: they reſolue flat impoſtumes, and
the ſwellings behind the ears: now the manner is to foment the ſaid infirmities with their deco-
ction. Being laid too with ſalt, they heale vlcers tending to putrifaction, and gangrens.

As touching Glaux, in old time called Eugalacton, it is an herb in leafe reſembling Treetri-
folie, and the Lentill, but that the back part of the leafe in Glaux is whiter. The branches, that
be in number fiue or ſix, and thoſe ſpringing directly from the root, very ſmall, doe creepe along
the ground: the flours which it putteth forth be of a purple colour: and this herb is found grow-
ing ordinarily neare the ſea-ſide. Being boiled in a gruell made of fine wheat floure, it cauſeth
nources that drinke it, to haue plenty of milke in their breſts; but then they muſt preſently goe
to a baine or hot houſe. I

Chap. X.

¶ *Of Glaucion. Of Pæonie, and Cudweed or Cottonwort, called alſo Chamæzelon. Of Galedra-
gon, Holcus, Hyoſiris, Heloſteon, and Hippophæſton.*

GLaucion grows naturally in Syria and Parthia: a low herb, tufted thick with leaues, much
like vnto Poppie, but that they be ſmaller and looke more foule and greaſie; of an vnplea-
ſant and ſtinking ſmell; bitter alſo in taſt, ſtyptick, and aſtringent: graines it beareth of a
Safron colour, whereout is drawne the juice Memithra, called by the Greeks Glaucium alſo, as
wel as the herb. Now for to get this juice, they vſe to couer the graines in mud or clay, and put K
them in an earthen pot which they ſet in an ouen; where, after they are well heat, they vſe to
preſſe out of it the foreſaid juice. And not onely it, but the leaues alſo if they be ſtamped, are
much vſed for the flux of humors to the eies, eſpecially ſuch as fal together all at once in great
violence. And of this herb or juice there is a certaine collyrie compounded, which the Phyſiti-
ans call Diaglaucion: a good medicine alſo for nources to drinke in water, if they haue loſt
their milke and would recouer it againe.

Pæony, which ſome in Greeke call Glycyſide, others Pæonia, or Pentorobos, hath one main
ſtem two cubits high, & the ſame accompanied with two or three more leſſe ſtalks of a reddiſh
colour, and the rind reſembleth that of a Bay tree: the leaues be very like vnto Woad, were they
not fatter, rounder, and ſmaller: ſeed it beareth in certaine husks like grains, and thoſe be partly L
red and partly blacke Of Pæony there be two kinds; the female it is thought to be, to the root
whereof there ſticke eight long bulbes commonly, or ſix at leaſt: the male hath more of them
hanging to it, by reaſon it ſtandeth not vpon one ſingle and entire root onely, but of many, and
thoſe run downe a ſpan deep, and be white withall. Theſe roots are found to be aſtringent and
ſtypticke at the tongues end. As for the female, the leaues thereof do ſent of Myrrhe, and grow
ſomewhat thicker than thoſe of the male. They loue both to grow in woods. It is commonly
ſaid, That the roots muſt be digged vp in the night ſeaſon, for feare that the Wood-ſpeight or
Hickway ſhould ſee them: for in the day time the ſaid bird would flie in their faces that carry
it away, and be readie to job out their eies. In the very drawing alſo of thoſe roots out of the
ground, there is ſome danger, leaſt their fundament or tiwill fal out of their bodies who are im- M
ployed about that buſineſſe. But I ſuppoſe all this to be but a fabulous and vaine inuention, de-
uiſed onely to make folke beleeue it is an herbe of wonderfull operation. Moreouer, the grains
are diuerſly vſed: for the red, beeing taken to the number of fifteene or thereabout, in ſome
groſſe or hard VVine, doe ſtay the monethly fluxe of the reds in women: whereas the blacke

drunke

20030
copy 1

A drunke to the ſame number in ſweet wine cuit or ſimple wine, cure the paſſions of the matrice, [and namely the riſing of the mother.] The root giuen in wine, appeaſeth all the paines of the belly, clenſeth the guts, cureth the convulſion or cramp which plucketh the neck & body backward, and the jaundiſe: it pacifieth alſo the griefes of the reins and bladder. As for the wrings of the matrice and ſtomack, the ſame boiled in wine, doth aſſuage them; the lask it ſtaieth: and being eaten with meat, it is good for thoſe that be troubled in their braines, or otherwiſe giuen to melancholy. But in theſe caſes foure drams is counted a ſufficient doſe. The black grains taken to the number abouelaid in wine, help thoſe that be ridden with the night-mare, and in danger thereby to haue their breath ſtopped. For the gnawing in the ſtomack, the ſame being either eaten or applied in a liniment, are ſingular good: impoſtumations likewiſe growing to ſuppuration, if they be taken betimes, may be reſolued with a plaſter made of the black berries, and ſay they were of long continuance, the red will do the deed. But as well the black as the red, are ſoueraigne for thoſe who be ſtung with ſerpents: as alſo for young children who haue the ſtone, and be entring into the ſtrangury, and piſſe drop-meale.

Cudwort or Cottonweed, ſome there be who call Gnaphalion, others, Chamæzelon. The white, ſoft, and delicat down of the leaues, many vſe in ſtead of flocks; and ſurely it is not much vnlike. This herb is good to be giuen in ſome auſtere and ſtyptick wine, for the bloudy flixe. It ſtaieth lasks, and reſtraineth the immoderat flux of womens fleurs. Being clyſterized, it is ſingular for the Tineſme, that is to ſay, the continual prouocations to the ſeege without any voidance of excrements. Laſt of all, in a liniment it ſerueth well to be applied in vlcers tending to putri-
B faction.

As touching Galedragon (an herb ſo called by *Xenocrates*) it reſembleth the Thiſtle named Leucacanthe [*i.* S. *Mary* thyſtle] and groweth full of ſharp pricks in moory grounds. The ſtem riſeth vp tall, in maner of Ferula or Fennell geant, in the very head and top whereof it beareth a thing reſembling an egge, in which there breed (they ſay) in proceſſe of time certain grubs or litle worms, which are excellent for to eaſe the tooth-ach, if they be kept in a box with bread, and as need requireth, tied faſt vnto the arm of the patient on that ſide where they ake; for it is wonderfull how ſoon the paine wil by this means ceaſe. Mary they ought to be changed euery yere, for after one yeare they be of no vertue in this caſe: and in any wiſe they muſt at no time touch the ground.

C As for Holcus, it groweth vpon ſtony grounds and thoſe that be dry. It riſeth vp with a ſtem like vnto the ſtraw of that Barly which ſpringeth euery yere without ſowing: in the top whereof it beareth ſlender ſpikes or eares. This herb bound about the head, or the arme, * draweth forth of the body any ſpils what ſoeuer: whereupon ſome name it Ariſtida.

* Hyoſeris reſembleth Cichory or Endive, but that it is leſſe, and in handling more rough: a ſoueraigne vulnerary herb, ſo it be ſtamped and laid to a wound.

D Holoſteon, which the Greeks ſo call by the * contrary, is an herbe without any hardneſſe at all, as if we ſhould terme * [Gall] by the name of [Sweet.] So ſmall and ſlender it groweth, that a man would take it to be all hairs; foure fingers long, in manner of quich-graſſe or ſtitchwort. The leaues be narrow, and haue an aſtringent taſt. It commeth vp ordinarily vpon banks & hil-
E locks, which be all earth and nothing ſtony. Being drunke in wine, there is great vſe thereof for convulſions, ſpreins, and ruptures. It is a great healer beſides, and skinneth greene wounds: and experience hereof may be ſoone ſeene: for if it be put among pieces of fleſh in the pot whileſt they boile, it will cauſe them to grow together and vnite.

Hippophæſton is a certain pricky buſh growing by the ſea-ſide, wherewith * Fullers and Diers fil their leads & coppers; without ſtem, without floure: it bringeth forth certain little knobs or buttons only, & thoſe hollow: leaues alſo it hath ſmal, and many in number, of a graſſe green colour: the roots be white and tender; out of which there is a juice drawne by way of expreſſion in Summer time, which is ſingular good for to purge the belly, if it be taken to the weight of three oboli; and principally helpeth thoſe that be ſubject to the falling ſickneſſe, trembling of
F the members, and the dropſie: it cureth alſo thoſe that be giuen to the ſwimming and dizzines of the braine, to ſtraitneſſe of winde, and who cannot breath but vpright; and laſt of all, to ſuch as be entering into a palſie.

* And therfore it is called *Holcus*, ἀπὸ τῆς ἕλκεσι.

* As one would ſay, ſwines Endive or cichory

* χολιαπόφασιν: for the word ſignifieth, All bone.

* So in Greeke χολὴ [*i.* fell] is called χλωρὸν, as in ſome part of France (as *Dalechamp.* noteth) Gallis named *le doux*.

* Some reade βαφίων, *i.* Diers: others, ταφίων, *i.* Fullers.

CHAP.

G

Chap. XI.

¶ *Of Hypogloſſa and Hypecoon, Idæa, Iſopyron, Lathyris, Leontopetalon, Lycopſis, Lithoſpermon. The vulgar ſtone. Of Limeum, Leuce, and Leucographis.*

Bistingua. Horſe-tongue, or Double-tongue.

HYpogloſſa hath leaues faſhioned like vnto Butchers broome, and thoſe turning hollow, and pricky: within which concauities there come forth certaine little leaues reſembling tongues. A garland or chaplet made of theſe leaues, and ſet vpon the head, eaſeth the pain thereof.

Hypecoon groweth amongſt corne, and is leafed like vnto Rue. It hath the ſame nature and H
properties that Opium or the juice of Poppie.

As for the herb Idæa, the leaues therof reſemble thoſe of ground-Myrtle or Butchers broom: vnto which there grow cloſe certaine tendrils, and thoſe carry floures. It ſtoppeth a lask, ſtaieth the immoderat flux of womens moneths, and ſtancheth all vnmeaſurable bleeding: for by nature aſtringent it is and repercuſſiue.

Iſopyron, ſome there be who call it Phaſiolum, becauſe the leaf (otherwiſe like vnto Anniſe) doth turne and writh like vnto the tendrils of Phaſils. In the top of the ſtemme it beareth ſmall heads or buttons full of ſeed, reſembling Nigella Romana. A ſoueraigne hearbe, taken either in hony or mead, againſt the cough and other infirmities of the breaſt: likewiſe for the accidents of the liuer. I

* Lathyris. * For the milky juice haply. For *Dioſcor.* ſaith *amygdalæ*, *i.* of the Almond tree. * *Purgata facilia.* Some thinke gentle purgatiues.

* Spurge hath many leaues reſembling * Lectuce: beſides which, it putteth forth as many other ſlender and ſmall branches, containing in little tunicles or husks certain ſeeds in manner of capers: which being dried and taken forth, reſemble for bigneſſe corns of Pepper, white in colour, ſweet in taſt, & eaſie * to be clenſed from their husk. Twenty of theſe ſeeds drunk either in cleare water or mead, do cure the dropſie: beſides waterſh humors, they euacuat choler. They that deſire to be throughly purged & would haue them to work ſtrongly, vſe to take them husk and all; but certainly ſo taken, they hurt the ſtomack: and therfore there is a deuiſe of late found out to giue them either with fiſh, or els in ſome broth of a cock or capon.

Leontopetalon, which ſome cal Rhapeion, carſeth leaues like to Coleworts, and a ſtalk halfe a foot high, garniſhed with many branches reſembling wings: and ſeed it beareth in the head K
contained within cods, after the maner of ciches. The root is made much after the faſhion of a rape or turnep, big and black withall. This herb groweth in corne grounds. The root is a ſingular counterpoiſon to be giuen in wine againſt the ſting or venome of any ſerpents; and verily there is not in the world a more ſpeedy remedy. Very good it is for the Sciatica.

* Some take it for a kind of Orchanet, others for Hounds-tongue.

* Lycopſis hath leaues like to Lectuce, but that they be longer and thicker: it riſeth vp with a long ſtem, and the ſame hairy, with many branches growing thereto of a cubit in length: and beareth little Purple floures. It loueth to grow vpon champion plaines. A liniment made with it and barly meale, is good for the ſhingles and S. *Anthonies* fire. In agues it procureth ſweat, ſo that the patient drink the juice thereof mingled with hot water.

But of all herbes that be, there is none more wonderful then Greimile: ſome call it in Greek L
Lithoſpermon, others Ægonychon, ſome Dioſpyron, and other Heracleos. It groweth ordinarily * fiue inches high: and the leaues be twice as big as thoſe of Rue. The foreſaid ſtalks or ſtems be no thicker than bents or ruſhes, and the ſame garniſhed with ſmall and ſlender branches. It bringeth forth cloſe ioining to the leaues, certain little beards one by one, & in the top of them little ſtones white and round in manner of pearls, as big as cich peaſe, but as hard as very ſtones. Toward that ſide where they hang to their ſteles or tailes, they haue certain holes or * concauities containing ſeed within. This herb groweth in Italy, but the beſt in the Iſland Candy. And verily of all the plants that euer I ſaw, I neuer wondred at any more: ſo ſightly it groweth, as if ſome artificiall goldſmith had ſet in an alternatiue courſe and order, theſe prety beads like orient pearls among the leaues: & ſo rare a thing it is & difficult to be conceiued, that a very hard M
ſtone ſhould grow out of an herb. The Herbariſts who haue written thereof, do ſay that it lieth along and creepeth by the ground: for mine owne patt, I neuer ſaw it growing in the plant: but ſhewed it was vnto me plucked out of the ground. This is for certaine knowne, that theſe little ſtones called Greimile ſeed, drunke to the weight of one dram in white wine, breake the ſtone,

* *Quincuncialiſsimè*: others read *Quinque caulibus ferè*, *i.* commonly it beareth fiue ſtalkes. * This ſome take to bee meant of that Greimile called *Iobs* teares.

expell

20030
copy 1

A expell the ſame by grauell, and diſpatch thoſe cauſes that be occaſions of ſtrangurie. Certes, a man no ſooner ſeth this hearb, but he may preſently know the vertues thereof, and for what it ſerueth in Phyſicke; a thing that he ſhall not obſerue again in any other whatſoeuer: for at the very firſt ſight of theſe little ſtones, his eie will tell him what it is good for, without information from any perſon at all. There be common ſtones found about riuers, bearing a certain drie hoary moſſe vpon them. Rub one of theſe ſtones againſt another, hauing ſpit firſt therupon, and then therewith touch the tettar or ringworme in any part of the body, it will kill the ſame: but the party muſt as he toucheth it, vtter this charme following:

* φεύγετε Κανθαρίδες, λύκος ἄγει ὕμας διώκων.

B That is to ſay,

Cantharides flie apace: for a wilde Wolfe followeth in chaſe.

* He termeth tetta or ringwormes Cantharide, and the latter ſtone, the wild Wolf.

The French-men haue a certaine herbe which they call Limeum, out of which they draw a venomous juice, named by them Stags-poiſon, wherewith they vſe to envenome their Arrow heads when they go to hunt their red Deere: Take of this as much as goeth to the poyſoning of one arrow, and put it in three meaſures or Modij of a maſh wherewith they vſe to drench cattel: and make ſops thereof, and conuey them down the throat of ſick oxen or kine, it will recouer them. But preſently after the receit of this medicine, they muſt be tied vp ſure vnto their bouſies vntill the medicine haue done purging: for the beaſts commonly fare all the while that it is C in working, as if they were wood. In caſe they fall a ſweating vpon it, they muſt be waſhed all ouer with cold water.

* Leuce is an herbe like vnto Mercury; but it tooke that name by reaſon of a certaine white ſtrake or line that runneth croſſe through the mids of the leafe, for which cauſe ſome cal it Meſoleucas. The iuice of this herbe healeth fiſtuloes: and the ſubſtance of the herbe it ſelfe ſtamped, cureth cancerous ſores. It may be peraduenture the ſame herb which is named Leucas, that is ſo effectuall againſt all venomous ſtings proceeding from any ſea-fiſhes. The herbariſts haue not deſcribed this herb otherwiſe than thus, That the wild kind thereof with the broader leafe, is more effectual in the leaues; and that the ſeed of the garden kind, hath more acrimony than the other.

* *Menth Saracenica.*

D Touching Leucographis, what manner of herbe it ſhould be, I haue not found in any writer: and I wonder thereat the rather, becauſe it is reported to be ſo good for them that void & reach bloud vpward, namely, if it be taken to the weight of three oboli with Safron: likewiſe ſtamped with water and ſo applied, it is ſingular good againſt thoſe fluxes that proceed from the imbecility of the ſtomacke: ſoueraigne alſo for to ſtay the immoderat flux of womens termes. And it entereth into thoſe medicines which are appropriate for the eies, yea and into incarnatiues, ſuch eſpecially as be fit to incarnat thoſe vlcers which are in the moſt tender and delicat parts of the body.

Chap. XII.

E ¶ *Of Medium, Myoſota, Myagros, Nigina, Natrix, Odontitis, Othonne, Omoſma, Onopordos, Oſyris, Oxys, Batrachion, Polygonon, Pancration, Peplos, Periclymenos, Laucanthemon, Phyteuma, Phyllon, Phellandrion, Phalaris, Polyrrhizon, and Proſerpinaca: of Rhacoma, Reſeda, and Stœchas.*

MEdion hath leaues like vnto * garden Floure-de-lis. The ſeed alſo reduced F into pouder and drunke in wine, repreſſeth their extraordinary ſhifts.

* *Iridis ſativæ:* others read *Seridis i.* Endiue. * *Tripedalem.* But *Dioſcor.* ſaith *Tricubitalem.i.* three cubits high.

* Myoſota, otherwiſe called Myoſotis, is a ſmooth herbe, ſhooting forth many ſtems from one ſingle root, and thoſe in ſome ſort of a reddiſh colour, and hollow: garniſhed with leaues, which toward the root be narrow, long, and blackiſh, hauing their backe part ſharpe and edged: which leaues grow along the ſtems two by two together: and out of the concauities or armpits

* Mouſe eare.

be-

between the ſtalk and them, there put forth other ſmall branches with a blew floure. The root is G
of the thickneſſe of a mans finger, bearded with many ſmall ſtrings reſembling hairs. This root is of a corroſiue nature, fretting and exulcerating any place wherunto it is applied: in which regard it healeth vp the fiſtulous vlcers called Ægilops, growing between the noſe and angles of the eies. The Ægyptians are of opinion, that if vpon the 27 day of that moneth which they call Thiatis (and which anſwereth very neare to our moneth Auguſt) a man or woman do annoint themſelues with the juice of this herb in a morning before they haue ſpoken one word, he or ſhe ſhall not be troubled with bleared eies all that yeare long.

Myagros is an herb growing vp with ſtems in manner of Fenell geant, in leaues reſembling Madder, and riſeth to the height of 3 foot. The ſeed which it beareth is oleous, & out of it there is an oile drawne, which is good for the ſores in the mouth, if they be annointed therewith. H

The herbe called Nigina, hath three long leaues like vnto thoſe of Succorie; wherewith if ſcars (remaining after vlcers and wounds) be rubbed, it will reduce them to the natural color of the other skin.

There is an herb, which in Latine is named Natrix, the root whereof being pulled out of the ground, hath a rank ſmell like vnto a Goat; with this herbe they vſe in the Picene countrey to driue away thoſe hob-goblins which they haue a maruellous opinion to be ſpirits, called Fatui: but for mine own part, I am verily perſuaded they be nothing elſe but fantaſticall illuſions of ſuch as be troubled in mind and beſtraught, the which may be chaſed and rid away by the vſe of this medicinable herbe.

Odontitis may be reckoned among the kinds of hey-graſſe, putting forth many ſmall ſtems I
growing thicke together from one root, and thoſe knotted and ful of ioints, triangled and blackiſh withall: in euery ioint ſmall leaues it hath, reſembling thoſe of knot-graſſe, howbeit ſomwhat longer: in the concauities between the ſaid leaues and the ſtem there is contained a ſeed like vnto Barly corns: the floure is of a purple colour, and very ſmall. It groweth ordinarily in medow grounds. The decoction of the branches and tender ſtalks of this herb, to the quantitie of one handful, boiled in ſome aſtringent wine, cureth the toothach, if the patient hold the ſame in the mouth.

Othonne groweth plenteouſly in Scythia, like vnto Rocket: the leaues be full of holes, and the floure reſembleth Safron: which is the cauſe that ſome haue called it Anemone. The juice of this herbe entreth very well into thoſe medicines which are appropriate to the eies; for it is K
ſomewhat mordicatiue, and heateth gently: beſides exiccatiue it is, and by that meanes aſtringent. It clenſeth the eies of thoſe films and clouds which darken the ſight, and remoueth whatſoeuer hindereth the ſame. Some ordain for this purpoſe that it ſhould be waſhed firſt, and after it is dried againe made into certain balls or troſchisks.

Onoſma beareth leaues wel-neare three fingers long, and thoſe lying flat vpon the ground: three in number, and indented or cut after the manner of Orchanet, without ſtem, without flour, without ſeed. If a woman with child eat thereof, or do but ſtep ouer it, ſhe ſhal caſt her vntimely birth out of her wombe.

As for Onopordon, they ſay if Aſſes eat thereof, they will fall a fizling and farting. Howbeit of vertue it is to prouoke vrine, and the monethly ſickneſſe of women: to ſtop a laske, to diſcuſſe L
and reſolue impoſtumes, and to heale them when they be broken and do run.

* Linaria or Toads flax. * According to *Dioſcorides:*

* Oſyris putteth forth ſmall branches of a browne colour, ſlender, pliable, and eaſie to wind; the ſame be garniſhed with leaues * reſembling thoſe of Line or flax, of a dark & duskiſh green at firſt, but afterwards changing colour, and inclining to a red colour, and the ſeed is contained in thoſe branches. Of theſe leaues are made certain waſhing balls, to ſcoure womens skin, and make them look faire. The decoction of the root being drunk, cureth thoſe that haue the jaundiſe. The ſame roots, gathered before the ſeed be ripe, cut into roundles, and dried in the Sun, do ſtop the laske: but drawn after that the ſeed is ripe, they repreſſe all catarrhes and fluxes of the belly, if the patient drink the ſupping wherein they are boiled. Alſo ſtamped ſimply, and ſo giuen in rain water, they haue the ſame effect. M

* Cuckowes meat, or Wood-Sorell.

* Oxys beareth three leaues and no more. This herb is ſingular to be giuen for a feeble ſtomack which hath loſt all appetite to meat. They alſo who haue a rupture, and whoſe guts be fallen down, eat thereof to very good ſucceſſe.

Polyanthemum, which ſome call Batrachion, hath a cauſticke quality, whereby it doth bliſter

20030
copy 1

A ſter any vnſeemly ſcars, by means whereof, reduceth them to their freſh and former colour: the ſame alſo applied, ſcoureth away the morphew, and bringeth the skin to the natiue hue, anſwerable to the reſt of the body.

Knot graſſe is that herb, which the Greeks name Polygonon, and we in Latine, Sanguinaria: in leaf it reſembleth Rue, in ſeed common quich graſſe, & riſeth not from the ground but creepeth along: the juice of this herb conueied vp into the noſthrils, ſtancheth bleeding at the noſe. They who ſet down many kinds of Polygonon, do hold that this is to be taken for the male, and by reaſon of the multitude of ſeed which it beareth is called * Polygonon: or for that it groweth ſo thick in tufts, Calligonon. Others name it * Polygonaton, for the number of * knots or
B knees which it carrieth. There be again, who giue it the name Theuthalis: ſome cal it Carcinetron, others Clema, & many Myrtopetalon: and yet I meet with ſome writers, who ſay this is the female knot-graſſe: and that the male is the greater, and not altogether ſo dark of colour, growing alſo thicker with knots, & ſwelling with ſeed vnder euery leaf: wel, howſoeuer it is, the property of them both, the one as well as the other, is to bind and coole: and yet their * ſeed doth looſen the belly; which if taken in any great quantity, is diuretical and repreſſeth any rheums, prouided alwaies that the patient be troubled therwith, otherwiſe it doth no good. The leaues are ſingular good to be applied vnto the ſtomack, for to aſſuage the heat thereof: in a liniment they mitigat the griefe of the bladder, and ſtop the courſe of thingles and ſuch like wilde-fires. The juice is ſoueraigne to be dropped alone by it ſelfe into the eares that run, and into the eyes to abate their pain. It is vſually giuen to the quantity of 2 cyaths in tertian Agues, and Quar-
C tans eſpecially, before the fit commeth: likewiſe for the feebleneſſe of the ſtomack when it will keep nothing: for the bloudy flix, and the rage of cholerick humors both vpward and downward A third kind there is, which they cal *Oreon, growing vpon the mountains, reſembling a tender reed: riſing vp in one ſingle ſtem, but full of little knees or knots, and thoſe * couched & thruſt together. Leafed it is like the Pitch tree: the root needleſſe, and of no vſe: and generally the whole herb of leſſe ſtrength and operation than the former. Howbeit, this ſingular propertie hath it, to help the ſciatica. A fourth Polygonum there is, called the wild; and this buſheth like a ſhrub or a prety tree rather: the root is of a wooddy ſubſtance, & the ſtock or plant of a reddiſh colour, reſembling the Cedar: it beareth branches much like to Spart or Spaniſh broome, two ſpans long, iointed into three or four knots, and thoſe of a blackiſh colour. This alſo hath an a-
D ſtringent nature, and taſteth in the mouth like to a Quince. The decoction thereof in water, till the third part be conſumed, or the pouder of it dried, is commended for the ſores in the mouth, and for any part that is fretted and galled. And the very ſubſtance thereof is good to be chewed in caſe the gums be ſore. It repreſſeth the malignity of eating corroſiue vlcers and cankers: and in one word, ſtaieth the malice of all ſores that run on end, and be vntoward for to be healed: but a peculiar property it hath by it ſelfe to cure any vlcer occaſioned by the ſnow. Our Herbariſts vſe this kind much for the ſquinancy; and to eaſe the head-ach, make a garland thereof, appointing it to be ſet vpon the head: but to repreſſe any violent catarrhs, they preſcribe to weare it about the neck. In Tertian agues, ſome giue direction to pluck it out of the ground with the left hand, and then to tie it to the arm or other part of the patient. And there is not an herb or plant
E that they be more careful to keep dry and to haue alwaies ready at hand, than Polygonon, for to ſtanch any iſſue or flix of bloud whatſoeuer.

Pancration, which ſome chuſe rather to cal the little Squilla or ſea-onion, beareth leaues reſembling the white Lilly, but that they be longer and thicker; with a great bulbous root; & the ſame in color red. The juice of it taken with the floure of Eruile, maketh the belly laxatiue: and outwardly applied, mundifieth vlcers. For the dropſie and hardneſſe of the ſpleene, it is giuen with hony in maner of a ſyrrup. Some take the root and boile it in water vntill the liquour be ſweet, which they poure forth; and then ſtamp the ſaid root, and reduce it into bals or troſches, which they lay to dry in the Sun: and vſe them afterwards as occaſion ſerueth for the skals or
F vlcers of the head, and all other ſores that require mundification. Semblably, they giue thereof as much as one may take vp with three fingers in wine, for the cough, and in a liquid electuarie or lohoch for the pleuriſie and peripneumonie. They preſcribe it likewiſe to be drunke in wine for the Sciatica: to allay alſo the gripes and wrings of the belly, and to procure the monethly termes of women.

* Peplos, called by ſome Syce, by others Meconion * Aphrodes, from one ſmal root buſheth into

* of πολὺς many and γόνυ knees.

* And yet *Scribonius* ſaith it is called Polygonō, becauſe it groweth euery where ſo common.

* For γόνυ ſignifieth a knee or knot.

* *Aluum ſoluunt.* If the place be not corrupt, as I doubt it is.

* *Oreon, ab ὄρος,* a mountaine. Some reade ὠρεῶν, *i.* faire: others, ὄρεος, for that it growes like to an horſe-taile, or the herbe Hippuris.

* *In ſefarciis.*

* A kind of Eſula.

* *i.* Frothie Poppie.

into many branches ; the leaues be like vnto Rue, but that they be ſomewhat broader : the ſeed G
appeareth vnder the leaues round,& (but that they be ſmaller) not vnlike to the white Poppie.
Ordinarily it is found among Vines,and they gather it in harueſt time. They hang it forth ſeed
and all together a drying,ſetting water vnderneath,that the ſaid ſeed or fruit may fall down in-
to it. If it be taken in drinke, it purgeth the belly, and doth euacuat both choler and fleagme.
The meaſure of one acetable is counted an ordinary and indifferent potion to be drunk in three
hemines of mead or honied water. With this ſeed they vſe to pouder meats and viands, thereby
to keep the body ſoluble.

*Wood-bind. * Periclymenos is alſo a buſhie plant,and loueth to branch much: it beareth whitiſh & ſoft
leaues,diſpoſed two by two at certain ſpaces & diſtances very orderly. In the top of the bran-
ches it beareth hard ſeeds between the leaues,which hardly may be plucked off. It groweth in H
tilled corn fields & hedges,winding about euery thing that it can catch hold of, for to ſupport
and beare it vp. The ſeed after it is dried in the ſhade, folk vſe to pun in a morter,and ſo to make
it vp into trochiſks. In caſe that the ſpleen be ſwollen or hard, they take of theſe troſches, and
after they be diſſolued,giue thereof a ſufficient quantity in 3 cyaths of white wine for 30 daies
together:which drink is of ſuch operation, that it will waſt and ſpend the ſpleen,partly by vrine
which wil appeare bloudy,and partly alſo by ſeege:and this will be perceiued ſenſibly by the
tenth day of the cure. The leaues alſo be diureticall,and a decoction made with them,prouokes
vrine. The ſame likewiſe are good for thoſe that cannot draw their wind but ſitting with their
body vpright. Being drunk in like manner, they help women who are in ſore trauell, to ſpeedie
deliuerance,and fetch away the after-birth. I

*Some take it for *Securidaca*, i. Axfitch. As touching * Pelecinum,it groweth as I ſaid before among corn,branching thick,and gar-
niſhed with leaues like vnto the cich peaſe. It beareth ſeed in certain cods,which crook in man-
ner of little horns,and thoſe be four or fiue in number together. The ſaid ſeed reſembleth Gith,
ſo far as euer I could ſee,and is bitter,but good for the ſtomack:one of the ingredients that goe
into antidotes and preſeruatiues againſt poiſon.

Polygala reacheth vp with a ſtem a ſpan high,in the top wherof it beareth leaues reſembling
the Lentils,of an aſtringent taſt,which being drunk,cauſeth nources to haue plenty of milk in
their breaſts.

Poterion,or as ſome call it,Phrynion or Neurada,brancheth and ſpreadeth much:armed it is
with ſharp pricks,and beſides,full of a kind of thick down : the leaues be ſmall and round : the K
branches ſlender,long,ſoft,and pliable:the floure in form long,of a graſſe green color. The ſeed
is of no vſe in Phyſick,but of a quick and ſharp taſt,odoriferous alſo,and pleaſant to the ſmell.
It is found growing as well in watery places,as alſo vpon little hils. Two or three roots it hath,
which run down two cubits deep into the ground ful of cords or ſinews,white,and of a firm and
hard ſubſtance. About Autumne they vſe to dig round about it, hauing before cut the plant it
ſelfe aboue ground, which yeeldeth thereby a juice like vnto a gum. The root is (by report) of
wonderfull operation in healing wounds,and eſpecially of ſinews cut in ſunder,if it be applied
thereto in a liniment. Alſo the decoction thereof drunke with honey in manner of a ſyrrupe,
helpeth the feebleneſſe and diſſolution of the ſinewes ; and namely, when they bee wounded
and cut. L

Phalangites by ſome is called Phalangion,by others Leucanthemon,or,as I find in ſome co-
pies,Leucacantha. Little branches it putteth forth,neuer fewer than twaine, and thoſe tending
directly a contrary way. The floures white,faſhioned like the red Lilly : the ſeed blacke,broad,
and flat,ſhaped after the manner of halfe a Lentill, but much leſſe : and the root is of a gree-
niſh colour. The leaſe,floure,and ſeed of this herbe is a ſingular remedie againſt the venomous
ſting of ſcorpions,the ſpiders Phalangia, and ſerpents ; alſo for the wringing torments of the
belly.

As for Phyteuma, ſomewhat els I haue to do rather than to deſcribe it, conſidering there is
no vſe of it but in amatorious medicines to procure womens loue.

There is an herbe called by the Greekes Phyllon, growing vpon ſtony mountaines ſtanding M
much vpon a rocke. The female of this kinde is of a deepe greene colour, the ſtem is ſlender,
the root ſmall, the ſeed round, and like vnto that of Poppie. This herbe ſerueth for the get-
ting and conceiuing either of boyes or girles, according as the male or the female is vſed :
which differ only in ſeed or fruit,which in the male reſembleth an oliue that is new come forth

and

20030
copy 1

A and biginneth only to ſhew. But both of them are for the ſaid purpoſe to be drunke in wine.

Phellandrion groweth in moory grounds, and in leaſe commeth neere vnto garden Parſley: the ſeed thereof is good to be drunke for the ſtone, and the infirmities incident to the bladder.

As for Phalaris, it hath a long ſlender ſtem like vnto a reed, in the top whereof it beareth a floure bending downward; and the ſeed reſembleth that of Seſama: and this alſo breaketh the ſtone, if it be drunke in wine or vineger, or otherwiſe with milk and honey. The ſame cureth the accidents of the bladder.

Polyrrhizon is leafed like vnto the Myrtle, and hath many roots, which being bruiſed, are giuen in wine againſt the poiſon of ſerpents; not only if men but alſo if fourfooted beaſts be ſtung
B by them.

* Proſerpinaca likewiſe, being otherwiſe a common herb, is counted a ſoueraigne remedy againſt ſcorpions: the ſame ſtamped and incorporat with fiſh-pickle and oile, is (by report) a ſingular medicine againſt the prick of ſcorpions. Ouer and beſides, it is ſaid, that if it be but held vnder the tongue, it refreſheth thoſe who be ouertrauelled or any waies wearied, ſo as they haue loſt their ſpeech with very faintneſſe: but in caſe it be ſwallowed downe the throat, it procureth vomit, which alwaies is good and wholſome for the Patient.

* Thought to be the ſame that *Polygonū* or Knot graſſe abouenamed.

As touching Rhacoma, it is brought vnto vs out of thoſe countries which are beyond the kingdome of Pontus: a root it is much reſembling the black Coſtus, but that it is ſmaller and ſomewhat redder; alſo without any ſmell; hot at the tongues end and aſtringent: being punned, it is of a wine colour inclining to ſafron: a liniment made of this root, doth mitigate all impo-
C ſtumes and inflammations; healeth wounds, and appeaſeth the violence of any rheums taking a courſe to the eies, eſpecially if it be applied with cuit: al marks remaining after ſtripes, & other places of the skin black and blew, it taketh away, if they be annointed with it and vineger together: the pouder thereof is good to be caſt vpon old morimals and vlcers vntoward to be healed: & being to the weight of one dram taken in water, it is ſingular for them that caſt vp bloud: moreouer, in caſe of the dyſentery and the flux proceeding from imbecility of the ſtomacke, it is an excellent medicine to be taken in wine, if the Patient bee free of the ague; otherwiſe, it would be giuen in water. For to pun or ſtamp this root more eaſily, it had need to lie and ſoke in water ouernight: the decoction thereof is giuen to drinke in double meaſure or quantity for thoſe that be plucked with the cramp, burſen, & bruiſed, or to ſuch as haue tumbled down from
D ſome high loft. In pains of the breſt, there had need ſome Pepper and myrrh to be put thereto: in caſe the ſtomack be feeble and clean done, it ought to be taken in cold water: and whether it be giuen inwardly or applied outwardly, it helpes all thoſe that void vp filthy matter from the parts beneath: likewiſe it cureth ſuch as haue weak liuers, hard or ſwelled ſpleens, and the Sciatica: it healeth the infirmities of the kidnies, ſhortneſſe of wind, & ſtraitneſſe of breath, namely, when a man is driuen to ſit vpright for it. The hoarſneſſe and roughneſſe of the throat it cureth, if either the pouder be taken to the quantity of 3 oboli in cuit, or the decoction drunk. The filthy tettars called Lichenes it ſcoureth away, applied vnto them in a liniment with vineger. In drink, it diſſolueth ventoſities, riddeth away through-colds, and namely the ſhiuerings and ſhakings in cold agues: it repreſſeth the yex or hicquet, appeaſeth the wrings of the belly, cleareth
E the windpipes, diſpatcheth the poſe, the murre, and heauineſſe of the head, ſtilleth the dizzines of the head and turning of the brain occaſioned by melancholy humors: and finally aſſuageth all painfull laſſitudes, and is ſingular good for cramps or convulſions.

About the towne Ariminum there groweth an herb commonly knowne by the name of Reſeda: it reſolueth and diſcuſſeth all impoſtumes: it reduceth alſo into temperature any inflammation. But they that vſe to cure with this herb, muſt when they lay it to the place, ſay withall theſe words following; *Reſeda, morbos Reſeda, ſciſne ſciſne, quis hic pullos egerit? Radices nec caput nec pedes habeant.* That is to ſay, *Reſeda, cauſe theſe maladies to ceaſe: knoweſt thou, knoweſt thou, who hath driuen theſe pullets here? Let the roots haue neither head nor foot.* This charm (I ſay) they muſt pro-
F nounce three times ouer, and ſpit vpon the ground as often.

To conclude, Stœchas groweth in thoſe Iſlands onely which carry that name and be called Stœchades: an odoriferous herb it is, bearing leaues like vnto hyſſop, and is bitter in taſt: taken in drink, it procureth womens moneths, and doth mitigat the pains of the breſt. Alſo it is one of the ſpecies or ingredients entring into the preſeruatiue compoſitions called Antidotes.

Chap. XIII.

¶ *Of Nightſhade: of Smyrnium, and Telephium. Of Trichomanes, Thalictrum, and Thlaſpi. Of Tragonia, Tragonis, Tragum, Tragopogon, and Spondylis, Alſo, that ſome diſeaſes are not incident to certaine countries.*

NIghtſhade, called in Latine Solanum, the Greeks name Strychnos, as ſaith *Cornelius Celſus*; an herbe this is which hath a vertue repercuſſiue and refrigeratiue.

Loueach, named otherwiſe Smyrnium, hath a ſtem like vnto Perſley, and the leaues be larger: it putteth forth many ſions or imps from about the ſtem: and out of their concauities there ſpring certain fatty leaues, & thoſe hanging as if they were broken, toward the ground; hauing an aromaticall ſmel, joined with a certain acrimony which is not vnpleaſant: of a colour inclining to a weak and faint yellow. The ſtem beareth in the head certain round ſpoky tufts in manner of Dill. The ſeed round and black, which waxeth to be dry in the beginning of ſummer: The root is likewiſe redolent; but in taſt quick and biting, full of juice, ſoft and tender: the rind of which root, is black without, but pale within; the odour which it hath, teſtifieth the qualitie of myrrh, whereupon it took the name * Smyrnium. This herb groweth vpon hills, as well ſuch as be rocky as thoſe that be altogether earthy. The nature of it generally, is to heat and extenuat. The leaues and root both prouoke vrine, and the monthly terms of women: the ſeed knitteth the belly, and ſtaieth a lask. The root vſed in a liniment, diſcuſſeth all impoſtumes, as well broken as not broke, ſo that they be not inueterat and of long continuance: and in one word, reſolueth all hardneſſe in the fleſh. Soueraigne it is againſt the prick of the venomous ſpiders Phalangia, and the ſting of ſerpents, being drunk in wine with Cachrys, Polium, or Baulm; with this charge, That if it be taken peece meale: for if it were taken entire and whole, it would prouoke vomit: and for this cauſe otherwhiles it is giuen with Rue. The ſeed or root, chuſe whether you will, cureth the cough and difficulty of breath, when the Patient cannot take his breath but ſitting vpright. In like manner, it helpeth thoſe who are diſeaſed in the cheſt, ſpleene, reines, and bladder. The root hath a particular property to heale ruptures and convulſions: the ſame giues ſpeedie deliuerance to women in trauell of child, and expelleth the after-birth: alſo for the ſciatica it is giuen in wine together with Creſtmarine, otherwiſe called Sampier: it prouoketh ſweat, breaketh wind vpward, and cauſeth rifting; whereby it riddeth the ſtomack of the ventoſities that trouble it: it healeth wounds and bringeth them to cicatrice or skin again. Out of the root there is a juice alſo preſſed, good in womens infirmities, and in the maladies incident to the cheſt and precordiall parts; for it clenſeth, increaſeth naturall heat, and helpeth digeſtion. The ſeed hath a ſpeciall operation to cure them that haue a dropſie, giuen in drink; like as the juice alſo applied in a liniment; and the rind of the foreſaid root dry, incorporate in an emollitiue cataplaſme. Moreouer, it is much vſed in meats together with honied wine, oile, fiſh ſauce named Garum, but principally if fleſh meats be boiled together therewith. It helpes concoction in the ſtomack, as hauing a ſauor and taſt much like vnto pepper. The ſame is right effectuall to allay the paine of the ſaid ſtomacke.

* For *Smyrna* in Greeke is myrrhe.

As touching * Telephium, it is an herb in leaf and ſtem reſembling Purcellane: immediatly from the root there ſpring ſeuen or eight ſmall ſhoots or branches, and thoſe garniſhed with groſſe & fleſhy leaues. It loueth to grow in toiled grounds, but principally among vines: whiles it is green, it ſerueth in a liniment to fetch out ſpots and freckles in the viſage: for which purpoſe alſo, it is good dry, being brought into pouder: it mundifieth the skin alſo from the morphew, ſo that the place be annointed therewith euery day or night ſix houres together, for the ſpace of three moneths, and afterwards well rubbed with barly meale. It healeth all wounds beſides and cureth fiſtuloes.

* Orpine.

The Maidenhaire called in Greek Trichomanes, is like vnto Adiantum, only it is more ſlender and blacker: the leaues grow thicke in manner of Lentils, one ouer-againſt another, and the ſame be bitter in taſt. The decoction of this hearbe ſodden in white wine, and ſo drunke with wine or ruſticke cumin, cureth the ſtrangurie: the juice keepeth the haire on the head, which is ready to fall off; or if it be ſhed already, cauſeth new to come vp againe in the place. The ſame beeing beaten to powder and incorporate with oile into a liniment, maketh the haire to grow thicke,

20030
copy 1

A thicke,where it is thin by occaſion of the infirmity Alopecia. If it be taſted at the tongues end it prouoketh ſneezing.

Thalictrum[otherwiſe named Thalictrum]hath leaues made like vnto Coriander,ſaue that they be ſomwhat fattier,and in the ſtem reſembleth Poppy: it liketh any ground,but loueth eſpecially to grow vpon plains: the leaues incorporat with hony,heale any vlcers.

Thlaſpi or Thlaſpe,is of two kinds:the one with narrow leaues,a finger long,and as broad as a finger breadth:the ſame grow inclining toward the ground,and in the head diuided or ſlit:the ſtem is but ſlender and halfe a foot high, howbeit not altogether naked and without branches. In form,the fruit or cod reſembleth a buckler,incloſing ſeed within not vnlike in ſhape to Len-
B tils, but that it ſeemeth cruſht and broken, whereupon the plant took the name Thlaſpi: the floure which it beareth is whitiſh. This herb groweth ordinarily about common foot-paths & in hedges. The ſeed in taſt is hot and vnpleaſant,working vpon choler and fleam,which humors it doth euacuat vpward and downward:the right doſe wherof is the meaſure of one acetable for a potion. Good it is alſo for the Sciatica,being miniſtred in a clyſtre vntil it bring away bloud. Moreouer,it procureth women their deſired ſickneſſe;but if they be with child, it killeth that which they go withal. The ſecond Thlaſpi,which ſome cal the Perſian*Napi,hath broad leaues and great roots:this herb alſo is good to be clyſterized for the Sciatica: and as well the one as the other is ſoueraigne for the tumors or riſings in the ſhare: but the party who gathereth it muſt haue in charge to pluck it vp with one hand,and ſay withall,That he taketh it for the botches in the ſhare,for all impoſtumes and wounds.

* or rather *Sinapi*,*i*. Scnvic.

C As for Trachinia,I find not in any writer what manner of herb it ſhould be:and verily,I cannot beleeue that *Democritus* reporteth truly of it as he doth: for monſtrous it is and incredible which he promiſeth of it,namely,That in three daies it will waſt the ſpleene,if the patient doe but weare it tied to any part of the body.

Tragonus or Tragion groweth vpon the ſea-coaſts of the Iſland Candy only:an herb,in ſeed, leafe,and branch,very like vnto the Iuniper:a iuice or liquor it yeeldeth reſembling milk,which gathering thick to the conſiſtence of a gum,with once laying too, draweth forth arrow heads, thorns,or whatſoeuer ſticking within the fleſh:for which purpoſe,it ought to be ſtamped green, and ſo made into a liniment with wine;or elſe the pouder of it drie,muſt be incorporat with hony. The ſame cauſeth nources to haue good ſtore of milk in their breſts,and is beſides an excel-
D lent medicine for the ſores and diſeaſes incident to that part.

There is another hearbe called Tragos, which ſome name alſo Scorpion: it groweth halfe a foot high, putting forth many ſhoots and branches, but without leaues; in ſtead whereof you ſhall ſee pretty little berries, or grapes (as it were) of a ruddy colour, of the bigneſſe of wheatcorns,and pointed ſharp in the head. This herb likewiſe groweth by the ſea-ſide. Of theſe berries,ten or twelue kernels dried and beaten into pouder,and ſo taken in wine,do helpe the fluxe proceeding from a weak and feeble ſtomack; in like manner thoſe alſo that haue a bloudy flix, and that reach vp bloud. They cure likewiſe women of the extraordinary ſhifts of their monthly fleurs.

Moreouer,there is an herb called Tragopogon, which others name Come:the ſtem thereof
E is ſmall,the leaues like vnto thoſe of Safron,the root long and ſweet;bearing aloft vpon the top of the ſtem a certain cup,which is broad and large,with black ſeed within it. In rough places it groweth commonly,amongſt greeues and buſhes; but goodneſſe there is little or none at all in it.

Thus much verily as touching herbs,I thought memorable and worth the writing,which either I haue ſeen my ſelfe,or learned from others;howbeit,for a farewell to this treatiſe,I think it not amiſſe to aduertiſe the reader thus much more concerning herbs, that ſome of them keep their ſtrength and vertue longer than others;for,as I haue before noted,Elaterium continueth a world of yeres:the black Chamæleon laſteth 40 yeares good: but Ceutaury will not indure a-
F boue twelue: Harſtrang, Ariſtolochia, and the wilde Vine,may be preſerued ſound one yere in the ſhade. Moreouer,this would be obſerued, That of the herbs aboue named, there is not a liuing creature whatſoeuer will touch the roots,vnleſſe it be Spondylis(and that is a kind of ſerpent)which indeed ſpareth none.

As for this one point,namely,that the roots of herbs be leſſe in force and of weaker operation, in caſe the ſeed bee ſuffered to ripen vpon the plant, no man maketh any doubt: as alſo

that their ſeeds be nothing ſo effectuall, if inciſion were made in the roots for to draw juice out of them, before the ſaid ſeed is fully ripe. G

Furthermore, this is known & found by experience, that the ordinary vſe of all ſimples doth alter their properties and diminiſh their ſtrength; inſomuch, as whoſoeuer is daily accuſtomed vnto them, ſhall not find when need requires, their vertue powerfull at all, either to do good or to work harme, as others ſhall who ſeldome or neuer were acquainted with them.

Ouer and beſides, all herbs be more forcible in their operations, which grow in cold parts, expoſed to the Northeaſt winds, likewiſe in dry places, than in the contrary.

Alſo there is no ſmall difference to be conſidered betweene nation and nation: for, as I haue heard them ſay who are of good credit, as touching worms and ſuch like vermin, the people of Egypt, Arabia, Syria, and Cilicia, be troubled & infeſted with them: wheras contrariwiſe, ſome H Græcians & Phrygians haue none at all breeding among them. But leſſe maruel there is of that conſidering how among the Thebans and Bœotians (who confine vpon Attica) ſuch vermine is rife and common; and yet the Athenians are not giuen at all to ingender and breed them: the ſpeculation whereof, carrieth me away again vnto a new diſcourſe of liuing creatures, and their natures; and namely, to fetch from thence the medicins which Nature hath imprinted in them, of greater proofe and certainty than any other for the remedy of all diſeaſes. Certes, this great Mother of all things, entended not that any liuing creature ſhould ſerue either to feed it ſelfe only, or to be food for to ſatisfie others; but her will was and ſhe thought it good, to inſert and ingraffe in their inward bowels, wholſom medicines for mans health, to counterpoiſe thoſe medicinable vertues which ſhe had ingrauen and beſtowed vpon thoſe furd and ſenceleſſe herbes: I nay her prouidence was ſuch, that the ſoueraigne and excellent means for maintenance of our life, ſhould be had from thoſe creatures which are indued with life; the contemplation of which diuine myſterie, ſurpaſſeth all others, and is moſt admirable.

K

THE TVVENTY EIGHTH BOOK OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

Chap. I. L

¶ *The medicinable vertues of liuing creatures.*

HAuing diſcouered as well all thoſe things which are ingendred between Heauen and Earth, as alſo their natures; there remained nothing for me to diſcourſe of, ſaue only the Minerals digged out of the ground; but that this late Treatiſe of mine, as touching the medicinable properties of Herbs, Trees, and other plants draweth me quite aſide from my purpoſe, and haleth me back againe, to conſider the foreſaid liuing creatures themſelues (euen the ſubject matter of Phyſicke) in regard of greater meanes found out euen in them, to aduance Phyſicke and cure diſeaſes. For, to ſay a truth, ſince I haue deſcribed and pourtraied both Herbes and Floures, ſince I M haue diſcouered many other things, rare and difficult to be found out; ſhould I conceale ſuch meanes for the health of man, as are to be found in man himſelfe? or ſhould I ſuppreſſe other kind of remedies which are to be had from creatures liuing amongſt vs, as wee doe, if they may benefit vs? eſpecially ſeeing that our very life is no better than torment and miſerie, vnleſſe

wee

20030
copy 1

A we be free from paine and ſickneſſe? No verily; and far be it from me that I ſhould ſo do. But on the contrary ſide, I will do my beſt indeuor to performe and finiſh this task alſo, how long and tedious ſoeuer it may ſeem to be: for my full intent and reſolution is, ſo I may benefit poſteritie and doe good to the common life of man, the leſſe to reſpect the pleaſing of fine eares, or to expect thanks from any perſon. And to bring this my purpoſe about, I mean to ſearch into the cuſtomes of forrein countries, yea and to lay abroad the rites and faſhions of barbarous nations, referring the readers who ſhal make ſcruple to beleeue my words, vnto thoſe Authors whom I alledge for my warrant. And yet herein, this care I haue euer had, To make choice in my reports of ſuch things as haue bin held and in manner adjudged true, by a generall conſent & ap-
B probation of all writers; as coueting to ſtand more vpon the choice of ſubſtance, than the variety and plenty of matter. But before I enter into this argument, I thinke it very neceſſary to aduertiſe the Reader thus much, That whatſoeuer I haue heretofore written of liuing creatures, concerneth the inſtinct of Nature wherewith they be indued, and certain ſimples whereof they haue giuen vs the knowledge (for ſurely, as much good haue they done vnto vs by the medicinable herbs by them found out, as poſſibly they can by the remedies which themſelues do afford from their own bodies:) But now it remaineth to ſhew ſimply the medicinable & helpful properties in themſelues, which notwithſtanding in the former treatiſe were not altogether left out and paſſed ouer. And therefore this my preſent diſcourſe of thoſe creatures, how ſoeuer it is in nature different, yet it dependeth of the other. Begin then I will at Man himſelfe, to ſee what Phyſick there may be found in him to help his neighbor. In which firſt entrance of mine,
C there preſenteth it ſelfe vnto mine eie, one obiect that troubleth and offendeth my mind exceeding much: for now adaies you ſhal ſee them that are ſubiect to the falling euil, for to drink the very bloud of fencers and ſword-plaiers as out of liuing cups: a thing, that when we behold within the ſame ſhew-place, euen the tygres, lyons, and other wild beaſts to do, we haue it in horrour as a moſt fearfull and odious ſpectacle. And theſe monſtrous minded perſons are of opinion, That the ſaid bloud forſooth is moſt effectuall for the cure of that diſeaſe, if they may ſucke it breathing warme out of the man himſelfe; if they may ſet their mouth (I ſay cloſe to the veine, to draw thereby the very heart bloud, life and all: how vnnaturall ſoeuer otherwiſe it be holden for a man to put his lips ſo much as to the wounds of wild beaſts, for to drinke their bloud: nay,
D there be others that lay for the marow bones, the very braine alſo of young infants, and neuer make ſtrange to find ſome good meat and medicine therein. Ye ſhall find moreouer among the Greeke writers not a few, who haue deciphered diſtinctly the ſeuerall taſtes as well of euery inward part, as outward member of mans body; and ſo neare they haue gone, that they left not out the paring of the very nailes, but they could pick out of them ſome fine Phyſicke: as if health conſiſted in this, That a man ſhould become as bloudie as a ſauage beaſt; or that be counted a remedy, which indeed is cauſe of a miſchiefe and malady. And wel deſerue ſuch bloud-ſuckers and cruell leeches to be fruſtrat of their cure, and thereby to worke their owne bane and deſtruction; for if it be held vnlawfull and abhominable to prie and look into the entrails and bowels of a mans body, what is it then to chew and eat them? But what monſter was hee, who firſt broched this geare, and deuiſed ſuch accurſed drugs! Ah wicked wretch, the inuenter and artificer
E of thoſe monſtroſities; thou that haſt ouerthrowne all law of humanity; for with thee wil I haue to do, againſt thee will I whet my tongue and turne the edge of my ſtyle, who firſt didſt bring vp this bruitiſh leech-craft, for no other purpoſe but to be ſpoken of another day, and that the world might neuer forget thy wicked inuentions. What direction had he who thus began to deuoure mans body lim by lim: nay, what conjecture or gueſſe moued him ſo to do? what might the originall and foundation be, whereupon this diueliſh Phyſick was grounded? what ſhould he be that bare men in hand, and would perſuade the world, That the thing which is vſed as a poiſon in witchcraft and ſorcerie, ſhould auaile more to the health of man, than other knowne and approued remedies? Set caſe that ſome barbarous people vſed ſo to do: ſay that ſtrange na-
F tions and far remoued from all ciuility, had theſe manners among them, muſt the Greekes take vp thoſe faſhions alſo, yea and credit them ſo much as to reduce them into a method, amongſt other their goodly Arts? And yet ſee what *Democritus* one of them haue done? there be extant at this day books of his inditing and penning, wherein you ſhal reade, That the ſcul of a wicked malefactor, is in ſome caſes better than that of an honeſt perſon; and in other, That of a friend and gueſt, preferred before a ſtranger. As for *Apollonius*, another of that brood, hee hath writ-

ten, That if the gums be ſcarrified with the tooth of a man violently ſlain, it is a moſt effectuall G
and preſent remedy for the tooth-ach. *Artemon* had no better receit for the falling ſickneſſe, than to draw vp water out of a fountaine in the night ſeaſon, and to giue the ſame vnto the Patient to drink it in the brain-pan of a man who died ſome violent death, ſo he were not burnt. And *Antheus* took the ſcull of one that had bin hanged, and made pills thereof, which he miniſtred vnto thoſe who were bitten by a mad dog, for a ſoueraigne remedy. Moreouer, theſe writers not content to vſe theſe ſorceries about men, imploied the medicines alſo of the parts of man to the cure of foure footed beaſts; and namely, if kine or oxen were dew-blowne or otherwiſe puffed vp, they were wont to bore holes through their horns, & ſo to inlay or interlard them (as it were) with mens bones: finally, when ſwine were diſeaſed, they tooke the fine white wheat Siligo, being permitted to lie one whole night in the very place where ſome men were killed or burnt, H
and gaue it them to eat. As for me, and all vs that are Latine writers, God forbid we ſhould defile our papers with ſuch filthineſſe: our intention is to put downe in writing, thoſe good and wholſome medicines which man may affoord vnto man, and not to ſet abroad any ſuch deteſtable and hainous ſorceries: as for example, to ſhew what medicinable vertue there may be in breſt-milke of women newly deliuered; what healthfull operation there is in our [faſting] ſpittle; or what the touching of a man or womans body may auaile in the cure of any malady; and many other ſemblable things ariſing from naturall cauſes. For mine owne part verily, I am of this mind, That we ought not ſo much to make of our health or life, as to maintain and preſerue the ſame by any indirect courſe and vnlawful meanes: And thou, whoſoeuer thou be, that doeſt addict thy ſelfe to ſuch villanies whiles thou liueſt, ſhalt die in the end a death anſwerable to I
thy beaſtly and execrable life. To conclude therefore, let euery man for to comfort his heart, and to cure the maladies of his mind, ſet this principle before his eies, That of all thoſe good gifts which Nature hath beſtowed vpon man, there is none better than to die in a fit and ſeaſonable time: and in ſo doing, this is ſimply the beſt, * That in his power it is, and the meanes hee hath, to chuſe what death he liſt.

* Look for no better diuinitie in *Plinie* a meere Pagan, Epicurean, and profeſſed Atheiſt.

Chap. II.

¶ *Whether Words, Spels, or Charmes, are auaileable in Phyſicke. Alſo whether wonders and ſtrange prodigies may be either wrought and procured, or put by and auoided by them, or no.* K

THe firſt point, concerning the remedies medicinable drawn from out of man, which mooueth the greateſt queſtion, and the ſame as yet not decided and reſolued, is this, Whether bare Words, Charms and Inchantments, be of any power or no? If it be granted Yea, then no doubt ought we to aſcribe that vertue vnto man. But the wiſeſt Philoſophers and greateſt Doctors, take them one by one, doubt thereof, and giue no credit at all thereto. And yet go by the common voice of the whole world, you ſhall find it a generall beleefe, and a blinde opinion alwaies receiued, whereof there is no reaſon or certain experience to ground vpon. For firſt and formoſt we ſee, that if any beaſt be killed for ſacrifice without a ſett forme of praier, it is to no purpoſe, and held vnlawfull: ſemblably, if theſe inuocations be omitted, when as men ſeeke to L
any Oracles, and would be directed in the wil of gods by beaſts bowels or otherwiſe, all booteth not, but the gods ſeem diſpleaſed thereby. Moreouer, the words vſed in crauing, to obtaine any thing at their hands, run in one form; and the exorciſmes in diuerting their ire, & turning away ſome imminent plagues, are framed after another ſort: alſo there be proper termes ſeruing for meditation only and contemplation. Nay, we haue ſeene and obſerued, how men haue come to make ſuit and tender petitions to the ſoueraign and higheſt magiſtrats, with a preamble of certain ſet prayers. Certes, ſo ſtrict and preciſe men are in this point about diuine ſeruice, that for fear leaſt ſome words ſhould be either left out, or pronounced out of order, there is one appointed of purpoſe as a prompter to read the ſame before the prieſt, out of a written booke, that hee miſſe not in a tittle; another alſo ſet neare at his elbow, as a keeper to obſerue and mark, that he M
faile not in any ceremony or circumſtance; and a third ordained to goe before and make ſilence, ſaying thus to the whole aſſembly & congregation, *Fauete linguis*, [*i.* ſpare your tongues and be ſilent:] and then the fluits and haut-boies begin to ſound and play, to the end that no other thing be heard for to trouble his mind or interrupt him the while. And verily, there haue

been

20030
copy 1

A been memorable examples knowne of ſtrange accidents inſuing both waies, namely, as often as either the vnlucky foules by their vntoward noiſe * haue diſturbed and done hurt, or if at any time there haue bin error committed in the preſcript prayer & exorciſme: for by this means it falleth out oftentimes, that all on a ſudden as the beaſt ſtandeth there in place to be ſacrificed, the maſter veine in the liuer, named the head thereof, is found miſſing among other entrails, and the heart likewiſe wanting: or contrariwiſe, both theſe to be double, and appeare twain for one. And euen at this day there remaineth a moſt notable precedent and example to all poſterity, in that preſcript forme of exorciſme, whereby the two *Decij*, both the father and ſonne, betooke themſelues to all the helliſh furies and fiends infernall: moreouer, the imprecation of the veſtall Nun *Tuccia*, when ſhee was put to proue her virginity, continueth extant vpon record; by

B vertue of which charme ſhe carried water in a ſiue without ſhedding one drop: which happened in the yeare after the foundation of Rome city 609. And verily, no longer ago than of late time in our own age, we ſaw two Græcians, to wit, a man and a woman; yea, and ſome of other nations, with whom in thoſe daies wee maintained warres, buried quicke within the beaſt-market in Rome: in which maner of ſacrifice, whoſoeuer readeth the prayer or exorciſme that is vſed, and which the VVarden or Principall of the colledge of the Quindecemvirs is woont to reade and pronounce to the exorciſt; he would no doubt confeſſe, that ſuch charmes and execrations be of great importance: and namely, ſeeing they haue bin all approoued and found effectuall by the experience and euents obſerued for the ſpace of * eight hundred and thirtie yeares: As for our veſtall virgins in theſe our daies, we are certainely perſuaded and beleeue, that by the vertue of

C certaine ſpels and charmes which they haue, they be able to arreſt and ſtay any fugitiue ſlaue for running one foot farther; prouided alwaies that they be not gone already without the pourpriſe and precinct of the city wals. Now if this be receiued once as an vndoubted and confeſſed truth, and if we admit that the gods do heare ſome praiers, or be moued by any words; then ſurely we may reſolue at once of theſe conjectures; and conclude affirmatiuely of the maine queſtion. Certes, our anceſtors from time to time haue euermore beleeued and deliuered ſuch principle, yea, and that which of all other ſeemeth moſt incredible, they haue affirmed conſtantly, That by the power of ſuch charmes and conjurations, Thunder and Lightening might be fetched downe from aboue (as I haue formerly ſhewed.) *L. Piſo* reporteth in the firſt booke of his Annals or yearely Chronicles, That *Tullus Hoſtilius* king of Rome, was ſtricken dead with Light-

D tening, for that when hee went in hand to call *Iupiter* downe out of heauen, by vertue of a ſacrifice which king *Numa* was woont to vſe in that caſe, hee had not obſerued exactly all the exorciſmes and ceremoniall words contained in thoſe bookes of king *Numa*, but ſwarued ſomwhat from them. And many other writers do teſtifie, that by the power of words and oſſes, the deſtinies and prodigies of great importance preſaged to one place, haue bin cleane altered and tranſferred to another: as it was like to haue happened to the Romanes, at what time as they laied the foundation of *Iupiters* Temple vpon the mount or rocke Tarpeius. For when they digged there for the foundation of the ſaid Temple, and chanced to finde within the ground a mans head: the Senate of Rome ſent certaine Embaſſadours of purpoſe to the Sages and VViſards of Tuſcane, to know the ſignification of this ſtrange ſight and miraculous occurrent. VVhere-

E of *Olenus Calenus* (who was reputed the moſt famous diuinor and prophet of all the Tuſcanes) hauing ſome intelligence, and foreſeeing the great felicity and happineſſe that it imported and preſaged, intended by ſubtill interrogatiue to tranſlate the benefit thereof to his owne native countrey of Tuſcane. Hauing therefore firſt with a ſtaffe ſet out and deſcribed (as it were) the modell and forme of a Temple, vpon the ground which lay before him; hee came about the Roman Embaſſadors beforeſaid, and queſtioned with them in this wilie manner: Is it ſo, Romans, as you ſay? and are theſe your words indeed? There muſt be a Temple here of *Iupiter* that moſt gracious and mighty god: we haue light here vpon a mans head. Vnto which interrogation of his, the ſaid Roman Embaſſadours according to the inſtructions which they had receiued beforehand from the VViſard or Diuinors ſonne, anſwered in this manner: No, not here in this

F very place, but at Rome (we ſay) the head was found. And verily, our antient Chronicles doe all of them moſt conſtantly affirm, that had they not been thus forewarned and taught what to ſay, but had ſimply anſwered Yea, here we haue found a head, &c. The fortune of the Roman State and Empire had gone quite away to the Tuſcans, and been eſtabliſhed among them. The ſame had like to haue happened a ſecond time, as we may ſee in the Records and Monuments of old

date,

*Which is called *Obnũtiatio dicarum*, as we may reade in *M. Tull. de Diuinatione*, 1.

*In which yere it ſeemeth *Plinie* wrote this worke.

date,when as a certain chariot with foure horſes, made of clay, and prepared for to be ſet vpon G
the louver or lantern of the ſaid temple, chanced as it lay baking in the furnace, to grow into an extraordinary bigneſſe. For the foreſaid Wiſe men of Tuſcan being asked what the ſaid prodigy ſhould betoken,practiſed the like,as *Olenus* did:but the Romans being wiſe & wary in their words,ſaued and retained the ſame fortune ſtill for the behoofe of Rome, which was preſaged vnto them by that happy foretoken. Theſe examples may ſuffice to ſhew & prooue euidently, that the vertues and ſignifications of theſe ſignes and preſages do lie in our own power:and are no otherwiſe of force and effect, but according as euery one of them is ſo taken * and accepted. True it is,and held for an vndoubted principle in the Augures diſcipline & learning, That neither curſed execrations, ominous and vnlucky birds, nor any other preſage by their flight ſinging and feeding,can touch thoſe perſons who take no heed of them,and do proteſt plainly,that H
they regard them not,what buſineſſe ſoeuer they go about and be entering into: a greater gift than which,and teſtimony of the diuine indulgence and fauor of the gods to vs, we cannot haue, thus to ſubiect their ſecrets to our puiſſance. Moreouer,in the laws and ordinances of the 12 tables here at Rome,are not in one place theſe very words to be found, *Qui fruges occentaſſit*, [*i. whoſoeuer ſhall enchant or fore-ſpeake any corne or fruits of the earth:*] and in another place, *Qui malum carmen incantaſſit*, [*i. What perſon ſoeuer vſeth pernicious charmes to the hurt or miſchiefe of any creature?*] Ouer and beſides, *Verrius Flaccus* doth affirm vpon the credit of certain Authors which he alleadgeth and beleeueth, That the firſt thing which the antient Romans were wont to doe at the ſiege and aſſault of any towne or city, was by their prieſts to conjure and call forth that god or goddeſſe which was the patron or patroneſſe therof; and withal to promiſe vnto the ſaid I
god or goddeſſe, either the ſame place againe,or elſe a greater and more ſpacious ſeat; yea, and the like diuine worſhip, or better, among the Romanes: and euen at this day our Pontifies or Biſhops haue the charge of this ſacred ceremony amongſt other functions belonging to their miniſtery. And hereupon well known it is,that for this cauſe and nothing elſe, it was neuer diuulged obroad,what god was the protector and patron of Rome city,for feare leaſt ſome of our enemies ſhould aſſay to coniure him forth,and deale by vs as we do by them. Furthermore,who is there that is not afraid of all maledictions and curſed execrations; and eſpecially when the * names of the infernall fiends or vnluckie foules are vſed in ſuch bannings? For feare likewiſe of ſome harme,ſee we not that it is an vſuall thing to * cruſh and break both egge and fiſh ſhels, ſo ſoon as euer the meat is ſupped and eaten out of them;or els to bore the ſame through K
with a ſpoone ſtele or bodkin? From hence came thoſe amatorious eidyls and eclogues of *Theocritus* among Greek Poets,of *Catullus* and *Virgil* among vs,full of amorous charmes,in imitation of ſuch exorciſmes and coniurations indeed. I aſſure you many folke there be of this beleefe, That by certaine ſpells and words,in manner of charmes, all the pots and veſſels of earth baking in a furnace,may be cracked and broken, without touching them at all. And there are not a few who are perſuaded for certaine,that euen the very ſerpents as they may be burſt by inchantment,ſo they can vnwitch themſelues: and that as brutiſh otherwiſe and earthly as they be,yet in this one thing they haue a quicke ſence and vnderſtanding,inſomuch,as at the charms of the Marſians they will ſhrink from them and draw in their bodies round into a knot,though L
it were in the night ſeaſon when they lie aſleepe. Some there be alſo that when a skare-fire hath taken an houſe,write certaine * words vpon the walls, and thereby limit and confine the fire,that it ſhall go no farther. Certes,I am not able to ſay,whether ſtrange,forraine, and ineffable words hard to be pronounced,are more auailable to the effecting of theſe incredible things, or our Latin words,comming out at a venture vnlooked for and ſpoken at randon: which muſt needs ſeem ridiculous in our judgement, ſeeing that the ſpirit and mind of man, expecteth alwaies ſome great and mighty matter in theſe coniurations and exorciſmes, which may carry a majeſty therewith to incline and moue the gods to mercy and fauour, or rather indeed to command their heauenly power perforce. But to proceed, *Homer* the Poet hath written, that prince * *Vlyxes* being wounded in the thigh,ſtanched the bloud with a charme. And *Theophraſtus* teſtifieth,that there be proper ſpels to cure the Sciatica. *Cato* hath left in writing, that there is a M
ſpecial charm for diſlocations,wherby any bone put out of ioint may be ſet again. And *M. Varro* reporteth the like vertue of certain good words for the gout. As for *Cæſar* the Dictatour, it is commonly ſaid of him, that hauing beene once endangered with the fall or ouerthrow of his coach wherein he rode,would neuer afterwards ride in coach againe,vnleſſe ſo ſoone as euer hee had

* Whereupon it was thought materiall to ſpeake in this manner *Accipia omen*. For otherwiſe it auailed not.

* As in ſaying thus, The Deuill take thee, or,the Rauens peck out thine eies,or I had rather ſee thee Pie pekt: and ſuch like.

* Becauſe afterwards no witches might pricke them with a needle in the name and behalfe of thoſe whom they would hurt and miſchiefe,according to the practiſe of pricking the images of any perſon in wax; vſed in the witchcraft of theſe daies.

* That is to ſay, *Arſe verſe*, out of *Afranius*. as Feſtus noteth,which in the old Tuſcane language ſignifieth *Auerte igneum*, *i.* Put backe the fire.

* or rather the ſonnes of *Autolicus*: in his *Odyſſea*.

20030
copy 1

A had taken his place,and before that he ſet forward vpon his way, he had pronounced a certaine charm that he had in ſtore: and perſuaded he was,that if he ſaid it ouer three times together,he ſhould come by no miſchance in his iourney,but trauel in ſecurity. A thing that I know many now adaies to practiſe ordinarily as well as he. But for farther prooſe and confirmation of this opinion,I report me to euery mans conſcience and knowledge;to that(I ſay)which there is not one but knoweth: What is the cauſe I pray you,that the * firſt day of euery yeare we ſalute one another for luck ſake,with wiſhing a good new yere? What is the reaſon,tel me, that in all our publick proceſſions and generall ſolemnities euery fifth yeare for the health and good eſtate of the city,they * made choice of ſuch perſons for to lead the beaſts appointed to ſacrifice,whoſe *names were good and fortunat?or how commeth it about,that for to preuent or diuert witch-
B craft and ſorcery,we obſerue a peculiar adoration,and inuocat vpon the Greekiſh[goddeſſe of vengeance]*Nemeſis*;in which regard onely,we haue her ſtatue or image ſet vp in the Capitoll, notwithſtanding we know not yet what name in Latine to giue her? How is it, that in making mention of thoſe that be dead, we ſpeake with reuerence and proteſt that we haue no meaning to diſquiet their ghoſts thereby,or to ſay ought preiudiciall to their good name and memoriall? If there be nothing in words,how hapneth it,I would fain know,that we haue ſuch an opini-
on of odd numbers,beleeuing that they be more effectuall in all things than the euen?a matter I may tell you of great conſequence,if we do but obſerue the criticall daies in feuers. Alſo in the gathering of our firſt fruits,be they Pears,Apples,Figs,&c.wherfore vſe we to ſay,Theſe be old,God ſend vs new? What moueth vs to with health and ſay,God helpe, or bleſſe,when one
C ſneezeth? for euen *Tiberius Cæſar*,who otherwiſe was known for a grim ſir,and the moſt vnſociable and melancholick man in the world, required in that manner to be ſalued and wiſhed well vnto,whenſoeuer he ſneezed,though he were mounted in his chariot. And ſome there be who in this caſe do ceremoniouſly ſalute the party by name,and thinke there is a great point of religion lies in that. Moreouer,is not this an opinion generally receiued,That when our ears do glow and tingle,ſome there be that in our abſence doe talke of vs! *Attalus* auoucheth for a certainty, that if a man chance to eſpie a ſcorpion,and do no more but ſay this one word * Duo[*i.*two]the ſerpent wil be ſtil & quiet,and neuer ſhoot forth his ſting. And now ſeeing by occaſion of mentioning a ſcorpion,I am put in mind of Africk,you ſhal vnderſtand thus much,that throughout all that country there is not one goeth about to do any thing,but before he begins he ſaith this
D word * Africa*i.* Africk. As for other nations,in euery enterpriſe that men take in hand,they vſe the name of their gods,& pray ordinarily,that it would pleaſe them to giue a grace and bleſſing to their attempts. As for this ceremony,namely,when the table is ſpread and furniſhed with viands,to lay a ring from the finger vpon it,we ſee it commonly & orderly practiſed;and that it is of force to put by many ſcrupules aud religious doubts it is very euident. You ſhall ſee ſome men to take the ſpittle out of their mouths,and conuey it with their fingers end behind the ear, for to reioice the heart & driue away all penſiueneſſe and melancholick fanſies that trouble the mind. And to bend or bow down the thumbs when we giue aſſent vnto a thing,or do fauor any perſon,is ſo vſuall,that it is growne into a prouerbiall ſpeech,to bid a man put down his thumb in token of approbation. In adoring the gods and doing reuerence to their images, wee vſe to
E *kiſſe our right hand and turne about with our whole body: in which geſture * the French obſerue to turne toward the left hand; and they beleeue that they ſhew more deuotion in ſo doing. As touching the maner of worſhipping and adoring flaſhes of lightening, all nations with one accord and conformity do it with a kind of * whiſtling or chirping with the lips. If there be mention made of ſcare fires at the table as we ſit at meat,we hold it ominous,but we turn away the perillous preſage thereof, by ſpilling and caſting water vnder the bourd. When one riſeth from his meat and is ready to depart,if they of the houſe go in hand preſently for to ſweep the floore and make all cleane: as alſo to take away diſhes,trenchers,&c.vpon the bourd; or to remoue the cupbourd of plate,& liuery table,whiles one of the gueſts is a drinking, are thought to be moſt vnfortunat tokens,and to preſage much harm. *Seruius Sulpitius* a principal perſon of
F our city,hath written a treatiſe of this argument,wherein he giueth a reaſon why we ſhould not leaue or ſhift our trenchers at euery courſe or change of diſhes;for in thoſe daies there were no more allowed than there ſat gueſts at the tables,and thoſe were ſerued but once for all. If one chance to ſneeze after repaſt, the order is to call for a diſh of meat and a trencher againe to be ſet vpon the bourd: and in caſe he taſte not of ſomwhat afterward,it is thought a moſt fearefull and

* *Dicis cauſa*, *i.pro forma:*
* As *Valeſius*, *Lucius*, *Salvius Statorius*, *&c.* which are ſignificant, and import by the very letter., ſome happines and proſperity

*Which faſhion was afterwardstaken vp in doing reuerence to princes and great perſons.
*whereas other nations obſerued to turn to the right hād, as appeareth by *Plautus*, *Quo me vertā nſcio, B. Si deos ſalutas, Dextrorſum cenſeo.*
Poppyſmus, in ſetting our lips cloſe together, and drawing the breath inward, as our manner is in playing with a tame Sparrow, or chearing vp and making much of an horſe.

and curſed preſage on this behalf: like as to ſit at the table and eat nothing at all. * See how ceremonious thoſe men were, and what preciſe ordinances they inſtituted, who were of beleef, that in all our affaires and actions, and at al times, the diuine power of God was preſent: and that by theſe means they left them pacified for all our ſins and vices. Neither is there an end here: for ouer and beſides it hath been marked, that many times all the table is huſht, and there is not a word heard from one end to the other: but this is noted neuer to happen but when the gueſts make a juſt euen number. But what doth this ſilence preſage? Surely, euery one of them * ſhall be in danger to loſe or impaire his credit, good name, and reputation. Moreouer, if a peece of meat chanced to fall out of the hand down to the floore, it was taken vp and deliuered vpon the boord again, where it paſſed from one to another, and went through the table: but in any wiſe they were forbidden to blow therupon, for to clenſe it from the duſt or filth that it caught. Furthermore, they haue proceeded thus far, as to gather preſages from ſuch things as happen juſt at the time whiles one either ſpeaketh or thinketh of the ſame. But of all others, this was counted a moſt execrable token, in caſe it chanced that the Pontifie or high Prieſt ſitting at the table *pro forma*, and for order ſake, at any ſolemne feaſt or ſacrifice, let fall a morcel of meat: but if the ſame were laid vpon the boord again, and afterwards burnt and ſacrificed to the familiar gods of the houſe *Lares*, it was thought a ſufficient expiatory ſatisfaction. Semblably, men are of opinion, That if any medicines purgatiue or others, fortune to be ſet vpon a table before they bee giuen to the patient for to drink, they wil do no good at all, but loſe their operation. Alſo there is a ſuperſtitious ceremony in paring the nailes of the fingers, during the market daies held at Rome, with this charge, that the party hold his tongue and be ſilent all the while, & bigin at the fore-finger; and this forſooth concernes the mony of many a man. Likewiſe, as great a matter as that, lieth in ſtroking or handling the haire of the head, either on the 17 day after the change of the Moon, or the 29: for a ſpecial means this is to keep the haire on, which is giuen to fal, as alſo to eaſe the head-ach. Moreouer, the peaſants in the country obſerue this cuſtome in many mannors and farmes of Italy, to forbid their wiues and women to ſpin as they walke vp and downe abroad in the ſtreet or any common way of paſſage, or to carry their rockes and diſtaues vndizened or bare; for this opinion they haue, that in ſo doing they preiudice the hope of al fruits, and the corne eſpecially growing in the field for that yeare. Not long ſince, *M. Seruilius Nonianus*, (who in his time was a principal citizen of Rome) to preuent the bleardneſſe of his eies which he feared, before that either any man elſe foretold him of that diſeaſe, or himſelfe once named it, took a little piece of paper, and wrote therein theſe two capital Greek letters P and A, which he lapped round & faſt tied with a linnen thred, and ſo wore it hanging at a lace about his neck vnder his throat. *Mutianus* (who had bin thrice Conſull of Rome) obſerued the ſame effect by wearing a flie aliue within a little rag of white fine linnen cloth: and both of them did highly commend theſe medicines of theirs; reporting, that by thoſe meanes they were free from bleared eies. Finally, we read of certain charms and ſpels againſt ſtorms of hail: againſt ſundry ſorts of diſeaſes, and namely for any part that is burnt or ſcalded, and verily ſome of them haue been proued by experience to be effectuall. But for mine own part abaſhed I am and aſhamed to put them downe in writing, conſidering how diuerſly men are affected in minde. And therefore to conclude this matter, I leaue euery man to himſelfe to giue credit or otherwiſe vnto them at his owne pleaſure and diſcretion.

* Of the ſpeciall prouidence of God: *Plinie* ſpeaketh like himſelfe, a heathenish Infidell.

Chap. III.

¶ *Remedies proceeding from man, for the cure of diſeaſes.*

IN my former Treatiſe as touching ſtrange and wonderfull nations, I ſpake of certaine races of men which were of a monſtrous nature, and carried a venomous regard and looke in their very eies: beſides many other properties of beaſts, which here to repeat were needleſſe. Howbeit, in this place I think it not amiſſe to note, that ſome people there be whoſe bodies be from top to toe all medicinable and wholſome to others. As for example, the men of thoſe families which do terrifie ſerpents, and driue them away with their very preſence: who alſo are of this nature, that they be able to cure and eaſe ſuch as are ſtung already either by touching only, or elſe by a medicinable ſucking of the place: of which kind are the Pſylli and Marſi: thoſe alſo in the Iſland * Cyprus, whom they call Ophugenes: and of this race and houſe there came an Embaſſadour

M

* Or *Pares.*

20030
copy 1

A ſador out of the ſaid Iſland, whoſe name was * *Exagon*, who by the commandement of the Conſuls was put into a great tun or pipe wherein were many ſerpents, for to make an experiment and trial of the truth: and in very deed the ſaid ſerpents licked his body in all parts gently with their tongues, as if they had bin little dogs, to the great wonder of them who beheld the manner of it. A man ſhall know thoſe of this family (if any of them remain at this day) by this ſigne, that they breath a ſtrong and ſtinking ſent from them, eſpecially in the Spring ſeaſon. Now, theſe people beforenamed had not only a gift to cure folk with their ſpittle, but their very ſweat alſo had a medicinable vertue againſt the ſting of ſerpents. For as touching thoſe men who are born and bred in Tentyrus (an Iſland lying within the riuer Nilus) ſo terrible they be vnto the Crocodiles, that they wil not abide ſo much as their voice, but flie from them ſo ſoon as they heare
B it. Moreouer, it is knowne for certaine, that all the ſort of theſe people, who haue their bodies thus priuiledged by that ſecret antipathie in nature between them & ſerpents, are able to eaſe thoſe who are ſtung, if they do but come in place where they be: like as a wound will be more angry and ſore, if they come neare who at any time before haue been hurt by ſting of ſerpent or tooth of mad dog: ſuch alſo carry about with them in their bodies ſo venomous a quality, that their onely preſence is enough to marre the egs that a brood-hen ſits vpon, and make them all addle, yea, and to driue ewes and other cattell to caſt their yong before the time: ſuch a virulent property remaineth ſtill behind in their bodies who haue bin once ſtung and bitten, that notwithſtanding they be cured thereof, yet venomous they are now and hurtfull to others, who beforetime were poiſoned themſelues. But the only way to remedy this inconuenience, is to cauſe
C them to waſh their hands before they enter into the roome where the patients lie, and with the ſame water to beſprinckle and waſh them who are to be cured. Againe, this is to be obſerued, that whoſoeuer at any time haue bin pricked with a ſcorpion, ſhal neuer afterwards be ſtung by hornets, waſpes, or bees. A ſtrange thing this is no doubt, howbeit, no great wonder vnto them who know, that a garment or cloth which had bin vſed at funerals, wil neuer be afterwards moth eaten: and how that ſerpents hardly can be plucked out of their holes, vnleſſe it be by the left hand.

* *Euegon.*

Chap. IIII.

D ¶ *Of certaine Sorceries: and the properties of a mans ſpittle. Alſo againſt Magitians.*

THe inuentions of *Pithagoras* as touching numbers, beare a great ſtroke in theſe matters, and lightly miſſe not: but principally in this, That the ſaid Philoſopher would giue iudgment by the vowels contained in the proper name of any perſon, concerning their fortunes, for in caſe the vowels were in number odde, he pronounced, that if the party euer proued lame of a lim, loſt an eie, or met with any ſuch like accidents, the ſame ſhould happen vpon the right ſide of the body: but contrariwiſe, if the number of vowels were euen, then theſe infirmities ſhould befall the left ſide. Furthermore, it is commonly ſaid, that if one take a ſtone, dart, or inſtrument of ſhot, wherewith a man hath killed theſe three liuing creatures, a man, a wilde Bore,
E and a Bear, one after another, & that with one ſingle ſtroke to euery one of them, and fling the ſame clean ouer an houſe where there is a woman in hard trauell of child-birth, ſo as it light on the other ſide without touching any part thereof, the woman ſhal preſently be deliueed. More reaſon there is that a * light jauelin or Pertuiſan ſhould do this feat, which had bin drawn forth of a mans body, ſo as it neuer touched the ground after; for do but bring this murdering jauelin into the place where a woman is in labor, it wil forthwith procure her deliuerance. *Orpheus* and *Archelaus* do write much after the ſame maner of arrows pulled out of men bodies, namely, that if care be had that they touch not the earth, & then be laid vnder the bed where man or woman lieth, they wil cauſe the parties to be enamored vpon them that beſtowed the ſaid arrows there: and theſe authors report moreouer, that the veniſon of any wild beaſt killed with the ſame weaF pon which was the death of a man before, is ſingular to cure the falling ſickneſſe.

* *Veliterk haſt*, which alſo wa called *Veliburn.*

As ſome men there be whoſe bodies all throughout be medicinable, ſo there be others who haue certain parts onely of the ſame vertue, according as I haue written already concerning the thumbe of king *Pyrrhus*. In the citie Elis alſo the inhabitants were wont to ſhew as a wonderfull monument the rib of *Pelops*, which they auouched to be all of Iuory. And euen at this day,

many

many there are who make great ſcruple to ſhaue or clip the haire growing in any molle or wert G.
vpon the face. As touching the faſting ſpittle ſpecially of man or woman, I haue ſhewed alreadie how it is a ſoueraigne preſeruatiue againſt the poiſon of ſerpents. But that is not all: for in many other caſes it is found by daily experience to be of great operation, and to worke effectually. For firſt and formoſt, if we ſee any ſurpriſed with the falling ſickneſſe, we ſpit vpon them, and by that means we are perſuaded, that we our ſelues auoid the contagion of the ſaid diſeaſe. *Item*, an ordinary thing it is with vs to put by the danger of witch-craft, by ſpitting in the eies of a witch: ſo do we alſo, when we meet with one that limpeth, and is lame of the right leg. Likewiſe when we craue pardon of the gods for ſome audacious and preſumptuous praiers that wee make, we vſe to ſpit euen into our boſoms. Semblably, for to fortifie the operation of any medicines, the manner is to pronounce withal a charm or exorciſme three times ouer, and to ſpit vp- H
on the ground as often; and ſo we doubt not but it will do the cure and not faile. Alſo when we perceiue a fellon or ſuch like vncom ſore a breeding, the firſt thing that we doe, is to marke it three times with our faſting ſpittle. I will tell you of a ſtrange effect, and whereof it is no hard matter ywis to make the triall. If one man hath hurt another, either by reaching him a blow neare at hand, or by letting flie ſomwhat at him farther off, & repent him when he hath ſo done; let him preſently ſpit juſt in the midſt of the palm of that hand which gaue the ſtroke, the party immediatly that was ſmitten, ſhall be eaſed from pain, and take no harm thereby. And verily we find this to be ſo, by experiments oftentimes made vpon the bodies of fourfooted beaſts: for let them be ſwaied in the back, or hipped by ſome ſtripe giuen them with ſtone or cudgel, do no more then but ſpit into that hand which did the deed, & ſtreightwaies they will goe vpright a- I
gain vpon all foure. Contrariwiſe ſome there be, who before they either ſtrike or diſcharge any thing from them againſt another, after the ſame manner firſt ſpit into the bal of their hands, and ſo they make account to do a greater diſpleaſure, & to hurt more dangerouſly. But this we may aſſure our ſelues, that there is not a better thing in the world for to kil tettars, ringworms, & the foule leprie, than to rub and wet them continually with our owne faſting ſpittle: likewiſe to annoint therewith euery morning our eies, keepeth them from being bleared: alſo cankerous ſores are cured with the root of Sowbread, which we call the earth-apple, if the ſame be wrought into a ſalue with our faſting ſpittle. Moreouer, if a man haue a cricke and ach in the nape of his neck, let him take the ſpittle of a man that is faſting, ſome in his right hand, and there with anoint the ham of his right leg; and the reſt with his left, and do the like to the left leg: and thereupon hee K
ſhall find eaſe. If an earwig or ſuch like vermin be gotten into the eare, make no more ado but ſpit into the ſame, and it will come forth anon. Among countercharms, & preſeruatiues againſt forcerie, theſe be reckoned, namely, that a man ſpit vpon his own vrine as ſoon as he hath deliuered it out of his body; likewiſe to ſpit into the ſhooe that ſerueth his right foot, before he put it on in a morning; alſo whenſoeuer he goeth ouer or paſſe by a place where ſometime he was in danger, to remember that he ſpit vpon it. *Marcion* of Smyrna, who wrote a Treatiſe of the vertues and effects of ſimples, reporteth, that the Scolopendres of the ſea will burſt in ſunder if one ſpit vpon them: and ſo will hedge toads and other venomous frogs. *Ophilius* writeth, that ſpittle wil do the like by ſerpents, if one ſpit into their mouths as they gape. As for the learned *Salpe*, ſhee L
ſaith, that if one perceiue any member or part of the body be aſleep and benummed, there is not a better thing to recouer the ſence thereof, than to ſpit into the boſome, or to touch the vpper eielids with faſting ſpittle. Now, if we beleeue theſe things to be true, we may as well giue credit to all that which followeth. Wee ſee it is an ordinary thing, that if a ſtranger come in place where a babe lieth in the cradle, or look vpon the ſaid infant whiles it is aſleep, the nource vſeth to ſpit thrice: although I am not ignorant that there is a religious opinion of this ſillable* Mu, that it is able to defend ſuch yong ſucklings; as alſo of the fooliſh puppet *Faſcinus*; both which are of power to put back any witchcraft from them, and returne the miſchiefe vpon the eie-biting witch. And ſince I am light vpon this name, I muſt let you vnderſtand that this *Faſcinus* is holden to be a god forſooth, the gardian & keeper not of infants only, but of great captains and M
braue generals of the field; who hath diuine ſeruice done to him at Rome among other gods, and that by the veſtall Nuns; for the manner was to hang this ridiculous puppet vnder the chariots of noble victorers riding in triumph, not onely to defend them by a medicinable power againſt the venome of enuious and ſpightfull tongues, but alſo to returne all enuie vpon them, & bid as it were to take it among them: the like vertue is in the tongue, beſeeching fortune to bee pro-

* *Mututatur*, As *Turnebius* found it in an old copie. And conſiderig the fooleries both before & after mentioned, this will ſort well ynough with ſuch ſtuffe: & namely their *Faſcinus* in the old time (which was *turpiculares, quale membrũ virile*) hanging about childrens necks to withſtand the miſchiefe that might come by the eye, called in Latin *Faſcinum* alſo: for a witch would not willingly ſettle her eye long vpon ſuch a beaſtly and filthie obiect.

20030
copy 1

A propitious and fauorable vnto them: Fortune (I ſay) who ordinarily commeth after to whip and
punish them, as the ſcourge and tormentreſſe of glory and honour. Ouer and beſides, the tooth
of a man, eſpecially when he is mad, is reckoned to be as dangerous and pernicious a biting as
any other. The excrement found in mans ears, called ear wax, is thought in this caſe to be ſoue-
raigne: and let no man maruell thereof, conſidering how it will heale the ſting of Scorpions and
ſerpents alſo, if it be applied to the place preſently: but it is the better and more effectuall, if it
be taken out of the Patients own ears, who is thus wounded: and in that ſort it healeth alſo the
whitflaws and impoſtumations that breed about the naile roots. Moreouer, take a mans or wo-
mans tooth, and ſtamp it into pouder, it is thought good for the ſting of a ſerpent. The haire of
B yong boy-children which is firſt clipped off, is held to be a ſingular remedy for to aſſuage the
painful fits of the gout, if the ſame be tied faſt about the foot that is grieued: & generally their
haire, ſo long as they be vnder 14 yeres of age, eaſeth the ſaid anguiſh, if it be applied vnto the
place. Likewiſe, the hair of a mans head cureth the biting of a mad dog, if it be laid to the place
with vineger: it healeth alſo the wounds in the head, applied with oile or wine. But if it were
plucked from his head whiles he hangeth vpon the gallows, then is it ſoueraign for the quartan
ague: but we may chuſe whether we will beleeue it or no. Certainly the haire of the head burnt
to aſhes, is known to be very good for a cancerous vlcer. If a woman take the firſt tooth that a
yong child caſt, ſet it in a bracelet, and ſo weare it continually about her wreſt, it will preſerue
her from the pains & grieuances of her matrice and naturall parts. Tie the great Toe and that
which is next vnto it together, you ſhall ſee how it will allay any riſings & tumors in the ſhare.
C Bind gently the two middle fingers of the right hand, with a linnen thred, marke of what force
this remedy is to repreſſe the rheum falling into the eies, and how it wil keep them from being
bleared. If all be true that is commonly ſaid, the ſtone that one hath voided & thruſt out of the
body, eaſeth all others that be pained with the ſtone, if the ſame be kept faſt tied to the ſhare:
alſo it doth mitigat the griefe of the liuer, and procureth ſpeedy deliuerance to women in tra-
uel with child. *Granius* affirmed moreouer, that in all theſe caſes it would do the better, if one
were cut for it, & that it were taken forth of the bladder by way of inciſion. If a woman be neere
her time, and looks euery day to fal to labour & cry out, let the man come by whom ſhe is with
child, and after he hath vngirt himſelfe, gird her about the middle with his own girdle, and vn-
looſe the ſame againe, ſaying withall, this charme, *I tied the knot, and I will vndo it againe*, & there-
D with go his waies, ſhe ſhall ſoone after fall to her buſineſſe and haue more ſpeedy deliuerance.
Orpheus and *Archelaus* both, do affirme, That if the ſquinancy be anointed with man or womans
bloud (it skilleth not out of what vein or part of the body it iſſued) it is an excellent remedy for
that diſeaſe. The like effect it hath, if their mouthes be rubbed with the ſaid bloud, who being
ouertaken with the epilepſie, are falne down; for immediatly thereupon they will riſe and ſtand
vpon their feet. Some write, That if the great toes be pricked vntill they bleed again, the drops
that come forth worke the like effect in the falling ſickneſſe, ſo that the face of the Patient be
ſprinkled or beſmeared therewith: or if a maiden touch the parties face that lieth in a fit of the
ſaid diſeaſe, with her bare thumbe or great toe, he ſhall come againe to himſelfe and recouer. By
which experiment Phyſitians going by coniecture, are of opinion, That ſuch perſons ſubject to
E that diſeaſe, ſhould feed of the fleſh of * ſuch beaſts as neuer were with yong. *Æſchines*, a Phy- * *Virgines car-*
ſitian of Athens, was wont to cure ſquinſies, the inflammations of the amygdals, the infirmities *nes.*
of the uvula, and all cancerous ſores, with the aſhes of a man or womans body burnt: and this
medicine he called Botryon.

Many maladies there bee, that goe away the firſt time that either a man hath carnall know-
ledge of a woman, or that a maid ſeeth her monthly ſickneſſe: but if they end not at ſuch a time,
commonly they proue chronicke diſeaſes and continue a long time, and eſpecially the falling
ſickneſſe. It is ſaid moreouer, That the company of a woman caſeth them very much who are
ſtung with a ſcorpion: but women in the ſame caſe catch harme by that means. Some ſay alſo,
F that if the eies be dipped three times in that water wherein a man or woman hath waſhed their
feet, they ſhall be troubled neither with bleardneſſe nor any other infirmity. And others there
be who affirm, that the wens called the Kings euil, the ſwelling kernels alſo behind the ears, and
the ſquinancy, are cured with touching the hands of them that haue died a violent & vntimely
death. Some ſtand not ſo much vpon that point, but ſay, That the backe of the hand of any one
that is dead (it skills not how nor by what means) if it touch the grieued part, wil work the like

effect,ſo that the dead party & the Patient be both of one ſex. As for the tooth-ach,it is a com- G
mon ſpeech, That if one bite off a peece of ſome tree that hath been blaſted, or ſmitten with lightning,prouided alwaies that he hold his hands behind him at his back in ſo doing, the ſaid morſell or peece of wood will take away the toothach if it be laid vnto the tooth. Some there be who giue direction to take the perfume of a mans tooth burning in the fire, for to eaſe the tooth ach of a man;and ſemblably of a womans tooth to help women in the ſame caſe. Others you ſhall haue,that preſcribe to draw one of the eie-teeth, called in Latine Canini, out of the head of man or woman lying dead and not yet enterred,and to wear the ſame againſt the tooth-ach. It is a common ſpeech, That the earth found in or about a man or womans ſcull, is a ſingular depilatory,and fetcheth away the haire of the eiebrows. As for the graſſe or weed that grows therein (if any ſuch may be found) it cauſeth the teeth to fall out of the head with chewing on- H
ly. As alſo that no vlcer wil ſpread farther but keep at a ſtay,if there be a circle drawne about it with the bone of a man or womans body. As touching the cure of a tertian ague, ſome there be who lade vp water out of 3 pits,as much out of one as another, and mingle all together; which done,they put the ſaid water into a new earthen pot that neuer was occupied before,& begin to the Patient out of it,giuing the reſt vnto him or her for to drink,when the fit commeth. But for the quartan ague,they get me a broken fragment of a wooden pin which held the ſides & croſſe peece of a paire of gallows together,wrap it within a lock of wool,and ſo hang it about the Patient:or els they take a peece of the halter or rope from the gallows, and vſe it in like maner for the foreſaid purpoſe:but wot ye what? when the patient is by this meanes rid of the feuer, the ſaid parcel of wood or cord they vſe to bury or beſtow cloſe in ſome hole within the ground, I
where the Sun may neuer ſhine on it,& then the acceſſe wil neuer return more. See the toies & vanities of theſe Magitians!and yet theſe be not all;for they run on ſtil and ſay,that if one take a whetſtone which hath ſerued a long time to whet kniues & other edge tooles on, and lay the ſame vnder the boulſter or pillow where one lieth that is ready to faint and giue vp the ghoſt vpon ſome indirect means,by ſorcery,witchcraft, or poiſoning (but this muſt be done without the knowledge of the ſaid party) you ſhal from the very mouth of the patient hear,what poiſon was giuen,in what place,& at what time;but who it was that gaue it, he or ſhe ſhal not be able to name. Moreouer,this is known for a truth,that if one be ſtrucken ſpeechleſſe with lightning, and then the body be bent and turned toward the wounded place,the party ſhal recouer preſent- K
ly and ſpeak again. Some there be,who to driue back and keep down the biles and botches that riſe in the ſhare,take the thred or yearn out of the weauers loome which ſerue for the ſelvedge or liſt,making ſeuen or nine knots,and in the knitting of euery one of them name ſome widow or other,and then tie it faſt about the grieued place. Alſo for to aſſuage the paine of any wound, they giue order, that the wounded party take a naile or ſome other thing that one hath troden vnder foot,and to weare the ſame tied about the neck,arme, or other part of the body. For to be rid of warts,ſome chuſe a time to pluck them vp by the roots,when the Moone is twenty daies old at leaſt,and then lay themſelues along vpon their backs in ſome ordinary high way,looking fully vpon the Moone, and ſtretching their armes backeward as farre as they can beyond their heads,and looke what they can catch hold of with their hands,therewith they rub the place. If one cut and pare an agnell or corn in any part of the body,obſeruing a time when a ſtar ſeemeth L
to ſhoot or fall,they ſay, it wil quickly weare away and be healed for euer. They would beare vs in hand, That if a man poure vineger vpon the hooks and hindges of doors,and make a liniment with the durt that commeth of the ruſt thereof,and therewith annoint the forehead, it will aſ-ſuage the head-ach. They promiſe alſo to do as much with a wyth or halter that a man is hanged withall vpon a gibbet,in caſe it be done about the temples of the head in manner of a fron-tall. Moreouer,if any fiſh-bone ſtick in the throat and will not remooue, it ſhall incontinently goe downe, if the party ready thus to bee choked withall, put his feet into cold water: but if ſome peece of any other bones be ready to choke one,make no more adoe, but take ſome other little ſpils of the ſaid bone and lay them vpon the head,you ſhall ſee it paſſe away and doe no harm. If a peece of bread haue gone wrong or lie in the way readie to ſtop the breath, take the M
crums of the ſame loafe and put them into both the eares,you ſhall ſee it will ſoon be gon and do no further harme. Furthermore,the Grecks (who were giuen much to make money of euerie thing,and namely of their publicke places of bodily exerciſe) made great account of certaine excrements that came from mens bodies,as ſingular remedies for many diſeaſes: for the filth

that

20030
copy 1

A that was ſcraped & rubbed from the bodies of wreſtlers,&c. ſerued to mollifie, to heal, reſolue, and incarnat; a medicin conſiſting of ſweat & oile tempered together: with it they vſed to cure the inflammations, contractions, diſtortions, and riſings of the matrice, by application outwardly: therwith they would draw down the monthly fleurs of women; lenifie the intemperat heat, and diſſolue piles and ſwelling bigs in the ſeat or fundament: they vſe the ſame alſo to aſſuage the griefe of the ſinews, to rectifie diſlocations & ſet the bones in ioint, and to diſcuſſe the nodoſities of the ioints. Howbeit, the ſcrapings that come of ſweating in banes and hot-houſes, be counted of greater validitie in all theſe infirmities, and therefore no maruell if they enter into the compoſition of maturatiue emplaſters, and which bring an impoſtume to ſuppuration: as
B for the foreſaid medicines which ſtood vpon ſweat, oile wherewith wreſtlers were anointed, and ſome vrine mingled among, they be good onely to mollifie the nodoſities of the ioints: for as they heat and reſolue more effectually, ſo in the other reſpects nothing ſo forcible they are as thoſe that be gathered out of ſtouves & bains. Verily a man would not beleeue to what ſhameleſſe and impudent curioſity ſome authors are grown vnto (and euen thoſe of all others who be moſt renowned) who baſh not with open mouth to commend vnto vs that, for a ſingular remedy againſt the prick of ſcorpions, which I am not willing to name, euen the filthy ſperme that paſſeth from a man by his priuities. Neither could they ſtay there, but to cauſe barren women for to teem and beare children, they haue found out a proper peſſarie to be put vp into their ſecret parts, made forſooth of the ordure that commeth away from infants ſo ſoone as they be out of their mothers womb: and this medicine they haue a pretty name for, & call it Meconion. More-
C ouer, the Greeks haue gone ſo neare, that they haue ſcraped the very filth from the wals of their publicke halls and places of wreſtling, and ſuch like exerciſes; and the ſame (ſay they) hath a ſpeciall excalfactory vertue, whereby it diſcuſſeth and reſolueth the biles and impoſtumes called Pani; and ſerueth as a ſoueraigne liniment to heale the vlcers in the bodies of children and old folk, yea & to skin any place that is galled, raw, & bliſtred with burning. Lo what remedies haue bin found in the body of man? And ſurely ſince I haue taken the pains to put them down, I may not omit thoſe voluntary medicines which depend vpon his minde, & proceed from his will and vnderſtanding. In the firſt place, you ſhall haue ſome that wil faſt and forbeare al kinds of meat; others drink not at all; one while they abſtaine from wine onely, another while from all fleſh meats; and you ſhall ſee diuers men neuer come vnto bathe or baine, euery one according
D as their ſicknes doth require. And this kind of abſtinence or regiment of themſelues, they hold to be the readieſt and ſureſt means to recouer their health. In the rank of theſe remedies, are reckoned bodily exerciſe, ſtraining of the voice, vnction, ſcratching, and rubbing, as need and occaſion requireth; for hard and vehement friction doth conſtipat and bind the body: contrariwiſe, gentle and ſoft frictions do mollifie and open the pores; and, as much rubbing taketh down the body and cauſeth leanneſſe, ſo that which is moderat ſetteth it vp and encreaſeth fatneſſe: but nothing is there more wholſome than walking and geſtation; which is an exerciſe performed many waies. If the ſtomacke be weake, and the legs feeble, riding on horſeback is an excellent exerciſe: for the phthyſicke or conſumption, nothing ſo good as to ſaile or be rowed vpon the
* water: but in caſe there be a long diſeaſe hanging vpon a man, what better thing in the world * Specially vpon the ſea.
E than to change the aire, and remoue from place to place? In like manner to procure ſleep, by lying in ſome pretty bed that may be rocked too and fro, is oftentimes good for a mans health: as alſo to vomit now and then, but in no wiſe to vſe it ordinarily. Lying in bed vpon the backe, is commended for the infirmities of the eies; but vpon the belly, for the cough. To lie vpon the ſides ſhifting from one to the other, is held to be ſingular againſt rheums and catarrhs. *Ariſtotle* and *Fabianus* do ſay, That we be giuen to dreame at the Spring and Fall, more than in the other ſeaſons of the yere: alſo, moſt when we lie with our face vpward, but neuer groueling. And *Theophraſtus* affirmeth, That ſleeping vpon the right ſide, helpeth forward the concoction of meat in the ſtomacke; whereas they that lie vpon their backe ſhall not haue ſo quicke digeſtion. The
F manner of bathing alſo and vſing the baine and hot houſe, (which is one of the chiefe and principall means of our health) is in a mans power to order as he liſt himſelfe: like as he may chuſe what kind of friction he will in the ſtouve or hot-houſe; either to be rubbed with linnen cloths, or well curried and ſcraped with kombes. *Item*, it is knowne to bee verie good and wholeſome, to waſh ones head with hot-water, before hee enter into the baine or hot-houſe; and after that he is out of it, to doe the like with cold water: as alſo to take a draught of cold water

immediatly before meat, and to do as much between meals: likewiſe to drink the ſame to bed- G
ward, yea, and otherwhiles in the very night, ſo as we ſleep both before and after; where, by the way this would be noted, That no liuing creature elſe but man alone, delighteth to drinke any drink hot, know then hereby, that ſuch kind of drinks be not natural. Finally, to waſh the mouth with wine before one goeth to bed, for a ſweet breath: likewiſe ſo ſoon as he is vp betimes, with cold water againſt the tooth-ach, ſo as he do it three or fiue times together, or at leaſt-wiſe obſeruing ſuch an odde number; as alſo to bath the eies in a morning with Oxycrat (*i*) with vineger and water mingled together, to preſerue them for being bleared, are ſingular and approoued experiments.

Chap. V. H

¶ *Obſeruations as touching Diet, and the manner of our feeding, for the regiment of Health.*

LIke to the former rules is this alſo, as touching our Diet, That it be not too preciſe, but ſo as we may feed indifferently of all viands, and acquaint our bodies with variety of meats; which is obſerued to be the beſt way to maintain our health; and in very truth, *Hippocrates* ſaith, That to eat but one meale a day (*i*) to forbeare dinners, is a diet that will drie vp a mans body within, and bring them ſoon to age and decay. But this aphoriſm of his he pronounced as a Phyſitian to reclaim vs from that hungry and ſparing diet, and not as a patron and maintainer of full feeding and gourmandiſe: for I aſſure you, a temperat and moderate vſe of our meats, is I
the wholſomeſt thing that is for our bodily health But *L. Lucullus* was ſo ſtrict herein, that hee ſuffered himſelfe to be ordered and ouer-ruled by his owne ſeruant, who would not let him eat but as he thought good: in ſuch ſort, that it was no ſmall diſgrace vnto him in his later daies thus to make his man his maſter, and to be gouerned by him rather than by his * own ſelfe: for was it not (think you) an approbrious and ſhamefull ſight, to ſee a * ſlaue and no better, to put his lords hands from a diſh of meat, beeing an aged gentleman as he was, and who in times paſt had rode in triumph; to gage him thus (I ſay) and keep him ſhort, though hee were ſet amongſt great ſtates at a roiall feaſt within the capitoll of Rome?

* For euery man is to be his owne Phyſitian: whereupõ might riſe this prouerbe, *A foole or a Phyſitian.*

* Thought to be *Caliſthenes* his Phyſician: for in thoſe days Phyſicians were reckoned but ſeruants to ſuch perſons as *Lucullus* was.

Chap. VI. K

¶ *Of Sneezing: the vſe of Venerie: and other means which concerne mans health.*

SNeezing diſchargeth the heauineſſe of the head, and eaſeth the poſe or rheum that ſtuffeth the noſe: and it is commonly ſaid, That if one lay his mouth to the noſthrils of a mouſe or rat and touch the ſame, it wil do as much. To ſneeze alſo, is a ready way to be rid of the yex or hicquet. And *Varro* giueth counſell, to ſcrape a branch of a * Date tree with one hand after another by turnes, for to ſtay the ſaid hicquet. But moſt Phyſitians giue direction in this caſe, to ſhift a ring from the left hand to the longeſt finger of the right; or to plunge both hands into very hot water. *Theophraſtus* ſaith, that old men doe ſneeze with more paine and difficulty than others. L

As touching carnall knowledge of man and woman, *Democritus* vtterly condemned it: and why ſo? Becauſe (quoth he) in that act, one man goeth * out of another. And to ſay a truth, the leſſe one vſeth it, the better it is for body and mind both: and yet our profeſſed wreſtlers, runners and ſuch gamſters at feats of actiuity, when they feele themſelues heauy or dul, reuiue and recouer their liuely ſpirits again by keeping company with women. Alſo this exerciſe clenſeth the breſt and helpeth the voice, which being ſometime before cleare and neat, was now become hoarſe and ruſty. Moreouer, the temperat ſports of *Venus*, eaſeth the pain of the reins and loins, mundifie and quicken the eieſight, and be ſingular good for ſuch as be troubled in mind and giuen ouermuch to melancholy.

Moreouer, it is held for witchcraft, to ſit by women in trauell, or neare vnto a Patient who M
hath a medicine either giuen inwardly or applied vnto him, * with hand in hand, croſſe-fingered one between another: the experience whereof was well ſeene (by report) when lady * *Alcmena* was in labour to be deliuered of *Hercules*. And the worſe is this peece of ſorcery, in caſe the party hold the hands thus joined a-croſſe one finger within another about one or both knees. Alſo

* *Palma alterna manu ſcalpere:* vnleſſe hee meaneth [to ſcratch the palm or inſide of the hand, &c.] which anſwereth ſomewhat to the remedies next following.

* *Homo alius exiliret ex homine:* which *Dalecampius* expounds thus, For that a man in that action, goeth beſide himſelfe.

* For it holdeth women in pain ſtill, & hindreth the operation of Phyſicke.

* There was an old witch that by this meanes kept her in a long and tedious trauaile.

to

20030
copy 1

A to ſit croſſe-legged, with the ham of one leg riding aloft vpon the knee of the other, and that by turns ſhifting from knee to knee. And in very truth, our anceſtors time out of mind, haue expreſly forbidden in all councels of State, held by princes, potentats, and Generals of the field, to ſit hand in hand or croſſe-legged; for an opinion they haue, That this manner of geſture hindereth the proceeding and iſſue of any act in hand or conſulted vpon. They gaue out likewiſe a ſtrait prohibition, That no perſon preſent at any ſolemnity of ſacrifices or vows making ſhould ſit or ſtand croſſe-legged or hand in hand in manner aforeſaid.

As for veiling bonnet before great rulers and magiſtrats, or within their ſight, *Varro* ſaith, it was a faſhion at firſt not commanded for any reuerence or honour thereby to be done vnto go-
B uernors, but for healths ſake; and namely, that mens heads might be more firm & hardy, by that ordinary vſe and cuſtome of being bare.

When a mote or any thing els is falne into one eie, it is good to ſhut the other hard. If there be water gotten into the right eare, the maner is to jump and hop with the left leg, bending and inclining the head toward the right ſhoulder; ſemblably, if the like happen to the left eare; to do the contrary. If one be falne into a fit of coughing, the way to ſtay it is to let the next fel low ſpit vpon his forehead. If the uvula be falne, it will vp again, if the Patient ſuffer another to bite the haire in the crown of his head, and ſo to pull him vp plumb from the ground. Hath the neck a crick or a pain lying behind, what better remedy than to rub the hams? Be the hams pained? do the like by the nape of the neck: ſay the cramp take either feet or legs, plucking & ſtretching the ſinewes when one is in bed, the next way to be vſed, is to ſet the feet vpon the floore or the
C ground where the bed ſtandeth: or put caſe the crampe take the left ſide, then be ſure with the right hand to catch hold of the great toe of the left foot: and contrariwiſe, if the cramp come to the right leg, do the like by the right foot. If the body fall a ſhaking and quiuering for cold, or if one bleed exceſſiuely at the noſthrils, it is paſſing good to bind ſtrait and hard the extreame parts; to wit, hands and legs, yea and to plucke the eares alſo. It falleth out oftentimes, that one cannot lie dry nor hold his water, but it commeth from him euer and anone; what is then to be done? mary tie the foreskin of his yard with a linnen thred or a papyr ruſh, & withall, binde his thighs about in the middle. If the mouth of the ſtomacke be ready to turne, and will neither receiue nor hold any thing, it is good to preſſe hard and ſtraine the feet together, or els to thruſt both hands into hot water.

D To come now vnto our ſpeech and exerciſe of the tongue: in many caſes and for diuers cauſes it is wholſom to ſpeak but little. I haue head ſay, that *Mecænas Meſſius* inioined himſelfe three yeres ſilence, and during that time neuer ſpake word, for that in a fit of a conuulſion or crampe, he had beforetime caſt vp bloud. In caſe any thing be ready to fall or ruſh violently againſt vs, and that we be in danger of ſome ſtroke, ſay that we be climbing vp hill, or turned downe backward, or lying along, there is not the like meanes againe to preſerue our bodies, as to hold our winde: and this inuention we had from a bruit and dumbe beaſt, according as I haue ſhewed before.

Moreouer it is ſaid, that to ſtick down a ſpike or yron naile in that very place where a man or womans head lay during the fit of the falling ſickneſſe, at the very firſt time that hee or ſhe fell,
E ſecureth the party that ſo doth, for euer being troubled with that diſeaſe. Alſo it is holden for a ſingular thing to mitigat the intollerable torments of the reins, loins, and bladder, to piſſe with the body bending forward and groueling in the bathing tubs within the baines. As for greene wounds, it is wonderfull how ſoon they will be healed, in caſe they be bound vp and tied with a * *Hercules* knot: and verily it is thought, that to knit our girdles which we weare about vs euery day with ſuch a knot, hath a great vertue in it, by reaſon that *Hercules* firſt deuiſed the ſame.

* Wherein no ends are to be ſeene, they are ſo cloſe couched, & therefore hardly to be vnlooſed.

Demetrius, in a treatiſe that he compiled as touching the number of foure, affirmeth that it is of great efficacy; and he alledgeth reaſons why it is not good to preſcribe in any medicine to be drunke, the quantitie of foure ſextars or foure cyaths. To rub the ears behind, is ſuppoſed to be
F very good for them that are giuen to be bleare-eied: like as to rub the forehead, for weeping or watering eies.

Concerning the ſigns of life & death which may be found in man, this is one, That ſo long as the Patients eie is ſo cleare that a man may ſee himſelfe in the apple of it, wee are not to deſpaire of life.

As for the Vrine of mankind, diuers authors haue treated of it; who as I find, haue not onely

ſet downe their reaſons in nature as touching the vertue thereof, but alſo haue bin very ceremonious and ſuperſtitious in handling that argument; yea, and they haue written diſtinctly of the ſeuerall kinds of vrine digeſted into certain principal heads. And among other things, I remember, that they ſet down the vrine of * men that are vnable for generation, to be ſingular good by way of injection, to make women fruitfull. But to ſpeak of ſuch remedies as we may be bold to name with honeſty: the vrine of yong children who be not yet vndergrowne nor 14 yeres of age, is good againſt the venomous humor of the Aſpides or Adders which the Greeks name * Ptyades, for that they ſpit their poiſon vpon the eies and faces of men and women. Alſo the ſame is held to be ſingular for the pearle, the cataract, the filmes, the pin and web in the eies; like as for the eie-lids alſo, and the accidents happening vnto them. Being incorporate with the floure of Eruile, it is good for ſun-burnings: ſodden alſo with bolled leeks to the conſumption of the one halfe in a new earthen pot which was neuer occupied, it is excellent to mundifie the eares that run with matter, or that haue any worms or vermin within them: and verily a ſtouph made with the vapour of this decoction, bringeth downe the deſired ſickneſſe of women. Dame *Salpe* ordaineth to foment the eies with the ſaid decoction, for to fortifie the ſight, and to ſtrengthen them that they fal not out of the head: ſhe appointeth to make a liniment with it and the white of an egge, but principally if it be of an oſtrich, and therewith to annoint the skin that hath bin tanned and burnt in the Sun, for the ſpace of two houres together: with it a man may waſh away any blots or blurs of ink. Mans vrine is much commended for the gout in the feet, as wee may ſee by Fullers, who neuer be goutie, becauſe ordinarily their feet are in mens vrine. Stale chamber-lie or vrin long kept and incorporat together with the aſhes of oiſter ſhels, cureth the red-gomb in yong infants, and generally in all running vlcers: the ſame ſo prepared, ſerueth in a liniment for eating cankers, burns and ſcalds, the ſwelling piles, the chaps and rifts in the ſeat and feet, alſo for the ſting of ſerpents. The moſt expert and skilfull midwiues haue pronounced all with one reſolution, that for to kill an itch in any part of the body, to heale a ſcald head, to ſcoure away dandruffe and ſcurfe in the head or beard, and to cure the corroding vlcers in any place, but in the priuy members eſpecially, there is not a liquor more effectuall than vrine, with a little ſal-nitre put thereto. But ſurely, euery mans own water (if I may for reuerence of manhood ſo ſay) is ſimply beſt; and namely, if the Patient that is bitten with a dog, do ſtraightways bath the place therewith; or in caſe there be any prick of vrchin, hedghog, or ſuch like ſpill ſticking in the fleſh, to apply the ſame thereto in ſpunges or wooll, and ſo let it lie on. But ſay it was a mad dog that bit the Patient, or that he be ſtung with a ſerpent, it is good to temper it with aſhes and lay it vnto the ſore. For as touching the vertue thereof againſt Scolopendres, it is wonderfull what is reported, namely, That whoſoeuer be hurt by them, if they doe wet the crown of their heads but with one drop of their own vrine, it will preſently cure the ſame, ſo as they ſhall feele no more pain nor harm thereby. Ouer and beſides, by the ſpeculation of our vrine, we are able to giue iudgement and pronounce of health and ſickneſſe; for if the firſt water made in a morning be white and cleare, and the next after it higher coloured and inclining to a deep yellow, the former ſheweth that concoction was then begun, and the ſecond is a ſigne that digeſtion is now perfect. A red vrine is naught, but the black is worſt of all: likewiſe if it be ful of bubbles and froth aloft, and be withal of a groſſe and thick ſubſiſtence, the ſame is but a bad water. If the Hypoſtaſis or Sediment which ſetleth heauy to the botom, be white, it ſignifieth that there is ſome pain and grieuance like to inſue about the joints or principall parts within the body. Doth an vrine look greeniſh? it betokeneth ſome obſtruction or diſeaſe already in the noble bowels and inwards: is it of a pale hew: it ſaith that choler aboundeth in that body: If it look red, the bloud be ſure is predominant and diſtempered. The vrin is not to be liked but preſageth danger, wherin there appeare certain contents like brans & blackiſh clouds: alſo, a white thin, and wateriſh vrine is neuer good: but in caſe it be thick and of a ſtinking ſmell withall, it is a deadly ſigne, and there is no way but one with the Patient. As for children, if their water be thin and wateriſh, it is but ordinary and naturall.

The Magitians expreſſely forbid in making water, to lay bare the nakedneſſe of that part againſt Sun and Moon, or to piſſe vpon the ſhadow of any perſon. And therefore *Heſiodus* giueth a precept, to make water againſt a wall, or ſomething ſtanding full before vs, for feare leaſt our nakedneſſe being diſcouered, might offend ſome god or Angell. To conclude, *Hoſthanes* doth vpon his warrant aſſure vs, That whoſoeuer droppeth ſome of his owne vrine euerie morning

* *Spadonum.*

* Απο τῦ πτύειν, à ſputando, i. of ſpitting.

A morning vpon his feet, he ſhal be ſecured againſt all charms, ſorceries, and deadly poiſons whatſoeuer.

Chap. VII.

¶ *The remedies that womens bodies do miniſter.*

THe medicines which are ſaid to proceed from the bodies of women be ſuch, and the operations ſo miraculous, that they come nearer to the nature of monſtrous wonders than true reports of natural works: to ſay nothing of much miſchiefe and many wicked parts committed by the means of their vntimely births and infants ſtil born, which haue bin diſmembred and cut in pieces for ſome abhominable practiſes: to let paſſe the ſtrange expiations wrought
B by their monthly terms, and a thouſand more deuiſes which haue bin deliuered and ſet abroad not only by midwiues, but alſo by ſecret harlots that haue ſlipt their conceptions, and bin deliuered in corners. But to ſpeak of the foreſaid remedies which are in vre, and commonly known. The perfume that the hairs of a womans head make whiles they burn, chaſeth away Serpents. The ſmell thereof alſo raiſeth and reuiueth women, who in a fit of the mother lie ſpeechleſſe and breathleſſe. The aſhes verily of the ſaid hairs burnt in ſome earthen pan or fiſh-ſhell, being applied alone or with litharge of ſiluer, is a ſingular medicine for the aſperity of the eies, & the itch. *Item*, It taketh warts away, and cureth the red gum and ſores that infants be ſubiect vnto, if it be vſed with hony. The ſame aſhes mingled with Hony and Frankincenſe, healeth wounds in
C the head, and doth incarnat or fil vp with good fleſh hollow vlcers what ſoeuer they be. And incorporat with ſwines lard, it is good for the broad biles called Pani, for the gout, and S. *Anthonies* fire: it ſtaieth alſo any bleeding preſently, and ſtoppeth the running of ring-wormes and ſuch like.

Touching womens milke, it is holden by a generall accord, of all other to be ſweeteſt & moſt delicat: whereupon it is preſcribed by Phyſitians vnto thoſe that haue lien of a long & languiſhing feuer; as alſo to ſuch as be troubled with a fluxe occaſioned by a feeble ſtomacke: but in theſe caſes, that milk is reputed moſt wholſom which a nurce giueth that hath newly weaned her child: beſides, when the appetite of women is giuen to an inordinate longing after ſtrange things, in agues alſo, in gnawings and frettings of the ſtomacke, it is found by experience to be
D moſt effectuall. Likewiſe, being incorporat with Frankincenſe, it is ſingular good for the impoſtumes breeding in womens breſts. If the eies be bloudſhotten vpon any ſtripe, if they be in pain or troubled with a violent rheum falling into them, let a nource milk it in them, they ſhall find very much eaſe thereby: howbeit for the accidents abouenamed, it is held to be more ſoueraign, in caſe it be applied to the place together with hony & the iuice of the daffodil, or els with the pouder of frankincenſe: where by the way this would be obſerued, that for what vſe ſoeuer milk is imploied, that is ordinarily of more force which a woman giueth that bare a man child: but if ſhe was brought to bed of two twins, both boies, then it is beſt and moſt effectuall; prouided alwaies, that the mother her ſelfe do forbeare drinking of wine, & eat no meat or ſauces that be ſharp. Moreouer, this is knowne for certaine, that if womans milk be incorporat with the liquid
E white of an egge, and ſo applied to the forehead with wooll wet in the ſaid liquor, it ſtaieth the flux of humors into the eies. Moreouer, a ſoueraign remedy is milk againſt the venomous ſlime or ſpittle of toads, in caſe they piſſe or ſpurt into our eies. Alſo if they haue bitten one, there is not a better thing either to be drunk or dropped vpon the ſore, than breſt milk. It is a common ſaying, That whoſoeuer can meet at one time together with the milk of mother and daughter both, ſhall neuer need to feare all their life long any infirmities of the eies, ſo they be annointed or bathed therewith. Semblably, womens milk is ſingular for to cure the accidents befalling to the eares, if it be dropped in with a little * Opium put thereto: but if ſo be the eares are pained * *Modice admiſto opio.*
by reaſon of ſome ſtripe that they haue receiued, the ſaid milke would haue ſome Gooſe greaſe mixed with it, and ſo be inſtilled warme. And ſay that they haue a ſtrong and ſtinking ſmell
F with them, as commonly it falleth out in all long diſeaſes, there is nothing better than to put wooll into them, which is ſoked in breſt milk and hony together. If it happen that the eies look ſtill yellow after the jaundiſe, it is good to drop milk into them with the iuice of the wild Cucumber. This peculiar vertue it hath ouer and beſides thoſe abouenamed, if it be taken in drink, to help thoſe that haue bin poiſoned with the ſea-Hare, the worme Bupreſtis, and as *Ariſtotle* ſaith

ſaith,with the deadly Dwale called Dorycnion. In this maner alſo it cureth thoſe who ſe brains G
be troubled and intoxicat with drinking Henbane. Phyſitians likewiſe haue preſcribed to make a liniment with milk and Hemlock for to be applied vnto the gout. And ſome there be who vſe it in that caſe,together with Oeſype (*i*) the ſweat or fattineſſe of vnwaſhed wooll, and Gooſe-greaſe: in which manner it ſerueth in a peſſary to be put vp in the naturall parts of women, to aſſuage the pain of the matrice. To drink breſt milk is a good meane to ſtop a laske, as *Rabirius* writeth,& yet the ſame doth prouoke the monthly courſe of womens fleurs: what is to be ſayd now of a womans milk who hath born a maid child? ſurely it is better than the other in theſe caſes only;to wit,in ſcouring the skin of the face,and taking away the pimples,ſpots and freckles, which be therein. But I muſt not forget,that any breaſt-milke whatſoeuer,cureth the maladies incident to the lights: and if there be tempered therewith the vrine of a yong lad not ful four- H
teen yeares old,and Attick honey,ſo there be of each one ſpoontull, I find it to be an excellent remedy for to rid away the ringing end thumping within the ears. And to conclude,it is a generall ſpeech, That if dogs do lap and taſt the milke of a woman which hath borne a maid child, they will neuer run mad.

As touching the faſting ſpittle of a woman, it is judged to be a proper medicine for bloud-ſhotten eies;alſo for the rheum that hath taken a courſe thither, if ſo be the corners of the eyes be euer and anone bathed and wet therewith when they be hot and inflamed;but more effectually will this remedy work,in caſe the woman forbeare all meat and wine the day before. I read moreouer in ſome Authors, That if the head be bound vp with a womans haire-lace or fillet, it
eaſeth the pain thereof. And thus much in ſome good ſort as touching the medicines proceeding from women. As for the reſt that are written and reported,they exceed all reaſon,and there is no end of them. I

For firſt and formoſt it is ſaid,that if a woman whiles her monthly ſickneſſe is vpon her, bee ſet into the wind abroad with her belly naked,ſhe will ſcar away haileſtorms,whirlewindes, and lightenings,yea,and auert any violence of the weather whatſoeuer. And at ſea verily, any woman ſtanding openly againſt the weather bare,although ſhe haue not her fleurs,is enough to ſecure the ſailers and paſſengers from all tempeſts. As for the very monthly flux it ſelf of women, (a thing in other reſpects and at all times,as I haue ſhewed before,of a monſtrous nature) there be writers who tell and preſage wonders thereof, ſuch as be horrible, abhominable, and indeed not to be ſpoken:and yet ſome of theſe things I hold it no ſhame to deliuer in writing;namely, K
If it fall out juſt in the eclipſe of Sun or Moon,that a woman hath her ſickneſſe come down,the ſame is a peſtilent quality,and apt to breed diſeaſes incureable. Likewiſe, if haply the time of the change,when the Moon is in coniunction with the Sun,and thoſe things concurre together, the man who medleth with her during that time,ſhall not auoid his bane but it will bring vpon him ſome peſtilent malady remedileſſe. Moreouer,the venome thereof is ſo ſtrong at that time eſpecially more than at any other,that the preſence or breath only of a woman then, will infect and ſtaine any purple cloth. And yet bad enough it is at all times: for whenſoeuer they are in their fleurs,it skills not in what quarter of the Moone, if they goe about any field of corn with their nakedneſſe vncouered, yee ſhall ſee the canker-wormes, caterpillers, beetles, and all ſuch L
wormes and hurtfull vermine,to fall from the corn as they paſſe along. This inuention by the ſaying of *Scepſius* and *Metrodorus*,came from the Cappadocians,who being infeſted with a number of thoſe green flies called Cantharides,deuiſed this means to be rid of them; for they cauſed their women at the time of their monthly terms (ſauing the reuerence of womanhood be it ſpoken) to go through the ſtanding corne,with their cloths tuckt vp round about their waſt,and all bare beneath. In other countries yet they are more mannerly, and in a better reſpect to the honor of women,put them only to go barefoot for this purpoſe,with their haire hanging looſe about their eares,vngirt,vnlaced,and vnbraced. Howbeit, great heed muſt be taken, that they walke not thus at the Sunne-riſing,for then ſurely all the crop vpon the ground will wither and dry away to nothing. Alſo if a woman during her natural courſes doe but touch any yong vines, M
it is enough to marre them for euer. As for Rue and Iuie,Plants otherwiſe of themſelues moſt medicinable,and indued with ſingular vertues againſt poiſon,they will preſently die with their touch. Much I haue already ſaid of this ſtrong and peſtiferous venome,and yet I haue not written all. For ouer and beſides,certaine it is that if a menſtruous woman doe no more but touch a Bee-hiue,all the Bees will be gone and neuer come to it againe. Alſo if at ſuch a time ſhe han-

A dle any skains or ſlips of linnen yearn and ſet them ouer the fire to ſeeth, they will in the boiling turn black. Let her but take a barbers raſor in her hand, the edge wil turn and become blunt: nay if ſhe do no more but touch any braſen veſſel, it is wonderfull what a ſtrong ſauor it wil caſt, and how it wil ruſt and canker therupon; and the rather, if this fall out to be in the decreaſe or wane of the moon. Doth a woman at ſuch a time touch a mare that is in fole, it is enough to make her caſt the ſame before due time. And not onely ſo, but the very ſight of women in that caſe, although they be a great way off, is able to do much harm; but principally the firſt time that they haue the ſaid fleurs after the loſſe of their maidenhead; or otherwiſe during their virginity, when they firſt come down by courſe of nature of the owne accord. The malignitie of this venomous humor is ſo great, that the ſlime ingendred within the lake of Sodome in Iury, as viſcous as it is
B otherwiſe, will forgoe all that tenacity, and diuide in ſunder by nothing els but a thred infected with the ſaid menſtrual bloud, according as I haue declared heretofore. So forcible it is beſides that the very fire, which is of power to ouercome all things and change their nature, is not able to conquer and alter this: for burne or calcine it to aſhes, and ſtrew neuer ſo little thereof vpon any cloths that are to be waſhed or ſcoured in the Fullers mill, it wil change their color, though they were of purple, and cauſe any die whatſoeuer to loſe the freſh luſtre. And more than that, ſo pernicious is the quality of this venome, that as naturall otherwiſe as it is to women, it is no better than a poiſon to thoſe of their own ſex: for in caſe one woman with child be annointed about her naturall parts, with the foreſaid bloud of another, or do but ſtep ouer the place where it is, ſhe will immediatly fall to labour, and ſlip an abortiue birth. As for the famous curtizans,
C *Lais* and *Elephantis*, who haue written ſo contrary one to the other of this argument, and namely, as touching abortions, and of what efficacy the cole of Colewort, Myrtle, or Tamariske root is, after it hath bin quenched in the ſaid bloud; as alſo, how ſhe. Aſſes will not conceiue for ſo many yeres as they chance to eat Barly corns infected therewith; beſides other ſtrange deuiſes that they haue ſet abroach; I think them incredible, & I would not haue any credit at all giuen vnto their writings, conſidering the monſtruoſities & contrarieties which they haue put down; whiles the one preſcribeth medicines for to make fruitful, & the other ordaineth the very ſame, to hinder conception and cauſe them to be barren. Moreouer, *Bythus* of Dyrrhachium ſaith, that for to make a mirror or looking glaſſe cleare againe, which was dusked and dimmed by the aſpect of a menſtruous woman, the next way is to cauſe her to caſt her eies backward and to look
D ouer her ſhoulders vpon it again; he ſaith moreouer, that if women in that caſe haue about them the fiſh called a Barbill, they ſhal not by that means infect or do hurt at all, but the ſame menſtruous bloud ſhall loſe all the foreſaid ſtrength.

Well, as hurtfull and miſchieuous as it is otherwiſe, yet many there be who affirm it to be in many diſeaſes medicinable; and namely, for the gout, if the place be annointed therwith: as alſo if women while their monethly ſickneſſe is vpon them, doe handle the wens named the Kings euil, the ſwelling kernels behind the ears, the broad tumors or biles called Pani, ſhingles, S. *Anthonies* fire, felons, or violent flux of humors to the eies or other parts, there wil inſue much eaſe therupon. *Lais* and *Salpe*, two notable ſtrumpets, haue left in writing, That if the foreſaid menſtruous bloud beſtowed within a little locke of wooll that came from a blacke Ram, be worne
E incloſed within a ſiluer bracelet, it is a ſoueraigne remedy againſt the biting of mad dogs, and for Tertian and Quartan agues. *Diotimus* of Thebes reporteth, That any little peece or rag of cloth, yea, though it were but a thred ſtained therein, and ſo ſet handſomly into a bracelet, is ſufficient to do as much. *Sotira* the renowned midwife affirmed, That there was not in the world ſo good a thing againſt the Tertian & Quartan, as to rub & anoint therwith the ſoles of the patients feet: but much more effectualy would it do the deed, in caſe the woman her ſelf had the doing of it with her own hand, ſo as the ſick party know not thereof in any hand. And this (quoth ſhe) is a ſoueraigne medicine to raiſe them out of a fit of the Epilepſie, who are ſurpriſed and fallen therewith. *Icetidas* a worthy Phyſitian among the Greeks, aſſureth vs vpon his word, That Quartane agues will make an end and go away by the act of generation, at what time onely as a
F woman beginneth to enter into her fleurs. But this is agreed vpon by all authors profeſſed and ſeen in this theam, that if one be bitten with a mad dog, and ſo far gone, that he is * afraid of wa- * ὑδροφοβεῖν
ter, ſo as he dare not ſee it or drink at all, do but put a clout or ſhred of cloth dipped in the ſaid menſtruall bloud vnder the cup whereout hee is to drinke, hee ſhall immediatly be deliuered from that feare: And this commeth by that powerfull and predominant Sympathie, whereof

the

the Greeks write ſo much, between mad dogs and the ſaid bloud, conſidering, as I haue before- G
ſaid, that they begin firſt to run mad by taſting therof. This is known for certain, that the aſhes of a burnt cloth infected therewith, or of the bloud it ſelf calcined, is a ſingular pouder to heale the farcins or ſores of horſes and all ſuch laboring beaſts, ſo it be mixed with the ſoot of chimny or furnace, and al incorporat together with wax. Now ſay there be any garment or cloth polluted therewith, there is not any thing will take out the ſtaine, but the vrine onely of the ſame woman. The aſhes beforeſaid tempered alone with oile of Roſes into a liniment, and ſo applied in maner of a frontal to the forehead, allaieth the headach of women ſpecially. This alſo would be noted, That for the firſt yeare after a woman hath known a man, and ſo parted from her virginity, her fleurs are moſt ſharp, mordant, and fretting. Furthermore, this alſo is reſolued clearly among all writers, That there is no charme or enchantment whatſoeuer, of any validity to doe H
harm to that houſe where the ſide poſts or dore cheeks are ſtriked lightly ouer with menſtruous bloud: an argument I aſſure you, that conuinceth notably the folly of theſe Magitians, the vaineſt people vnder heauen, and ouerthroweth all their art: and a point that pleaſeth me very wel, & which for mine own part I am right willing to beleeue: and ſince I am light thus vpon them, I care not much, if to detect their vanities, I ſet downe one of the moſt modeſt receits that they haue giuen their word for, and which may ſeem to carry ſome ſhew of truth or probability. For thus they preſcribe with great warrantize, To take al the nail-parings of toes and fingers of man or woman lying ſick of an intermittent feuer, and to mix or incorporat them with wax, ſo as the party in the doing herof do ſay theſe words, *I am about a remedy for the Tertian, Quotidian, or Quartan ague* (according as the patient is troubled with the one or other of theſe feuers) which done I
and ſaid, to ſtick vp the ſaid wax vpon the dore of another man or womans houſe that is not ſick at all, and that before the Sun be riſen; which no doubt (as they ſay) wil cure the ſick perſon, and ſet the ague vpon another that was well before. Now would I gladly know what greater vanitie and folly there can be, if this medicine miſſe and do not the feat? or what more villany and miſchiefe, than thus to transfer and remoue diſeaſes from thoſe that be ſick already, vnto ſuch as be ſound and think no harme? To conclude, ſome of theſe Magitians are ſo far gone, that after all the foreſaid nailes of fingers and toes be pared, they ordaine them to be thrown into Ant-holes, and to obſerue that Emmet that firſt bigins to draw one of them into her neſt, to catch her vp quickly, and hang her about the necke of any one that is ſick of an ague, and ſo the patient *pro certo*, ſhall ſhake off the diſeaſe and be quite rid of it. K

Chap. VIII.

¶ *The medicines that are found in diuers ſtrange and forrain beaſts, as namely, the Elephant, Lion, Cammell, Hyæna, Crocodile, Chamæleon, Skinke, Water-horſes, and Ounces.*

THeſe be the remedies which the bodies of men and women do affoord: as many I meane as I may with ſome honeſty relate: and yet ywis many of them be ſuch as are not to be read out and vttered, but with leaue and patience firſt craued, for the reuerence that we owe to
chaſte eares. I know ful wel there is a great deale more behind that I haue not touched, but ſuch L
ſtuffe I aſſure you as is deteſtable and not fit to bee ſpoken or committed to writing, which makes me rather to make haſt and leaue the diſcourſe of Man and Woman, and ſo to proceed to the ſingular vertues and operations of bruit beaſts.

And to begin with the Elephant, The bloud of that beaſt, eſpecially the male, ſtaieth all fluxes of humors, which the Greeks cal Rheumatiſmes. The ſhauings of yvory (which is the Elephants tooth) incorporat with Attick hony, ſcatter (as folk ſay) the duskiſh ſpots that appeare in the viſage: like as the duſt thereof, which the file or ſaw doth make, cureth the whitflawes or impoſtumations breeding at the naile roots. The trunk or muffle of an elephant if it be but touched only, allaieth the head-ach; & the more effectuall it is, in caſe ſneezing come withall. It is
ſaid moreouer, if one take a piece of the right ſide of the ſame trunke, & carry it faſt about him M
with the red ocre of Lemnos (called Terra Sigillata) it will incite him mightily to carnal luſt. The bloud of an elephant is ſingular good for thoſe that be in a conſumption & waſt away: like as the liuer helpeth ſuch as be giuen to the falling ſickneſſe.

The greaſe or fat of a Lion tempered with oile of Roſes into an vnguent, preſerueth the skin of

20030
COPY 1

A of the face from all ilfauord ſpots,and keepes it white and ſmooth. The ſame ointment healeth th skin that is ſcorched and pilled with cold,by trauelling ouer mountains charged with ſnow; yea,and abateth the tumors & nodoſities vpon the ioints. Now, if we liſt to beleeue the fooleries of Magitians,they would bear vs in hand,that whoſoeuer be anointed all ouer with the ſaid greaſe,ſhall be gracious with princes and kings,yea,and win much fauor among the people,and any ſtate or nation where they ſhall converſe;but principally it muſt be the fat in the forehead between the eie-brows(where indeed it is vnpoſſible to find any at all.) The like effects they do promiſe of the Lions teeth,and thoſe eſpecially of the right ſide;like as of the ſhag haire (forſooth) that ſhould hang vnder their nether jaw. Indeed the gal of a Lion mixed with water,clarifieth the eieſight,in caſe the eies be bathed therwith:the ſame tempered with the own greaſe,
B diſpatcheth as they ſay the falling ſicknes,in caſe the patient taſt neuer ſo little of it,& ſo ſoon as he hath taken it,run a while for to digeſt the ſame. A Lions heart cureth a Quartane ague,if the ſick perſon do eat thereof;and their fat is a ſoueraigne remedy for the feuer Quotidian,if it be vſed with oile roſat. There is not a beaſt ſo fel and ſauage,but it wil run away from them that be anointed with Lions greaſe:and it is thought to be a ſingular preſeruatiue for to preuent any ſecret ambuſhes or practiſes intended againſt one.

As touching the Cammell, his braine (by report) is excellent good againſt the epilepſie or falling ſic kneſſe,if it be dried and drunk with vineger;ſo doth the gall likewiſe taken in drinke with hony:which alſo is a good medicine for the Squinancy.It is ſaid that a Cammels tail dri-
C ed cauſeth looſneſſe of the belly:like as the dung reduced into aſhes and incorporate with oile, doth curle and frizle the haire of the head. The ſaid aſhes made into a liniment and ſo applied, yea,and taken in drink as much as a man may comprehend with three fingers, cureth the dyſentery : ſo doth it alſo the falling ſickneſſe. Cammels piſſe(they ſay) is paſſing good for Fullers to ſcour their cloth withal:and the ſame healeth any running ſores which be bathed therein. It is well known that the barbarous nations keep this ſtale of theirs vntil it be 5 yeres old,and then a draught thereof to the quantity of one hemine, is a good laxatiue potion : likewiſe that the heire of their tails,twiſted into a wreath or cord,and ſo worn about the left arme in manner of a bracelet,cureth the Quartane ague.

As for the Hyæna,there is not a wild beaſt of the field that the Magitians haue ſo much in
D admiration as it:for they hold that in the Hyæna it ſelfe there is a certaine magicall vertue, attributing a wonderfull power thereto,in tranſporting the mind of man or woman,and rauiſhing their ſences ſo,as that it will allure them vnto her very ſtrangely. Concerning the rare property of theſe beaſts to chaunge the ſex each other yeare(*i.*) to be male this yeare, and female next; as alſo touching other monſtrous qualities obſerued in their nature;becauſe I haue diſcourſed already of them, it remaineth now that I proceed to ſhew the medicinable vertues that are reported to be found in them : wherof this may be counted for one of the chiefe,that conſidering they be ſo terrible * to Panthers,that they dare not quetch nor make head againſt them : who- *i. Luzernes,
ſoeuer hath about him but a piece of the Hyænes skin may be ſure that a Panther will not ſet vpon him,nor once come neere. And that which is a wonderfull thing to be ſpoken, in caſe the
E hides of them both be hung vp one againſt another,the haire of the Panther will fall off. When the Hyænaes flie before the hunter and would not be taken,they wind with a cariere out of the way toward the right hand,and wheele about vntil the man be gotten before them;& this they do,becauſe they would meet with his tracts and footing;which if they happen vpon,and get behind him,you ſhall ſee the hunter incontinently to be ſo intoxicat in his brain,that he is not able to beare his head nor ſit his horſe,but to fall from his back. But in caſe that they turn on the left hand,it is an euident ſigne that they be ready to faint,and then will they quickly be taken. The ſooner alſo and with more eaſe be they caught (if we may beleeue art Magick) if the hunter tie his girdle about his middle with 7 knots,and the cord of his whip likewiſe wherwith he ruleth and jerketh his horſe,with as many. But ſee how ſubtil and cunning theſe Magitians bee
F to cloke and colour their vanities and deceits, with ſuperſtitious circumſtances! This chaſe forſooth after the Hyæne,muſt be iuſt at the very point when the moon is paſſing through the ſign Gemini:and then if they be taken,the huntſman muſt be ſure to ſaue euery haire of their skins, and miſſe not one,ſo medicinable they are. By their ſaying alſo the skin that grows to the head of the Hyæne,if it be applied in manner of a frontall,is ſingular good for the headach : the gall of the Hyæne cureth bleared eies,if the forehead be anointed therwith:but if the ſame bee ſod-

den

den with three cyaths of Attick hony and one ounce of Safron, to a liniment, it is an excellent G
preſeruatiue to keep one from euer being blear-eied, if ſo be the eies be annointed with it. The
ſaid compoſition likewiſe is ſingular for to rid away the cloudy films and catarracts that breed
in the eie. But for to clear the ſight & quicken it, the older this medicine is, the better they hold
it to be. And kept it muſt be in a braſen or copper box; which eie-ſalue they ſay, ſerues alſo for
the mailles or ſpots, for the aſperities, excreſcences, cicatrices, dents, & excauations remaining
in the eies. The grauie or dripping likewiſe of the Hyænes liuer, newly taken out of the body
and roſted, being incorporat with clarified hony into an vnguent, riddeth away the red film that
ouercaſteth the apple of the eie and darkneth the ſight thereof. They will make vs beleeue, that
the Hyænes teeth are good for the tooth-ach, if the pained teeth be but touched therwith, or if
the ſaid teeth be arranged in order, and ſo applied faſt vnto the patients teeth, as they may fit e- H
uery tooth in his head. The ſhoulders alſo of the Hyæne are proper to eaſe the paines that lie
in our ſhoulders and arms both, ſo they be ſet likewiſe orderly and hanged cloſe to the grieued
parts. The teeth of rhe ſaid Hyæne plucked out of the left ſide of the chaw, and bound vp ſure
within a piece of a ſheep or goats skin, is right ſoueraigne to be worn in manner of a ſcutcheon
or ſtomacher for to eaſe the intollerable paines of the ſtomacke. A diſh of meat made of their
lungs and eaten, is ſoueraigne for the flux proceeding from a feeble ſtomack. But if the ſame be
burnt and reduced into aſhes, and ſo brought into the form of a liniment with oile, and applied
accordingly, it comforteth the ſtomack mightily. The pith or marrow taken out of the backe-
bone along, and incorporat with old oile and * gall, is paſſing good for the nerues. The liuer of
the Hyæne driueth away Quartan agues, in caſe the patient take three bits thereof one after a- I
nother before the acceſſe. Take the aſhes of the Hyænes ridge bone, the tongue and right foot
of a Seale, put thereto a Buls gall, ſeeth them all together and make a cataplaſme thereof, ſprea-
ding the ſame vpon a piece of a Hyænes skin, and apply it accordingly, you ſhall ſee how it will
eaſe the pain of the gout. The very gal likewiſe of this beaſt mixed with the pouder of the ſtone
Aſius, is commended by them for to cure the ſaid malady. They that are ſubiect to trembling
and to the cramp, ſuch alſo as be giuen to leap out of their beds, or are troubled with the bea-
ting and panting of the heart, ought to take and boile the heart of the Hyæne, and eat one part
therof, and with the other being burnt to aſhes and with the brains of the ſaid Hyæne together
reduced into a liniment, to annoint the grieued part. This compoſition likewiſe ſerueth to take
away the hairs of any place, if it be annointed either with it alone, or els with the gall, & in caſe K
one would not haue them euer to come vp againe, they ought to be plucked vp before, and then
the place to be annointed. Thus they vſe to rid away the haires of the eie-lids that be trouble-
ſome. In like manner for the pains of the loins, the fleſh about the Hyænes loines is preſcribed
to be eaten, and therwith oile together, and the place alſo is to be rubbed well and beſmeared.
They ſay moreouer, that if a woman which is barren, eat the eie of a Hyæne with Liquorice and
Dill, ſhe ſhall proue fruitful: and ſo neare they go, as to promiſe ſhe ſhal conceiue within three
daies after. And (by their report) whoſoeuer are haunted with ſprites in the night ſeaſon, and be
affrighted with ſuch bugbears, let them but take one of the maſter teeth of the Hyæne, & weare
it about them tied by a linnen thred, they ſhall be freed from all ſuch fantaſtical illuſions: theſe
Magitians alſo giue direction to thoſe that be out of their wits and gon beſides themſelues, to L
haue a perfume made with the ſmoke of thoſe teeth, and to weare one of them hanging before
the breſt, with the fat growing about the kidnies, or els with the liuer or the skin. If a woman be
with child, and would gladly go out her full time, let her take a peece of the white fleſh of this
beaſt, and 7 haires, neither more nor leſſe, together with a ſtags pizzle; bind them all faſt within
the skin of a Buck or Doe, and ſo weare them hanging about her necke juſt againſt her breaſt,
ſhe ſhall not ſlip an vntimely fruit. Furthermore they promiſe in the behalfe of this beaſt, that
if a man or woman do eat the genitall member of a Hyæne, according to their ſex, they ſhall be
prouoked to fleſhly luſt, how cold ſoeuer the man were before, and could not abide to imbrace a
woman. Ouer and beſides, if the ſaid pizzle and ſhap of this beaſt be kept in any houſe, together
with a joint of the ridge bone, skin & al as it groweth too, the whole family ſhal agree together M
well, and liue peaceably; now this ioint or knot aboueſaid they call Atlantion, and it is the very
firſt ſpondyle of them all. The ſame alſo they make no ſmall reckoning of, but hold it for a ſpe-
ciall remedy for the falling ſickneſſe. Fry the greaſe or fat of an Hyæne, the fume therof (by re-
port) wil chaſe away ſerpents: a piece of the chawbone beaten ſmal to pouder & eaten together
with

* *Felle*: ſome read *melle*, i. Honey.

20030
copy 1

A with aniſe ſeed, doth mitigat the quiuering & quaking in a cold ague fit. A ſuffumigation made therwith, draweth down womens ſickneſſe, if we may beleeue magitians; who are grown to this paſſe in their vanity, that they auoueh for certain, that if an archer do bind vnto his arm a tooth of an Hyæne, growing on the right ſide of the vpper chaw, hee ſhall ſhoot point blanke and neuer miſſe his mark. Take the palat or rouſe of the mouth of this beaſt dried and made hot together with Ægyptian Alumne, put the ſame into the mouth and change it three times for new ſtil, they promiſe it ſhal correct a ſtinking breath, and heale any vlcers or cankers in the mouth. And as for thoſe that weare vnder the ſoles of their feet within the ſhoo, a Hyæns tongue, there is not a dog will be ſo hardy as to bay or bark at them. The brain of the Hyæne lying in the left ſide of the head, eaſeth any deadly diſeaſes of man or beaſt, if the noſthrils be annointed there-
B with. The skin of the forehead ſerueth as a countercharm againſt all witch-craft and inchauntments. The fleſh growing to the nape of the necke, being dry and made into pouder, appeaſeth the pain in the loins of the backe, either eaten or drunk, it skils not whether. For the griefe of ſinews, they giue order to make a ſuffumigation with the nerues of Hyæna, which run along the ſhoulders and back. And the hairs growing about the muzzle of this beaſt, haue an amatorious vertue with them, to make a woman loue a man, in caſe her lips be but touched therewith. The liuer of the Hyæna giuen in drink, cureth the cholique and ſtone. As for the heart, be it taken in meat or drink, it eaſeth all the pains of the body: the milt cureth the ſpleen: the kell with the fat about it, helpeth any inflammation of vlcers if it be applied with oile: the marrow within the
C bones, appeaſeth the griefe of the backbone and ſinews; and finally, doth recouer and refreſh the wearineſſe of the reins and kidnies. The ſinews of this beaſt drunk in wine with frankincenſe, reſtore women to the fruitfulneſſe of the wombe, eſpecially when by indirect meanes of ſorcery they are become barren and vnapt for conception. The matrice of the female Hyæne giuen in drink with the rind of a ſweet pomegranat, is a very comfortable medicin for that part in a woman. A ſuffumigation made with the fat taken from the hetchfill piece or loines, is ſingular for thoſe women that be in hard trauell of childe, and procureth them ſpeedy deliuerance: the marow or pith out of the ridge bone whoſoeuer carrieth about them, ſhal find help againſt vain illuſions and fantaſticall imaginations. The pizzle of the male Hyæna, if it be burnt, caſteth a fume which is good for them that haue any ſinews pluckt with the cramp. Saue the feet of this
D beaſt, and the very touching of them is ſoueraigne for bleared eies, for ruptures, & inflammations: but this regard muſt be had, that the left foot be applied to thoſe griefes in the left ſide, and the right to the contrary. But wot ye what? if the right foot of the Hyæna chance to be carried ouer a woman whiles ſhe is in labour of childbirth, ſhe ſhall ſurely die of it; but contrariwiſe, let it be the right foot, ſhe ſhall haue a quick diſpatch and be deliuered with eaſe. The skin or purſe that holdeth the gall, beeing either drunke in wine or taken with meat, helpeth thoſe that for weakneſſe of ſtomack be apt to faint and fall into cold ſweats: and the bladder taken with wine, cureth thoſe that cannot hold their water. Now look what vrine is found within the bladder of this beaſt, you muſt thinke it is an excellent drink if it be mixed with oile, Seſame ſeed, and hony, for any old griefe whatſoeuer. The firſt rib and the eighth wil make a perfume, which
E is paſſing good for thoſe who are burſten: the ſpondyles or ioints of the ridge-bone, are as conuenient for women in trauell of child-birth: and the Hyæns bloud taken inwardly with fried barly meale, doth mitigat the wrings and gripes of the belly. If the ſide poſts or dore cheeks of any houſe be ſtriked with the ſaid bloud, whereſoeuer Magitians are buſie with their feats and jugling caſts, they ſhall take no effect, whether they be charms, exorciſmes, or inuocations: inſomuch as they ſhall not be able to raiſe vp ſpirits, nor haue any conference with familiars by any means of conjuration, whether it be by torch-lights, by baſon, by water, by globe, or otherwiſe. The fleſh of this beaſt eaten, is very effectuall againſt the biting of a mad dog; and yet the liuer is of greater efficacy in this caſe. If there chance either fleſh or bone of man or woman whom this beaſt hath killed and deuoured, to be found in the maw, ſurely the perfume thereof is a preſent remedy for the gout, as theſe Magitians would ſeeme to perſuade vs. But how if there be
F found the nails of man or woman there? then wo be to all thoſe that were at the hunting and taking of this beaſt, for it preſageth that one of them is ſure to die for it. Beſide all this, they do affirme, That either the excrements or bones which the Hyæna diſchargeth out of the belly at the time that ſhe is killed, ſerue for countercharms or preſeruatiues againſt ſorceries and practiſes of Magitians. As for the ordure or dung which is found within her guts, being dried and ta-

ken in drinke, is auaileable againſt the dyſentery: and the ſame reduced into a liniment with G
gooſe greaſe and ſo applied, helpeth thoſe that by ſome poiſon are infected all the body ouer.
The greaſe likewiſe of this beaſt vſed as an ointment, hath a ſingular property to cure the biting of a dog, ſo that the patient be couched vpon the skin of the ſaid Hyæna, as ſay our Magitians: who affirm moreouer, that a decoction made with the aſhes of the paſtern bone of the left leg, boiled together with the bloud of a weazil, cauſeth as many as be anointed all ouer therewith, to be odious in the eies of all men. The ſame effect do they attribute to the decoction of the eie. But of all the fooleries that they haue broched as touching the Hyæna, this paſſeth and may go for the chiefe, That the hindmoſt end of the gut in this beaſt is of vertue, that no captain, prince, or potentat, ſhall be able to wrong or oppreſſe thoſe who haue but the ſame about them: but contrariwiſe aſſureth them of good ſpeed in all their petitions, and of happy iſſue in H
all ſuits of law and trials of iudgements. The concauity or wrinckle thereof, if a man do weare faſt tied about his left arme, is ſo forcible to charme a woman, that if he do but ſet his eie vpon her, ſhe will leaue all and follow him preſently. The aſhes of the haire growing therabout made into a liniment with oile, and applied accordingly, cauſeth thoſe men who before were giuen to lewd wantonneſſe and liued in bad name, not onely to become chaſt and continent, but alſo to put on grauity and grow ſtaid in their behauiour. Thus much of Hyæna.

For fabulous tales, the Crocodile may challenge the next place: a beaſt this is which naturally doth liue as well on land as in water: for two kinds there be of them; whereof the former (keeping thus in both elements) hath this eſpeciall vertue, if we may beleeue theſe Magitians, To prouoke vnto carnal luſt, if the teeth which grew in the right ſide of the chaw, be hanged faſt I
likewiſe to the right arme of man or woman. The eie-teeth of the ſaid Crocodile, filled vp with frankincenſe (for hollow they be) and tied to any part of the body, put by thoſe periodicall feuers which vſe to return at ſett and certaine hours; but then the patient muſt not for fiue dayes together, ſee the party who faſtened the ſame about him. And they report likewiſe, that the little grauel ſtones taken out of their belly, be of the ſame vertue to driue away the ſhaking fits of agues when they are comming; which is the cauſe that the Ægyptians vſe ordinarily to anoint their ſick folke with the fat of this beaſt. The other Crocodile reſembleth this in forme; but far leſſe he is, and keepeth only vpon the land, liuing vpon moſt ſweet and redolent flours. In which regard, much ſeeking there is after his guts, for the pleaſant ſenteurs and odors wherewith they be ſtuffed ful: this dung they cal Crocodilea, a ſingular remedy for all the diſeaſes of the eies, K
and namely againſt cataracts, ſuffuſions, and miſtie films, if they be anointed with an eie-ſalue, made of it and the iuice of Porret mixed together. The ſame brought into a liniment with the oile Cyprinum, ſerueth to take away all pimples that riſe in the face, and clenſeth the skin from thoſe ſpots that blemiſh the viſage. But if it be incorporat with water, it ſcoureth what ſoeuer accidents be apt to run ouer the face, and reduceth the skin vnto the natiue color; for it riddeth freckles, moles, and generally any ſpots or flecks that marre the beautie or fauour. The ſame is good to be drunke in oxymell to the weight of two oboli for the falling ſickneſſe: and applied in forme of a peſſarie, it prouoketh womens fleurs. Now if you would chuſe the beſt Crocodilea, take that which is whiteſt, brittle, or eaſie to crumble, leaſt weighty in hand, and withall L
ſwelling in manner of a leuaine, if it be rubbed between the fingers. The manner is to waſh it, as they do white lead called Ceruſſe. Sophiſticated it is with amyll, or the ſcouring Fullers clay & Tuckers earth called Cimolia; but principally with the dung that ſterlings meut, which are of purpoſe caught and fed only with rice. Now there is not a better thing in the world (ſay theſe Magitians) for the cataract, than to anoint the eies with it and honey together. And if a man may beleeue their words, there is a ſoueraigne perfume made of the guts and the whole body beſides, for women who are ſicke of the mother, or otherwiſe diſeaſed in the matrice, if they ſit ouer it whiles it ſmoketh. In like manner, it doth them good to be lapped round about with wooll that hath bin ſo perfumed. The aſhes of the Crocodiles skin, as well the bigger as the leſſe, brought into a liniment with vineger, and applied vnto thoſe parts of the body which M
had need to be cut away or diſmembred, cauſeth the patient to haue no ſenſe or feeling at all either of ſaw or launcer. The very ſwoke alſo of the ſaid skin burning, doth the ſemblable. The bloud of both Crocodiles mundifieth the eies, and cauſeth them to ſee cleare which are annointed therewith, remouing the films and diſpatching the ſpots that impeach the ſame. The very body or fleſh it ſelfe of the Crocodile, all ſaue head and feet, is good meat ſodden, for

thoſe

20030
copy 1

A thoſe who bee troubled with the Sciatica: the ſame cureth an old cough, eſpecially the chin-cough in children; and aſſuageth the paine of the loins. The Crocodiles haue a certaine fat in them that is depilatorie; for no ſooner is the hare rubbed therewith, but preſently it ſheddeth. The ſaid fat or greaſe preſerueth thoſe who be anointed therewith, from the danger of the Crocodiles, and is excellent good to bee melted and dropped into the wounds made by their bit. The Crocodiles heart wrapped within a lock of wooll which grew vpon a black ſheep, & hath no other color medled therewith, ſo that the ſaid ſheep were the firſt lambe that the dam yeaned, is ſaid to driue away quartane agues.

To this diſcourſe of Crocodiles, wee ſhall not doe amiſſe if we annex other beaſts in ſome
B ſort reſembling them, and which be likewiſe ſtraungers as well as they. And to begin with the Chamæleon, *Democritus* verily made ſo great reckoning of this beaſt, that hee compiled one entire booke expreſſely of it, and hath anatomized euery ſeuerall member thereof: and certes, I cannot chuſe but take great pleaſure therein, knowing as I do by that meanes how to deſcicipher and deliuer abroad the loud lies of vaine Greekes. This Chamæleon for ſhape & bigneſſe, is much anſwerable to the Crocodile laſt named, differing onely in the curbing or crookedneſſe of the ridge-bone, and largeneſſe of the taile. There is not a creature in the world thought more fearefull than it; which is the reaſon of that mutability whereby it turneth into ſuch varietie of colours: howbeit of exceeding great power againſt all the ſorts of hawkes or birds of prey; for by report, let them fly and ſoare neuer ſo high ouer the Chamelæon, there is an attractiue vertue that will fetch them downe, ſo as they ſhall fall vpon the Chamelæon and
C yeeld themſelues willingly as a prey to be torne, mangled, and deuoured, by other beaſts. *Democritus* telleth vs a tale, That if one burn the head and throat of the Chamæleon in a fire made of oken wood, there will immediatly ariſe tempeſts of rainy ſtormes and thunder together: and the liuer will do as much (ſaith he) if it burne vpon the tiles of an houſe. As for all the other vertues which the ſaid author aſcribeth to the Chamæleon, becauſe they ſmell of witch-craft, and I hold them meere lies, I will ouerpaſſe them all, vnleſſe they be ſome few, for which he deſerueth well to be laughed at, and would indeed be reproued by no other means better: namely, That the right eie of this beaſt if it be pulled out of the head whiles it is aliue, taketh away the pearl, pin and web in man or womans eies, ſo it be applied therto with goats milk. The tongue likewiſe plucked forth quicke, ſecureth a woman from the danger of childbirth, if ſhee haue it
D bound to her body whiles ſhee is in trauell. If there be found by chance a Chamæleon in the houſe where a woman is in labor, ſhe ſhall ſoon be deliuered in ſafety: but if ſuch an one bee brought thither of purpoſe, the woman is ſure to die. Alſo, the Chamæleons tongue pulled out of the head whiles the Chamæleon is quicke, promiſeth good ſucceſſe in iudiciall trials. The heart bound within black wooll of the firſt ſhearing, is a moſt ſoueraigne remedy againſt quartan agues. The right forefoot hanged faſt to the left arm within the skin of a Hyæna, is ſingular againſt the perrils and dangers by theeues and robbers; as alſo to skar away hobgoblins and night ſpirits. In like manner, whoſoeuer carry about them the right pap of this beaſt, may bee aſſured againſt al fright and feare. But the left foot they vſe to torrifie in an ouen with the herb called alſo Chamæleon, and with ſome conuenient ointment or liquor to make in certaine
E troſches, wherof if a man do carry any in a box of wood about him, he ſhal go inuiſible, as ſayth *Democritus*, if we were ſo wiſe as to beleeue him: who affirmeth moreouer, That whoſoeuer hath about him the right ſhoulder of the Chamæleon, ſhall bee able to ouerthrow his aduerſarie at the barre, and to vanquiſh his enemie in the field: but firſt, hee muſt be ſure to caſt away and make riddance of the ſtrings and ſinewes belonging thereto, and to tread them vnder-foot. As for the left ſhoulder, I am aſhamed to relate, vnto what monſtrous ſpirits hee doth conſecrate it; and namely how by the vertue thereof, a man may cauſe what dreames and fantaſticall illuſions hee liſteth, yea, and make thoſe whome hee will himſelfe, to imagine the ſame apparitions. As alſo, how the right foot of the ſaid beaſt driueth away all ſuch ſtrange viſions; euen as
F the lethargie will goe away by the meanes of the left ſide of this beaſt, which lethargie was occaſioned by the right. Touching head-ache, hee ſayth plainely, that the next way to cure it, is to beſprinckle and wet the ſame with wine, wherein either of the two ſides were ſoked. Take the aſhes (quoth hee) of the left thigh or foot, chuſe you whether, incorporate the ſame with the milke of a Sow, and therewith annoint the feet, it wil be an occaſion, ſpeedily to bring the gout vpon them. But of the Chamæleons gall, for the moſt part, folk are in manner verily perſuaded,

that it will rid the pin and web, the cataract also of the eies, with three daies anointing; chase away serpents if it be dropped into the fire; gather al wezils in a country together, only by throwing it into the water; and fetch off haire if the body be anointed therewith. It is a common saying also, That the liuer of this beast is of the same effect, in case it be brought into a liniment with the lights of a hedge land-tode: like as, that all amatorious drinks & loue-charms become void and of none effect by the said liuer. As for those who be troubled in mind & giuen to melancholy, they find remedy, if out of this beasts skin they drink the juice of the herb Chamæleon. Furthermore, the guts, and the dung therein contained (and that is worthy to be noted, considering this beast liueth vpon no meat at all) being striked vpon the dore of an enemies house, together with the vrine of apes, cause him to be hated of all the world. The like wonders they report of the Chamæleans taile, namely, how it wil stay any violent streame of riuer; stop the course and inundations of waters; and withall, bring asleep and mortifie serpents. The same being aromatized or spiced with Cedar and myrrh, and tied fast to a branch of the Date tree growing double or forked, wil diuide the waters that be smitten therewith, so as a man may see whatsoeuer is in the bottome. And would God *Democritus* himselfe had met with one crop of this branch, to haue made him hold in so many lies as he hath told, considering hee hath reported this quality of it among other, namely, to represse intemperat speech and inordinat walking of the tongue: But euident it is, that the only reason why *Democritus* faulted that way (being otherwise a man of a singular wit and wholly addicted to the good of mankind) was an excessiue and extraordinary zeale that he had to profit and benefit the whole world. G H

Much like to this kind is the Skink (whom some haue named the land Crocodile) saue that the skin is whiter & more fine. But the principal difference is this, for that the bristles or scales are couched so, as they tend from the taile vpward to the head; whereas in a crocodile the same are set contrary. The biggest of this sort, be those of India: the next be they which are brought out of Arabia; & transported they be to vs salted. The muffle & the feet giuen to drink in white wine, do inflame the heat of lust; but especially when they be mixt with Satyrion and Rocket seed, of each one dram, mingled with two of pepper; and when they be wrought into troches weighing euery one a dram, one of them must be taken at once. But the very flesh of the Skinks sides, drunk to the quantity of 2 oboli, with myrrh and pepper in like proportion, are supposed to be more effectuall for this purpose. The same (as *Apelles* reporteth) taken both before & also after meat, is a singular preseruatiue against invenomed arrows. Besides, it is one of the ingredients which go to the noble compositions that be called Antidots. Howbeit, *Sextus* is of opinion and doth write, that if a man drink aboue one dram weight of it in a hemin of wine, it is enough to indanger his life. Moreouer, the iuice or broth of the Skinks flesh boiled and taken with hony, is thought to keep downe th flesh and to coole lust. I K

As touching the riuer-horse called Hippopotamus, there is a great affinity or kindred rather between him and the crocodile, in regard that they both do haunt the same riuer, and participat both of land & water. This beast (as I haue shewed hertofore) deuised first the practise of phlebotomy or bloud-letting. Great store there be of them beyond the Seignory Saitica in Ægypt. Take the ashes of this beasts hide, and reduce them with water into a liniment, it is singular to cure the broad biles or apostemations called Pani. The grease, and likewise the dung, is good against the cold fits of agues, if the patient receiue the perfume thereof. The teeth which grow on the left side of the mouth, do ease the tooth-ach, if so be the gums be scarified therewith: the skin taken from the left side of the forehead, laid vnto the share and kept fast thereto, staieth the prouocations to venery. The ashes of the same doth cause the hair to grow again thick in those places, where by disease it is shed. Take of the genetoirs of this water-horse, the poise of one dram, and drink it in water, it is a good counterpoison against the venome of serpents. As touching their bloud, it serueth painters in good stead. L

The Onces be likewise taken for strange and forrein, and of all foure-footed beasts they haue the quickest eie and see best: by the testimony of all writers, there is in the Island Carpathos, a singular kind of ashes made of their houfs, burnt together with their hide: and they hold, that if men drink therof, they will become chast, were they neuer so licentious and libidinous before: again, let women cast the same vpon their nature or priuie parts, it will coole their appetite of mans companie; yea and kill the itch in any part of the body, if it be rubbed therwith. And the vrine of this beast helpeth the Strangurie, to wit, the infirmitie of the bladder when the water M

passeth

20030
copy 1

A paſſeth by drop-meale: which propertie they being by a naturall inſtinct aware of, ſo ſoone as euer they haue piſſed, do hide and couer the vrine with mould, which with their feet they raiſe juſt ouer it, as it is commonly reported. The ſame vrine is preſcribed for a good remedy in the pain or griefe of the throat. Thus much may ſuffice as touching forrein beaſts: returne therfore now I will to thoſe in this part of our world; and firſt declare the vertues and properties medicinable which are found common in al liuing creatures, yet making choiſe of thoſe that be ſingular aboue the reſt.

Chap. IX.

B ¶ *The common and ordinary medicines drawne as well from wild beaſts as thoſe which be tame of the ſame kind. The vſe of milk in Phyſicke, with the obſeruations belonging thereto. Alſo of Cheeſe, Butyr, the greaſe alſo and tallow of beaſts.*

AND to begin with Milk: theſe points following are to be obſerued: *Imprimis*, Each liuing creature liketh beſt and findeth moſt good by the own mothers milk. *Item*, For nources to conceiue with child whiles they giue ſuck, is a moſt hurtful thing to their babes: for after ſuch a time, their milk will thicken and cruddle in manner of a cheeſe (a dangerous matter for ſucking infants) who thereupon be called Coloſtrati. Now the beeſtings, called in Latine Coloſtra, is that thick and ſpungeous milk which is drawne firſt from the teat after the birth of the
C yong, be it in woman or beaſt. Alſo, there is no milk ſo nutritiue as that of a woman, what ſoeuer it be: next vnto which, goats milk is thought to nouriſh moſt: whereupon haply aroſe the fable that Poets fained, who deuiſed, that *Iupiter* was ſuckled therewith. Howbeit, letting womans milke aſide, the ſweeteſt of all other is that which the Camels giue: but aſſes milk is ſuppoſed to haue moſt vertue and efficacie in it. Moreouer, this is to be noted, that the bigger bodied beaſts be more glad-milch, and their milk ſooner paſſeth away through the belly and is eaſier digeſted than that of the ſmaller kind. Goats milk agreeth beſt with the ſtomack; the reaſon is this, becauſe they brouſe rather than graze: but cow milk is held to be more aromaticall and medicinable; howbeit ewes milk is the pleaſanter, & yeeldeth more nouriſh nent; notwithſtanding it be not ſo wholſom, for that it is more fatty and groſſe than any other. And generally,
D the milke which any beaſt giueth in the Spring, is more wateriſh & fuller of whey than in ſummer time: like as the milke of any young thing is thinner than other. But ſimply the beſt milk is that held to be, which ſticketh to ones naile and wil not run off. Milk is leaſt offenſiue and hurtfull when it is ſodden, eſpecially with little grauell ſtones among. Cow milk of all other is thought meeteſt for to make the body ſoluble. But what milk ſoeuer it be, leſſe ventoſities it ingendreth boiled than raw. In ſum, this property hath milk in generall, To heal all inward vlcerations, but chiefely of the kidnies, bladder, guts, throat, & lungs: applied outwardly, after a ſpare diet or abſtinence from meat, it cureth the itch of the skin; & any wheals & breakings forth occaſioned by phlegmatick humors. As for the diet drink made of cow milk (which they vſe in Arcadia for the phthyſick or conſumption of the lungs, for thoſe that be giuen to
E colliquations and to weare away, as alſo in caſe of miſliking when the habit of the body receiueth no benefit by food) I haue written already in my treatiſe of herbs. We ſhall find vpon record in the Chronicles, diuers who by drinking aſſes milk, haue bin deliuered from the gout, as wel of hands as feet. The Greek Phyſitians, beſides the generall kinds of milk, haue made mention of one more, which is artificiall, and they name it Schiſton: the maner of making it is thus: Take what quantity you will of any milke, but let it be of a goat eſpecially, if you can come by it, ſeeth the ſame in a new earthen pan neuer occupied before, with certaine branches of fig-tree, ſuch as be freſh and new gathered; but you muſt put to euery hemine of milke, one cyath of mead or honied wine: while it doth ſeeth, keepe it from running ouer the veſſell, by plundging
F into it a ſiluer gobblet or boll full of cold water, and take heed that none thereof doe run out: after it is throughly ſodden take it from the fire; for when it is cooled, you ſhall ſee how the parts therof wil diuide, and the whey depart from the milky ſubſtance. Some there be, who take the very whey againe, being now very ſtrong of the mead or Muſt aboue ſayd, and boile the ſame vntill a third part thereof be conſumed, and then ſet it a cooling abroad in the open ayre: The vſe heereof is very effectuall and commodious, if for fiue daies ſpace together, the Pa-

tient take at times, with ſome reſt between, one hemine thereof in a day; but after the drinking G
of this whey, if ſome exerciſe by geſtation be preſently vſed, it will haue the better operation.
This drinke is vſually giuen to thoſe that be ſubiect vnto the falling ſicknes, the paſſions of melancholy, and the palſie; alſo for the leproſie, elephanſie, and all gouts or diſeaſes of the ioynts.
But to returne againe vnto milk: a clyſtre made therewith, is excellent good againſt any inward
gnawings and frettings occaſioned by the taking of ſome ſtrong purgatiue medicines. Alſo in
caſe of the dyſentery, or hot exulceration of the bowels, the decoction of milk ſodden together
with the grauell ſtones about the ſea-ſide, or with barly ptiſan, is paſſing good to be clyſterized;
but for the corroſian of the guts, the milke of kine or ewes is better than any other. Alſo for the
dyſentery or bloudy flix, the milk that is injected by way of clyſtre, would be freſh and newly
drawne from the vdder: for the cholique, it ought to be miniſtred raw without any boiling: in H
like maner is it to be vſed raw, for the diſeaſes of the matrice, the ſting of ſerpents, the phthyſick
the poiſons of the Cantharides, Salamander, Bupreſtis, & Pityocampe. But to grow vnto more
particulars, cow milk is ſingular for them who be poiſoned with drinking Colchicon, hemlock,
Dorycnium, or the venome of the Sea-hare. As for aſſe-milk, it is ſoueraign good for thoſe who
haue taken inwardly, any plaſter ceruſe, * brimſtone, or quick ſiluer: alſo to looſen the belly that
is coſtiue in a feuer: moreouer, if the throat be exulcerat within, it is an excellent thing to gar-
garize therewith. The ſame is a very good reſtoratiue for them to drink, who after great weaknes
are vpon their recouerie and would gather ſtrength againe: ſuch alſo as the Greekes call Atro-
phos, who haue no feeling nor benefit of their meat: alſo it may be allowed in an ague, ſo that
the patient haue no head-ach. It was held in old time for a notable ſecret in Phyſick, to giue vn- I
to children before meat one hemine of aſſes milke; or at the end of a meale, if they felt any fret-
ting or gnawing occaſioned by their meat: but for default hereof, they vſed goats milke in ſtead
of the other. The whey of cow-milke is aboue all, ſoueraigne for thoſe that be troubled with
ſtraitneſſe of breath, ſo as they cannot fetch their wind but ſitting vpright, if there be put to it
a little creſſes: alſo it is good therewith to anoint bleared eies, adding to euery hemine of milk
foure drams of Seſame beaten to pouder. Goats milk cureth the hardneſſe and ſwelling of the
ſpleen, eſpecially if the goats being kept from meat two daies, were the third day fed with Ivy;
of which milk the patient muſt drink three daies together, and forbeare all other food: and yet
milk otherwhiles is contrary to thoſe who be giuen to head-ach, ſubiect to the debility of the
liuer, and the opilation of the ſpleen; to ſuch as haue the ague, occaſioned by ſome infirmitie of K
the ſinews; or be troubled with dizineſſe, with the murre, poſe, and ſtuffing in the head; with the
cough alſo, and bleared eies; vnleſſe it be giuen as a purgation. Sows milk is of al other moſt ex-
cellent for the inordinat deſire to the ſtoole, and ſtraining thereupon without doing any thing;
for the bloudy flix alſo, and the phthyſicke or conſumption of the lungs. And ſome Authors
there be, who affirme, that it is moſt wholeſome for a woman to drink in any of the afore-named
infirmities.

* Sulphur: I marvaile hereat, conſidering that brimſton may be taken inwardly with ſafety. I ſuppoſe therefore that for Θεῖον, which is Solanũ manicon, i. deadly dwale, (a peſtiferous and venomous herbe) he read Θεῖον, i. brimſtone, in the author whom he followed.

Of Cheeſe, and the ſundry kinds thereof, I haue ſpoken ſufficiently in that diſcourſe wherein
I treated of Vdders, and the ſeuerall parts or members of liuing creatures. And verily *Seſtius* at-
tributeth the ſame effects to the cheeſe made of mares milk, as he doth to that which is gathe-
red of cow-milk: that kind of cheeſe he calleth Hippace. Generally, all cheeſe vnſalted (*i*) freſh L
and greene, is good for the ſtomack. Old cheeſe ſtoppeth a laske, abateth fleſh and maketh the
body lean, yea, & is * hurtfull to the ſtomack. In ſum, all ſalt meats take down thoſe that be cor-
pulent, whereas ſoft and tender viands do feed and nouriſh the body. Freſh cheeſe applied with
hony, reduceth the skin which is black and blew by reaſon of ſtripes, to the freſh and naturall
color againe. * Old cheeſe maketh the body coſtiue, and aſſuageth the torments of the belly, if
it be made into troſches, and thoſe ſodden in ſome ſtyptick or auſtere wine, and afterwards fri-
ed in a pan again with hony, and ſo applied. There is a kind of rotten & putrified cheeſe, which
the Greeks call Sapron: the ſame being punned with ſalt and drie Seruoiſes, and ſo giuen in
wine to drinke, cureth the flux of the belly cauſed by the infirmitie of the ſtomack. The cheeſe
made of goats milke, ſtamped into a cataplaſme and ſo applied, healeth the carbuncles engen- M
dred about the priuy parts; ſo doth the ſoure cheeſe alſo with oxymell. The ſame reduced into
a liniment with oile, taketh away all ſpots in the skin, if the body be therewith annointed in a
ſtouph or hot-houſe.

* Inutiliores: ex Dioſcor. χειροβρωτα.

* Vetus.

As touching Butyr, it is made likewiſe of milk, and among barbarous nations is held for the
daintieſt

20030
copy 1

A daintieſt meat,and which doth diſtinguiſh the * rich and better ſort from the poore commons. The milk of kine yeeldeth moſt butyr, whereupon it tooke that name: but the fatteſt Butyr is made of Ewes milke. Alſo there is a kind of Butyr gathered of Ewes milke: but in Winter the milke ought to be heated: whereas in ſummer time there needs no more to do but to preſſe it forth from the milk after much ſhaking & often agitation in cerrain long veſſels (called cherns hauing in the very mouth,a little narrow hole to receiue aire and giue vent to that within,or els otherwiſe ſtopped cloſe, and bound vp with ſome cloth. Now in the cherning, they vſe to put thereto a little water, to the end that the milke may ſoure the ſooner. After this beating and working of the milk, the thickeſt part [which is Butyr] floteth aloft, & is naturally of an oily ſubſtance. The reſt they vſe to boile in certain pans,& that which ſwims aboue,they take from
B the other,& putting ſalt to it, they cal it Oxygala.* Buttyr the ſtronger ſent or ſmacke that it hath,the better it is eſteemed to be:& in very truth,ſtale butyr that hath bin long kept, is mingled in many compoſitions:for by nature it is *aſtringent,emollitiue, incarnatiue,& mundificatiue. Moreouer,there is another way to make Oxygala,namely,to put ſour milk into the freſh and ſweet which you would haue to be ſoure,and this kind of chern milk,ſour-milke,or buttermilk,call it what you will,is thought to be moſt wholſom for the ſtomacke. But the properties and effects thereof I will ſet down in another place.

Among the medicinable parts which be common to all liuing creatures, their fat deſerueth greateſt commendation:buteſpecially ſwines greaſe,which in old time they vſed with great ce-
C remony and religion. Certes,euen at this day there is a ſolemne ceremony,that the bride newly wedded,as ſhe entreth into her husbands houſe, ſhould ſtrike the ſide poſts therewith for good luck ſake. Hogs lard or greaſe may be kept two maner of waies,either with ſalt, or as it is of it ſelfe vnſalted:and indeed,the older,the better. The * Greeks in their books called it Axungia. But that there ſhould be ſuch ſtrength in ſwines greaſe,it is no maruell:for the reaſon is plain, becauſe it is a beaſt that feedeth much of herb roots. Which is the cauſe alſo that their dung is much vſed for a number of purpoſes. And therefore take my words thus,that I meane no other ſwine but ſuch as * feed and root in the field: among which, the female,eſpecially a guelt that neuer farrowed,is more effectuall than a [tame]bore,barrow hogge,or a breeding ſow. But the greaſe and dung both,of the wild bore,is preferred before al. Swines greaſe then is imploied to
D mollifie,to heat,to diſcuſſe and mundifie. And ſome Phyſitians there be who preſcribe for the gout an ointment made of it,with gooſe greaſe,buls tallow,and the greaſie ſweat of wooll called Oeſypus. But in caſe the pain continue ſtill,they giue direction to vſe it with wax, myrtle, roſin,and pitch. Hogs greaſe alone vnſalted and ſimply as it is,healeth burns and ſcaldings,yea, though one were ſcortched and ſendged with ſnow. It cureth alſo kibed heels,if it be tempered with the aſhes of burnt barly and gall nuts pulverized, of each a like quantity, and ſo reduced into a ſalue. Alſo it is good to anoint merigals therwith,namely, when one part of the body is fretted & chafed againſt another:likewiſe it refreſheth thoſe that be weary & tired with much trauell:for an old cough, ſeeth of freſh hogs greaſe, that is ſweet,the quantity of three ounces in as many cyaths of wine,putting hony thereto,and let the patient drinke it. Old ſeame alſo that
E is tried and kept vnſalted,made into pils and taken inwardly,cureth the phthiſick & conſumption of the lungs. For ſurely if it haue taken ſalt once, there is no vſe therof,vnleſſe it be to mundifie and cleanſe,or els before the part is exulcerat. Some there be who ordaine to ſeeth hogges lard & hony,of each three ounces,in three cyaths of wine,for a medicine to cure the conſumption of the lungs: with this charge,that the fift day after the patient take a quantity of tarre in a rere egge,hauing his ſide,breaſt,and ſhoulders well ſwadled before and emplaſtered with the ſaid compoſition:for ſo forcible it is,that if a plaſter thereof be but bound to the knees,the very ſent thereof will come vp to the mouth, and cauſe a kind of ſaliuation, whereby the patient ſhal ſeeme to ſpit it vp againe. The greaſe of a young guelt which neuer had pigs,is a very proper medicine for women,to make their skin ſupple and euen without wrinckles. But any hogs
F ſeam tempered with beaſts tallow or ſuet,to the qnantity of a third part,& ſome pitch, all melted together,& made ſomwhat hot,is ſoueraigne for ſcabs. Swines greaſe that is pure and vnſalted,if it be put vp beneath in manner of a collyrie or peſſary,giueth comfort to the infant within the mothers wombe, which otherwiſe would haue bin ready to ſlip forth before-time, and proue an abortiue fruit. The ſame being tempered with ceruſſe or litharge of ſiluer,into a ſalue, and ſo applied,reduceth any skars to the naturall colour of the other skin about them. But with brim-

* Either for that the rich onely are allowed to feed vpon butyr, or becauſe they haue plenty thereof, and raiſe a yearely reuenue for that commoditie,whereas the reſt can ſpare none from their own bellies:

* *Quo magis virus reſipit.* Some would amend this place,and for [*magis*] put in [*minus*] in a contrary ſence: but I ſuppoſe he writeth in regard of barbarous people who make more account of ſuch ranke butyr: like as the vnciuill Iriſh in theſe daies.

* *Natura eius adſtringere*, ſome reade *digerere*,i. it is digeſtiue.

* And yet it is a Latine name of *axis & ungo*: becauſe they vſed to greaſe axeltrees therwith.

* Not thoſe that be frankted or kept in ſtie.

brimſtone it cureth the raggedneſſe of the nails: it ſtaieth likewiſe the haire of the head which G
is giuen to ſhed: alſo if it be mixed with a fourth part of gall-nuts, it healeth the vlcers in a womans head: but if it be well ſmoked, it helpeth to preſerue the haires of the eie-lids. An ounce weight thereof boiled in one hemine of old wine, vntill there be three ounces and no more of the whole remaining, is giuen (an ounce at once) to thoſe who are in aphthy ſick. Some appoint a little hony to be put thereto. The ſame together with Quick-lime reduced into a liniment, is ſingular for the biles and impoſtumes called Pani, as alſo for felons and the hard tumors of womens paps: it ſerueth beſides to cure inward ruptures and convulſions, ſpaſmes, crampes, and diſlocations. Being applied with white Ellebore, it healeth corns, agnels, fiſſures, chaps and calloſities. But incorporat with the pouder of a ſaltars pot-ſhard, it heales the ſwelling impoſtumes behind the ears, as alſo the wens called the Kings euil, being ordered in like manner. If the bo- H
dy be well rubbed and annointed therwith in the baine or hot-houſe, it taketh away all itch, red pimples & wheals riſing in the skin. Moreouer, prepared after another ſort, to wit, with old oile together with the ſtone called by the Greekes Sarcophagus, beaten to pouder, adding thereto the herb Cinquefoile ſtamped in wine either with Quicklime or with aſhes, and ſo reduced into a liniment, it is very good for thoſe that be troubled with the gout. Thereof alſo is made a ſingular plaſter againſt inflammations, in this wiſe, Take of the ſaid greaſe the weight of fourſcore and fiue pound, of white litharge of ſiluer one hnndred pound weight, mix them both together. As for Bores greaſe, if there be a liniment made of it and roſin, it is thought to be excellent good for to anoint therwith vlcers that be corroſiue and giuen to ſpread farther. [In old
time men vſed it moſt about the axletrees of their carts and wagons, anointing them therwith, I
that the wheels might turn about more eaſily: whereupon it took the name Axungia.] And being emploied in this maner, it ſerueth for a medicin to cure the vlcers of the ſeat & priuy members ſeruing to generation, by reaſon that it is mixed and coloured with the ruſt of the yron incorporat into it. The antient Phyſitians made moſt account alwaies of the ſaid hogs greaſe, by it ſelfe, which was plucked from the kidnies, for after it was clenſed from the ſtrings, veins, and skins, they waſhed it often and rubbed it well in rain water; which done, they ſod it in new earthen pots, ſhifting it out of one into another many times; and beeing thus tried and clarified, they kept it for their vſe. Howbeit, all are agreed, that when it hath taken ſalt, it is a greater emollitiue, it heateth alſo, diſcuſſeth and reſolueth more: yea, & being waſhed in wine, it is much better than otherwiſe. K

As touching the fat or greaſe of a Wolfe, *Maſſurius* writeth, that in old time it was eſteemed before any other, & had the price aboue all. And he ſaith, that new wedded wiues were wont vpon their mariage day to anoint the ſide poſts of their husbands houſes therwith at their firſt entrance, to the end that no charms, witchcrafts and ſorceries might haue power to enter in: thus much of greaſe. Look what vertue greaſe hath, the ſame, be ſure, is the ſuet and tallow endued with which commeth from thoſe beaſts that chew cud: and although it may be handled & dreſſed otherwiſe, yet in force it is nothing inferior. But what talow ſoeuer it be, the beſt way of preparing it, is after the skins or veins be rid away, to waſh it firſt either in ſea water or ſalt brine, and then within a while to ſtamp it in a mortar, eftſoons ſprinkling it with ſea-water: after which L
it ought to be ſodden in many waters, vntill it haue loſt all the ſauor & rank taſt that it had: and then at laſt by ſetting it in the Sun continually, it wil be reduced to a perfect whiteneſſe: moreouer, this is to be noted, that the beſt ſuet is that which groweth about the kidnies. But ſay that old tallow is called for, and to be vſed in any cure, it ought firſt to be melted, and then anon to be well and often waſhed in freſh cold waters; which done, it muſt be liquified a ſecond time, caſting and pouring thereupon eftſoons the beſt odoriferous wine that may be gotten: after which maner they vſe to ſeeth it again and again, and neuer giue ouer, vntill the rank ſmell and ſent thereof be clean gone: and verily many are of opinion, that particularly the fat of Buls, Lions, Panthers, and Cammels ought thus to be ordered and prepared. As for the vſes & properties of theſe Pomonades, I will treat thereof in conuenient place.

Concerning marrow, it is a thing common to all creatures, like as the fat aboueſaid. All the M
kinds thereof are emollitiue and incarnatiue: they dry alſo & * heat the body. The beſt marrow ſimply is that of Deere, as well red as fallow: next to it in goodneſſe is calues marrow: and then in a third rank follow kids and goats marrow. Prepared they ought to be and dreſſed, before Autumne, when they be new and freſh waſhed, and dried in the ſhadow. But afterwards they muſt be

*If they come from beaſts of hot nature: for o herwiſe they be temperat.

20030
copy 1

A be melted again and run through a finer ſercer or preſſed through linnen ſtrainers, which done, they ſhould be put vp in earthen pots, and ſet in a cold place.

But of all thoſe things which are generally to be found in euery liuing creature, the gall is that which is of greateſt efficacy in operation: for power it hath naturally to heat, bite, cut, draw, diſcuſſe and reſolue. The gall of ſmaller beaſts is taken to be more ſubtill and penetratiue than that of the greater, and therfore ſuppoſed to be the better for to go into eie-ſalues. Buls gall is thought to haue a ſpeciall faculty aboue all others, principally in ſetting a golden colour vpon skins, & braſſe. What gall ſoeuer it be, in the preparation therof for any vſe, regard muſt be had, that it be taken freſh and new, and then the orifice of the burſe or bag wherein it is contained, ought to be tied faſt with a good round packthred; thus being bound vp cloſe, it muſt be caſt in-
B to boiling water, and there remain halfe an hour, within a while after, ſo ſoon as it is dried (out of the Sun) it ought to be preſerued and kept in hony. The gal of horſes only is vtterly condemned, & reputed as a very poiſon: which is the cauſe that the arch-Flamin or principall ſacrificer is forbidden by law expreſſely to touch an horſe, notwithſtanding that in Rome it is an ordinary thing to ſacrifice euen horſes publickly: and not their gall alone but alſo their bloud, is corroſiue by nature, and putrifactiue. The bloud of Mares milke likewiſe, vnleſſe they be ſuch as were neuer couered nor bare foles, doth corrode: in which reſpect it is good to eat away ſcurfe about the brims of ſores and vlcers: and verily * Buls bloud freſh running out of the body, is reckoned no better than venom: and yet I muſt except Ægira, a city in Achaia, where the prieſt-
C reſſe of the goddeſſe * *Ops*, at what time as ſhe is to propheſie and foretel things to come, vſeth by drinking buls bloud to prepare her ſelf before ſhe goeth down into the vault or ſhrouds out of which ſhe deliuereth her propheſies: ſo forcible is that ſympathy, wherof we ſpeak ſo much, that otherwhiles it is occaſioned either by a religious opinion & deuotion in mens mindes, or els by the nature of ſome place. *Druſus* ſomtimes a Tribune of the commons in Rome, drank (as it is reported) Goats bloud, to make himſelfe look pale & * wan in the face, at what time as he meant to charge *Q. Cæpio* his enemy with giuing him poiſon. And verily, the bloud of a buck goat is ſo ſtrong, that there is not any thing in the world wil either ſharpen the edg of any yron tools ſooner, or harden the ſame when it is keen, than it. And as for the ruggednes of any blade, it wil take it away more effectually and poliſh it better than the very file. Conſidering then this
D diuerſity which is ſeen in the bloud of beaſts, I cannot write thereof in ſuch generall termes as of a thing indifferently common to euery one of them, but I muſt be forced to ſpeak particularly of their ſeuerall effects. In which regard I will treat reſpectiuely of beaſts, according as they do yeeld remedies againſt this or that malady: and firſt as touching thoſe which are aduerſe vnto Serpents.

* *Themiſtocles* ther with poiſoned himſelf.

* *i. Tellus* or *Terra* the earth.

Invidia, for *Liuor*.

To begin then with Stags and Hinds: no man there is ſo ignorant but he knoweth, that they plague ſerpents to the very death, for they pluck them forth of their holes, and eat them when they haue don. And not only whiles they be aliue do they war againſt ſerpents with the breath of their noſthrils, but alſo when they be dead, euery member and piece of their body is contrary vnto them. Burn a piece of an Harts horne, you ſhall ſee how the ſmoke and ſmell thereof will cha ſe away ſerpents, as I haue obſerued hertofore: & yet they ſay that the perfume of the bones
E which are about the throat of a Stag, hath a contrary property, to gather them together. Let a man lay vnder him Stags skins in ſtead of a mattrace, he ſhall ſleep ſecurely, without any feare that ſerpents will approch to do him harm. The rennet in their maw, or the rede it ſelfe, if it bee drunk with vineger, is a ſoueraigne antidot againſt their venomous ſting: and look what day one do but handle it, he ſhall be ſure and ſafe fiom any danger by them. The genetoirs of a Stagge kept vntill they be dry, like as the pizzle alſo made into pouder and taken in wine, is a ſingular counterpoiſon, reſiſting the venome of Serpents. Euen as the rim of the paunch, which is called in Latine Centipellio. Whoſoeuer haue about them ſo much as the tooth of an Hart, or be annointed with the marrow or ſuet of a Stag, Buck, or Hind-calfe, need not to fear any ſerpents, for
F they will flie from them. But aboue all remedies, there is none like to the rennet of a Fawne or Hind-calfe, ſuch a one eſpecially as was ripped out of the dams belly, as I haue ſhewed heretofore. If together with Deeres bloud there be burned the herbe Dragon, baſtard Mariaram, and Orchanet, in a fire made with Lentisk wood, Serpents (by report) will gather round together into an heap: take away the ſame bloud and put into the fire the root of * Pyrethrum, they will ſcatter aſunder againe.

* *i* Pelitary of Spaine.

Ireade

I read in Greek writers of a certain beaſt leſſe than a Stag, but like in haire, called Ophion, G which folk ſay is wont to be found only in the Iſle Sardinia: but I ſuppoſe that the race of them is vtterly extinct and gone. Wherefore I will forbeare to write of the medicinable properties reported by that beaſt.

Chap. X.

¶ *The medicines (againſt Serpents) found in the wild Bore, in Goats, and wild horſes. Alſo of other remedies which diuers beaſts do yeeld againſt all diſeaſes.*

THe brains of a wild Bore is highly commended againſt the ſting and venome of ſerpents. H So is the bloud likewiſe. Semblably, is the liuer kept and preſerued long with Rue, if the ſame be drunk in wine. In like maner the fat of the wild bore incorporat with hony & roſin. Alſo the liuer of a tame bore being clenſed from the filaments and ſtrings therein, taken to the weight of foure oboli, or the very brains drunke in wine.

If a man burn the horn or haire of goats, the fume therof driueth away ſerpents, as it is commonly ſaid: and the aſhes that come thereof either drunke inwardly or applied in a liniment without, are of great force againſt their ſtings. Moreouer, a draught of Goats milke taken with the grape of the vine Taminia, or of their vrine drunk with ſquilliticke vineger. Furthermore, it is ſaid, that cheeſe made of Goats milk together with Origan vſed in a cataplaſme, or their tallow incorporat with wax, worketh the like effect. A thouſand medicines beſides are reported to I be drawn from this beaſt, as ſhall hereafter appeare: whereat for mine own part I much maruel, conſidering, it is commonly ſaid that he is neuer out of a feuer. The wilde of this kinde doe affoord medicines more effectuall than the tame, and thoſe as I haue ſaid multiplie exceedingly. As for the Bucks or male Goats, they haue medicinable properties apart by themſelues. And *Democritus* ſaith, That the Buck which the dam bare alone, is of greater efficacy than any other: who affirmeth moreouer, that it is very good to anoint the place ſtung with ſerpents, with Goats dung ſodden in vineger: alſo with the aſhes of the ſaid dung freſh made, and tempered with wine into a liniment. In ſum, as many as hardly are cured of ſerpents ſtings, recouer therof paſſing wel, if they ordinarily haunt Goat-pens and ſtals where they be kept. But ſuch as would haue a more ſpeedy & aſſured cure, take the panch cut out of a Goat newly killed, together with K the dung found therein, & preſently bind the ſame faſt to the place affected, ſo ſoone as they be ſtung. Others perfume the fleſh newly hurt, with kids hair burnt: & with the ſame ſmoke chaſe away ſerpents: they vſe alſo to apply their skin newly flaied, to the wound: like as the fleſh and dung of a horſe that lieth out and feedeth abroad in the field: the rennet likewiſe of an Hare in vineger againſt the prick of a ſcorpion and the venomous tooth of an hardiſhrew. Moreouer, it is ſaid, that as many as rub and anoint their bodies with hares rennet, need not feare their ſtinging. If any be hurt by a ſcorpion, Goats dung helpeth them; but the better, if it be boiled in vineger: and in caſe one be poiſoned with ſwallowing down thoſe venomous flies called Bupreſtes, he ſhall find great help by eating lard and drinking the broth or decoction thereof. Furthermore, if a man round an aſſe in the eare, and ſay cloſely, That he is wounded by a ſcorpion, L the pain and grieuance thereof will immediatly paſſe away: yea and any venomous thing whatſoeuer, will flie from the fume of his lungs as it burneth: alſo it is good for thoſe who are ſtung by ſcorpions, to be perfumed with the ſmoke of calues dung. If a man be wounded by the biting of a mad dog, ſome there be who cut round about the place to the very quick, laying therto the raw fleſh of a calfe, and then giue the patient to drink the broth of the ſaid fleſh boiled, or els hogs greaſe ſtamped with quick-lime. Others highly praiſe the liuer of a buck Goat, affirming that if it be once applied, he ſhall not fall into that ſymptome of hydrophobie or fearing water, incident to thoſe that be bitten with a mad dog. They commend alſo a liniment made of goats dung and wine or hony tempered together: like as the decoction of a grey or badger, of a cuckow and a ſwallow, taken in drink. For the biting of other beaſts, it is an ordinary practiſe M to lay vnto the ſore, dry cheeſe made of goats milk, together with origan, but they giue direction to drink the ſame in ſome conuenient liquor: in caſe one be bitten by a mans tooth, they preſcribe bœufe ſodden and applied; howbeit the fleſh of a calf is more effectual; with this charge, that this cataplaſm be not remoued before the fift day. It is a common ſaying, that the muffle or

ſnout

20030
copy 1

A ſnout of a Wolfe kept long dried, is a countercharm againſt all witchcraft and ſorcery; which is the reaſon that they vſually ſet it vpon gates of countrey ferms. The ſame force the very skin is thought to haue which is flaied whole of it ſelf, without any fleſh, from the nape of the neck. Aud in truth, ouer and aboue the properties which I haue reported already of this beaſt, of ſuch power and vertue it is, that if horſes chance to tread in the tracts of a Wolfe, their feet will be immediatly benummed and aſtonied. Alſo their lard is a remedy for thoſe who are empoiſoned by drinking quick-ſiluer. Aſſes milke if it be drunke, doth dull and mortifie the force of any poiſon: but more particularly, if any haue taken Henbane, the viſcous gum of the herb Chamæleon, Hemlock, the ſea-Hare, the iuice of Carpathum, the poiſon Pharicum, or Dorycnium: al-
B ſo in caſe that crudled milk haue done harm to any; for ſurely it is no better than poiſon, eſpecially the firſt beeſtings, if it quaile and cruddle in the ſtomacke. To conclude, Aſſes milke hath many other medicinable properties which we will ſpeake of hereafter. But remember alwaies to vſe this milke whiles it is freſh and new drawne out of the vdder, or els not long after, & then it muſt be warmed: for there is not any milk that ſooner loſeth the vertue. Moreouer, the bones of an Aſſe well broken, bruiſed, and ſodden, are giuen for a counterpoiſon againſt the venome of the ſea-Hare. And for all theſe purpoſes beforeſaid, the milke and bones of the wild Aſſes be thought more effectuall.

As touching wild horſes, the Greeks haue written nothing, becauſe throughout all Greece there are none of them to be ſeene. Howbeit, whatſoeuer medicinable vertues be attributed to horſes, the ſame we muſt think more forcible in the wild than in others. Neither had the Greeks
C any experience of thoſe Neat or Buffles called Vri and Biſontes: & yet the foreſt of India be ful of wild buls & kine. Now by good reaſon and proportion, we are to think, that whatſoeuer commeth from them, is more auaileable in Phyſicke, than from the tame of that kind. And verily, Cow milk is ſaid to be a generall counterpoiſon, able to kill any of thoſe venoms abouenamed. Ouer and beſides, if the dangerous Lilly called Ephemerum Colchicum, be taken inwardly and ſetled in the ſtomack, or if the greene flies Cantharides haue bin giuen in drink, the ſaid milke will ſend vp all againe by vomit. And as for the Cantharides, the broth of Goats fleſh will doe the like. Againſt thoſe corroſiue poiſons which kill by exulceration, the tallow of a calfe or any Bœufe, is a ſoueraigne medicine. As for the danger that commeth by drinking Horſe-leaches,
Butyr made of Cows milk, is a ſingular remedy, if it be taken with vineger, heat with a gad of
D ſteele. The ſame alone without any other thing is a good counterpoiſon, for if oile be wanting, butter may ſerue the turn as well. Being ioined with hony, it healeth the ſores occaſioned by the biting of the Porcelets called Multipedæ. The broth made of their tripes, if it be drunke, is thought to kil any poiſon abouenamed: and beſides, the Aconite and Hemlock: ſo doth the ſuet of a Calfe. Greene cheeſe made of Goats milk, is good for them that haue drunk the venomous viſcoſitie iſſuing out of the herb Chamæleon, called Ixias: but their milke is a remedy againſt the flies Cantharides and the venomous hearbe Ephemerum, if it bee drunke with the grape Taminia. Goats bloud ſodden together with the marrow, is taken againſt the poiſons called Toxica; and kids bloud againſt the reſt. The rennet found in the maw of a kid, hath a peculiar vertue to mortifie the venom of the foreſaid viſcous gum Ixia, as alſo of the herb it ſelf, Cha-
E mæleon the white, yea, and Buls bloud: for which the rennet of an Hare with vineger, is a ſingular defenſatiue. Againſt the venomous Raie or Puffen called Paſtinaca Marina: the pricke or ſting alſo of any ſea-fiſh, the ſaid rendles of an Hare, Kid, or Lamb, is a ſingular antidot, taken to the weight of one dram in wine. As for the rennet of an Hare, it is one of the ordinary ingredients that go to the compoſition of all preſeruatiues and counterpoiſons.

There is a kind of Butterflie that vſeth to fly about candles as they are burning, which is reckoned among poiſons. The aduerſatiue remedy againſt it, is a Goats liuer: like as their gal is ſoueraigne againſt any venomous drinkes made of the ruſticke weazill.

F

Chap. XI.

¶ *Receits and remedies for many kinds of maladies, taken from ſundry beaſts.*

BVt now will I returne to the remedies appropriate to diſeaſes reſpectiue to the particular members of the body: and firſt to begin at the head: Bears greaſe mixed with Ladanum, and that kind of Maidenhaire which is called Adiantum, retaineth the haire of the head which

is

is giuen to fall off: alſo the places that be already bare, it repleniſheth again with new haire: the G
ſame being incorporat with the fnngous excreſcence growing about the candle-ſnuffe, as alſo
with the ſoot found ſticking to the ſockets of lamps and candleſtickes, cauſeth the haire of the
eie-lids to come thick. Mixed with wine, it is good againſt the skurfe and dandruffe among the
hairs: for which purpoſe ſerueth the aſhes of Harts-horn burnt and applied with wine: the ſame
alſo preſerueth the haire from breeding lice and nits. Likewiſe, Goats gall mixed with Fullers
*Creta Cimolia * earth and vineger, if the head be waſhed withall, ſo as the hairs may dry againe by little & lit-
* Hircinum. tle. Semblably, the gall of * Buck-goats tempered with Buls ſtale, killeth lice: now if the ſayd
Some reade Scrofinum, gall be old, adde thereto brimſtone, and it ſcoureth beſides the dandruffe. It is thought, that the
* Swines gall. aſhes of an aſſe pizzle will make the haire to grow thick, and preſerue them from being grey, if
the place be firſt ſhauen and well rubbed therewith, or anointed with the liniment made of it H
and oile, punned together in a leaden morter. Likewiſe, the vrin of a yong Aſſe fole is ſuppoſed
to thicken the haire: but there would be mixed ſome Spiknard with this waſhing lie, to rectifie
the ſtrong ſent of the ſaid vrine. Buls gall mixed with Ægyptian Allum, ſerueth for a liniment
to make the haire come again, if the bald place be anointed therwith warm. As for the running
skals of the head, there is not a better thing to cure them than Buls vrine: ſo doth ſtale chamber
lie, if there be put to it Sowbread and brimſtone: howbeit, Calues gall is of greater efficacy in
this caſe, which if it be mingled with vineger, and the head rubbed therwith hot, riddeth nits al-
ſo. Calues ſuet ſtamped with ſalt and reduced into a liniment, is ſingular good for the ſores in
the head. In theſe caſes great account is made of Fox greaſe, but eſpecially of their gall and
dung, tempered with an equall portion of Senvy and ſo brought into an ointment. Take the I
pouder or aſhes of Goats horn, but principally of the Bucke, put thereto ſal-nitre and the ſeed
of Tamarisk: incorporat all with butter and oile into an vnguent. It is wonderfull effectuall in
keeping haire from ſhedding, ſo that the head be firſt ſhauen. Semblably, the aſhes of a dogge
burnt, & made into a liniment with oile, cauſeth the haire of the eie-brows to look black: goats
milk by report taketh away nits. An ointment made with their dung & hony together, cauſeth
the hair to grow thick, in places deſpoiled thereof by occaſion of ſome diſeaſes. Likewiſe the
aſhes of their houfs incorporat with pitch, keep the haire on which is about to ſhed.

As touching the pain of the head, the aſhes of an Hare burnt, mixed with oile of Myrtles, al-
lay the ſame: ſo doth the blown water which is left in the trough after that a bœufe or Aſſe hath
done drinking, if the patient take a draught of it: and if we may beleeue it, the genitall member K
of a he-Fox, worne about the head in maner of a wreath, cureth the head-ache. The aſhes of a
Harts horn brought into a liniment with vineger, oile roſat or oile of Ireos, hath the like effect.
For watering eies there is a ſingular ointment made of bœufe tallow boiled together with oile.
And the aſhes of Harts horn ſerueth by way of iniunction to cure their aſperity and roughnes:
for which purpoſe the very tip and points of the knags are thought more effectuall. The ex-
crements or dung of a Wolfe are good to anoint the eies for the cataract. The ſame reduced to
aſhes and made into a liniment with the beſt Attick honey, is ſingular for thoſe whoſe ſight is
dim and troubled, ſo that the eies be anointed therewith: in which caſe, Beares gall is excellent.
The greaſe of a wild Bore incorporat with oile roſat, is ſingular good for the bloudy fals or chil-
blanes called Epinyctides. L

The aſhes of an Aſſes houſe mixed with Aſſes milke, taketh away the cicatrices of the eies,
together with the films and pearls that trouble the ſight, if they be annointed therewith. The
marrow of a Beefe taken forth of the right leg before, punned with ſoot, and ſo incorporat toge-
ther in manner of a liniment, rectifieth the diſordered hairs, and other accidents of the eye-lids
and corners of the eies: but for to haue an excellent ſoot, proper to make a ſalue for to beautifie
the eies, it ought to be gathered from a wieke or ſnuffe made of Papyr reed, and burning with
Seſame oile, in ſuch ſort as the ſame may be wiped away with a wing into a new earthen pot
that neuer was vſed: & verily, this is a ſoueraigne ſoot to hinder the growth again of haires after
they be once plucked vp from the eie-browes. Of an Oxe gall tempered with the white of an
egge, are made eie-ſalues reduced into rolles, which beeing diſſolued in water, ſerue to annoint M
the eyes for foure daies together. Calues ſuet with Gooſe greaſe and the iuice of Baſill, is ſin-
gular for all the accidents whereto the eie-lids be ſubiect. The marrow of a Calfe, incorporate
with equall weight of wax and common oile or oile Roſat, together with an egge, maketh a ſo-
ueraigne liniment for the Stian or any other hard ſwellings in the eie-lids. The violent rheums

that

20030
copy 1

A that fall into the eies,are repreſſed and allaied with a cataplaſm of tender cheeſe made of goats milke ſoked in hot water,and ſo laid too:and if there be any tumor or ſwelling riſen by occaſion of ſuch a flux, it would be applied with hony : and both of them,as well with ſwelling as without,ought to be fomented with warme whey. But ſay the eies be inflamed and bleered onely, without any * extraordinary moiſture appearing in them, the little muſcles lying within the loins of a ſwine,roſted and afterwards punned to a cataplaſme,and ſo applied,do quite rid away the ſame bleeredneſſe. It is commonly ſaid,that goats be neuer troubled with bleered eies, nor yet roe-bucks or does,by reaſon of certain herbs which they feed vpon : and for that their ſight is as good by night as day,therfore certain pils be ordained for the infirmities of the eies,made of their dung,inwrapped within wax, for to be ſwallowed at the change of the Moone. Many

B there be who are of opinion,that ſuch as be dim-ſighted and ſee little or nothing toward night (whom the Greeks call * Nyctalopes) are cured with goats bloud, eſpecially the male : alſo with the liuer of a goat ſodden in ſome auſtere or hard wine. Some giue direction, to annoint the eies all ouer with the grauie or dripping of the ſaid liuer roſted, or elſe with the gall of a goat,and to feed of the ſaid fleſh;with this regard, That whiles the ſame is a ſeething, the eyes may receiue the vapor and ſteem thereof. And of this opinion they be, that the ſaid medicine will do the better,if the goat be of a bright ruddy colour. Moreouer,they would haue the eyes of the patient to be fomented with the vapor and fume that riſeth from the decoction of the liuer whiles it boileth:but others there be,that preſcribe to take the ſmoke thereof as it roſteth or

C frieth. As for goats gall,there be that vſe it many waies prepared;ſome with hony, againſt the fumoſities that trouble and dim the eie-ſight:others,with a third part of white Ellebore,for the pin and web : others againe with wine,againſt cicatrices,pearles,obſcurity of ſight, filmes and ſpots. But for the eie-lids,after the haire which pricked and offended the eie is pulled out,they applie it with the iuice of Beets,ſuffering the ſaid liniment to dry vpon the eie-lids. If any tunicles of the eie be broken, they take womans milk to apply vnto it. In ſum,for al infirmities of the eies whatſoeuer,they hold a goats gall which is old and hath bin long kept, to be more ſoueraigne and effectuall in operation than any other. Neither doe they reiect the dung of this beaſt,but repute a liniment made of it and honey,to be as good for waterie eyes, as the marrow for the paine thereof : likewiſe the lungs of an hare. And verily the gall of an hare(as it is com-

D monly reported) incorporat with cuit or honey,and ſo applied, helpeth thoſe that be dim-ſighted. Furthermore they ordaine,to rub and annoint the eies againſt their inflammation and bleeredneſſe,either with woolues greace,or elſe with ſwines marrow. And no maruell, for they ſay, That whoſoeuer vſe to carry about them in a bracelet a foxes tongue, ſhall neuer be troubled with ſore eies.

For the pain & infirmities incident to the ears,there is not a better nor more excellent thing than the vrin of a wild bore ſaued and kept in a glaſſe:the gall likewiſe of a wild bore or ſow,as alſo of a bœufe,mixt with Cicinie oile and oile Roſat,in equall quantity,is a ſingular remedy : but eſpecially buls gall, dropped into the ears warm with the iuice of Porret;or els with hony, in caſe they be impoſtumat within and run with water. The ſame alone by it ſelfe warmed in the rind of a pomegranate,is excellent to take away the ranke and ſtrong ſauour of the eares : and

E if any part within be broken,the ſaid gall inſtilled with womans milke, healeth it effectually. Some there be, who ordaine the eares to be well waſhed with it ſo prepared, for to remedy the difficulty and hardneſſe of hearing : others vſe to put into the eares wooll,waſhed before in hot water,and incloſe therewith a peece of a ſerpents ſlough,with vineger : but if the deafeneſſe be the greater,they infuſe the ſaid gall into the eares,tempered with Myrrhe and Rue,and ſo made hot all together in the pill of a Pomegranate. Fat lard alſo is good for this purpoſe : and the greene dung of an Aſſe inſtilled with oile Roſat;prouided alwaies, that all theſe medicines be warme when they be dropped into the eares. But the ſome that a horſe doth froth,is better than all theſe : or the aſhes of horſe dung freſh made and burned, mixed with oile of Roſes. In this caſe likewiſe are commended bœufe ſuet, gooſe greaſe, and freſh butter. The vrine of a Goat

F or bull, yea and ſtale chamber-lie which fullers vſe,made hot, and the vapour thereof receiued into the eare,at the narrow mouth or necke of a bottle,cureth the deafeneſſe thereof. Some put thereto a third part of vineger,and a quantitie of the piſſe of a calfe which is yet a ſuckling and neuer taſted graſſe:yea and others there be,which put thereto the dung mixed with the gall of the ſaid calfe. The skin or ſlough alſo which ſnakes caſt off, is very good to be applied vnto the

* Κηγωπαλωπέκα.

* *Nyctalopes,* are they alſo called,who ſee better in the night than by day:according as the word importeth.

eares,but they ought to be well chaufed and ſet into an heat before. Now are theſe medicines to G
be incloſed within wooll,and ſo applied. Moreouer, calues tallow, with Gooſe greaſe and the
juice of Baſill,is good for the hearing:alſo calues marrow incorporat together with the pouder
of cumin,and ſo powred into the eares. The ſlimy ſperme of a bore which paſſeth from the ſhap
of a ſow after ſhe is brimmed,if it may be gotten before it touch the ground, is ſingular for the
pain of the eares. If the eares be crackt and hang flagging down,there is nothing better than glue
made of calues pizzles,if the ſame be diſſolued in water. For other impediments of the eares,the
fat of foxes is very good. In like manner, Goats gall, with oile of Roſes warme, or the juice of
leeks: or if there be any rupture within the eares,the ſaid gall muſt be applied with breſt-milke.
For thoſe who be hard of hearing, or haue their eares running and ſuppurate within, it is not a-
miſſe to drop into them a beaſts gall, with the vrine of a ſhee-goat or of the male, it makes no H
matter. But theſe medicines howſoeuer they are to be vſed,are thought to be more effectual by
far,in caſe they were put into a goats horne, and ſo hung in the ſmoke for the ſpace of 20 dayes
together. Alſo there is great commendation of the rennet of an hare, if there be one third part
of a Roman denarius thereof,and halfe a denare weight of gum Sagapene,concorporat in Ami-
nean wine. As for the ſwelling impoſtumes behind the eares,bears greaſe repreſſeth and keepeth
them downe,if there be a cerot made thereof, together with the equall weight of wax and bulls
tallow:ſome there be who put Hypoquiſtis thereto:and butter alone is good to annoint them
with,ſo that they were fomented before with the decoction of Fenigreeke. Howbeit, of much
better opperation it would be,in caſe Nightſhade were added thereto. The ſtones of a fox,buls
bloud alſo dried and reduced to powder,be commended in this caſe. Moreouer,the vrin of a ſhe I
goat made warm,and ſo dropped into the eares:the dung likewiſe brought into a liniment with
hogs greaſe is very good.

To come now to the infirmities of the teeth:if they be looſe and ſhake in their ſockets,the a-
ſhes of harts horn will ſettle them firme and faſt again:if they ake,the ſame aſhes are verie good
to eaſe the paine, whether the teeth be rubbed or waſhed therewith. But ſome are of opinion,
that the pouder of the ſaid horne not burnt at all,is far better than the aſhes in theſe caſes:how-
beit,there be dentifrices made both of the powder and alſo of the aſhes. Moreouer, the aſhes of
a wolues head is thought to be a ſoueraigne remedy for the pains incident to the teeth. Now it
is well knowne,that among the excrements of a wolfe,there be many times bones found,which
if they be hanged about the necke,arme,or other parts of the body, haue the ſame effect. Like- K
wiſe the crudled rendles of an hare infuſed into the eare, are ſingular for the tooth-ache: the a-
ſhes alſo which come of the head burnt, is a pretty dentifrice for to rub the teeth withall: but
if you put Nard thereto, it doth correct and palliat a ſtinking breath. But ſome there be, who
chuſe rather to mingle therewith,the aſhes of mice and rats heads. There is found in the ſide
* Βλωνιδιὸν ὀστοῦν. of a hares head a certaine * ſharpe bone like vnto a needle;herewith,Phyſitians giue counſel to
ſcarrifie the teeth and let the gums bloud,for the tooth-ache. Take the bone of a beaſt, ſet it on
fire,and when it is red hot,hold it cloſe to the teeth that be looſe and ake withall,it wil ſet them
faſt againe: the ſame being reduced into aſhes,and tempered with myrrhe,is a proper dentifrice
to blaunch the teeth. The bonie ſubſtance likewiſe of hogs cleyes burnt and calcined, is of the
ſame force and operation: alſo the hollow hetchill or whirlebones of their hips, about which L
their bucklebones turne,worke the like effect if they be brought into aſhes. Well knowne it is,
that if the ſame be conueighed downe by a horne into the throat of horſes and ſuch like beaſts,
they will cure the wringing torments of the botts that fret and gnaw them in the bellies: and
beeing burnt, they are ſingular good to confirme and faſten the teeth that bee looſe and doe
ſhake. Alſo if the teeth be payned by occaſion of ſome blow giuen vnto them, Aſſes milke
helpeth them: ſo do the teeth of the ſaid beaſt,if they be calcined and reduced into aſhes: this
infirmitie is helped alſo with the rough wert or corne of an horſe if it be infuſed into the eares
with oile: this bunch is called by the Greekes Lichen: and it is not that which is named Hip-
pomanes,whereof I haue no purpoſe to ſpeak(conſidering it is a hurtful and venomous thing)
but a certaine excreſcence growing about Horſe knees, and aboue their houfes. Moreouer,in M
the heart of an Horſe there is found a bone, like for all the world to the eye-teeth of a dogge:
this they hold to be a very ſoueraigne thing for to ſcarrifie the teeth when they ake. Alſo if
one take a tooth out of one of the chawles of a dead horſe, it will eaſe his owne that aketh. ſo
it be correſpondent in place and number to that which is in paine. The ſperme that paſſeth
from

20030
copy 1

A from the mature of a mare after ſhe hath been couered by a ſtallion, if the wieke of a candle or lamp be therewith beſmeared and ſet a burning, doth repreſent a moſt ſtrange and monſtrous ſight of horſe heads, as *Anaxilaus* hath reported: euen ſo will that of the ſhee Aſſe, make a ſhew and apparition of Aſſe-heads. As for Hippomanes beforenamed, it is ſo ſtrong and forcible a venome, eſpecially to incite and ſtirre vnto luſt, that being vpon a time poured into the braſen mettall that was caſt into the forme and ſimilitude of a mare at Olympia, the ſtone-horſes which came neare vnto the ſaid image, were ſet into ſuch a heat and ſo farre inraged, that they could not by any means be held back but they would needs couer the ſaid braſen mare. Moreouer, the glew that Carpenters and Ioyners vſe, cureth the tooth-ache, if the ſame be boyled in water, and the teeth annointed therewith; but the ſame within a little while after muſt be remo-
B ued, and the mouth preſently waſhed with wine, wherein were ſodden the pill of ſweet pomegranats. Furthermore, if the teeth be ill affected, a collution made with goats milke, or buls gal, is thought to be a remedy of great efficacy. Finally, the aſhes of the ankle bones of a female Goat whiles they be freſh and new, are counted an excellent dentifrice to whiten the teeth: ſo are the ſaid bones of all other four-footed beaſts, reared or nouriſhed about a ferm houſe, if they be in like manner calcined: which I note but once for all, becauſe I would not repeat one thing ſo often.

C

Chap. XII.

¶ *Remedies obſerued out of the bodies of beaſts, for the accidents that befall to the viſage, necke, and breaſt.*

IT is thought generally, that the skin of the face may be made ſmooth and without wrinckles, tender and delicat, yea and be kept faire and white, with aſſes milk: for well knowne it is, that ſome dainty dames (forſooth) there be, that keep and maintain daily in ordinary to the number juſt of 500 ſhe Aſſes for this purpoſe: according to the firſt example of the Empreſſe *Poppæa*, wife to *Nero* the Emperor; for ſhe vſed commonly to bath in Aſſes milk, and deuiſed whole baines to ſwim therewith: and euer as ſhee rode in progreſſe, or remooued from place to place, ſhe had her cuirie of ſhe Aſſes in her traine attending vpon her for no other intent, but onely to
D waſh and bath her body in their milke. As for the pimples and wheales that breake out in the face, if they be annointed with butter, they will weare away and be gone; and the ſooner, if Ceruſſe or Spaniſh white be tempered therewith: but pure butter alone without any thing elſe mingled with it, killeth any fretting humors in the face that be corroſiue, if ſo be that preſently after the inunction, barly meale be caſt vpon the place. The gleane of a Cow hauing newly calued, taken whiles it is moiſt and ſo applied, is good for any vlcers of the viſage. There is another receit made for this purpoſe, which may ſeeme but a fantaſtical and fooliſh thing, howbeit, for to ſatisfie and pleaſe in ſome ſort, our fine dames that are deſirous of ſuch deuiſes, I am content to ſet downe: They ſay (forſooth) that the paſterne bones of a young white bulkin or ſteere, ſodden for the ſpace of 40 daies and nights together, vntill ſuch time as they be reſol-
E ued into the liquor, if the face be wet with a fine linnen cloth dipped in the ſaid decoction, it cauſeth the skin to looke cleare and white, and without any riuels or wrinckles; but the ſaid liniment muſt be kept all night to the face in manner of a maske. Moreouer, they ſay, that bulls ſherne is an excellent complexion forſooth, to ſet a freſh roſat or vermilion colour in the ball of the cheeke: and the liniment Crocodilea, made of Crocodiles ordure, doth it no better: but then they giue order, that the face be waſhed with cold water both before and after this dreſſing. The dung of a calfe tempered and wrought in ones hand with oile & gum, is ſingular good to take away ſun-burning, or any thing whatſoeuer whereby the colour is decaied and loſt. As touching the vlcers and chaps appearing in the lips or face, the ſuet of a Calfe, or beaſts tallow, incorporat with Gooſe greaſe and the juice of Baſill, maketh a ſingular pomado to amend and
F and rectifie thoſe defects and imperfections. There is another compoſition alſo for this purpoſe; to wit, calues ſuet and deeres marrow mixed together, with the leaues of the white Saint *Mary* thiſtle, punned all together and reduced into a liniment. The ſame operation hath any marow, though it be of a cow, and the broth of cow bœufe. The tettars and wild-fires breaking forth about the mouth and noſe, there is not the like medicine againe to be found, to kill and

extinguiſh,than a glew made of a calues genetoirs, diſſolued in vineger with quicke brimſtone, G
and mingled together with a fig-tree branch; with this charge, that when it is freſh made, the
place affected be anointed twice a day therewith. This glew boiled in hony and vineger, is ſin-
gular for the leproſie:which diſeaſe,the liuer alſo of a calfe applied hot,doth cure: like as goats
gal healeth the foule white lepry called Elephantiaſis:but an oxe gall and ſal-nitre mixed ther-
with taketh away the lepry and the filthy dandruffe appearing in the skin. The vrine of an aſſe
taken about the riſing of the Dog-ſtar, clenſeth the face from all ſpots: ſo doth the gall as well
of an aſſe as a bull,vſed alone by it ſelfe,after it hath bin well broken and tempered in water,and
the old skin of the face taken off; but then the patient muſt forbeare to goe abroad either into
the Sun or wind. The like effect hath buls tallow or calues gall,incorporat with the ſeed of Sa-
uorie and the aſhes of an Harts horne, if the ſame be burnt at the beginning of the Dog-daies. H
Aſſes greaſe is a ſoueraigne thing to reduce vnto a freſh and natiue colour, any skars or places
of the skin blemiſhed with the ſtooles remaining of ringworme,tettar,and leproſie. The gal of
a buck-goat incorporat with cheeſe, ſulphur viſ, and the aſhes of a ſpunge, and brought to the
conſiſtence and thickneſſe of honey,taketh away moles and pimples. Some make choiſe rather
of old galls which hath been long kept to vſe in this caſe, mingling therewith hot brans to the
weight of one obolus, and four times as much of hony;but firſt the ſaid ſpots and ſpecks ought
to be plied well with chauſing and rubbing. The ſuet of the ſame Goat, tempered with Gith
or Nigella ſeed, Brimſtone, and Floure-de-lys root, is verie effectuall for this purpoſe. Sem-
blably,it is good for the chaps in the lips, if it be incorporate with Gooſe greaſe, Deeres mar-
row,roſin,and vnquencht lime. I finde it recorded in ſome Authors, that they who are giuen to I
haue red pimples appearing in their face,are diſabled for exerciſing any ſacrifices belonging to
Art Magicke.

If the tonſils,throat,and windpipe,be either inflamed or exulcerat, they finde much eaſe by
cow milke,or goats milke, ſo the patient gargarize therewith warme as it commeth new from
the beaſt,or otherwiſe made warme againe afterwards:but goats milk is the better of the twain,
if mallows be ſodden therein, and a little ſalt. For bliſters in the tongue and throat, the broth
made of tripes is very good to be gargariſed:and more particularly, for the inflammations and
ſores incident to the tonſils or almonds of the throat, the kidnies of a fox dried are ſingular, if
they be beaten into pouder and reduced into a liniment with honey. The gall of a bull or goat
mixed with hony,ſerueth right well for the ſquinancy. The liuer of a grey or badger tempered K
with water and made in manner of a collution, rectifieth a ſtrong and ſtinking breath: the can-
kers alſo and ſores in the mouth,are healed with butyr. If a thorne, fiſh-bone,or any other ſuch
thing ſticke in the throat,take the dung of a cat,rub & annoint the place wel without-forth,the
ſame(by report)will thereupon come vp againe,or paſſe downeward. As for the ſwelling wens
called the kings euill,either the gall of a bore doth ſcatter and diſpatch; or elſe of a bœufe, if
the place affected be annointed therewith warme:for hares rendles tempered with wine and put
into a linnen cloth, is good to be applied vnto the ſame onely when they be ſore and run. The
aſhes alſo of the houſe both of horſe and aſſe, incorporat with oile, water, and hot vrine, into a
liniment,& ſo applied,doth reſolue them before they be broken. Of the ſame effect is the aſhes
of an Oxe or Cowes clee,applied vnto the place with water: as alſo their dung laid too very hot L
with vineger. In like manner Goats ſewet with quicke-lime, or their dung ſodden in vineger
and the genetoirs of a fox. For this purpoſe, there is much good done with ſope: an inuention
deuiſed by the French for to colour the haire of the head yellow:made it is of tallow and aſhes:
the beſt of all other is that which they make of Beech-wood aſhes and Goats ſuet; and the
ſame after two manner of waies; either thicke and hard, or elſe liquid and ſoft: but the one as
well as the other is verie much vſed in Germanie, and a great deale more indeed by men than
women.

The crickes and pains in the neck,are much aſſuaged by rubbing the nape of the necke with
butter or beares greaſe:if the ſame be ſtark and ſtiffe, there is nothing in the world better than
beaſts tallow, the which, together with oile, is very good for the kings euill beforeſaid. The M
* Supinus & poſterganeus, raptus. Aureliano. * painfull cramp that draweth a man back,ſo as he cannot bow his head forward (which convul-
ſion the Greeks name Opiſthotonos) is much eaſed by infuſing into the eares the vrine of a ſhee
goat,or with a liniment made with their dung and bulbe roots.

If the nailes be bruiſed, it is paſſing good to tie about them the gal of any beaſt whatſoeuer.

As

20030
copy 1

A As for the riſings and ſore excreſcences about their roots, bulls gall diſſolued in hot water, and ſo applied, eaſeth that grieuance: ſome there be who put thereto brimſtone and alumne, of each a like weight.

Moreouer, it is ſaid, that a wolues liuer taken in a draught of wine warme, cureth the cough: alſo a bears gall mingled with hony: or the aſhes made of the vppermoſt tips of a beaſts horne: likewiſe the froth or ſlauer of an horſe mouth: and ſome ſay, that be the cough neuer ſo bad, it will make an end thereof in three daies drinking. Semblably, the lights of a ſtag, together with the throat dried in the ſmoke, and afterwards puluerized and brought into a loch or liquid electuary, is good for the cough, to be taken ordinarily euery day: and for this purpoſe, the lungs of the ſpitter in this kind of red deere, is thought to be more effectual. In caſe a man ſpit bloud,
B the aſhes of Harts is much commended: and the rendles of an hares maw taken in drinke to the weight of a third part of a denier, with Terra Samia and Myrtle wine, cureth it perfectly. The aſhes likewiſe of Hares dung drunk in wine late in an euening, ſtaieth the cough which is buſie in the night ſeaſon: alſo a perfume made with the hair of an hare, diſchargeth the lungs of thoſe tough and viſcous humors which ſtick vnto them, and are not otherwiſe eaſily remooued. The purulent vlcers in breſt and lungs, remaining after a pleuriſie or peripneumony: the ſtrong and ſtinking breath alſo proceeding from the lights, are cured moſt effectually with an electuarie made of butter, boiled with a like quantity of Attick hony, vntill it look reddiſh; if the patient take thereof euery morning the meaſure of one ligula or ſpoonfull: ſome in ſtead of hony, chuſe
C rather to put thereto the * roſin of the Larch tree. If one do reach or caſt vp bloud, it is ſaid, that cowes bloud, taken moderatly and with vineger, is of great force and efficacy to ſtay the ſame: but to think that this is meant of buls bloud, were great folly and raſhneſſe. Howbeit the ſtrong glew that is made of a buls skin, taken to the weight of three oboli in warm water, is ſoueraigne for an old infirmity of reaching and fetching bloud vpward.

* Which is our Turpentine.

Chap. XIII.

¶ *Receits for the paine of ſtomacke and loines: alſo for the infirmities of the reins.*

D IF there be an vlcer growne in the ſtomacke, drinke the milke of an Aſſe or Cow, and it will heale it. Stew a peece of bœufe in wine and vineger among, the broth thereof is ſingular for the gnawing and fretting in the ſtomacke: the aſhes of an Harts horne is verie good to drie vp rheumes and catarrhes, that haue taken a courſe thither. As for thoſe that caſt vp bloud, the freſh bloud of a Kid taken to the quantity of three cyaths, with the like proportion of ſharpe vineger, and ſo drunke as hot as may be: the rendles alſo of the ſaid Kid drunke with vineger, ſo as there be two third parts of the vineger to one of the rundles, is a ſingular remedy for the ſaid infirmities.

For the griefe of the liuer, cauſed by obſtructions, the liuer of a wolfe dried and taken in honied wine, is a proper receit. So is the liuer of an Aſſe being dried and brought into pouder with
E two parts of ſtone parſley, and ſo incorporat with three nut kernels and hony; which compoſition, the patient muſt vſe to eat. In which caſe, goats bloud is highly commended, if it be prepared ſo as it may be taken with meat.

Moreouer, it is ſaid, that for them who be ſhort winded, there is nothing ſo good as to drink the bloud of wild horſes. In the next place to it, great account is made of Aſſes milke warme, or ſodden together with bulbe roots, ſo that the patient drinke the whey that commeth thereof, putting to three hemines of the bloud one cyath of white garden creſſes, infuſed firſt in water, and then tempered with hony. The liuer alſo or lungs of a fox, taken in ſome groſſe wine like Alegant: or a bears gall in water, doth open the wind-pipes ſtuffed with fleame, and giueth free liberty for the wind to go and come.

Furthermore, Bears greaſe is exceeding good for the paines in the reins of the backe, yea and
F for any place els that hath need of emollitiues, in caſe it be wel rubbed therewith. Alſo in theſe caſes, it is thought meet, to take the aſhes either of a bores or ſowes dung which hath bin long made, and therewith to ſpice a cup of wine.

But before I proceed any farther, it is to be noted, that Magitians alſo haue medled with this part of Phyſicke, and haue deuiſed ſtrange medicines, drawne from the parts and members of

beasts. And first of all they would make vs beleeue, that be a buck-goat neuer so much inraged, G
do but stroke him by the beard, he will come into good order and be quiet againe: cut and lop
the same off with a paire of sheers, he will not stray away nor depart to another flock. But to re-
turn to the griefe of the reins: the Magitians adde to the foresaid medicine, goats dung, which
being put into a linnen cloth, and the same well greased, they giue direction to hold in the hol-
low ball of the hand, as hot as may be indured; with this regard, that if the paine be in the left
side, this medicine be made in the right hand, and so contrariwise. Moreouer, the dung or tred-
dles which must serue this turn, they giue order, that it be gathered and taken vp with the point
of a brasen needle or bodkin. Now the foresaid medicine must be held in the hand so long, vntil
the patient perceiue that the vapor thereof do pierce as far as the loines: which done, they ap-
point afterwards to anoint the head with the iuice of leeks stamped: to rub the loines also with H
the said dung tempered with hony: giuing counsell, to eat the stones also of an Hare, for to ap-
pease the said pain. As for those that be troubled with the Sciatica, they ordaine a cataplasme
of oxe or cow dung, to be laid vpon the grieued place; but it ought first to be lapt within some
leaues, and so made hot in the embers. For the pain in the kidnies, they giue order to swallow
downe the kidnies of an Hare raw, or at leastwise sodden, yet so, as the patient touch them not
with his teeth. Ouer and besides, they do say, that whosoeuer haue about them the ankle bone of
an Hare, shall not be grieued with the belly ach. As touching the paine of the spleene, the gall
of a swine, be it Bore or Sow, taken in drink, or the ashes of Harts horn in vineger, assuageth the
same. But the most effectuall and soueraigne remedy of all other, is the milt of an Asse which
hath bin long kept; for within one three daies the benefit thereof will be felt, and the patient I
shall find ease. Also, for the disease of the spleen, they vse to giue in oxymell, the ordure of an
asses sole, which first came from it after it was soled (and this dung the Syrians call Polea:) fur-
thermore, for this infirmity the tongue of an horse which hath bin kept dry a long time, giuen
in wine, is a present remedy: and this is a secret which *Cæcilius Bion* reporteth that he learned of
the Barbarians, whiles he conuersed among them. In like manner, a beasts milt whether it bee
cow or oxe, hath the same operation, if it be vsed in that manner: but say it be fresh and new ta-
ken out of the beast, then it ought to be either rosted or sodden, and so taken as meat. Ouer and
besides, take 20 heads of garlick, pun them all, and after they be bruised, put them into a beasts
bladder with a sextar of vineger; apply the same to the region of the spleene, it assuageth the
pain. And if all be true that these Magitians say, the milt of a calfe is singular good for the ma- K
lady of the spleen; but then it must be bought at the same price that the butcher setteth first vp-
on it, without hucking and beating it lower for to haue any thing abated; because in their opi-
nion (so ceremonious they be) therin lieth a great matter. Now when it is thus bought, it would
be slit through the length in two parts, & both pieces attached to the shirt of the patient; with
this charge, That when he is about to put on his other cloths and make himselfe ready, he suffer
the said pieces to drop down to his feet, and then take them vp again, and so dry them in the sha-
dow: for in thus doing, the diseased spleen of the sick party will likewise fall and settle down, so
as the patient shal sensibly perceiue himself to be deliuered of that infirmity. Finally, the lungs
of a Fox dried in the ashes and so drunk in water, is good for the spleen: as also the milt of a kid, L
applied to the grieued part accordingly.

Chap. XIIII.

¶ *For to stop a lask and knit the belly: for the flux proceeding from the imbecilitie of the stomacke: for the dysenterie or bloudy flix: for the ventosities and inflation of the belly: for ruptures: the straining vpon the seege without doing any thing: for the wormes in the guts, and for the cholique.*

TO stay the running out and extraordinary loosnesse of the belly, these medicines follow-
ing be conuenient: *Imprimis*, the bloud of a stag: *Item*, the ashes of an harts horne: the li-
uer of a bore fresh and without any salt at all, taken in wine: likewise the liuer of a sow ro- M
sted, or of a male goat sodden in one hemine of water: the crudled rennet in a hares maw, drunk
in wine to the quantity of a cich-pease; or in water, in case the patient haue an ague. Some there
be, who put gall nuts thereto; others content themselues with Hares bloud alone sodden with
milke. Also the ashes comming of horse dung drunke in water: the ashes of that part of an old
bulls

20030
copy 1

A bulls horne which groweth next to the head, ſtrewed into a draught of water. In like manner, Goats bloud ſodden vpon coles. A Goats skin or fell, haire and all boiled together, yeeldeth a decoction which is good in this caſe to be drunke.

Contrariwiſe, to looſe the belly: the runnet found in a Colts maw: the bloud of a femal goat, or els hermarrow or liuer, are thought conuenient laxatiues. *Item*, a plaſter made with a wolues gal, together with the juice of a wild Cucumber, and applied to the nauil. Alſo a draught either of Mares or Goats milke, taken with ſalt and hony. The gall of a ſhe-Goat is good for this purpoſe, if it be taken with the iuice of Sowbread and a little Allum. But ſome there be who think it better to put thereto ſalnitre and water. Buls gall ſtamped and incorporat with Wormwood,
B made into a round ball, and ſo put vp in ſtead of a ſuppoſitorie, will giue a ſtoole, and make the body ſoluble.

Butter eaten in any great quantity, is good for thoſe who haue a flux occaſioned by the weakneſſe of the ſtomack, and a dyſenterie or bloudy flix: ſo is a Cowes liuer: the aſhes of an Harts-horn, taken to the quantity of as much as three fingers will comprehend, in a draught of water: likewiſe the rennet of an Hare wrought in dough for to make bread: or if the patient do voyd bloud withall, the ſame ought to be incorporat in parched Barley meale. The aſhes of a Bores, Sowes, or hares dung, is good to ſpice a warme potion of wine in theſe infirmities. Moreouer, an ordinary Veale broth, as it is commonly giuen, is counted one of the remedies for theſe kind of fluxes abouenamed, whether they come of feeble ſtomacke or exulcerat guts. But if the patient drink Aſſes milk for this purpoſe, it will be the better, if hony be put thereto. Furthermore, the
C aſhes of an Aſſe dung taken in wine, is as effectual in operation as the reſt, for both diſeaſes. As alſo the firſt ordure of the Aſſe fole, which we termed Polea in the former chapter. The cruds or rennet of an horſe fole maw, called by ſome Hippace, is ſoueraign for ſuch lasks, yea, though the patient did ſhere bloud vpon the ſtoole. The aſhes alſo of horſe dung, and the pouder of Horſe teeth is ſaid to be ſingular: yea, and Calues milk ſodden and ſo drunke. But if the flux do proue to be a dyſentery, Phyſitians giue aduiſe to put thertoa little hony: if gripes come thick, they preſcribe the aſhes of Harts horn, or buls gall tempered with Cumin ſeed: and the fleſhy ſubſtance of a Gourd, to be laid in maner of a cataplaſme to the nauill. The tender cheeſe curd of Cowes milke clyſterized, is paſſing good both for the ſtomack flux, and alſo for the bloudie flix. In like ſort the butter made of Cows milk taken to the quantity of foure hemins with two
D ounces of right Terpentine, either in the decoction of Mallowes or oile of Roſes. The ſuet of a Calfe, or beaſts tallow, is likewiſe an ordinary remedy in theſe caſes. But diuers there be who ſeeth the marrow forth as well of the one as the other, with meale, wax, and a little oile, yet ſo, as the broth be clear, that it may be ſupped off. Their marrow alſo is vſually incorporat in the paſt whereof bread is made, and ſo taken with great ſucceſſe. Goats milke ſodden vntill the halfe be conſumed, is reputed alſo a proper medicine. And in caſe the guts beſides be wrung & griped, there would be put thereto a little vnpreſſed wine of the firſt running, called Mere-goutte: howbeit, ſome there be who think it ſufficient for to appeaſe the torments of the wombe, to drinke Hares rennet but once in a draught of wine warm: but the wiſer ſort and thoſe that deale more warily, think it good withall to make a liniment of goats bloud, incorporat with barley meale
E and roſin, & therewith to anoint the belly. And they alſo aduiſe their patients for any violent flux of the belly whatſoeuer, to apply thereto ſoft cheeſe: but if the flux be from the ſtomack, or dyſentericall, they preſcribe old cheeſe to be grated and giuen to the patient in wine, with this proportion, that in 3 cyaths of wine there be a third part of cheeſe. Goats bloud boiled with this marrow, is ſingular good for the dyſentery or bloudy flix. The liuer of a female goat roſted, is a ſoueraign medicine for the fluxions of the ſtomack, but it were better if the male Goats liuer were taken in drinke after it hath bin ſodden in ſome green and auſtere wine, or with oile of Myrtles reduced into a cataplaſme, and ſo laid to the nauill: ſome ſeeth the ſame in water, from ſix ſextars to one hemine, and put Rue thereto. Others roſt the milt of a goat, male or female (it
F skilleth not) and vſe it for the ſame purpoſe, or elſe they take the ſuet of a buck goat with bread that hath bin baked on the harth vnder the embers. But aboue all they hold, that the ſuet taken from the kidnies of a ſhe goat, & ſo drunk alone by it ſelfe, is a ſingular remedy for theſe infirmities: but they inioin the patient preſently therupon to drink a little cold water. Yet there be others who ordain the ſame ſuet to be boiled in water with fried barly groats, Cumin, Dill, and vineger mixt all together. And they giue order to ſuch as haue the ſtomack flux to anoint their

bellies

bellies with Goats dung ſodden with honey. And for both theſe fluxions, as well from the ſtomack as the vlcer of the guts, they preſcribe the rennet of a Kid to the quantity of a Beane for to be drunk in Myrtle wine: alſo a pudding made of the bloud thereof, which kind of meat we call in Latine * Sanguiculus. Moreouer for the dyſenterie, they ordaine to iniect into the guts by a clyſtre, Buls glue reſolued in hot water. G

*i. a blouding.

For any ventoſities, Calues dung is holden to be ſingular good for to reſolue them, if it be ſodden in wine and the decoction thereof vſed. But if the guts be diſeaſed any waies, the rennet of red Deere is very effectuall, ſodden with Lentils and Beets, and ſo eaten with meat. Likewiſe the aſhes of the haire of an Hare boiled with hony. Alſo to drink Goats milk ſodden with Mallowes and a little ſalt put thereto, is good for the ſaid infirmities: but if the rendles be mixed therewith, the opperation wil be the better. Of the ſame vertue is Goats ſuet, taken in any warm ſupping; with this charge, that the Patient drinke preſently vpon it cold water. Moreouer, it is ſaid, that the aſhes of a kids hanch hath a wonderfull vertue to ſouder the rupture, whereby the guts are ſalne downe. Likewiſe, Hares dung ſodden with hony, and taken euery day to the quantity of a Beane, is a medicine for a rupture, ſo ſoueraigne, that it hath bin knowne to cure them who were paſt all hope of remedy. Much commended alſo is the decoction of a Goats head ſodden, haire and all together. H

The diſeaſe called Teneſmos, which is a deſire to go often to the ſtoole without doing any thing, is cured by drinking of Aſſes and Cowes milke.

All the ſort of worms bred in the guts, the pouder of Harts horn taken in drink, doth expell.

There be, as I ſaid before, certaine bones found among the excrements of a Wolfe, which if they be hanged about the arme, do cure the Collicke; if this regard were had before, that they neuer touched the ground. As for Polea (whereof I made mention before) which is the firſt ordure of an Aſſes ſole, it is ſingular good in that caſe. Likewiſe the pouder of a Sows dung taken in the decoction of Rue ſodden in water, with Cumin, is ſingular for the collicke. Finally, the aſhes of a yong Harts horne while it is new come vp and tender, incorporat with the ſhell fiſhes of Barbary, ſtamped ſhels and all together, and ſo taken in a draught of wine, is highly commended for the paſſion of the cholicke. I

Chap. XV.

¶ *For the dolorous torments of the bladder: for the ſtone and grauell. The remedies for the infirmities of the members of generation, of the fundament and the ſhare.* K

THe vrine of a Bore helpeth thoſe who be tormented with the paine in the bladder, and the ſtone: yea, and the very bladder of the Bore eaten as meat, is ſingular good in that reſpect. Howbeit, if the one and the other were permitted to be confected before in ſmoake, you ſhould ſee a greater operation. Now the ſaid bladder ought to be firſt ſodden & then eaten: and if a woman be troubled with the ſaid griefs, ſhe is to chuſe the bladder of a wild ſow. There be found alſo in the liuers of Swine certain little ſtones, or els hard calloſities like vnto ſtones, and white of colour, ſuch as we may ſee daily in our tame ſwine: which being beaten into pouder and drunk in wine, do expell the ſtone and grauell within our bodies. And verily the Bore feeleth himſelfe ſo far forth charged with his own vrine, that vnleſſe hee be deliuered thereof before, he is not able to flie before the chaſe, but ſuffereth himſelfe to be taken as if he were incloſed and faſt bound within net and toile: and they ſay that his vrine doth burne him within. The kidnies of an Hare kept vntill they be dry, then made into pouder and drunk in wine, doe thruſt forth the ſtone. In the peſtle and gammond both of a ſwine, there be certain ioint whirlbones as I haue ſaid before, which if they be ſodden, do yeeld a broth that is very good for the eaſie paſſage of vrine. Likewiſe, the reins of an Aſſe dried, pulverized, & giuen in pure wine of the grape, do cure the diſeaſes of the bladder. The ſurots or rugged werts in horſe legs & the corns about their houf called Lichenes, drunk either in ſimple wine or meath for the ſpace of 40 daies together, do expel the ſtone and grauell engendred in the body: the aſhes alſo of an horſe houſe, taken in wine or water, is good in that caſe. In like maner Goats dung drunk in honied wine, is ſingular for thoſe accidents; but eſpecially that of the wilde Shamois is much more effectuall. Moreouer, the aſhes of Goats haire is thought to auaile much in theſe diſeaſes. L M

As

20030
copy 1

A As touching the botches and carbuncles which ariſe in the priuie members; the brains and bloud of a Bore or Sow are thought to be proper remedies for them: and ſay there be ſome cankerous or corroding vlcers in thoſe parts, the liuer of a Bore or ſwine burned in a fire made principally of Iuniper wood, together with the Papyr reed and Arſenicke, doth heale the ſame: ſo doth the aſhes of their dung. Or els take a Cow or Oxe gall and Ægyptian Allum, wrought and incorporat together with * Myrrh, to the conſiſtence of honey. Beets alſo ſodden, yea, and their ſleſh boiled in wine and ſo applied as a cataplaſme. In caſe they be running ſores: the ſuet and marrow of a calfe boiled in wine, or Goats tallow tempered with hony and the iuice of the brier, are reputed to be ſoueraign. Now if the ſaid ſores ſpread farther ſtil, it is ſaid, that their dung B incorporat with hony or vineger, doth much good: as alſo butter and nothing els ſimply applied to the grieued place. If the cods do ſwell, the ſuet of a calfe made into a liniment, with ſal-nitre put thereto, keepeth downe the tumour. Of the ſame operation and effect is the dung alſo of a Calfe boiled in vineger.

* Some read *Muria*, i. in pickle or brine.

Such as cannot hold their vrine, but that it paſſeth from them againſt their wills, finde great helpe by eating of a Bores bladder roſted or broiled. And verily the aſhes of a Bores or Sowes cleyes, is ſingular good againſt the involuntary ſhedding of vrine, if a cup or drinke be ſpiced therewith for the patient to take. Likewiſe, the bladder of a Sow burnt and giuen to drink, ſerueth well in this infirmitie: ſo doth the bladder of a kid, or the lungs in that manner vſed. Furthermore, it is ſaid, That the brains of an Hare taken in wine, is ſingular to helpe this infirmity. Semblably, the ſtones of an Hare broiled and eaten, or the rennet in the Hares maw, incorporat C with Gooſe greaſe in Barley groats. The kidnies beſides of an Aſſe, reduced into pouder and drunk in pure wine of the grape. The Magitians haue a deuiſe by themſelues, and they affirme, That for to hold ones vrine, it is paſſing good to drink the aſhes of a Bores pizzle in ſweet wine: but they inſtruct the patient withall, to make water in a dogs kenel, and in ſo doing, to ſay theſe words, *I do this, becauſe I would not piſſe my bed as the dog doth his couch*. Thus much for the incontinency of vrine. Now if one be pent and would gladly void vrine, let him take the bladder of a Swine, ſo that it neuer touched the ground, and apply the ſame to the ſhare, for it will prouoke the water to paſſe.

But to come vnto the diſeaſes of the * ſeat: there is nothing ſo good for them as Bears gall, incorporat together with their greaſe. Some put thereto litharge of ſiluer and Frankincenſe: in D which caſes butter is very good, if with Gooſe greaſe and oile of Roſes it be reduced into a liniment: the conſiſtence or thickeneſſe of which compoſition, muſt be ſuch as the grieued place will admit; namely, that it be gentle and ſmooth, ſo as there be no paine in the anointing. Alſo Buls gal is a ſoueraigne medicine applied therto vpon ſoft lint: for it wil quickly skin the chaps and clefts in the fundament. If that part be ſwelled, the ſuet of a Calfe is very good to anoint it therewith: but if the tumors appeare about the ſhare, then there would be Rue ioined therto: as for other infirmities incident to thoſe parts, nothing better than Goats bloud, tempered with parched Barly meale. In like manner, for the hard knobs in the ſeat called Condylomata, Goats gall by it ſelfe is a ſpeciall remedy: ſo is the gall of a Wolfe tempered in wine and ſo applied.

* That is to ſay, *Piles*, blind hemorrhoids, chaps, fiſſures, and ſwelling biggs.

For the biles and impoſtumes riſing in any place therabout, there is not a better medicine to E ſcatter and diſſolue them, than Bears bloud or Buls bloud, dried firſt and ſo beaten to pouder. But the ſoueraigne remedy of all others, is the ſtone which a wilde Aſſe is ſaid to void with his vrine, at what time as he is killed in chaſe: which ſtone as it commeth firſt forth of his body, ſeemeth very liquid and thin, but being ſhed once vpon the ground it groweth thicke and hard of it ſelfe. This ſtone tied to the twiſt or inward part of the thigh, is ſaid to diſpatch all collection of humors that might ingender biles and botches; or at leaſtwiſe ſo to reſolue them, that they ſhall neuer impoſtumat and come to ſuppuration. This ſtone is very rare and hard to be found, for it is not in euery wild aſſe: but ſurely famous it is and much ſpoken of by reaſon of this medicinable property that it hath. Moreouer, the vrin of an Aſſe together with Nigella, otherwiſe F called Gith, is ſingular good in theſe caſes. Likewiſe a liniment made with the aſhes of an horſe houſe incorporat together with oile and water: ſo is the bloud of any horſe, but eſpecially of a ſtallion: the bloud alſo and gal of a Cow or Oxe. Their fleſh moreouer, which we cal bœuf, hath the ſame effect, if it be laid warme vnto the place. The aſhes alſo of their cleies tempered with water and hony. The vrine of ſhe Goats; the fleſh of the male Goats boiled in water. In like maner their dung ſodden with hony. Bears gall or the gall of a bore: laſt of all, the vrine of a Sow

applied

applied vnto the place with wooll. As touching the galls, which by ouermuch riding on horſe- G
back be incident to the twiſt and the inner parts of the thigh, as euery man knoweth full well, which do burne and chaufe the skin in thoſe parts; the fomie ſlime which a horſe yeeldeth, as well from his mouth as his cullions, is ſoueraigne therefore, if the place be annointed therwith.

It falleth out many times that there ariſe ſwellings in the very ſhare and groine, by occaſion of ſome ſores or vlcers in other parts of the body; for the repreſſing of which, there is a preſent remedy, namely, to take three horſe hairs, and to tie them in as many knots, and ſo conuey them into the ſaid vlcer which is the cauſe of ſuch tumors.

Chap. XVI.

¶ *Proper remedies for the gout: the falling ſickneſſe: for ſuch as be taken or ſtrucken with a Pla-* H
net or dead palſie: for the laundiſe, and fractures of bones.

A Cerot made of Beares greaſe, Buls tallow, and wax, of each an equall quantity, is ſingular good for the gout in the feet. And yet ſome there be who adde vnto them Hypoquiſtis and gall nuts. Others preferre a male Goats tallow, together with the dung of a female goat, Saffron, or Muſtard ſeed; and the branches of Yvie ſtamped with Parietary alſo of the wall; or els the floures of the wilde Cucumber, reduced all into the forme of a cataplaſme and ſo applied. In like manner, others vſe a pulteſſe made of beaſts dung & the mother of vineger tempered together. Some magnifie & highly commend in this caſe the dung of a calfe, which hath not as yet taſted of graſſe, or Buls bloud alone without any other thing: likewiſe a wolfe ſodden I
quicke till all the fleſh be gon and nothing but bones remaining: or els a liue Wolfe ſodden in oile til the ſaid oile be gellied to the height or conſiſtence of a cerot. Semblably, there is good account made of the tallow of a hee goat, with as much Parietary of the wall, and a third part of Senvy: as alſo of the aſhes of Goats dung incorporat with hogs greaſe: moreouer, it is ſaid, that the beſt thing that the patient can do for to haue eaſe of the Sciatica, is to endure the ſaid dung as hot as poſſibly he can, vnder his great toes, till it be ready to burne them. For all other joint-gouts as well in feet as hands or elſewhere, the gall of a Beare is a ſoueraigne medicin: as alſo a Hares foot bound faſt to the place affected. And ſome are of this opinion, that the gout of the feet will be aſſuaged, in caſe a man cut off the foot of a quick hare, & carrie it about him continually. As touching kibes, bears greaſe cureth them: ſo it healeth alſo the chaps in the feet: but K
more effectual it is, in caſe there be allum put therto: for which purpoſe Goats ſuet is commended: the pouder alſo of horſe teeth: the gall of a bore or ſow: the lights likewiſe of a ſwine, together with the fat laid to the place. Now if the feet be ſurbatted, galled, and bruiſed in the ſole by treading or ſtumbling againſt that which offendeth them, the ſame medicines be very good: but ſay they are benummed and frozen with cold, the aſhes of Hares haire bringeth them into order again. The lungs alſo of an Hare ſlit and skiced & ſo laid too, is good for any bruiſe or contuſion in the feet; or the aſhes of the ſaid lungs applied thereto. Contrariwiſe, if they be ſcorched and burnt with the heat of the ſun, they find a moſt ſoueraign cure by the greaſe of an aſſe: likewiſe by bœufe tallow & oile of roſes mixed together. The corns, agnels, chaps, & calloſities of the feet, the freſh dung of a bore or ſow doth heal, if it be applied therto in form of a cataplaſm, L
and not remoued before the third day. Of the like efficacy are the aſhes of a ſwines ankle bones, the lungs of a bore or ſow, or of a ſtag. If one haue galled his feet by the fretting & ſtubbornnes of hard ſhoes, the vrin of an aſſe together with the mire that is made of the ſame vrine vpon the ground, doth heal if it be applied to the place: the corns or agnels find much eaſe by bœufe ſuet & the pouder of frankincenſe reduced into a liniment. But kibed heels are beſt healed with the aſhes of lether burnt, eſpecially if it were an old ſhoe. Again, if the feet haue bin wronged by ſtrait ſhoes, take the aſhes of a goats skin tempered with oile. As for the painfull ſwelled veins, named in Latin Varices, there is a ſoueraign cataplaſm to aſſuage their griefe, made with the aſhes of calues dung boiled with lilly roots, & a little hony put therto: the ſame is ſingular for al impoſtumat inflammations that tend to ſuppuration. This medicin is good alſo for the gout in M
the feet, & for all diſeaſes of the ioints, if ſo be the ſaid dung came from an ox calf. The ioints if they haue gotten a ſprein by any ruſh, find remedy by the dung of bore or ſow, if it be laid to hot in a linnen cloth. The dung alſo of a calf that yet ſucks & neuer did eat graſſe, hath the ſame effect: euen as goats dung boild with hony in vineger: the raggednes of nails haue a proper remedy

of

20030
copy 1

A of calues dung, of goats treddles likewiſe, if there be red Arſnick or Orpinent mixed therwith.

As touching werts, there is not a better thing to take them away than the aſhes of Calues dung tempered with vineger, or the durt that is made by the vrine of an Aſſe.

For thoſe that be ſubiect to the falling euill, it is ſingular good to eat the genetoirs of a bear, or to drinke the ſtones of a Bore either out of Mares milk or plain water: alſo the vrine of a bore mingled with oxymell. But more effectuall in operation is that vrin which hath bin ſuffered to dry as it lieth in the own bladder. The ſtones likewiſe of a ſow which are taken from her when ſhe is ſplaied, if they be kept vntill they be dried, and ſo brought into pouder, are excellent in this caſe taken in the milk of a ſow, with this charge, that the patient abſtain from wine for certain daies together, both before and after the receiuing of this medicine. For this infirmity alſo

B they vſe to giue the lungs of a hare poudred or kept in ſalt, with a third part of frankencenſe in white wine for 30 daies together. Alſo the rennet or cruds found in the maw. The braines of an Aſſe firſt dried in the ſmoke * within certain leaues, drunk to the weight of half an ounce euery day in honied water; or the aſhes of the ſaid beaſts houſe, taken to the quantity of 2 ſpoonfulls daily for a months ſpace, are appropriat medicines for this malady. In like manner, their ſtones preſerued dry and reduced into pouder, ſerue to ſpice their drink, whether it be the milk of Aſſes (which is the beſt) or ſhere water: the pellicle wherein the yong fole was lapped in the dams womb, ſpecially if it were a male that was foled, is of great force to withſtand this diſeaſe, if the patient do but ſmell thereto when the fit is comming. Some giue counſell to eat the heart of a black he aſſe, together with bread: but in any wiſe it muſt be done abroad in the open aire, and

C when the moon is but one or two days old at the moſt. Others preſcribe to eat the fleſh; & there be againe who aduiſe to drink their bloud dilaied with water for 40 daies together. Some take horſe ſtale, mingling it with ſmiths water freſh out of the forge for the ſaid purpoſe: & with the ſaid drink cure thoſe that be lunatick & mad at certain ſeaſons. Mares milk is ordinarily giuen with good ſucceſſe to thoſe that be troubled with the falling euill: ſo are the rugged * werts growing vpon horſe legs to be drunk in oxymel. And to this effect the Magitians would haue a diſh of meat made with goats fleſh roſted againſt a funeral fire, where ſome dead corps is burnt: who ordain beſides their tallow and buls gall, of each an equall weight, to be ſodden, and then to be put vp again into the bladder or burſe of the ſaid gall, that it touch not the ground in any caſe; and being thus prepared, the patient forſooth muſt drink it in water ſtanding vpon the dore

D ſill, and vnder the very lintell thereof. Now, if you would know whether a man be ſubiect to this ſicknes or no, do but burn before him either a Goats or Stagges horne, the very ſmoke or fume thereof will bring the fit vpon him, if he be tainted therewith.

Concerning thoſe that be ſuddenly taken with a dead palſie of the one ſide of their body, it is ſaid that the vrin of an Aſſe-fole incorporat with Spikenard into the form of a liniment, is very good for them, if the inunction therewith be vſed.

For the jaundiſe, Harts horn burnt and reduced into aſhes, is a very proper medicine: ſo is the bloud of an aſſe fole drunk in wine. Likewiſe the * dung of an aſſes fole which came firſt from it after it was foled, giuen to the quantity of a bean in a draught of wine, cureth the iaundiſe within three daies. The ſame operation and effect there is in the firſt ordure that a colt maketh after

E it is come into the world.

If any bone be broken or bruſed, there is not a more preſent remedy than the aſhes of a cheek either of a wild bore or tame ſwine. In like maner, their lard ſodden & tied round about the broken bone, doth conſolidat and ſouder it again wondrous ſoon. And verily if there be any ribs in the ſide broken, the ſoueraigne and only remedy commended, is goats dung tempered with old wine, for it openeth, draweth, and healeth the fracture throughly.

As touching feuers, the feeding vpon the veniſon of red Deere driueth them all away, as I haue before ſhewed: but more particularly, if it be any of theſe Typicke and Periodicall agues, which be intermittent and return by fits, there is not a better thing, if we may beleeue Magitians, than to take the right eie of a wolfe, ſalt it, and ſo tie it about the necke or hang it faſt to any

F part of the patient. Of theſe feuers, there is one called a quotidian, which the Greeks name Amphemerinos; & from it (by their ſaying) a man ſhal be throughly rid, in caſe he let an aſſe bloud in the eare vein, and drink three drops thereof iuſt in 3 hemines of water. But againſt the Quartan ague, the Magitians giue order to weare about the neck or hanging to the arme cats dung, together with the claw or toe of a * ſeriche Owle, but ſo as they may not fall off nor be remoued

* *In ſolis*: ſome reade *ſoiis*, i. in the baines or ſtouues.

* *Lichenes*: ſome take them for the Malanders

* Called before *Volea*.

* *Bubonis*

moued before ſeuen fits be paſt. Now tell me(I pray you) what was he that could find out this G
ſecret firſt? Gladly would I learne what reaſon there is in this mixture, and why an owles claw or toe was choſen aboue all other for this purpoſe? Certes, there be ſome of them yet more modeſt than their fellows: and they haue giuen out, That the liuer of a Cat killed in the wane of the Moone, laid vp in pouder with ſalt, is to be giuen in a draught of wine a little before the acceſſe or fit of a Quartan. And theſe magitians haue yet another prety receit againſt ſuch agues: for they take the aſhes of a Cow or Oxe mucke, and ſprinkle it wel with the vrin of a yong boy; wherewith they annoint the toes of the patient: but to his hands or arms they bind the heart of an Hare; which done, they ordain alſo to giue him before the fit, the Hares rennet in a draught of drinke. To conclude, they ſay, that a freſh greene cheeſe made of Goats milke, out of which the whey hath bin well preſſed, is ſingular to be giuen in hony. H

Chap. XVII.

¶ *Proper remedies againſt the trouble of the braine by reaſon of Melancholy; againſt the lethargie, dropſie, ſhingles, and S.* Anthonies *fire. Alſo for the paine of the ſinewes.*

THe dung of a Calfe ſodden in wine, is an excellent remedy for thoſe who are giuen to melancholy. For to raiſe and awaken them that are in a lethargie, there is not a bettter thing than the rough werts growing vpon an Aſſes leg, if the ſame be tempered with vineger into a liniment, and the noſthrils anointed therewith: alſo the perfume of the horne or haires of a I
Goat: yea, and a bores liuer: which is the cauſe that it is giuen ordinarily to thoſe that haue the drowſie diſeaſe, and be alwaies ſleepie.

For the phthyſick, the liuer of a wolfe ſodden in wine is very good: likewiſe the lard of a lean running ſow feeding only vpon graſſe: as alſo Aſſe fleſh ſodden and eaten with the broth: and verily in Achaia this is the principall courſe they take for the cure of that diſeaſe. Moreouer, it is ſaid, that to receiue through a pipe or reed the ſmoke of the dry dung made by Cow or Oxe lying forth and feeding only vpon green graſſe, is very wholſome for thoſe that haue the phthiſick or conſumption of the lungs. Alſo there be who calcine the tips of Bœufs horns, & taking the meaſure of two ſpoonfuls of the aſhes, incorporat the ſame with hony, make it vp into pills, and ſo ſwallow them down for the ſaid malady. Many there are who affirm, That the phthyſicke K
and cough be cured by eating a kind of pottage made with Frumenty corne and goats ſuet: and they hold opinion, That the ſaid ſuet taken freſh and ſweet and ſo diſſolued in mead; with this proportion, that to euery cyath of the mead there be put an ounce of ſuet, and that order be taken to mingle them throughly well, with a branch or ſprig of Rue among, is a ſoueraigne medicine for thoſe infirmities. There is one writer of good credit & authority, who vpon his certain knowledge doth auouch, That there was one ſo far gone in a phthyſicke, that he was giuen ouer by the Phyſitians, & yet he recouered by drinking the ſuet of a Shamois or wild goat, together with milk, of each one cyath at a time. Others ſay, that much good hath bin found by drinking in ſweet cuit, the aſhes of ſwines dung, as alſo by the lungs of a red Deer, eſpecially the Spitter of that kind, dried in the ſmoke, reduced into pouder and ſo drunke in wine. L

In caſe of the dropſie, the vrin of a Bore found in his bladder giuen to the patient in drink by little and little, helpeth very much: but of greater efficacy it is, if the ſame be permitted to drie within the bladder. Furthermore, the aſhes of Harts dung, & namely of that Deer which is called the Spitter: as alſo of Neats dung, ſuch I mean as go abroad and feed with the heard (& that they call by a peculiar name * Bolbiton) is a ſoueraigne remedy for the dropſie. Mary, if the patient be a woman, there muſt be choiſe made of cow dung; but if a man, the dung of the other ſex is to be taken: and this I may tel you is ſuch a ſecret myſtery, that the Magitians would not haue to be reuealed & made known. Many other medicines there be for the dropſie, to wit, the dung of a Bull calfe vſed in a liniment: the aſhes of a calues dung drunk in wine, with an equall quantity of the wild parſnep ſeed: goats bloud together with the marrow, eaten with meat: it is M
thought that this bloud will worke the better, if it be taken from the male Goats; prouided alwaies, that they feed vpon the Lentisk tree, and then no doubt it will do the deed ſurely.

* i. Sherne.

As touching S. *Anthonies* fire, the ſhingles, &c. the meanes to quench the ſame, is to annoint the place with Bears greaſe, and eſpecially the fat that is found about the kidnies: alſo with the

greene

20030
copy 1

A greene dung of a calfe,cow,or oxe. Some vſe hard cheeſe made of goats milke and porret together: alſo the fine ſcrapings of a ſtags skin fetcht off with a pumiſh ſtone & brought into pouder,and ſo applied with vineger. For the redneſſe of the skin with much itching, the ſome of an horſe mouth,or the aſhes of his houſe,is a ſingular medicine. If there be any wheals or ſmall pox proceeding of fleam,do annoy the skin,no better thing than a liniment made of aſſe-dung aſhes incorporat in butyr: ſay theſe wheals or pimples appear blackiſh and ſwert by reaſon of melancholy,dry cheeſe made of goats milk brought into an ointment with hony and vineger, is good to rub the body withall in a bain or hot houſe,without any vſe of oile at all. For bliſters and angry meazils,the aſhes of ſwines dung are thought to be very meet:as alſo the aſhes of harts horn, ſo that the place be rubbed with them and water together. If there be any diſlocation or bone
B out of ioint,the green dung of a bore or ſow is good to be applied:ſo is that of a calfe: the ſome frothing from a bore,laid to the place with vineger:and goats dung with hony.

There is not a better thing to bring down any ſwelling,than a cataplaſm of raw beefe:and as for any hard tumors,ſwines dung made hot and dried in an earthen pot-ſheard,or vpon a tile, is excellent to diſcuſſe and reſolue them:the greaſe of a wolfe is exceeding good to break any impoſtumation that is grown to ripeneſſe: ſo is neats dung made hot vnder the embers: or goats treddles ſodden in wine or vineger:as touching fellons & ſuch like apoſtumations,bœuf tallow with ſalt is much commended for to reſolue them:& if the place be much pained,it were good to dip the ſaid tallow in oile,and to melt the ſame without any ſalt: and in like manner is goats
C ſeuet to be vſed. For a burn or ſcald,there is a proper ſalue made of bears greaſe and lilly roots: for which purpoſe,the dung of bore or ſow that hath bin long kept,is very good:ſo is the aſhes of their briſtles (ſuch as pargettars whiting bruſhes be made of) wrought and incorporate with greaſe:alſo the aſhes of a beaſts ankle or paſtern bone tempered with wax and the marow either of a deere or bul:like as the dung of an hare. And verily,goats treddles are ſo accommodate to this cure,that (by report) they will heal a burn without any skar at all. The moſt excellent glew is made of the ears and pizzles of buls:and there is not a better thing in the world than it,for to heal any place burnt or ſcalded;but nothing is ſo much ſophiſticate, what with other old skins and hides,and what with old ſhoes and ſuch like lether,boiled again and made into glew. The moſt faſt and ſtrongeſt glue which a man may truſt vnto,is made at Rhodes,and that is it,which
D painters & phyſitians moſt vſe:the whiter that the ſame is,the better is it eſteemed:that which looketh black,and is hard withall and brittle like wood,is reiected.

It is thought,that for the pain of the ſinewes,goats dung boiled in wine with honey is ſoueraigne,yea though a nerue began to putrifie: convulſions,crampes,and ſpreines of nerues vpon ſome violent ſtroke,are cured with bores dung gatherd in the ſpring & ſo dried. After the ſame manner,ſuch as be ouerſtrained and plucked with the draught of any charriot,or wounded with the wheels going ouer them;and generally,how ſoeuer the bloud be ſetled black vnder the skin by contuſion or bruiſe,if the places be anointed with the ſaid dung, though it were greene and freſh,much eaſe and help inſueth therupon:howbeit,ſome think that it were better to ſeeth the dung firſt in vineger:and others reduce the ſame being drie into pouder,and promiſe them that
E be either burſten,wounded and bruiſed inwardly,or haue bin ouerthrown and faln from on high if they drink it in vineger,that they ſhall haue help thereby. But the better, and thoſe that loue not to make the greateſt boaſt of their medicines,vſe the aſhes thereof with water. And verily it is ſaid,that the Emperor *Nero* was wont in this kind of drink to take great pleaſure, and with it to refreſh himſelfe,when his purpoſe was by that means to win a name,and approue himſelfe a doubtie wight,in running with coaches in the great cirque or ſhew place. To conclude, next to the dung of a bore, is commended that of a ſow or any other hog, and thought to be in a ſecond place of operation.

Chap. XVIII.

F ¶ *Medicines to ſtanch bloud: to heale vlcers,cancerous ſores,and the wild ſcab: alſo what medicines they be that draw thorns,pricks,or whatſoeuer ſticketh within the fleſh. Finally,proper receits to cicatrize and skin a wound or ſore.*

THe rennet of any Deere or a Hare, vſed in vineger, ſtancheth bloud. The aſhes alſo of the haire of an hare: likewiſe of Aſſes dung: yea and the very aſhes of their haire made into a liniment with any conuenient liquor,hath the ſame effect:but if you would haue it work

more effectually, chuſe theſe excrements of the male aſſe, mix the ſame with vineger, and apply G
it with wooll; for it will ſtay any flux of bloud whatſoeuer: likewiſe if it be of the haire which
is curried from the horſehead or buttock when he is dreſſed: or els the aſhes of calues dung tem-
pered with vineger, and ſo applied vnto the place. In like manner the aſhes of the goats horn or
dung, with vineger: and yet the bloud that iſſueth out of a buck-goats liuer when it is ſliced and
cut in ſunder, is more effectuall: but the aſhes of them both, as wel the male, as female; the liuer
and the bloud drunke in wine, or applied vnto the noſthrils with vineger, is of vertue to ſtaunch
bloud. Moreouer, the aſhes only of a leather wine bottle made of a male goats skin, mixed with
an equall quantity of roſin, doth not only ſtop an iſſue of bloud, but alſo conglutinat and heale
a wound. Furthermore, the rennet of young kids, with vineger; the aſhes alſo of their haunches
burnt, is thought to haue like operation in ſtanching of bloud. If there be any vlcers vpon the H
ſhins or any part of leg & thigh; bears greaſe & red oker incorporat together into a ſalue, doth
heale the ſame: but in caſe the ſaid ſores be corroſiue and eat farther, the gal of a bore with roſin
and ceruſe, cureth the ſame: ſo doth the aſhes of a bores or ſows cheek: likewiſe ſwines dung dri-
ed and applied to the grieued place: as alſo goats treddles warmed well ouer the fire with vine-
ger, and laid too accordingly. But for to mundifie and incarnat all other ſores, they vſe butter;
the aſhes of a ſtags horn, or the marow of red deere; buls gall likewiſe with the oile of the plant
Cypros; or els the dung of a goat, male or femal it skils not whether. If there be a wound made
by ſword or edged weapon, there is good means to heal it with the freſh dung of ſwine, or els the
pouder thereof being long kept and dried, if the place be dreſſed therewith. In caſe there be an
vlcer that eateth deep to the very bone, or an hollow fiſtula, it is good to iniect into it with a ſy- I
ringe, a buls gall, with the juice of leeks or breſt milk: or els to dreſſe the ſame with the pouder
of his bloud dried, incorporat with the herb called Vmbilicus Veneris. Is the ſame cancerous?
the rennet of a leueret with the herb Capers, taken of ech a like quantity, & ſprinkled with wine
doth cure it. If it grow to mortification & proue a gangrene, it is good to anoint the place with
bears gall, with a feather. As for corroding vlcers which ſpread ſtill farther, no better thing to
repreſſe them, than to ſtrew vpon them the aſhes of an aſſe-hoofe. The bloud of an horſe is cor-
roſiue, by vertue whereof it doth eat away and conſume the excreſcence of proud fleſh; ſo doth
the cinders of old horſe dung burnt: as for thoſe kind of fretting cankers which the Greeks call
Phagedænæ, the aſhes of a bœufe hide mingled with hony, doth cure and heale perfectly. The
application of raw veale vnto a green wound, keepeth it from ſwelling: and a cataplaſm of beaſts K
dung and hony together, doth the like. But ſay the vlcers be maligne and filthy morimals, ſuch
as the Greeks call Cacoëthe, the aſhes of a leg of veale incorporat with womans milk, do heale
vp cleane. Freſh wounds occaſioned by ſword or edged weapon, buls glue diſſolued or melted, &
ſo applied, doth cure very wel, ſo it be not remoued vntil the third day. If a ſore need to be clen-
ſed, dry cheeſe made of goats milk, tempered with vineger & hony, is a ſingular mundificatiue.
An vlcer giuen to go farther, and to eat as it goeth, is repreſſed by applying tallow thereto and
wax incorporat together: put to it pitch and ſulphur, it will heale and skin the ſame throughly.
In like manner, for the vnto vard morimals beforeſaid, which they call Cacoëthe, it is very good
to lay a pultus made with the aſhes of a kids leg and breſt-milke. As for carbuncles, take the
brains of a tame ſow, roſt the ſame and apply it vnto the ſores, it is a ſoueraigne remedy. Tou- L
ching the ſcabs that men be ſubiect vnto, there is not the like medicine for killing the ſame, to
the marow of an aſſe: & a liniment made with the vrin of the ſaid beaſt together with the earth
vpon which he hath ſtaled. Butyr likewiſe is very good in that caſe, as alſo for the farcins, ſullan-
ders, and mallanders in horſes, if it be applied thereto with roſin made hot: ſo is ſtrong buls glue
diſſolued in vineger, with quick lime put thereto: alſo goats gall tempered with the aſhes of a-
lume calcined. For the red bliſters and meazils likewiſe, there is not a better medicine than the
dung of a cow or oxe; and therupon they tooke the name of Boæ. The mange in dogs, is healed
with beaſts bloud, ſo they be bathed therewith whiles it is freſh and warm; and after the ſame is
dried vpon the body, to follow it a ſecond time the ſame day: & the morrow after to waſh them M
throughly with lie made of ſtrong aſhes.

If rhorns, ſpills, bones, and ſuch like things haue gotten into the fleſh and there ſticke, cars
durg is very good to draw the ſame forth: likewiſe the treddles of a goat with wine. Any rendles
alſo, but eſpecially that which is found in an hares maw, ſerue in that caſe, reduced into a ſalue,
with the pouder of frankincenſe and oile; or elſe with the like quantity of birdlime, or the ce-

reous

20030
copy 1

A reous matter in the Bee-hiue called Propolis.

Furthermore, the greaſe of an aſſe is ſingular to reduce any ſwert ſploches and black skars to a freſh and natiue colour; which, if they ouergrow the skin about them, are brought downe and made more euen and ſubtill, by an inunction of calues gall: but the Phyſitians prepare the ſayd gall with an addition of myrrh, hony, and ſafron, and then put it vp in a braſen box for their vſe: yet ſome there be, who mingle with the reſt verdegris or the ruſt of braſſe.

CHAP. XIX.

¶ *Receits appropriat to the maladies of women, and the diſeaſes of ſucking babes: alſo remedies for them that are vnable to performe the act of generation.*

B TO begin with the naturall courſe of womens purgation: the gall of a bul or oxe, applied to their ſecret parts in vnwaſhed greaſie wooll, is very effectuall to bring the ſame down. The skilfull midwife of Thebes, *Olympias*, vſed to put thereto * hyſſope and ſal-nitre. For this purpoſe, harts horne burnt to aſhes is very good to be taken in drinke. But if the matrice be out of order and vnſetled, it is not amiſſe to apply the ſame aſhes vnto the naturall parts: yea and buls gall together with * Opium to the weigh of two oboli; or elſe perfume their ſecret parts with a ſuffumigation of deers hair. Moreouer, it is ſaid, that the hinds when they perceiue themſelues to be in calf, ſwallow down a little ſtone; which is ſingular good for women with child to C carry about them, that they may go out their full time: and therefore much ſeeking there is after this ſtone, which is commonly found among their excrements at ſuch a time; or elſe in their womb, if haply they be killed with calfe, for then it is to be had there alſo. Moreouer, there are found certain little bones in the heart and matrice of an hinde, and thoſe bee paſſing good for great bellied women, and ſuch as be in trauel of child-birth. As for that ſtony ſubſtance reſembling a pumiſh, which in like manner is found in the wombe of kine, I haue ſpoken already in my diſcourſe or Kine, and their nature. If the matrice of a woman be growne hard, and haue a ſcirrhe in it, the fat of a wolfe will mollifie it: if it be grieued with paine, the liuer of a wolfe aſſuageth the ſame. When women be neare their time, and ready to cry out, it is good for them to eat wolues fleſh: or if when they fall firſt to trauell, there be but one by them who hath eaten D therof: & this is ſuch an effectuall thing, that if they were foreſpoken, or indirectly dealt withall by ſorcery & witchcraft, this is thought to eaſe them of paine, and procure them ſpeedy deliuerance. But in caſe ſuch a one as hath eaten wolues fleſh, chance to come into the chamber when a woman is in the mids of their trauell, ſhe ſhall ſurely haue a hard bargaine, and die of it. Moreouer, great vſe there is of the hare in all womens infirmities; for the lungs of an hare dried, made into pouder, and taken in drinke, is comfortable to the matrice, and helpeth it in many accidents thereof: the liuer drunk with Samian earth in water, ſtaieth the exceſſiue flux of their fleurs: the rennet of their maw fetcheth away the after-birth when it ſtaieth behind; but then in any wiſe the woman muſt not bathe or ſweat in bain theday before: the ſame rennet appliedas a cataplaſme vpon a quilt of wooll, with Safron & the juice of porret, forceth the dead infant E within the mothers wombe to come forth. Many are of opinion, that if a woman eat with her meat the matrice of an hare, ſhe ſhall thereupon conceiue a man child if ſhe company with her husband. And ſome ſay, that the genetoirs of the male hare, yea & the rendles, are good for that purpoſe. And it is thought, that if a woman who hath giuen ouer bearing children, doe eat the young leueret taken forth of the dams belly when ſhe is newly bagd, ſhe wil find the way again to conceiue & breed freſhly as before: but the magitians do preſcribe the husband alſo to drink the bloud of an hare, for ſo (ſay they) he ſhall ſooner get his wife with child. And they affirme moreouer, that if a maiden be deſirous her breſts or paps ſhould not grow any more, but ſtand alwaies at one ſtay, knit vp round and ſmall, ſhe is to drink 9 treddles or grains of hares dung: and for the ſame intent, they aduiſe a virgin to rub her boſom with a hares rennet & hony together: F alſo to anoint the place with hares bloud, where the haire is plucked off, if they be deſirous that it ſhould not grow again. As touching the ventoſities and inflation of the matrice, it is good to vſe thereto a liniment made of bores or ſwines dung, incorporat with oile: but in this diſeaſe, it were better for to repreſſe the ſaid windines & flatuoſity, to ſpice a cup with the pouder of the ſame dung dried, & giue it to the woman to drink; for whether ſhe be vexed with wrings whiles

* *Hyſſopum*, ſome read *Oeſypum*, which the Apothecaries call *Hyſſopus humida*: & is nothng els but the greaſy filth & ſweat tried out of the wool growingin ſheeps flanks.

* *Opio*, ſome read *Apio*, i Perſley.

ſhe is with child, or pained with afterthrows in childbed, ſhe ſhall find much eaſe by that poti- G
on. Furthermore it is ſaid, that ſows milk giuen with honied wine to a woman that is in labour, helps her to ſpeedy deliuerance. Let a woman newly brought to bed drink the ſame milk alone ſhe will proue a good milch nource, and haue her breſts ſtrut with milke: but let her breaſts be annointed al ouer with the bloud of a ſow, they will grow the leſſe by that means. If the paps do ake and put the woman to paine, a draught of aſſes milke aſſuageth that griefe: put thereto a quantitie of hony, it will bring down the deſired purgation of a woman. The greace of the ſame beaſt, which hath beene tried and long kept, healeth the exulceration of the matrice: and being applied to the natural parts with a lock of wool in forme of a peſſarie or otherwiſe, it mollifieth the hardnes of that place. The ſame freſh, or long kept (it makes no matter whether) is depilatorie; for look what part is annointed with it & water together, the haire wil come no more there. H
The milt of an aſſe kept vntil it be dry, and tempered with water into a liniment for the breaſts, cauſeth them to grow, and bringeth ſtore of milke into them: and if the matrice be vnſetled and turned aſide any way out of order, it reduceth it into the place again. If a woman ſet ouer a ſuffumigation of an aſſes houſe, and receiue the fume vp into her body, ſhe ſhall haue quick ſpeed of childbirth; for ſo ſtrong it is, that it wil cauſe abortion and put her to a ſlip before the time: and therefore it is not to be vſed vnleſſe a woman haue gone her full time, or that the child be dead in her wombe; for ſurely it is able to kill the child within her body, without great heed and careful regard. Alſo it is ſaid, that the dung of this beaſt, if it be applied freſh & green, is of wonderfull operation to ſtop the extraordinarie flux of bloud in women: ſo is the aſhes of the ſame dung, which being laid vnto their naturall parts, is a ſoueraigne remedy for the accidents therto I
belonging. Moreouer, take the ſome or froth of an horſe mouth, and let the place be annointed
* Some read, fortic. therewith for * twenty daies together, either before the haire do come, or when it beginneth to ſpurt, it will keepe them for euer being vndergrown: of the ſame operation is the decoction of a harts horne; but it will do the feat the better, in caſe the ſaid horne be new and green. If the matrice be ſyringed and waſhed with mares milke, it will find much comfort and eaſe thereby. If a woman perceiue the infant to be dead in her body, let her take the powder of the rugged werts vpon a horſe leg, call Lichenes, in freſh water, it will exclude the ſaid dead fruit of the wombe: the perfume alſo of the houſe will do as much, or the dung dried. If the matrice be falne or ſlipt out of the body, an injection of butter by the metrenchyte, ſtaieth the ſame and keepeth it vp. If
there be any hardnes grown in that part, whereby it is ſtopped, a beaſts gall mingled with oyle K
of roſes & turpentine, and ſo applied outwardly in a lock of wool, openeth the ſaid obſtruction.
It is ſaid alſo, that a ſuffumigation made of ox dung, ſtaieth the matrice vp when it is readie to fall, yea and helpeth a woman in labour to ſpeady childbirth: but if ſhe vſe to drink cows milk, ſhe ſhal be the better diſpoſed & prepared to conceiue with child. Moreouer, this is a thing for certain known, that there is nothing bringeth a woman ſooner to barrennes, than hard trauaile in childbearing. But to preuent this inconuenience, *Olympias* the expert midwife of Thebes, affirmeth, that there is nothing better than to annoint the naturall parts of a woman with ox gall, incorporat in the fat of ſerpents, verdegrece, and hony mixed therwith, before that ſhe medleth with a man in the act of generation. Likewiſe, if a woman which is giuen to haue thoſe naturall
parts ouer-moiſt and ſlippery, by reaſon of humours purging immoderately that way, do apply L
vnto the neck of the matrice a calues gall, a little before ſhe mind to admit the carnal company of a man, ſhe will be the more apt to conceiue: and in very truth, the inunction therewith doth mollifie the hardneſſe of the bellie; repreſſeth outragious fluxions, if the nauell be annointed therwith: and in one word, is good euery way for the matrice. Howbeit in the vſe of this gal, they ordain a proportion, to wit, that to euery denier weight of the ſame, there be put a third part of
* *Apÿ*, ſome read *Opÿ*, *i.* the iuice of poppy. * perſly ſeed, with as much of the oile of almonds as is thought ſufficient to incorporat them into a liniment; and this they put vp with wooll in manner of a peſſarie. The gall of an ox calfe tempered with halfe as much hony, is a medicine ordinarily kept in readines for the diſeaſes of the matrice. Some make great account of veale, and doe promiſe, that if women about the time that they conceiue doe eat it with the root of Ariſtolochia, *i.* Birthwort, they ſhall bring forth M
boies. As for the marow of a calfe, ſodden in wine & water together with the ſuet, & ſo conveied vp in a peſſary, healeth the exulceration of the matrice. So doth fox greace & the dung of cats; but this ought to be applied with roſin and oile roſat. It is thought, that there is not ſo good a thing for the matrice, as to ſit ouer a ſuffumigation made of goats horn. The bloud of the wild goat

20030
copy 1

A goat or ſhamois tempered with the * ſea-ball, ſerueth to take away haires: but the gall of other goats that be tame, mollifieth the callositie in the matrice, if a peſſarie be ſtrewed withall, and cauſeth a woman to be meet for conception, if ſhee vſe it preſently vpon the purgation of her monethly terms. Alſo the ſame hath a depilatory vertue, if a liniment be made therewith, and vſed to the place where the haire is plucked forth already, and kept thereto three daies together. Furthermore, our midwiues do warrant, that if a woman drink goats vrine, it will ſtop all fluxes of bloud be they neuer ſo immoderat, ſo ſhee apply alſo outwardly the dung of the ſaid beaſt. The pellicle or glean wherein a kid was infolded within the dams wombe, kept vntill it be drie, and drunk in wine, putteth forth the after-birth in women. And they are of this opinion, that a ſuffumigation of kids haire, is very good to cauſe the matrice to return when it was falne down:

B alſo, that to drink their rennet, or to apply outwardly henbane ſeed, is ſingular for to ſtay any iſſue of bloud. *Oſthanes* ſaith, that if the loins or ſmall of a womans backe, be annointed with the bloud of a tike taken from a blacke Bull or Cow that is of a wilde kinde, it will put her out of al fanſies of venereous ſports. He affirmeth moreouer, that if ſhe drink the vrin of a male goat, with ſome ſpikenard among to take away the lothſome taſt thereof, ſhe will forget all loue that ſhe bare to any man before.

To come now vnto little infants: there is not a more proper thing for them than butyr, either alone by it ſelfe, or with hony: and to ſpeak more particularly, it helpeth them when they breed teeth, or haue their gums ſore, or mouth exulcerat. If there be hung about the neck of a little infant, the tooth of a wolfe, it keepeth them from ſtarting or skriching in their ſleep for feare, and

C allaieth the pain which they feele in toothing: the ſame doth alſo a wolues skin. And verily the great maſter teeth and grinders of a wolfe, beeing hanged about an horſe necke, cauſe him that he ſhall neuer tire and be weary, be he put to neuer ſo much running in any race whatſoeuer. Let a nurce anoint her breſt with the rennet of an hare, the babe that ſhe giueth ſucke vnto ſhall by that means be knit in the belly and not be troubled with the laske. The liuer of an Aſſe with a little of the herb Panax mingled withal, dropped into the mouth of an infant, preſerueth it from the falling ſicknes and other dangerous diſeaſes; but this (they ſay) muſt be don for forty daies together. If a child be lapped in a mantle or bearing-cloth made of an aſſe skin, it ſhall not be affrighted at any thing. The colts teeth that firſt fall from an horſe-fole, if they be hung about yong childrens necks, eaſe them much of the pain that they haue in breeding teeth: but more ef-

D fectuall they be, in caſe they neuer touched the ground. The milt of a bœuſe eaten with honey, and the ſame reduced to a liniment and applied accordingly, is good for the pain of the ſpleen: put hony thereto, it healeth the running skals that trouble children. The milt of a calfe ſodden in wine, ſtamped and brought into a liniment, healeth the cankers or little ſores in the mouth that yong infants be ſubiect vnto. The Magitians haue a deuiſe, to take the brains of a female goat, & let it paſſe through a gold ring, & to drop the ſame into the mouth of infants new born, before the teat be giuen vnto them: which (they ſay) is ſingular good againſt the falling ſicknes, and other infirmities that to ſuch babes are incident. Goats dung wrapt within a piece of cloth and ſo hanged about a yong child, ſtilleth it, being neuer ſo froward or vnquiet, and a girl eſpecially. The gums of yong babes waſhed with goats milk, or annointed with hares braines, cauſe

E them to haue great eaſe in toothing. *Cato* is of opinion, that whoſoeuer vſeth to eat hares fleſh, ſhall ſleep well. And the common ſort of people are perſuaded, that the meat of this kind of veniſon, cauſeth them that feed vpon it to look fair, louely, & gracious, for a week together afterwards. For mine own part, I think verily it is but a toy and meere mockery; howbeit there muſt needs be ſome cauſe & reaſon of this ſetled opinion which hath thus generally caried the world away to think ſo: the magitians affirm for certain, that if the eies be anointed with the gal of a female goat (ſuch only as had bin offred in ſacrifice) or laid vnder the pillow in bed, it wil procure them to take their repoſe who were far out of ſleep: the aſhes of a goats horn incorporat into an vnguent with oile of myrtles, keeps thoſe from diaphoretical ſweats who are anointed therwith. A liniment made of bores gall, prouoketh vnto carnal luſt: the ſame effect there is of that viru-

F lent ſlime, which *Virgil* the Poet deſcribeth to drop from * a mares ſhap, againſt the time that ſhe is to be couered: alſo the ſtones of an horſe ſo dried that they may be reduced into pouder, for to be put in drink: moreouer, the right genetoir of an aſſe drunk in wine as need requireth, or tied in a bracelet faſt to the arme, inciteth to venerie: furthermore, the frothie ſperme that an aſſe ſheddeth after he hath couered the female, gathered vp in a peece of red cloth, and incloſed within

* *Pila myrtea.* Dioſcorides ὀσφρᾶσθαι. Galen. lib. 2. Simpl.

* *Ad coitum equi:* not according to the meaning of *Virg.* 3. *Geor.* in theſe words, *Scilicet ante omnes furor eſt inſignis equarū &c.* & a little after: *Hinc demum Hippomanes, &c. Lentè deſtillat ab inguine virus.*

within ſiluer & ſo caried about one, is of great power in this caſe, as *Oſthanes* mine author ſaith. G
But *Salpe* (a famous courtizan) giueth direction to plunge the genitall member of this beaſt ſeuen times together in hot oile, and with the ſaid oile to anoint the ſhare and parts therabout. *Bialcon* aduiſeth to drink the aſhes of the ſaid member, or the ſtale of a bull preſently after hee hath done his kind to a cow, and with the earth that is moiſtened and made mire with the ſaid ſtale, to anoint the priuy parts. Contrariwiſe, there is not a thing that cooleth the luſt of a man more, than to annoint the ſaid parts with the dung of myce and rats. To conclude, for to auoid drunkenneſſe, take the lungs of an hog, be it bore or ſow it matters not; in like manner of a kid, and roſt it, whoſoeuer eateth thereof faſting, ſhall not be drunke that day, how liberally ſoeuer he take his drinke.

H

Chap. XX.

¶ *Strange and wonderfull things obſerued in beaſts.*

THere be other admirable properties and vertues reported of the ſame beaſt, ouer & beſides thoſe before rehearſed; for it is ſaid, that whoſoeuer do find and take vp an horſe ſhoe ſhaken from the houſe (an ordinary thing that happeneth vpon the way when a horſe caſteth his ſhooe) and lay the ſame vp, they ſhall find a remedy for the yox, if they do but call to mind and thinke vpon the place where they beſtowed the ſame. Alſo, that the liuer of an Hare is in this regard for curing of the hicket, like to an horſe ſhooe. Moreouer, if an horſe doe follow in chaſe after a wolfe, and chance to tread vpon the tracts where the wolfe hath run, he will be broken winded and burſt, euen vnder the man vpon his backe. It is thought moreouer, that the ankle-bones of ſwine, haue a property to make debate and quarrels. Alſo, when any ſheep-pens or oxe-ſtals be on a fire, if ſome of the dung be caſt forth, the ſheepe and oxen that be within will ſooner be gotten and drawne forth, and neuer come thither again. Furthermore, that goats fleſh will haue no ranke ſmell or taſte, if ſo be the ſame day that they were killed, they did eat barley bread, or drinke water wherein Laſer was infuſed. Beſides, that no fleſh which is powdred well with ſalt in the wane of the moone, ſhall euer corrupt and be ſubiect to worme or maggot. But ſee how diligent and curious our anceſtors haue bin in ſearching out the ſecrets of euery thing; inſomuch as we find obſerued by them, That a deafe Hare will ſooner feed and grow fat, than another that heareth. I

And to come vnto leechcraft belonging to beaſts: it is ſaid, that if an horſe void bloud exceſſiuely, it is good to poure or iniect into the body, hogs dung with wine. As for the maladies of kine and oxen, tallow, ſulphur-vif, crow garlick, a ſodden [hens] egge, are ſingular good medicines to be giuen euery one of them beaten together in wine: the fat alſo of a fox is good in that caſe. If ſwine be diſeaſed, the broth made of horſe-fleſh ſodden, is very good to be giuen them in their waſh to drinke. And in what diſeaſe ſoeuer it be of all four-footed beaſts, there is not a better remedy than to ſeeth a goat all whole, in the very skin, and a land toad together. Alſo it is ſaid, that a fox will not touch any cockes, hens, or ſuch like pullen, that haue eaten (before) the dried liuer of a Reinard; nor thoſe hens which a cock hauing a collar about his necke of a Fox skin, hath troden. The like effects are reported of a weazils gall: as alſo that kine and oxen both K
in the Iſle Cyprus, when they are troubled with the belly ach, cure themſelues with eating the excrements of a man: that the cleyes of kine and oxens feet will not weare to the quick nor be ſurbated, if their horns before were anointed with tar: That wolues wil not come into any lordſhip or territory, if one of them be taken, and when the legs are broken, be let bloud with a knife by little and little, ſo as the ſame may be ſhed about the limits or bounds of the ſaid field, as he is drawne along, and then the body be buried in the very place where they began firſt to dragge him. Others take the plough-ſhare from the plough wherewith the firſt furrow was made that yeare in the field, and put it in the fire burning vpon the common hearth of the houſe, and there let it lie vntill it be quite conſumed: and look how long this is in doing, ſo long ſhal the wolfe do no harm to any liuing creature within that territorie or lordſhip. Thus much by way of digreſſion: now it is time to return to the diſcourſe of thoſe liuing creatures which be raunged in M
their ſeuerall kinds, and ſuch as are neither tame nor ſauage.

THE TWENTY NINTH BOOK OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

CHAP. I.

¶ *The Originall of Physicke. When Physitians began to visit the sicke in their houses. When came vp first The manner of* curing diseases by outward application of Ointments and by fricatiõs. Of* Chrysippus *and* Erasistratus. *Of the * Empirick practise of Physicke. Of* Herophilus *and other famous Physitians. How many times the order of Physick hath bin changed. Who was the first professed Physitian in Rome, and when he began to practise. What opinion or conceit the antient Romanes had of Physitians. Finally, the imperfections and defaults in this art of Physicke.*

This course in practise was called *Clinice*, κατ' ἐξοχὴν, i. à lecto, i. the bed or bed-chamber.

* *Iatraleptice*, κατ' ἐξοχὴν ἰατρικὴ ἡ ἀλείφειν, *vel* ἀλοιφὴ, *quasi medicina unguentaria.*

* *Empirice*, κατ' ἐμπειρίαν. *i. Experimenta.* When Physitians cure by experiments only of medicines, without regard of the cause of the disease or nature of the patien.

THe admirable nature of a number of medicines, as wel those which I haue already shewed, as those which remain as yet to be handled, forceth me to write yet more of Physicke, and to sound to the very depth and bottome: albeit I know full well, that there is not a Latine writer who hath trauelled hitherto in this argument; and am not ignorant how tickliſh and dangerous a point it is at first to set abroch any new matters, especially such, whereby a man is sure to reape but small thanks, and in deliuerie whereof, is to make account of a world of difficulties. But forasmuch as it is very like that those who are well acquainted with this study, will muse how it is come about, that the remedies drawn from simples, so easie to be found and so accommodat to maladies, are cast behind and grown out of vse in the practise of physick; it cannot be, but withall they must maruell much, and think it a great indignity, that no science and profession in the world hath had lesse solidity in it and bin more vnconstant, yea, and how it daily changeth still, notwithstanding there is not any other more profitable and gainfull than it.

But to enter into the discourse thereof, First and formost, the inuention of this Art hath been fathered vpon the *gods, such I mean as are canonized gods in heauen: yea, and euen at this day we haue recourse stil vnto diuine Oracles for many medicines. Moreouer, the fabulous tales deuised by Poets haue giuen a greater name and reputation thereto, in regard of the offence committed by *Æsculapius* in raising prince **Hippolytus* again to life: for which bold part of his, *Iupiter* being highly displeased, smote him dead with lightning. And yet for al this, Antiquity hath not staid there, but made relation of others, who were reuiued by the means of the said *Æsculapius* or his art: which during the * Trojan war, whereof the fame and bruit is more certain, grew into much request and estimation: and yet in those daies there was no other part of Physicke professed and practised, but Chirurgery; and that in the cure of wounds only. But in the age insuing, and for many a yeare after, wonderful it is, in what obscurity this noble science lay dead, and as it were buried in darknesse and obliuion, euen vntill the famous Peloponesiacke war: for then arose *Hippocrates*, who reuiued and set on foot againe the antient practise of *Æsculapius*, so long forelet: and being borne in Coos, a renowned and wealthie Island, altogether deuote and consecrated to *Æsculapius*, he made an extract of al the receits, which were found written in the temple of the said god (for the maner was in that Island, that whosoeuer were cured and deliuered of any disease, registred there vpon record, the experiments of medicines whereby they had remedy;

*to wit, *Apollo* & *Æsculapius*.

* Tyndaridem: but out of *Plutarch*, & a manuscript old copy, it should be read *Thesidem*, the son of *Thesus* which was *Hippolytus*

* At what time and who, his 2 sons, *Podalyrius* and *Machaon* practised Chirurgerie.

remedie, to the end, that afterward they might haue help again by the ſame in like caſes) & ther- G
upon (as our countreyman *Varro* is perſuaded) after that the ſaid temple was burned, hee profeſ-
*i. Chamber-Phyſicke. So called, becauſe hee viſited his patients lying ſicke in bed.
ſed that courſe of Phyſick which is called * Clinice. Wherby Phyſitians found ſuch ſweetnes,
that afterwards there was no meaſure nor end of fees: inſomuch, as *Prodicus*, a diſciple of *Hippo-*
crates, and borne in Silymbria, erecting that kind of practiſe in Phyſicke, which is called * Iatra-
liptice, opened by that meanes the way to inrich euen thoſe, who vnder Phyſitians were employ-
* The manner of maintaining of health and curing diſeaſes by frictions, and outward application of oiles & ointments.
ed in rubbing and annointing mens bodies, yea, and brought gaine to other baſe and ſeruile mi-
niſters atending vpon their cures. After them came *Chryſippus* in place: who through his much
babble and pratling, wherewith he was well furniſhed, altered the Theoricke and ſpeculatiue
Phyſicke of * *Hippocrates* and *Prodicus*, with all their principles: whom ſucceeded *Eraſiſtratus*,
Ariſtotles ſiſters ſon, and he chaunged alſo many of *Chryſippus* his rules and receits, notwithſtan- H
ding he was a ſcholler of his and brought vp vnder him. This *Eraſiſtratus* for curing king *An-*
tiochus, receiued of his ſonne *Ptolomæus* (king after him) one hundred talents: which to beginne
withall, I note by the way, that you may ſee how (euen in thoſe daies) Phyſitians were well re-
warded for their pains and skill. But in proceſſe of time one *Acro*, a citizen of Agrigentum in
* Who wroght by reaſons and rules, & thereupon were called *Rationales*, and *Dogmatici*
Sicilie, much commended by the authority of *Empedocles* the famous naturall Philoſopher, be-
gan in that Iſland to inſtitute another faction and ſect of Phyſitians, who grounding altogether
their worke and operation vpon experience, called themſelues Empiriques. Thus there beeing
diuers ſchooles of Phyſick, the profeſſors in euery one of them entred into contention and vari-
ance, ſome ſiding this way and others taking the contrary; vntill at length *Herophilus* entred the
ſtage, who reproued and condemned as well the one as the other: and reduced the pulſes or bea- I
ting of the arteries vnto the times and meaſures in Muſicke, according to the degrees of euery
age. Long after it was not, but this Philoſophicall ſubtilty of his ſect was giuen ouer and aban-
doned, becauſe the profeſſion thereof required of neceſſitie ſo much learning and literature: and
albeit that *Aſclepiades* when he began to profeſſe Phyſick, brought with him an alteration of all
that was before, yet (as I haue already related) his Phyſick continued no longer than others: for
Themiſon (a ſcholler and auditor of his) ſo ſoon as euer his maſter was departed this life, altered
quite all that hee wrote and noted at firſt from his mouth, and betooke himſelfe to a new pra-
ctiſe, according to his owne head and fantaſie. But what became of it? Surely within a while af-
ter, *Antonius Muſa*, Phyſitian to *Auguſtus* the Emperour, put downe that which *Themiſon* had ſet
vp: and that by the authority and warrant of the ſaid Emperor his patient, whom he deliuered K
* *Quia calida fomenta non proderãt, frigidis curari coactus, auctore Antonio Muſa.* Suetonius *in vita Octau. Auguſt.*
from a dangerous diſeaſe, * vſing directly a contrary cure to that which had bin practiſed be-
foretime. Many other Phyſitians there were of great name, whom I ouerpaſſe: but the princi-
pall and moſt renowned of them all, were the *Caſij*, *Calpitani*, *Aruntij*, *Albutij*, and *Rubrij*, who in
their time might diſpend in fees allowed them out of the Princes and Emperours Exchequer,
vnder whom they liued, 250000 Seſterces apeece, by the yeare. And as for *Q. Stertinius* the
Phyſitian, he complained of the Emperors whom hee ſerued, and challenged them for that hee
had no greater reuenues than 500000 Seſterces by the yeare from them: whereas he was able
to make account, that by his practiſe in the city he gained yearely 600000 Seſterces, being re-
tained Phyſitian to certain houſes, which he could readily name at his fingers ends. A brother L
of his receiued no leſſe in fees from *Claudius Cæſar* the emperor. And albeit theſe brethren ſpent
a great part of their wealth & ſubſtance in building ſumptuouſly at Naples, wherby they ador-
ned and beautified that city, yet they left behind them in goods vnto their heires after them, to
* *Seſtertium trecenties*, as *Budæus* readeth.
the worth of * thirty millions; which was ſuch an eſtate, that vnleſſe it were *Aruntius* only, there
was neuer any known before thoſe daies to haue died ſo wealthy. After theſe men, there aroſe
one *Vectius Valens*, who ouer & beſides his profeſſion of Phyſicke and Rhetorick, which hee ear-
neſtly followed, grew into a greater name, by reaſon of the familiar acquaintance hee had with
Meſſalina the Empreſſe, wife to *Claudius Cæſar*. This minion of hers taking his time, and ſeeing
how mighty he was, followed his fortunes and erected a new ſect and practiſe of Phyſicke. But
within the compaſſe of that age, and namely in the daies of the Emperour *Nero*, in commeth M
* He reduced Phyſicke into a Method: and from him deſcended the ſect called *Methodici*.
* *Theſſalus*, who woon the name from all the Phyſitians of former times, and ouerthrew the pre-
cepts and doctrine of his predeceſſors; raging and faring as if he were mad, in open inuectiues
againſt all the profeſſors of Phyſicke that euer were: and with what ſpirit, policie, wit, and dex-
terity he performed this, it may be gathered ſufficiently by this one argument (if there were no
more) that vpon his ſepulchre or tomb, which remaineth at this day to be ſeen in the high way

or

20030
copy 1

A or cauſey Appia, he triumphed ouer them all, and intituled himſelf by the name of *Iatronices. And in very truth, neuer matched there player to the ſtage, or coachdriuer to the publick cirque for to run a race, better attended and with a greater traine of followers, than hee when he paſſed along the ſtreets: and yet *Crinas* of Marſiles put him down and outwent him far in credit and authoritie: and that by the means of a twofold skill and knowledge wherein he was ſeen: For beſides his ordinary profeſſion of Phyſicke, he ſhewed himſelfe more warie and ceremonious in all his practiſe than any other before him, by reaſon of the deepe inſight that he had in the Mathematicks; obſeruing the courſe of the ſtarrs, chuſing good daies and houres, and going euer by his Almanakes and Ephemerides, whenſoeuer he miniſtred vnto his patients, inſomuch, as in their very diet he was ſo preciſe, that he would not allow them to eat or drink but with great
B regard of times and ſeaſons. Whereby he grew to ſuch wealth, that of late he bequeathed by his laſt will & teſtament *ten millions of Seſterces vnto his natiue citie Marſils toward the fortifications therof, beſides the walls that he cauſed to be built and emmanteled about other towns, which coſt him little vnder the foreſaid ſumme. Whiles this *Crinas*, with ſuch other as himſelf, ſeemed with their aſtrologie to command the courſe of the deſtinies, and to haue mens liues at their own diſpoſition, all on a ſuddain one *M. Charmis*, a Marſilian likewiſe, put himſelf forward and entred the citie of Rome, who not onely condemned the former proceedings of the ancient Phyſitians, but alſo put downe the baines and hot houſes: hee brought in the bathing in cold water, and perſuaded folke to vſe the ſame euen in the middeſt of Winter: nay, he feared not to
C giue direction vnto his ſicke patients for to ſit in tubs of cold water. And I aſſure you, my ſelfe haue ſeen ancient Senatours, ſuch as had been Conſuls of Rome, all chilling and quaking, yea and ſtarke againe for cold, in theſe kind of baths: and yet they would ſeeme to endure the ſame, to ſhew how hardy they were. And verily, there is a Treatiſe extant of *Annæus* * *Seneca*, wherein he approues highly of this courſe. Neither is it to be doubted, but ſuch Phyſicians as theſe, who hauing won credit and eſtimation once by ſuch nouelties and ſtrange deuiſes, ſhoot at no other marke but to make merchandiſe and enrich themſelues euen with the hazard of our liues. And hereupon come theſe lamentable and wofull conſultations of theirs about their patients, wherin you ſhall ſee them ordinarily to argue and diſagree in opinion, whiles one cannot abide that another mans iudgment ſhould take place, and ſeem to carry away the credit of the cure. From hence alſo aroſe that Epitaph of his (whoſoeuer he was) that cauſed theſe words to be engrauen
D vpon his vnhappy tombe, *Turba medicorum perij, i.* The variance of a ſort of Phyſitians about me, were the cauſe of my death. Thus you ſee how often this art from time to time hath been altered, and daily ſtill it is turned like a garment new dreſſed and tranſlated: inſomuch, as wee are carried away with the vain humor of the Greeks, & make ſail as it were with the puffes of their proud ſpirit: For euer as any of theſe new commers can venditat and vaunt his owne cunning with braue words, ſtraitwaies we put our ſelues into his hands, and giue him power to diſpoſe of our life and death at his pleaſure; and without further regard, are as obedient to him as a ſouldiour to his captaine and Generall of the field. A ſtrang matter that we ſhould ſo do, conſidering how many thouſands of nations there be that liue in health wel ynough without theſe Phyſicians, and yet I canot ſay altogether without Phyſicke. Like as the people of Rome alſo
E (notwithſtanding the Romanes were euer knowne to be forward ynough to entertaine all good arts and diſciplines) continued for the ſpace of ſix hundred yeares and aboue, after the foundation of their citie, and knew not what a Phyſician meant, but afterwards they did caſt a great fancie to Phyſick alſo: howbeit vpon ſome little experience thereof, they were as ready to loath and condemne it, as they were deſirous before to haue a taſt and triall of it. And here I thinke it not amiſſe in this corrupt age of ours wherein we liue, to diſcouer and relate certain principall examples of our anceſtours, worthy to be noted in this behalfe.

And to begin withall, *Caſſius Hæmina*, an ancient Hiſtoriographer, doth report, That the firſt Phyſician that euer came to Rome, was one *Archagathus*, the ſonne of *Lyſanias*, from out of Peloponneſus, which was when *L. Æmylius* and *M. Livius* were Conſuls, and in the yeare after
F the foundation of the citie of Rome 535. And this mine Author ſaith, that he was enfraunchiſed free denizen of Rome, and had a ſhop prouided for him, ſtanding in the carrefour of *Acilius*, bought at the charges of the citie for to entertaine his patients, and therin to exerciſe his cunning. Called he was (by report) The vulnerarie Phyſician or Chirurgion: wonderfull much ſeeking & running there was after him, and none more wealthie than he at his firſt comming. But

ſoone

* *i* The maſter and conqueror of all Phyſitians.

* *centies H.S.*

* Such as bath in cold water, be called by *Seneca*, *Pſychrolouiæ*.

ſoon after, when hee was knowne once to carry a cruell hand ouer his poore patients, in cutting, G
lancing, diſmembring, and cauterizing their bodies, they quickly began to alter his name, and
to terme him the bloudy Butcher or Slaughter-man: whereupon not onely all Phyſitians, but
Phyſick alſo grew into a bad name and became odious; as may appeare euidently by the monu-
ments and books of *M. Cato*, a worthy perſonage, and in regard of whoſe vertues and commen-
dable parts, his triumph and Cenſorſhip, as famous & honorable as they were, deſerue the leaſt
part of his authority and reputation; ſo much was there in himſelfe, aboue the gifts and graces
of Fortune. I will therefore inſert in this place, word for word, an Epiſtle of his vnto his ſonne
Marcus, touching this matter, wherein he thus writeth: *Concerning theſe Greekes (ſonne* Marcus) *I*
will write in place and time conuenient, what I haue found out and knowne by them in Athens: and namely,
that it were good to looke into their books and reade them (as it were) by the way, but in no wiſe to ſtudy vp- H
on them much and learn them throughly. I haue already giuen the attempt, and intend to conuince and put
downe the wickedeſt race and moſt peruerſe and obſtinat kind of them. And learne this of mee, as from the
mouth of a true Prophet, That whenſoeuer this Greekiſh Nation ſhall bring into Rome their Philoſophie,
they will corrupt and marre all: but let them ſend once their Phyſitians hither, you ſhall ſee a greater wrecke
and confuſion thereby. For I aſſure thee, they haue complotted and ſworne one to another for to murder all
** Barbarians by means of their Phyſicke. And euen to effect and bring this about, they will be fed alſo and*
take money, to the end, that both we ſhould truſt them the rather, and they alſo haue the better meanes to
worke the feat and diſpatch folke with more facility. As for vs, it pleaſeth them vſually to name vs Barbari-
*ans, yea, and they giue vnto vs more filthy termes than any others, and miſ-call vs * Opiques. Well, remem-*
ber thou once for all, that I haue giuen thee warning of their Phyſitians, and forbidden thee to be acquainted I
with them. Now *Cato*, who wrote this letter, died in the ſix hundred and fifth yere after the foun-
dation of our city, when himſelfe was fourſcore yeres old and fiue: whereby a man may ſee that
he wanted not grounded knowledge when he deliuered this ſpeech vnto his ſonne; for hee had
both the practiſe of former times in publicke affaires, and age ſufficient of his owne to furniſh
him with experience of priuat examples. What ſay we then to this reſolution of his? Are wee
to judge and beleeue that hee hath condemned thereby a thing ſo neceſſary and profitable as
Phyſicke is? God forbid: for himſelfe ſetteth downe a little after, what Phyſick, and what me-
dicines both he and his wife were acquainted with, and by meanes whereof they came to be ſo
aged as they were: and thoſe were no other (verily) but the vſe of ſimples, whereof wee now are
in hand to treat. He ſaith moreouer and profeſſeth, that he hath made one Treatiſe expreſſely, K
containing certaine receits for the cure of his ſon and ſeruants, and for the preſeruation of their
health: the which I haue not omitted, but diſperſed here and there, according to the occurren-
ces of accidents and diſeaſes of ſundry ſorts, whereof I haue had ſome occaſion to ſpeak of, and
ſtil ſhall haue more: wherby it is plain, that our antient forefathers blamed not the thing it ſelf,
I meane, Phyſicke, and medicines, but the Art and cunning of Phyſitians, who had the hand-
ling thereof. And moſt of all, they held off and were afraid to entertaine thoſe amongſt them,
who ſought ſuch exceeding gaines for their handie worke, eſpecially where they indangered
their liues withall. And that they made ſome account of Phyſicke, may appeare by this, that
when they receiued *Æſculapius* as a canonized god into their Kalender, they built one temple
for him without the city of Rome: yea, and the ſecond which in his honour they erected, was L
ſcituate within the Iſland apart from other buildings. Alſo at what time as by vertue of an e-
dict all other Greeks were baniſhed Italy, Phyſitians were excepted; and that was many a yeare
after *Cato* his time. And here by the way, one word will I ſpeake to the honour of our Romanes
for their ſingular wiſedome and prouidence; namely, That howſoeuer they are growne to good
proofe and be accompliſhed in al other Arts and Profeſſions of the Greeks, yet their grauity hi-
therto hath bin ſuch, as they would not giue themſelues to the practiſe of this only Science.
And notwithſtanding the exceeding wealth that accrueth by Phyſicke, yet very few or none of
our naturall Roman citizens haue medled therewith. And thoſe alſo that haue betaken them-
ſelues vnto it, preſently haue forſaken their natiue language, and gone to the Greek tongue. For
this opinion verily there is of this Art, That if the Profeſſors thereof handle it in their vulgar M
and mother tongue, or otherwiſe in any other than Greeke, all the authoritie, grace, and credit
thereof is loſt, euen with thoſe that be altogether vnlearned and know not ſo much as the Greek
Alphabet. See the nature and fooliſh propertie of our Countreymen, to haue leſſe confidence
and truſt in thoſe things which concerne their life and health, if they be intellegible and

deliue-

*That is to ſay all nations but themſelues.

**Opici*, were a certain people of Italie, infamous for their vnhoneſt life and filthy language. *quaſi* ὀπικοὶ ἀπὸ τοῦ ὄπισθεν ἐρίζειν.

copy 1

A deliuered to their capacity; than in others, which they vnderſtand neuer a whit! And hereupon verily it is come to paſſe, that the art of Phyſicke hath this peculiar gift and priuiledge alone; That whoſoeuer profeſſeth himſelfe a Phyſitian, is ſtraightwaies beleeued, ſay what he wil: and yet to ſpeak a truth, there are no lies dearer ſold or more dangerous than thoſe which proceed out of a Phyſitians mouth. Howbeit, we neuer once regard and looke to that, ſo blind we are in our deep perſuaſion of them, and feed our ſelues each one in a ſweet hope and plauſible conceit of our health by them. Moreouer, this miſchiefe there is beſides, That there is no law or ſtatute to puniſh the ignorance of blinde Phyſitians, though a man loſt his life by them: neither was there euer any man known, who had reuenge or recompence for the euill intreating or miſuſage vnder their hands. They learne their skil by indangering our liues: and to make proofe & expe-
B riments of their medicines, they care not to kill vs. In a word, the Phyſitian only is diſpenſed withal, if he murder a man: ſo clear he goeth away without impunity, that none ſo hardy as once to twit or challenge him for it: but ſay that one be ſo bold as to charge them with any vntoward dealing; out they cry preſently vpon the poor patients, at them they rail with open mouth, they are found fault with their vnrulineſſe, diſtemperature, wilfulneſſe, and I know not what: and thus the ſillie ſoules that be dead and gone, are ſhent & bear away the blame. The decuries or bands at Rome of thoſe knights which are deputed and called Iudges, are not choſen but by an ordinary triall and examination of their eſtate, quality, and perſon; and the ſame by the principal of that order and degree, both taken and approued: ſtreight inquiſition there is made of their demeanor from houſe to houſe: of their parentage alſo, yea and true information giuen to the ele-
C ctors before they can be choſen. Mint-maſters, ſuch as are to giue their judgement of mony, and the touch of coin, be not taken hand ouer head: but if any be more skilfull than others therein, they are ſent for (rather than to faile) as far as from Calis and the ſtraits of Gilbretar. And for to pronounce ſentence as touching the baniſhment of a Roman citizen, the fiue deputed or elected delegats (named Quinqueviri) had no warrant or decree paſſed before 40 daies were expired. But for theſe Phyſitians, who are the judges themſelues to determine of our liues; and who many times are not long about it, but giue vs a quick diſpatch & ſend vs to heauen or hel; what regard is there had, what inquiry and examination is made of their quality and worthines? But ſurely, wel enough are we ſerued, and we may thank none but our ſelues, if we come by a ſhrewd turn, ſo long as there is not one of vs hath any care or deſire to know that which is good for his
D life and health. We loue to * walk (forſooth) with other mens feet. * We read, we looke by the eies of others: we truſt the remembrance of another, when we ſalute any man and to conclude, in the very main point of all we commit our bodies and liues to the care and induſtry of others: No reckoning is there now made of the riches and treaſure of Nature: but the moſt precious things indeed which ſerue for the maintenance and preſeruation of health and life, are vtterly rejected and caſt away: no account make we of any thing and think our owne, but to liue in pleaſures and dainty delights. I will not leaue my hold of *M. Cato*, whom I haue oppoſed as a ſhield and buckler againſt the enuie and ſpight of this ambitious and vain-glorious Art: neither will I giue ouer the protection of that honorable Senat which hath judged no leſſe: and that without catching aduantage of the ſinfull pranks & lewd parts which are committed and practiſed vn-
E der the pretence of this art, as ſome man haply would look that I ſhould ſet them abroad: for to ſay a truth, is there any trade or occupation goeth beyond it for poiſoning? what is the cauſe of more gaping and laying wait after wils and teſtaments, than this? What adulteries haue beene committed vnder the colour hereof, euen in Princes and Emperors palaces? as for example, *Eudemus* with *Livia* the Princeſſe, & wife to *Druſus Cæſar*: *Valens* likewiſe with the Queen or Empreſſe aboue named, *Meſſalina*. But ſay that theſe crimes and odious offences are not to be imputed vnto the Art it ſelfe, but rather to be charged vpon the perſons, I meane the corrupt and lewd profeſſors thereof: yet ſurely I am of this beleefe, that in regard of theſe enormities, *Cato* was as much afraid of the entrance of Phyſicke, as of ſome Queene into the citie of Rome. For mine own part, I mean not to ſay ought of their extreme auarice; of the merchandiſe, ſpoile, and
F hauocke that they make when they ſee their patients in danger of death, and drawing to their end; nor how high they hold (as it were in open market) the eaſement and releaſe of the ſicke mans pains, whiles he is vnder their hands; ne yet what pawnes and pledges they take as earneſt of the bargaine, to diſpatch the poore Patient out of the way at once; and laſtly, of their hidden ſecrets and paradoxes, which forſooth they will not divulge abroad, but for ſome round

ſumme

* In this place he caſteth in the Romanes teeth, their *Lexicarij*, *Anagnoſtæ*, and *Nomenclatores*. * *Agnoſcimus inuicem.*

ſumme of money. As for example, that a cataract or pearle in the eie is to be couched rather G
and driuen down by the needle, than quite to be plucked forth: wherby it is come to paſſe, that
it is a very good turne & the beſt for vs (as the caſe ſtandeth) that we haue ſo great a number of
ſuch murderers and theeues in the commonweaſth: for I aſſure you it is not long of any ſhame
and honeſty (whereof there is none in them) but their malicious æmulation, being ſo many as
they are, that the market is well fallen, and the prices come down of their workmanſhip. Noto-
rious it is, that *Charmis* the abouenamed Phyſitian that came from Marſiles, bargained with one
patient that he had, to haue 200000 Seſterces for his cure, and yet hee was but a ſtranger and a
prouinciall inhabitant. Alſo as well knowne it is, that *Claudius Cæſar* vpon a condemnation and
judgement, tooke at one time by way of confiſcation, one hundred thouſand ſeſterces from one
Alcontes, who was no better than a Chirurgion or Wound-healer: who beeing confined into H
France, and afterwards reſtored, gathered vp his crums again & got as much within few yeares.
I am content alſo, that theſe faults ſhould be laid not vpon the art, but the men that profeſſe it:
Neither verily do I mean to ſhew and reproue the baſe, abject, and ignorant ſort of that crew:
nor how little order and regiment they obſerue in the cure of diſeaſes, or in the vſe of bains and
hot waters: how imperiouſly they preſcribe otherwhiles to their patients moſt ſtrait diet: and a-
gain, when they are ready many times to faint & die vnder their hands for want of ſuſtenance,
how they be forced to cram them as it were, and giue them meat vpon meat, oftentimes in one
day, before they haue digeſted the former viands. Moreouer, how they do and vndo, altering the
manner and courſe of their proceedings a thouſand waies, miſliking and bethinking themſelues
after they haue done a thing: making a miſh maſh and mingle mangle in the kitchin of thoſe I
victuals which they ordain for their poore patients: beſides a deal of mixtures and ſophiſticat
compoſitions of drugs and ointments. For there is no ſuperfluity tending vnto vain pleaſures
and wanton delights that hath ouerpaſſed their hands. And ſince I light vpon the mention of
theſe drugs and ſpices, for mine owne part I am verily perſuaded, that our anceſtors and forefa-
thers were nothing well pleaſed with the bringing in of ſuch forrain wares, which beare ſo high
prices and are extream deare: and that *Cato* neuer thought of theſe drugs and mixtures, nor fore-
ſaw theſe corruptions by them occaſioned, when he blamed ſo much and condemned this art of
* i. Treacle, Phyſick. Yet ſee what account there is made of a compoſition called * Theriace, deuiſed onely
for exceſſe and ſuperfluity: compoſed it is of diuers ingredients far fetcht and deare bought:
whereas Nature hath beſtowed vpon vs and preſented to our eies ſo many wholeſome ſimples, K
and euery one of them by it ſelfe medicinable and ſufficient. Moreouer, another antidote and
confection there is, conſiſting of no fewer than 54 ſundrie ſorts of drugs and ingredients, all of
diuers weights, and ſome of them are preſcribed to carrie the poyſe preciſely of the ſixtieth
part of one denarius or dram. Now would I gladly know whatgod he was (for ſurely it paſſeth
the wit of man thus to diſpenſe the ingredients, and calculat their vertues, to a ſingle ſcruple)
that taught firſt this ſubtil and intricat compoſition? By which it appeares manifeſtly, that this
geere bewraieth onely a vaine oſtentation, and all to giue a glorious and wonderful luſtre to the
art, for to make it better accepted and more vendible. And yet the very Artiſts themſelues are
not ywis ſo skilfull, as to know that whereof they make profeſſion. For I my ſelfe haue ſeene
theſe that goe for Phyſitians, put commonly into their medicines and receits *quid pro quo*, and L
* *Sanguis Draconis*. Sangdragon *Lachrymæ ſpecies*, a kind of gum. namely, in ſtead of the Lidian * Cinnabaris, * Minium; which is no better than a very poyſon,
as I will proue and ſhew hereafter in my Treatiſe of Painters colours: which errour proceedeth
only from this, that they are not wel ſeen in Grammar, nor in the proper ſignification of words.
But theſe and ſuch like errours touch and concerne the health of euery one in particular. As for
* *Metallicum*, a minerall Vermilion. thoſe abuſes in the art of Phyſick, which *Cato* feared, foreſaw, and would haue preuented, they
be ſuch as are nothing ſo hurtfull and dangerous as the reſt, and indeed ſmall matters in the o-
pinion of man: and ſuch as the principall Profeſſors and Maſters of this Art do auow and con-
feſſe among themſelues. Howbeit, euen thoſe deuiſes, as harmleſſe as they ſeem to be, haue been
the ouerthrow of all vertue and good manners in our Romane State, I mean thoſe things which
we doe and ſuffer in our health: our exerciſe of wreſtling, our greaſing and annointing with oile M
for that purpoſe, brought in forſooth and ordayned by theſe Phyſitians for to preſerue our
health. And what ſhould I ſpeak of their drie ſtouves, hot houſes, and ardent bayns, which they
would beare men in hand tobe ſo good for digeſtion of meat in their ſtomackes? Yet could
I neuer ſee any, when hecame forth of them vpon his own feet, but he was more heauy, & found

himſelfe

20030
copy 1

himſelfe feebler than before he went in:and as for thoſe who haue bin more obſeruant of their rules than the reſt,and wholly gouerned by them,I haue known many ſuch caried out for dead, or elſe extream ſicke.To ſay nothing moreouer of the potions and drinks ordained by them,to be taken in a morning faſting,for to vomit and ſcoure the ſtomack therby,and all to make way for to quaffe and carouſe again vpon it more luſtily. I forbeare alſo to write of their roſins and pitch-plaiſters deuiſed by them for to pluck away and fetch off the haire where Nature hath ordained it to grow,wherby they would ſeem to effeminat our men. I baſh alſo to ſpeak how euen our women haue proſtituted their nakednes and priuities vnto them, by occaſion of theſe their wanton deuiſes. In ſum, conclude we may, that conſidering theſe enormities and corruptions which haue crept into our life,by nothing more than by the meanes of Phyſick,*Cato* was a true prophet indeed,and his oracle is verified &fulfilled euery day,when he ſaid,That it was ſufficient to look curſorily into the writings and witty deuiſes of the Greeks,without farther ſtudying therupon and learning them throughly.Thus much I thought good to ſpeak in iuſtification of that Senat and people of Rome,who not without great reaſon continued 600 yeres without the entertainment of Phyſicians;and againſt that Art which of all others is moſt dangerous and fulleſt of deceit:in regard wherof, it hath bleered the eies of good men, and they be thoſe who haue giuen credit & authority thereto. And withall,thus much may ſuffice to meet with the fond opinion and fooliſh perſuaſion of thoſe,who are rauiſhed and caried away with a conceit,eſteeming nothing good for the health of man,but that which is coſtly and pretious. For certes I doubt not,but ſome there be who will loath theſe receits taken from diuers beaſts, wherof I ſhall haue occaſion to ſpeak hereafter.But I comfort my ſelfe again herein,That *Virgil* diſdained not to name the very piſmires and the weevils ; * blind beetles alſo delighting in darkneſſe,and their neſts wherein they keep;of which he wrote,notwithſtanding he was not vrged thereto vpon neceſſitie.Neither did *Homer* think it improper,to*mingle the deſcription of a ſhrewd and vnhappie flie,euen with the heroicke battailes of the gods : ne yet dame Nature, who hath brought forth and made man, thought it any diſparagement to her majeſtie for to engender alſo theſe fillie and ſmall creatures. And therefore let euery man conſider their vertues,properties, and effects,and not regard ſo much themſelues. To come then to thoſe things that are moſt common and known,begin I will at ſheeps wooll,and birds egs,to the end that by that means due honour may be yeelded to the chiefe and principall of all others, as it doth appertain.Howbeit,I muſt of neceſſitie ſpeak of ſome other things by the way as occaſion ſhall be offered,notwithſtanding the place be not ſo proper & fit for them.Neither wanted I means ſufficient to furniſh this worke of mine with many gallant matters and pleaſant diſcourſes, if my delight and mind had been to looke after any thing elſe but a plaine and true narration,according to my firſt deſſeine and intention:For well I wot, that I might haue inſerted here and there,the rare receits which are reported to be of the aſhes of the bird Phœnix, and her neſt ; but that I know all to be meere fabulous, howſoeuer they carrie a pretence of truth Beſides, I count it a very mockerie and no better,to deliuer vnto the world thoſe medicins which are not to be but once in the reuolution of a thouſand yeres.

* *Lucifugis congeſta cubilia blattis.*
* *Iliados 4.*

Chap. II. ¶ *The vertues and properties of Wooll.*

THe ancient Romans attributed vnto Wool great authoritie,& had therein a certain religious and reuerent opinion of holines:inſo much as new wedded wiues by an old cuſtom and ordinance at Rome,were wont with great ceremonie to adorn and bedeck with wooll the ſide-poſts of the dore or entrie into their husbands houſe,on the mariage day.Now beſides the vſe of wool for decent apparrel,& defence againſt cold weather;that which is vnwaſhed and full of the ſheeps ſwet ſerueth in Phyſick,and is a ſoueraign remedy for ſundry accidents,being applied with oile,wine,or vinegre,according as need requireth, either in mitigation of pain,or mordicaſion and corioſion,and according as our purpoſe is,to bind,or to enlarge and open any part:and namely,it is imploied in diſlocations of members, and griefe of ſinues, if it be laid to the affected place,well ſprinkled & wet eftſoons with the ſaid liquors,that it might be alwaies moiſt.But more particularly,for disjointed members,ſome put thereto a little ſalt:others take rue,&when they haue ſtamped it,incorporat the ſame with ſome conuenient greaſe,& ſo apply it in maner of a cataplaſme vpon ſweatie wooll:after which maner,it is good for contuſions or bruſes & ſwellings. Alſo it is ſaid,that if the teeth&gumbs be well rubbed with ſuch wool and

hony mingled together, it will cauſe the breath to be the ſweeter: a ſuffumigation or perfume G
therof is ſingular for the frenſie: applied with the oile of roſes, it ſtanches bleeding at the noſe:
or otherwiſe if the ears be well ſtopped therwith, and a little garlick conueied withal therinto.
Moreouer, it is laid to inueterat ſores with good ſucceſſe, ſo that hony be put thereto. Soake
wooll in wine, vinegre, or cold water and oile, and then wring and preſſe the ſame forth, it heales
any wound. The wool of a ram well waſhed in cold water, & afterwards ſteeped in oile, is ſingu-
lar for womens infirmities, and particularly allaies the inflammation of the matrice: but in caſe
it be faln downward and readie to ſlip out of the bodie, a perfume therof receiued beneath, ſtai-
eth the ſame and keepes it vp. The fattie wooll of a ſheep being either applied, or put vp in ma-
ner of a peſſarie, drawes down the dead infant out of the mothers belly: and yet the ſame other-
wiſe repreſſeth the immoderat flux of womens fleurs. If it be couched hard & cloſe within the H
wound occaſioned by the biting of a mad dog, it ſerueth to great purpoſe; but with this charge
That it be kept bound therto & not remoued vntill the ſeuenth day be paſt: applied vnto whit-
flaws and impoſtimations about the naile-roots, with cold water, it cureth them: the ſame, if it
be dipped & ſoked in a medly made of ſalnitre, brimſtone, oile, vinegre, and tar, all diſſolued to-
gether and ready to boile, and ſo laid as a cataplaſm to the loins as hot as the patient can abide
it, changing it twice a day, appeaſeth the paine of thoſe parts. Take the greaſie wooll of a ram,
bind therwith very hard the joints of the extream parts, as namely the fingers and toes, you ſhal
ſee how it will ſtanch bleeding. [Howbeit, note this, that the wooll growing vpon the ſheeps
neck is euer beſt and moſt medicinable: and if we regard the country from whence it coms, that
of Galatia, Tarentum, Attica, and Miletum, is alwaies reputed better than any other.] Further- I
more, the greaſie or ſweatie wooll of a ſheepe, is proper to be applied to any raw places where
the skin is fretted off, to contuſions, bruſes looking black and blew, ſtrokes, cruſhes, ruſhes, rubs,
and gals; as alſo from them who are tumbled down from ſome high place; for the head-ach and
other pains; and laſtly, for the inflammation or heat of the ſtomack, being decently applied
with vinegre and oile roſat. Reduced into aſhes and vſed as a liniment, it is ſingular for them
that be cruſhes or ſqueeſed, wounded, burnt, and ſcalded. This aſhes entreth alſo into colyries
and eie-ſalues: it ſerueth for hollow vlcers & fiſtuloes: like as for the ears when they run filthie
matter. For theſe purpoſes aboue ſpecified, ſome ſheare it from the ſheeps back: others chuſe
rather to plucke it: and when they haue clipped off the vpmoſt parts, or forced it lay the ſame
forth to dry: they toze & card it alſo, and then beſtow it in an earthen pot not fully baked, which K
they beſmeer all ouer with hony, and ſo burn & calcine it to aſhes: others put vnder, ſmal chips
or ſlices of torchwood, and lay certain beds or courſes thereof between the locks of wooll; and
after they haue beſprinkled the ſame with oile, ſet all one fire: which done, the aſhes that come
therof they put into little pans or veſſels, & poure water theron: and after they haue well ſtirred
the ſaid aſhes with their hands, they ſuffer it to ſettle downe to the bottom; which they do of-
tentimes, alwaies changing the water till ſuch time as a man may perceiue the aſhes at the
tongues end to be ſomwhat aſtringent, but not biting: and they lay vp their aſhes for their vſe.
A great * ſcourer and cleanſer this is, and therefore moſt effectuall to mundifie the eye-lids.

* *Vis ejus ſmectica eſt*, out of *Dioſ.* not *ſeptica*, as is commonly read: for how can it be corroſiue if it bite not at all.

Moreouer, the very filthy excrements of ſheep, & the ſweat ſticking to the wool of their flanks,
between their legs & the concauities thereabout (which they cal Oeſypum) is thought to haue L
infinit number of medicinable ptoperties: but the beſt Oeſypum ſimply is that which coms
from the ſheep bred about Athens. This ſwet or filthy excrement, cal it what you wil, is prepa-
red and ordered many waies; but the principall is that which is gathered from the wooll newly
taken from between the legs & ſhoulders of the ſheep, and preſently tozed ready for to be car-
ded: others are content to teke the ſweatie filth of any wooll, ſo it be freſh plucked or clipped
from the ſheep; and whether it be the one ſort or the other, they let it diſſolue ouer a ſoft fire in
a pan of braſſe: which done, they ſet it a cooling, and take off the fat that ſwims aloft, & gather
it into an earthen veſſell. As for the reſt which remained behind of the firſt ſtuffe, they ſet it on
the fire again, that the fatnes may boile forth of it: after this the fat that floted aboue, as wel the
former as the later, they waſh in cold water, & let * it drie in a linnen cloth, expoſe it to the heat M
of the Sun, that it may frie therein vntill it be blanched white and look pure and cleare: then is
it put vp in tin boxes or peuter pots, and reſerued for vſe. The true mark to know which is good
Oeſypum, after it is thus tried & putrified, is thus: if it haue a rank ſmel ſtil of the firſt filthines
which it had from the ſheep: alſo, if when you rub it with your hand in water, it melt not, but in

* *Siccatur*, or rather *Saccatur*. *i.* ſtreine it through a linnen bag.

the

20030
copy 1

A the working look whitiſh like vnto cruſe or white lead: a ſoueraigne thing it is for the inflammation of the eies: for the hard calloſities alſo that grow vpon the eye-lids. Some there be who torrifie the foreſaid greaſie wooll into an earthen pot or pan, ſo long vntill it haue forgone and yeeldeth forth all the ſweet and fattineſſe; the which they ſuppoſe to be the beſt Oeſypum that is for any eroſion, fretting or hardneſſe of the eyelids: or to cure the ſcabs and ſores, yea, and the watering of the angles of the eies. Well, this fatty excrement thus clarified, incorporat with gooſe greaſe, cureth not only the vlcers of the eies, but of the mouth alſo and members of generation: the ſame tempered with Melilot and Butyr, maketh an excellent linement for all inflammations of the matrice: the chaps alſo and ſwelling piles or biggs in the fundament. Many other vertues it hath, which I will digeſt into their ſeuerall places, and ſpeake of them accordingly.

B As touching the filthy excrements hanging to ſheeps tailes, and baltered together into round pils or bals, if they be dried and ſo beaten to pouder, are ſingular for the teeth, yea, though they ſhooke in the head, if they be rubbed therwith; alſo for the gums, though there were gotten into them a cankerous ſore. Now concerning fleece wooll that is pure and waſhed, either by it ſelfe alone, or elſe with ſulpher vif, it is paſſing good to be applied to any place in paine, whereof the cauſe is not euident and known: which alſo being reduced into aſhes, is ſoueraign for the accidents which happen vnto the priuie parts. In ſum, of ſuch vertue is wooll, that there is no cataplaſme, pulteſſe, or plaiſter, in manner applied to a grieued place, but the ſame hath wooll laid ouer it. The ſame alſo hath a ſingular vertue aboue all things, to recouer the appetite of meat in the very ſheep that beare it, in caſe they haue loſt their ſtomacks and feed not: for pluck the

C wooll that groweth to their tailes, and therwith tie the ſame as hard as is poſſible, you ſhall ſee them preſently fall to their meat: But it is ſaid withall, that the reſt of the taile which is vnderneath the ſaid knot where it was bound, will quickly become mortified, and die.

*Doloribus cuiuis.

Chap. XIII.

¶ *The nature and properties medicinable of Eggs.*

GReat ſocietie and affinitie there is between wooll & egs; in this regard, That if they be applied both together in a frontall to the forehead, they repreſſe all violent flnxes & rheums falling into the eies: but you need not take for this purpoſe any wool that hath bin dreſſed or clenſed with the* Fullers ſcouring weed: neither is it required, that in this caſe there ſhould

D be vſed any more but the white of an egg, and the ſame ought to be infuſed or ſpread vpon the foreſaid wooll, with the pouder of Frankincenſe: & in very truth, the white of an egg alone, if it be inſtilled or dropped into the eies, is ſufficient to reſtraine the flux of humors thither, yea and to coole any hot rheume or inflammation incident to them. Howbeit, ſome think it better to put ſaffron therto, and vſe this gleere or white of the egg beaten, in ſtead of water, for all collyries or medecins appropriat to the eies. The white of an eg incorporat whit freſh butyr, is ſo ſoueraign for the red and bloud ſhotten eies which put little children to pain, as none in the world better; nay there is not in a maner any other vſed in that caſe. The ſame beaten and tempered with oile, aſſuageth the heat of S. *Anthonies* fire, if there be leaues of beets laid vpon the place and kept bound thereto. The white of an egg incorporat with ſalhormoniacke finely puluerized, doth ex-

E tend and turn backward, the haires of the eielids which grow inward into the eies: the ſame with pine nut-kernels, & a little hony mingled withall, and ſo reduced into a liniment, takes away the pimples that ariſe in the face: annoint the viſage therwith, it will keep it from being ſun-burnt. If one be ſcalded with hot water, lay quickly an egg to the place, yelke, white, and altogether, it will take out the fire and preſerue it from bliſtering: ſome put thereto barley meale and a little ſalt: but ſay the place be bliſtered & exulcerat with any burne or ſcald, parched barley with the white of an egg and ſwines greaſe, is an excellent medicine to heale the ſore: and the ſame cataplaſme is much vſed in the cure of the hæmorroids, piles, and chaps of the fundament; and eſpecially in children, for to reduce the tiwill into the right place, if it hang forth, for the riſts and chaps which appeare in the feet, take the white of an egg ſodden or roſted, the weight of two

F deniers of ceruſe, as much of letharge of ſiluer, and myrrhe, with a little quantitie of wine; incorporat all together into a cataplaſme, there is not a better medicine for them: and for the inflammation called S. *Anthonies* fire, the white of an eg beaten together with Amydum or ſtarch-floure, is right ſoueraign. It is ſaid moreouer, that the white of an egg is very good to congluti-nat or ſowder any wound, yea and two expell the ſtone and grauell out of the body.

* *Radicula*, called before *Struthium*.

The yelke of an egg ſodden vntill it be hard, and tempred wirh a little ſaffron, with hony alſo G
and breſt-milke, and ſo reduced into a liniment, allaieth the pain of the eies, if they be anointed
or fomented therewith: or if the ſame be incorporat with oile roſat & honied wine, and ſo ſpred
vpon a quilt of wooll and applied, it workes the ſame effect. Others there be who take the yelke
or an hard egg, mix therwith the pouder of perſley ſeed, adding thereto fried barly meale dried,
and honied wine; with which compoſition they annoint the ſore eies. Alſo the yelk of a ſoft egg
alone, ſupped off and ſwallowed down cleare that it touch not the teeth by the way, is ſingular
good for thoſe that be troubled with the cough, with the rheume or catarrhe that hath taken a
way to the breſt or pectorall parts; yea and the roughneſſe of the throat & pipes which cauſeth
* Which name it hath for that it cauſeth flux of bloud at ſundrie parts. hoarſeneſſe: but principally if one be bitten with a worme or ſerpent called * Hæmorrhois, let
him both ſup off the yelke of an egg raw or ſoft, and apply it alſo to the wounded place. It hel- H
peth the infirmities of the reins; it healeth the fretting, excoriation, and vlcers of the bladder;
yea and cureth thoſe that reach & caſt vp bloud. Fiue yelks of egs ſupped off raw in one hemin
of wine, are ſingular good for the dyſenterie or bloudy flix, and namely, with the pouder of
the ſhels from whence they came, the juice of Poppie, and a little wine withall. For the flux of
the belly proceeding from a feeble ſtomacke, they vſe to giue the ſaid yelks of eggs raw, with as
much in weight of good and full raiſins, aud the rind of a pomegranat; with direction to the pa-
tient, for to take this medicine three daies together by euen portions, and no more one day than
another: for which purpoſe alſo, there is another way to vſe them; namely, to take three yelks of
an egg, to incorporat the ſame in as many onnces of honey and old lard, putting thereto three
cyaths alſo of good old wine; and ſtamped all together into one compoſition vntill ſuch time I
as it be reduced to the conſiſtence or thickneſſe of hony, of which the patient muſt drinke as
need requires, with water, the quantity of an hazle nut at a time. Alſo it is good to lay three egs
in vinegre for three daies together, and vpon the fourth day to eat them, for the foreſaid flix of
the ſtomack: after which maner it auaileth much to take them againſt the oppilations & hard-
neſſe of the ſpleene: but to ſuch as are ſubject to caſting and reaching bloud vpward, Phyſicians
preſcribe to take them in three cyaths of new wine. Some vſe the yelks of egs that haue bin old
kept, for to reduce the skin that is blacke and blew to the freſh and liuely colour again; but they
incorporat the ſame in hony with bulbe roots: the ſame ſodden and drunk in wine, doe repreſſe
the immoderat flux of womens months: but applied raw with oile and wine, they diſcuſſe & re-
ſolue the ventoſities within the matrice. Incorporat with oile roſat and gooſe greaſe, they are K
good to be applied to the nape of the neck for the cricke and pain thereof: being roſted againſt
the fire hard, and ſo preſently applied hot to the ſeat, they are good for the griefs and accidents
of the fundament: but more particularly for the ſwelling piles and bigs riſing in thoſe parts,
they would be laid too with oile of roſes. Being ſodden in water vntill they be hard, they ſerue
very well for any burne or ſcald; with this charge, That preſently the aſhes of the ſame eg-ſhels
calcined vpon burning coales, be applied to the place, and then to annoint the ſame with the
foreſaid yelks and oile roſat mixed together. Now it falleth out ſomtime, that egs be all yelke
within, & haue no white at all; namely, when the hen hath couued & ſitten ouer them three daies
together, and then be taken away from vnder her; and ſuch kind of egs the Greeks call Schiſta,

Dalechampius would haue the ſame egs to be dried and reduced into pouder, &c. Take the egs from vnder the hen when they be full of chicken, a little before they ſpring and L
the chicke be hatched, together with halfe as much of gal nuts, and giue the ſame for to ſtreng-
then a feeble and weak ſtomack; with this caution, That the patient haue eate nothing in two
hours before. And ſo me doe aduiſe for the dyſentery or bloudy flix, to giue the ſaid chickins
ſodden egg and all together, putting therto one hemine of auſtere or ſharpe wine, and an equall
quantitie of oile and parched barly groats drie. The fine pellicle or skin that is within the egg-
ſhell, being taken from it (whether the egg be raw or ſodden it skilleth not) healeth the chaps
that are in the lips, if it be applied thereto. The aſhes of an egg-ſhell drunke in wine, ſtoppeth
the iſſue of bloud guſhing out at any part: but the ſame ought to be burnt, or calcined without
the pellicle or skin aforeſaid; and ſo it makes an excellent dentifrice alſo to cleanſe and ſcoure
the teeth white: a liniment made with the ſaid aſhes and myrrhe together, ſtaies the ſuperfluous M
flux of womens terms. And here I cannot chuſe but note vnto you by the way, the ſtrange pro-
pertie and wonderfull nature that egg-ſhels haue: for ſo hard compact and ſtrong they be, that
if you hold or ſet an egg endlong, no force nor weight whatſoeuer is able to break and cruſh it,
ſo long as it ſtandeth ſtreight and plumbe vpright, vntill ſuch time as the head incline to a ſide

and

20030
copy 1

A and bend one way more than another. Egs entire and all whole as they be [*i.* white, yelke, ſhell and skin] taken in wine with rue, dill, and cumin, helpe women in hard trauell to ſpeedie and eaſie deliuerance. Egs incorporat with oile & roſin of the cedar mixed together, are ſingular good for to heale ſcabs and to kill the itch: put thereto the root of Cyclamin, [*i.* Sow-bread] it healeth the running skalls of the head: for thoſe that reach vp purulent matter out of the cheſt, or ſpit bloud, it is good to ſup off a raw egg together with the juice of vnſet leeks, and an equall quantitie of Greekiſh wine; but firſt all muſt be warmed, before that it be giuen to the patient. Againſt a cough, they ordaine egs ſodden and ſtamped together with hony, and ſo to eat them; or elſe to ſup them off raw, with wine cuit & oile, of each a like quantity. If a man haue any ſore or vlcer in his ſecret parts ſeruing for generation, it were very good to inject one egg tempered
B with three cyaths of wine cuit, and halfe an ounce of Amylum or ſtarch-floure, preſently vpon his comming forth of the bains or hothouſe. An excellent linement there is made of ſodden egs ſtamped together with creſſes, for the ſting or biting of ſerpents. How many means there be whereby egs doe good as meat, there is not one but knoweth: for euen in their going downe, they paſſe through any tumor or ſwelling of the throat, and with their kind heat foment thoſe parts by the way. There is not any kind of viand in the world beſides it, that nouriſheth a ſicke man, without any offence or burden at all to the ſtomacke; and it may go well enough for meat and drinke both. As touching egs ſodden in vinegre, and how their ſhels may be made ſoft and tender therby, I haue alreadie ſhewed; ſuch egs if they be wrought and knead with meale into a dough or paſt, do make a kind of bread which is ſoueraigne for all fluxes of the ſtomack. Some
C there be who think it better to take theſe egs thus mollified & reſolued in vinegre, and to torriſie the ſame betweene two platters of earth; ſuppoſing that being thus prepared, they ſerued not only to ſtop a lask, but alſo to repreſſe the immoderat flux of womens monthly tears: but in caſe the ſaid fluxions be exceſſiue and beyond all meaſure vehement, they are to be ſupped off raw, with water and meale in maner of a grewell or pottage: or els the yelks may be boiled by themſelues in vinegre, vntill they be hard; and then a ſecond time be fried & torrified afterwards with groſſe pepper, and in this ſort they will die any looſeneſſe of the bellie. And yet there is another ſingular remedie for the bloudy flix, namely, to put the meat of a raw egg in a little earthen pot that neuer was occupied, and to add therto as much hony as may amount to the quantitie of the egg, to the end that all be of equall proportion; then, within a while after to temper therewith
D the like meaſure of vinegre & oile both, and to beat them all together oftentimes, that they may be well concorporat and vnited in one. In which compoſition, this is to be obſerued, That the better that euery one of theſe ingredients is that enter into this confection, the more excellent operation and ſpeedier remedy wil enſue therupon. Others there are, who in ſtead of oile and vinegre, put in red roſin and wine, according to the former rate and proportion: howbeit they temper the ſaid medicine after another ſort; for they put in of oile, only as much as the egg comes to, adding thereto of the pine-tree barke * two ſixtie parts of a Romane denier, and one ſixtie part of Sumach, which I called Rus, and fiue oboli weight of hony; with this charge, That they be all boiled together; and that the patient eat no other meat whatſoeuer for the ſpace of foure hours after. Many there be, who to cure and eaſe the wringing gripes and torments of the belly,
E taks two egs and foure cloues of Garlick, which they pun and ſtamp together; then they heat them ouer the fire in one hemine of wine, and giue this maſh vnto the patient to drinke. To conclude, becauſe I would not willingly omit any thing that may commend egs and giue grace vnto them, know thus much moreouer, That the gleere or liquid white of an egg with quicke-lime, maketh an excellent ſement to ſouder or vnite any broken pieces of a glaſſe together: beſides, of ſuch ſtrength and efficacie they are, that neither a piece of wood no nor ſo much as any parcell of cloath wet or dipped in the white of an eg wil burn, but check the violence of the fire. Howbeit, note that all which I haue ſpoken of egs, is to be meant thoſe that hens only do lay: for as touching other birds egs, I wil write in their due places; for as much as they are not deſtitute of many peculier vertues and ſingular properties of their own. Ouer & beſides, I will not ouer-
F paſſe one kind of eggs beſides which is in great name and requeſt in France, and whereof the Greeke authors haue not written a word: and this is the ſerpents egg, which the Latins call Anguinum. For in Summer time yerely, you ſhall ſee an infinit number of ſnakes, gather round together into an hpape, entangled and enwrapped one within another ſo artificially, as I am not able to expreſſe the manner thereof: by the means therfore, of the froth or ſaliuation which they

* *i.* about two graines.

yeeld from their mouths, and the humour that commeth from their bodies, there is engendred G
the egg aforesaid. The priests of France called Druidæ, are of opinion, and so they deliuer it,
That these serpents when they haue thus engendred this egg do cast it vp on high into the aire,
by the force of their hissing; which being obserued, there must be one ready to latch and receiue
it in the fall again (before it touch the ground) within the lappet of a coat of arms or soldiours
cassocks. They affirme also that the party who carrieth this egg away, had need to be wel mount-
ted vpon a good horse and to ride away vpon the spur, for that the foresaid serpents will pursue
him still, and neuer giue ouer vntil they meet with some great riuer betweén him and them, that
may cut off and intercept their chase. They ad moreouer and say, that the onely marke to know
this egg whether it be right or no, is this, That it will swim aloft aboue the water euen against
the stream, yea though it were bound and enchased with a plate of gold. Ouer and besides, these H
Druidæ (as all the sort of these magicians be passing cautelous and cunning to hide and couer
their deceitfull fallacies) do affirme, That there must be a certaine speciall time of the Moones
age espied, when this businesse is to be gone about, as if (forsooth) it were in the power and dis-
position of man to cause the moon and the serpents to accord together in this operation of en-
gendring the egg aforesaid by their froth and saliuation, I my selfe verily haue seen one of these
egs, and to my remembrance, as big it was as an ordinary round apple: the shell thereof was of
a certaine gristly and cartilagineous substance, and the same clasped all about (as it were) with
many acetables or concauities representing those of the fish called a Pourcuttle, which shee
hath about her legs. And it is the ensigne or badge that the Druidæ doe carry for their armes.
And they hold it a soueraigne thing, for to procure readie exceſſe vnto any princes, and to win I
their grace and fauour; as also to obtaine the vpper hand ouer an aduersarie in any sute and pro-
cesse of law, if one do carrie it about him. But see how this vanitie and foolish persuasion hath
possessed the minds of men! for I am able vpon mine owne knwledge to auouch, that the Empe-
ror *Claudius Cæsar* commanded a man of arms and gentleman of Rome, descended from the Vo-
cantians, to be killed for no other reason in the whole world, but because he carried one of these
egs in his bosome, at what time as he pleaded his cause before him in the court. This winding
and mutuall enfolding of these serpents one within another, putting me in mind of one thing
worth the obseruation, That it was not for nought that forrein nations haue ordained, that their
Embassadors who had commission to treat of peace, should carrie with them a certaine rod or
mace wherein were pourtraied serpents winding and clasping round about it; to signifie and K
shew, that these creatures, as sauage, fell, and venomous as they be otherwise, and as it were made
altogether of poison, yet otherwhiles they accord and agree well enough together: where it is
furthermore to be noted, that the manner was not to represent in these maces and ensignes of
peace, any furious serpents with crests vpon their heads.

As touching geese and their eggs, how good and profitable they are, before I enter into any
discourse (for my purpose is to treat of them also in this very booke) I cannot chuse but for the
honour due vnto the Comagenes, in regard of an excellent composition by them made, write
first of it, being of them called Comagenum: for that also the principall and best of that kind
was most vsed and in greatest request in Comagene: which is a region belonging vnto Syria. It
consisteth of goose greace, cinamon, casia or canelle, white pepper, and an herbe called likewise L
Comagene. Now for the better mixture and fermentation of these ingredients and the whole
composition, the vessell which containeth the same ought to be buried in snow: a pleasant smel
it hath, and is held to be a soueraigne ointment for any through-cold and quiuering fit; for con-
vulsions, for sodain pains whereof no euident cause is known; and in one word, for all lassitudes
and what infirmities soeuer be cured by the medicins called in Greeke * Acopa: in such sort, as
that it serueth not only for an outward ointment, but also for an inward medicine. This Coma-
genum is made in Syria after another maner, namely of the fat or grease of birds which is clen-
sed, tried, and purified, according as I haue before said, with an addition of Erysisceptron, Xylo-
balsamum, the barke or young shoots of the Date tree, and sweet Calamus, of each as much as
amounteth to the weight of the greace aforesaid; and all these together must be put into wine M
and set ouer the fire for siuer and to take two or three waulms. Now this is to be noted, that
the conuenient time of making it is in winter, because it will neuer jellie and grow to any thick
consistence in Summer, vnlesse there be * wax put into it.

Many other good medicines and ointments there be made of Geese, whereat I marueile as
much

* *Acopa*, so called, because they be good against lassitude or wearinesse.

* And that delaieth much the odoriferous smell.

20030
copy 1

A much as at * Goats: for it is ſaid, that all Summer long euen vnto the fall of the leafe, Geeſe and Rauens be continually ſicke. Finally, as touching the honour which Geeſe deſerued and woon by diſcouering the skallade that the Frenchmen made into the Capitoll hill of Rome, I haue written heretofore.

* For Goats are ſaid neuer to be cleare of the ague.

Chap. IIII.

¶ *Medicinable receits taken from dogs, and other beaſts which are not tame, but wild: alſo from foules. Remedies againſt the pricke or ſting of the venomous ſpiders Phalangia.*

B VPon the foreſaid occaſion, for the dogs which had the cuſtome of the Capitoll, barked not when the Gaules skaled the Capitoll, there is a cuſtome yearely obſerued at Rome to truſſe certain *dogs to forkes, and thus as it were crucified, to hang them aliue vpon an Elder tree for examplarie juſtice: which execution was performed between the temple of *Ieventus* and *Summanus*. But ſeeing I am thus light vpon the mention of dogs, I muſt needs diſcourſe of them more at large, and the rather, for that our anceſtours in old time obſerued many ceremonies about this beaſt. Firſt and formoſt, the ancient Romanes thought the fleſh of ſucking whelps to be ſo pure and fine a meat, that they vſed to ſacrifice and offer them as an expiatorie oblation to their gods for to appeaſe their indignation. And verily at this day they make no C ſcruple to ſacrifice a yong whelpe before it be full a day old, and eſpecially ſuch an one as the bitch puppied the ſame morning: yea, and at the ſolemne feſtiuall ſuppers ordained for the honour of the gods, they forget not this day to ſerue vp at the table certain diſhes of yong whelps fleſh that ſucke their dams. Moreouer, that young dogs fleſh was an ordinarie ſeruice at thoſe ſumptuous feaſts called * Aditiales, it appeareth plainely by the teſtimonie of *Plautus* in his * Comœdies. Certes, it is generally thought, that for the venome called Toxicum, there is not a better counterpoyſon than dogs bloud. It ſeemeth alſo that this domeſticall creature taught men firſt the manner of diſcharging and purging the ſtomacke by vomit. In ſumme, there are a number of other medicinable vertues in a dog highly commended, whereof I will write as occaſion ſhall be offered in conuenient place. But for this preſent I will proceed orderly according to my firſt intention and purpoſe.

*ἐνυλάκτας, ſaith *Cœl. Rhod. lib. 17. cap. 29.* ſuch as will not barke and giue warning of ſtrangers comming

*or *Adiſciales.* * *Feſtus* quoteth the place in the Comœdie called *Saturio* which is not now extant.

D To returne againe vnto the ſtinging of ſerpents, theſe remedies following are taken to be effectuall, to wit, ſheeps treddles and Goats dung freſh gathered and boiled in wine to the conſiſtence of a liniment, and ſo applied vnto the place: alſo mice and rats ſplitted and ſo laid hot vnto the wound. And verily, how baſely ſoeuer men thinke of this kind of cattell and hold them no better than vermine, yet they are not without certaine naturall properties, and thoſe not to be deſpiſed: but principally in regard of the ſympathy betweene them and the planets in their aſcent, as I haue noted heretofore: and namely, conſidering how the lobes and filaments of their liuers and bowels do encreaſe or decreaſe in number, according to the daies of the Moons age. And theſe magicians do report, That if one do giue vnto hogs the liuer of a mouſe or rat within a fig, they will follow the partie that gaue them that morcell. They ſay moreouer, that the E ſame is able to do as much in a man: but in caſe a cyath of oile be drunke vpon it, it looſeth all the vertue.

As touching Weaſels, there be two kinds of them: for there be wild ſort different from the reſt in bignes, for they be ſmaller: and thoſe the Greeks call * Ictides: their gall is ſaid to be very effectuall againſt the ſting of the Aſpis, whereas otherwiſe it is a very poyſon it ſelfe. As for that kind which keepeth about our houſes, wandering here and there in euery corner, and *vſeth to carie her kitlings in her mouth to and fro euery day from place to place and neuer reſteth (as mine author *Cicero* doth write) ſhee is an enemie ro ſerpents and naturally perſecuteth them. Their fleſh being ſalted, is giuen to the weight of one denier in three cyaths of wine, with great ſucceſſe, vnto thoſe that be ſtung by ſerpents: alſo their maw farced with coriander ſeed, and F kept in ſalt or brine, is good for the ſame purpoſe if it be drunke in wine. But the young kitling of the Weaſell is beſt and moſt effectuall.

* Which be our Ferrets.

* Some take theſe for our Cats.

Other vile creatures there are beſides, which for their baſeneſſe I baſh to name and relate in this place; howbeit, becauſe ſo many authors with one conſent haue ſo conſtantly commended their medicinable properties, I make it a matter of conſcience to paſſe them ouer in ſilence:

confide-

conſidering that all our medicins proceed from that conuenience and repugnancie which is in the nature of all things, whereof we haue ſo much ſpoken. As we may ſee for example in theſe punies or wall lice (the moſt ilfauoured and filthy vermine of all other, and which we loth and abhor at the very naming of them) for natually they are ſaid to be aduerſatiue to the ſting of all ſerpents, and principally of the Aſpis: nay they are thought to be a counterpoyſon againſt any venomous thing whatſoeuer: and folke ground their reaſon hereupon, becauſe looke what day that Hens do eat a wal-louce, the ſame day there ſhall no Aſpis haue power to kill them. And it is ſaid moreouer, That the very fleſh of ſuch hens as haue eaten ſuch punies, is ſingular good for thoſe that be ſtung alreadie by the ſaid ſerpents. Other receits there be ſet downe by our great maſters in Phyſicke, as touching this foule vermine: but thoſe which carie moſt modeſtie with them and haue greateſt reſpect vnto manhood & humanity, are theſe, namely, to rub or annoint the place which is ſtung, with the ſaid wal-lice and the bloud of a Tortoiſe together: alſo to chaſe away ſerpents, with the ſmoak or perfume of them: likewiſe if any beaſt which hath ſwallowed down horſe-leeches, do take them in drink, they will either kill them or driue them out, yea, and in what part ſoeuer they are ſettled and ſticke faſt, they will remoue them and make them to fall off. And yet ſome there be who vſe this naſtie and ſtinking creature in eie-ſalues, for they incorporat them in ſalt & womans milk, and therwith annoint their eies: yea, and drop them into the eares with honey and oile roſat mingled together. Others there be who vſe to burne theſe punaiſes or wal-lice, ſuch eſpecially as be of a wild kind, and breed vpon Mallowes, and incorporat their aſhes in oile of Roſes, and inſtill them into the eares. Touching other medicinable properties which they attribute vnto them, namely for impoſtumes and botches that are broken and run, for the Quartan agne and many more maladies; although they giue direction to ſwallow them down in an egge, or elſe encloſed within wax or a beane, I hold them for lies, and therefore not worthy to be related in ſadneſſe. Marie I will not ſay but there is ſome probabilitie and apparence of reaſon why they ſhould put them in thoſe medicines which are ordained for the lethargie: for ſurely they are knowne to be very proper againſt that drowſines, which is occaſioned by the venome of the Aſpis: to which effect ſeuen of them be ordinarily giuen in a cyath of water, or but foure, if the patient be a child. In caſe of ſtrangurie alſo, when a man piſſeth dropmeale, they vſe to put wall-lice into a ſyring, and ſo conueigh them into the paſſage of the yard. See the goodneſſe and induſtrie of dame Nature, the mother of all, how ſhe hath produced nothing in the world but to good purpoſe and with great reaſon. And yet here is not all that they report of theſe lice called punaiſes: For they ſay, that whoſoeuer carie two of them in a bracelet about his left arme, within a lock of wooll (but the ſame forſooth muſt be ſtollen from ſome ſhepheard) he ſhall be ſecured againſt thoſe agues that come ordinarily in the night ſeaſon: but ſay their fits vſe to returne by day time, then the ſaid punices ought to be lapped in a reddiſh clout of a carnation colour. Contrariwiſe, the worme called Scolopendra is an enemie vnto theſe wall-lice, and killeth them.

As for the Aſpides, look whom ſoeuer they haue ſtung, they die vpon it with a kind of deadly ſleepineſſe and benummedneſſe in all their lims: and to ſay a truth, of all ſerpents that creep vpon the ground, they are moſt mortall, and their wounds leaſt curable. Their venome if it enter once ſo farre, that it come to bloud, or doe but touch a greene wound, there is no remedie but preſent death: marie if it light vpon an old ſore, the danger is not ſo ſpeedie, nor the force ſo quick. Otherwiſe let the ſame be taken in drinke to what quantitie ſoeuer, it is harmeleſſe and doth no hurt at all: for ſetting aſide that ſenceleſſe drowſineſſe wich it inflicteth, putrifaction and infection it cauſeth none: which is the reaſon, that the fleſh of thoſe beaſts which die of their ſting is meat good enough. I would pauſe and make ſome ſtay in reporting a remedie that theſe Aſpides do yeeld, but that I haue my warrant from *M. Varro*, whom I know to haue deliuered the ſame, euen when he was * foureſcore yeeres old and eight: namely, That there is not in the world ſo good a thing to cure the bitings of the Aſpides, as to giue the party who is wounded thereby, ſome of their vrine to drinke.

* At which yers he would haue beene aſhamed to tell a lie.

To come now vnto the Baſiliske, whom all other ſerpents do flie from and are affraid of: albeit he killeth them with his very breath and ſmel that paſſeth from him; yea, and (by report) if he do but ſet his eie on a man, it is enough to take away his life: yet the Magicians ſet great ſtore by his bloud, and tell wonders thereof: and namely that being of it ſelfe as blacke and as thick congealed as pitch, yet when it is waſhed and diſſolued, it looketh more cleare and pure than

* Cinna-

20030
copy 1

A *Cinnabaris. Vnto it they attribute ſtrange and admirable effects: For whoſoeuer (ſay they) carie it about them ſhall & gratious with princes or great potentats, yea, and at their hands obtaine a grant of all their petitions: they ſhall find fauour with the gods aboue, and ſpeed in all their praiers: remedie they ſhall haue of all diſeaſes: and no ſorcerie or witchcraft ſhall take hold of them. And ſome of them there be who call it the bloud of *Saturne*.

*A kind of gum, called *Sanguis Draconis*.

As for Dragons, they haue no venome in them. And if it be true that our Magicians ſay, if a Dragons head be laid vnder the threſhold of a dore, after due worſhip and adoration of the gods, with praiers & ſupplications vnto them for their fauourable grace, that houſe ſhall ſurely be fortunat. The eies of a Dragon preſerued drie, pulveriſed and incorporat with hony into a liniment, cauſe (by their ſaying) thoſe who be annointed all ouer therewith to ſleepe ſecurely,
B without any dread of night-ſpirits, though otherwiſe they were fearfull & timerous by nature. Moreouer, if we may beleeue them, the fat growing about the heart of a Dragon, lapped within a peece of a Buckes or Does skin, and ſo tied faſt to the arme with the nerues or ſinues of a red Deere, is very auaileable, and aſſureth a man good ſucceſſe in all ſutes of law. The firſt ſpondyle or turning joint in the chine of a Dragon, doth promiſe an eaſie and fauourable acceſſe vnto the preſence of princes & great ſtates. The teeth of a Dragon lapped within the skin of a roe buck or wild Goat, and ſo bound faſt with the ſinewes of a Stag or Hind, do mitigat the rigor of great lords and potentats, cauſing them to incline to their petitions and requeſts, who preſent themſelues before them. But aboue all other receits, one compoſition there is which bewraieth the impudent and lying humor of theſe Magicians, who promiſe vndoubted and infallible victory,
C to thoſe that haue it about them, and this it is: Take (ſay they) the taile and head both of a Dragon, the haire growing vpon the forehead of a Lion, with a little alſo of his marrow, the froth moreouer that an Horſe fometh at the mouth, who hath woon the victory and priſe in running a race, and the nailes beſides of a dogs feet: bind all theſe together with a piece of leather made of a red Deere skin, with the ſinues partly of a Stag and partly of a fallow Deere, one with another in alternatiue courſe: carrie this about you and it will worke wonders. Impoſtures all, and loud lies. And verily, it is as gratious a deed to diſcouer and lay abroad theſe impudencies of theirs, as to ſhew the remedies for the ſting of ſerpents, conſidering how theſe deuices be no better than meere miſchiefes and ſorceries, which hurt and bewitch poore patients, and ſuch as truſt in them. True it is, that all venomous beaſts flie from thoſe that be annointed with Dra-
D gons greaſe. Likewiſe they cannot abide the ſtrong & virulent ſauour of the rat of India called Ichneumon: inſomuch as they ſtand in dread of them who are annointed with a liniment made of the aſhes of their skin incorporat in vinegre. Moreouer, lay the head of a Viper to the place where ſhe hath wounded one, it is a ſoueraign remedy; yea, though it were the head of any other Viper than it which inflicted the wound, it is infinitely good. Likewiſe if a man do hold vp the ſame Viper that inflicted the ſting, at a ſtaues end ouer the ſmoak of wood burning, or the vapor of ſeething water (and yet, ſay they, warie enough they be thereof, and will auoid it) or annoint the place with a liniment made of her aſhes burnt, it is ſufficient to heal the ſore. *Nigidius* mine Author affirmeth, That ſerpents after they haue ſtung one, are forced by a certain neceſſitie and inſtinct of Nature to returne vnto the party whom they haue hurt. The Scythians yerely vſe to
E ſlit a vipers head between the eares for to take forth a little ſtone, which ſhe is wont to ſwallow when ſhe is affrghted. Others make vſe of the whole head as it is. Certaine trochisks there be, made of a Viper, called by the Greeks Theriaci: for which purpoſe they cut away at both ends as well toward the head as the taile the breadth of foure fingers, they rip her belly alſo, and take out the garbage within: but eſpecially they rid away the blew ſtring or vein that ſticketh cloſe to the ridge bone. Which done, the reſt of the bodie they ſeeth in a pan, with water and dill ſeed, vntill ſuch time as all the fleſh is gon from the chine: which being taken away, and all the prickie bones therto belonging, the fleſh remaining they incorporat with fine floure, & reduce into troſches, which being dried in the ſhade, are reſerued for diuerſe vſes, and enter into many ſoueraigne antidotes and confections. But here is to be noted, that although theſe troſch s be
F called * Theriaci, yet are they made of vipers fleſh onely. Some there be, who after a Viper is cleanſed as aboueſaid, take out the fat, and ſeeth it with a ſextar of oile vntill the one halfe be conſumed: which ſerueth to driue away all venomous beaſts, if three drops of this ointment be put into oile, and therewith the body be annointed all ouer. Moreouer, this is held for certaine, that there is no ſting or bit of ſerpents ſo mortall and incurable otherwiſe, but the entrailes of the

* θηριακὸν. For *Theriaci* in the primitiue and naturall ſignification is more generall: of θὴρ or θηρίον, which is any wild or venomous beaſt.

the ſame which gaue the wound, applied thereto, will heale it: as alſo, that as many as haue at G
any time ſupped the broth wherein a Vipers liuer was boiled, ſhall neuer afterwards be ſmitten
or ſtung by ſerpents.

As for Snakes, venomous they are not but at ſome times of the month, when they feel them-
ſelues mooued by the inſtigation of the Moone: but contrariwiſe they be good for thoſe which
chance to be ſtung by them, if they be taken aliue, ſtamped, or braied with water, and therewith
the affected place fomented. Certes, they are thought to be medicinable in many reſpects, as I
will hereafter declare: which is the cauſe that a Snake is dedicated vnto the god of Phyſick, *Æſ-*
culapius. And *Democritus* verily talketh of many ſtrange and wonderfull compoſitions made of
ſnakes, by meanes whereof a man may vnderſtand the language of birds, and know what they
prattle one to another. But to ſay no more, was not *Æſculapius* brought from Epidaurus to H
Rome in the forme of a Snake? and keepe we not ſtill many of that race commonly in our houſes
tame and gentle, feeding them by the hand? Surely if their eggs and young frie were not eft-
ſoones deſtroied with firing them in their holes, the world would be peſtered with them, they
multiplie ſo faſt. The goodlieſt and faireſt ſnakes to ſee too, are thoſe which liue in the water, and
are called Hydri, *i.* water-ſnakes: but a more fell and venomous ſerpent, their liues not vpon the
face of the earth. Howbeit, the liuer of theſe water-ſnakes, if it be kept in ſalt, or otherwiſe preſer-
ued, is a ſoueraigne remedie for thoſe that be ſtung by the ſame kind.

Now for the ſpotted Lizard, called Stellions, a Scorpion ſtamped is ſingular good againſt
their poyſon. For this you muſt thinke, that of them there is made a venomous drinke: for let I
him be ſtrangled or drowned in wine, whoſoeuer drinke thereof ſhall find themſelues impoyſo-
ned, inſomuch as their faces will break forth into certaine ſpots and pimples & foule morphew.
And this is the reaſon that our jealous dames when they would auert the affection and loue of
their husbands from thoſe concubins, vpon whom they ſuſpect them to be enamoured, will if
they can poſſible, ſtifle a ſtellion in the complexion or ointment wherewith ſuch harlots vſe to
paint their viſage; by meanes whereof they become disfigured, and grow both foule and ill-fa-
uoured. But what is the remedie to cleanſe the skin from ſuch deformities? The yolke of an egg
incorporat with hony and ſalnitre, doth the feat. The gall of theſe Lizards or Stellions punned
and diſſolued in water, is ſaid to haue an attractiue facultie to draw all the Weaſels about the
place to reſort thither in companies.

Of all venomous beaſts, there are not any ſo hurtfull and dangerous as are the Salamanders. K
As for other ſerpents, they can hurt but one at once, neither kill they many together: to ſay no-
thing, how when they haue ſtung or bitten a man, they die for very griefe and ſorrow that they
haue done ſuch a miſchiefe, as if they had ſome pricke and remorſe of conſcience afterwards;
and neuer enter they againe into earth, as vnworthy to be receiued there: but the Salamander is
able to deſtroy whole nations at one time, if they take not heed and prouide to preuent them:
For if he get once to a tree, and either claſpe about it or creepe vpon it, all the fruit that it bears
is infected with his venome; and ſure they are to die, whoſoeuer eat of that fruit, and that by the
meanes of an extreame cold qualitie that his poyſon hath, which doth mortifie no leſſe than if
they had taken the Libard-baine call Aconitum. Moreouer, ſay that ſhee doe but touch any
peece of wood, billet, or hedge ſtake, wherwith either a loafe is baked, or a ſhiue of bread toſted, L
as many as eat thereof, ſhall catch their bane by it: or if one of them chance to fall into a well
or pit of water, looke whoſoeuer drinke thereof, ſhall be ſure to die vpon it: and that which is
more, if there happen neuer ſo little of the ſpittle or moiſture which ſhee yeeldeth, to light
vpon any part of the body, though it touched no more but the ſole of the foot, it is enough to
cauſe all the haire of the body to fall off. And yet as great and dangerous as the poyſon of
theſe beaſts is, there be ſome creatures and namely Swine, that eat them ſafely; ſo effectuall
is their contrarietie and repugnancie in Nature, that it conquereth and ſubdueth the ſaid poy-
ſon: And to mortifie this venome, it ſoundeth to good reaſon, that thoſe beaſts ſhould haue
power, which feed vpon them and find no harme thereby. But writers there be who ſay, that the
flies called Cantharides, taken in drink, or the Lizard in meat, are good for that purpoſe: beſides M
other things which are aduerſe and contrary thereto, wherof I haue already ſpoken & will ſpeak
more in time and place conuenient. As for that which the Magicians do report of the Salaman-
der, againſt skarefires (for that there is other beaſt but it, that ſcorneth the violence of the fire
and quencheth it) ſurely it had beene put in practiſe long ſince at Rome, in caſe their words

had

20030
copy 1

A had proued true. *Sextius* affirmeth, That the body of a Salamander cleanſed from the guts and garbage within, and parted from the head and feet, if it be condite in hony, inciteth greatly to fleſhly luſt thoſe that eat thereof: but he denieth flatly that it doth extinguiſh and put out the fire.

Now concerning thoſe birds which yeeld any helpe againſt ſerpents, the vulture or Geir deſerueth to be ſet in the firſt ranke: but this hath bin obſerued and found by experience, that the black of this kind are not ſo powerful as others in this behalfe. It is commonly ſaid, that a perfume made with burning their feathers, chaſeth ſerpents away. Likewiſe, it is an opinion generally receiued, that whoſoeuer carie about them the heart of this foule, are ſecured from the violent aſſault, not of ſerpents only, but alſo of other wild beaſts, yea, and of theeues & robbers by
B the high way ſide. The ſame alſo aſſures them to eſcape the danger of princes wrath and indignation, how ſoeuer they be ſet and incenſed againſt them. The fleſh of Cocks and Capons diſmembred, if it be applied warm (as it was plucked from the bones) to the place which is bitten or ſtung by any ſerpent, drawes out the venome, and mortifies the ſtrength therof, ſo doth their braines if it be drunke in wine. But the Parthians thinke it better to lay vnto the ſaid ſores the braines of an Hen. Alſo a broth made of ſuch pullein, hath a ſingular vertue in this caſe, if it be ſupped off: like as in many others it workes wonderfull effects, as it is vſed. For firſt and formoſt neither Lions nor Panthers will ſet vpon thoſe perſons who are bathed with their decoction, eſpecially if there were any Garlick ſodden therin. Secondly, it is paſſing good to keep the body looſe: but ſtranger is the operation if it were of an old Cocke. *Item*, It ſerueth very well to cure
C long feauers, the trembling alſo and nummednes of the lims, it aſſuageth the pain of all kinds of gout, eaſeth the head-ach, ſtaieth the violence of rheumes eſpecially falling into the eies, reſolueth ventoſities, quickeneth the dull appetite to meat, preuenteth the danger of the inordinat deſire to the ſtoole without doing any thing, if it be taken betimes and in the beginning of that diſeaſe; ſtrengtheneth a feeble liuer, comforteth the reins and the bladder, concocteth crudities in the ſtomack, and finally, helpeth thoſe who are ſhort winded. In regard of theſe manifold commodities, the maner of making this broth as it ought to be, is ſet down in writing, and direction giuen therefore. For more effectuall it is found to be, in caſe there be ſodden with the Cocke or Capon the ſea wort Soldanella, or the hearbe Cybium, Capres, or Perſely, Mercurie the herbe, Polypodium, or dill. Now the beſt way of making this broth, is to ſet the ſaid Cocke
D or Capon a ſeething with the abouenamed herbes in three gallons of water, and to ſuffer the ſame to boile vntil there remain but three pints of liquor: when it is thus ſodden to this height, it ought to coole without dores in the open air: and then it is ſingular good to be giuen in thoſe caſes aboue rehearſed, prouided alwaies, that the patient haue taken a vomit before, for that is the only ſeaſon. And for as much as I am thus far entred into a diſcourſe of Pullain, I cannot forget one miraculous experiment, although it be nothing pertinent to Phyſick, & this it is, That if one put the fleſh of an hen into gold as it is in melting, it will draw all the mettall into it, and *conſume it ſo, as therupon the ſaid fleſh is held to be the poyſon (as it were) of gold. Moreouer, if you would not haue a Cock to crow and chant, put a wreath or coller of Vine twigs about his necke. But to returne again to our receits and medicines againſt ſerpents: the fleſh of young Pi-
E geons newly hatched, as alſo of ſwallowes, is very good: ſo are the feet of a ſcriche Owle burnt together with the herbe *Plumbago. But before I write further of this bird, I cannot ouerpaſſe the vanitie of Magicians which herein appeareth moſt euidently: For ouer and beſides many other monſtrous lies which they haue deuiſed, they giue it out, That if one doe lay the heart of a ſcrich-Owle on the left pap of a woman as ſhe liee aſleep, ſhe will diſcloſe & vtter all the ſecrets of her heart: alſo whoſoeuer carie about them the ſame heart when they go to fight, ſhal be more hardie, and performe their deuoir the better againſt their enemies. They tell vs moreouer, I wot not what tales of their egges, and namely, that they cure the accidents and defects befalling to the haire of the head. But I would faine know of them what man euer found a ſcrich-Owles neſt and met with any of their egges, conſidering that it is holden for an vncouth and ſtrange pro-
F digie to haue ſeen the bird it ſelfe? and what might he be that tried ſuch concluſions and experiments, eſpecially in the haire of his head? Furthermore, they affirme aſſuredly, That the bloud of their young birds will curle and frizzle the ſame haire? Much like to theſe toies are their reports alſo of the Bat: for (ſay they) if a man goe round about a houſe three times, carrying a liue Bat with him, and then naile it vpon the window with the head downward, it is a ſoueraign

coun-

*Hereupō peraduenture it is that in collices & Cocks broths we vſe to ſeeth peeces of gold, with an opinio to make them thereby more reſtoratiue.

* Which ſome take for the leſſe wild Tazell.

counter charme againſt all ſorceries and witchcrafts: and more particularly, if a Bat be borne G
thrice round about a ſheepe-coat, and then hanged vpon the lintell of the dore, with the heeles vpward, it will ſerue for a ſingular preſervatiue to defend the ſheep from all ſuch harmes. As for the bloud of a Bat, they commend it highly for healing the ſting of ſerpents: if together with the leaues or ſeeds of a thiſtle it be applied to the place.

*Yet *Matthiolus* vpon *Dioſcorides* reckoneth *Tarantula* to be a kind of Phalangium, whereof there is great ſtore in Apulia.

Touching the venomous ſpider called *Phalangia, they know not in Italy what it is, for all there be many kinds thereof: for ſome are like vnto Piſmires, but that they be far bigger; their heads be reddiſh, the reſt of their body black, howbeit here and there marked with white ſpots. The ſting of this ſpider is more keene and ſharpe than that of the weſpe. It liueth ordinarily about ouens and mils. The beſt remedie againſt the prick of their ſting, is to preſent before the eies of the patient, another ſpider of the ſame kind: for which purpoſe folke vſe to keepe them H
in ſtore, when they find any of them dead. Their caſes or skins brought into pouder and taken in drink, haue the like effect to young weazils or kitlings, as I haue declared before. A ſecond ſort there is of theſe venomous ſpiders Phalangia, which the Greeks diſtinguiſh from others by the name of Lupus. Thoſe that be of a third kind, and yet named Phalangia, are the ſpiders which be couered all ouer with a certain downe, and of all the reſt haue the biggeſt heads. Cut one of them and rip the bellie, you ſhall find within two little wormes or grubs, which (if it be true that *Cecilius* hath left in writing) hinder women for conception in caſe they be knit within a peece of leather of a red deere skin, and tied to their armes or other parts of their bodie before the ſunne-riſing: but this vertue continueth not aboue one yeare. Thus haue I ſhewed one receit
*called *Alocia* only, of all thoſe that * keep women from conceiuing; which I may be allowed to do in regard I
of ſome wiues, who being too fruitfull and ouercharged with child bearing, haue ſome reaſon to play them a while and reſt from teeming: and therefore may be pardoned, if they vſe ſome ſuch meanes therefore.

There is another kind of ſpiders, which the Greeks call Rhagion, for that it reſembles a black grape kernill: theſe haue a very little mouth vnder their belly, and as ſhort legs, as if they were vnperfect and not fully made. Look where they bite, the pain that enſueth is much like to that which is occaſioned by the ſting of a ſcorpion: and their vrine who are hurt by them, ſeemes to ſhew to the eye, cobwebs floting aloft. I would ſay, that this ſpider were the ſame that Aſterion, another kind of them, but that theſe haue certain e raies or ſtreakes of white. Their ſting or pricke cauſeth looſeneſſe and feebleneſſe of the knees. As for the blew ſpider, which carrieth a K
blacke downe or cotton, it is worſe than both the former, cauſeth trouble and dimneſſe of the eyes by their pricking, yea, and vomiting of matter reſembling cobwebs. And yet there is another Phalangium worſe than it, which commeth neare in ſhape to the Hornet, but that it hath no wings at all, and look whom ſoeuer it biteth, they are ſure to become leane and pine away. The venomous ſpider, called by the Greeks Myrmecion, is headed like vnto an Emmet: the bellie is blacke, howbeit marked with certain white ſpots: their ſting is as painefull as that of
*i. Hauing four claws. Weſpes. But as touching that kind of Phalangium which is called * Tetragnatium, there be two ſorts thereof: The one, which is the worſt of the twaine, hath the head diuided directly in the middeſt with a white line; wheras in the other, the ſaid line or ſeame runneth croſſe ouerthwart. Theſe make the mouths to ſwell whom they haue bitten. But thoſe that be of a dead aſh L
colour, and yet whitiſh behind, are not ſo quicke with their prick as the reſt: Of which colour there is another ſort that be altogether harmleſſe: and, theſe be our common ſpiders or ſpinners which againſt wals vſe to ſtretch out their large webs as nets to catch poore flies. Now concerning the remedies appropriat to any pricke or biting of the foreſaid Phalangia, there is not a better thing than to drink in oxycrat, *i.* water and vinegre mingled together, the braines of a Cock or Hen with a little pepper. Alſo to take in drink fiue Piſmires, is thought to be a ſingular medicine: and withall to make a liniment of ſheeps mucke aſhes, tempered in vinegre, and therwith to annoint the grieued place. Moreouer, the ſaid ſpiders themſelues (of any kind whatſoeuer) reſolued and putrified in oile, ſerue for the ſaid purpoſe.

As for the miſcheeuous mouſe called the Hardiſhrew, the runnet found in a lambes maw ta- M
ken in wine, healeth the hurt that commeth by her biting: alſo the application of a ſalue made with the aſhes of a Rams cley incorporat with hony, worketh the ſame effect: ſo doth a young weazill or kitling, prepared and vſed in manner aforeſaid in the Treatiſe of ſerpents. If one of theſe ſhrewes haue bitten a horſe or other beaſt, it is good to lay vnto the place a mouſe or rat

new

20030
copy 1

A new killed, with ſome ſalt, or elſe the gall of a Bat with vineger. The ſhrew it ſelfe being burſt, and ſo laid freſh and warm to the ſore, cureth the ſame: for this is obſerued, That if one of them be with yong when ſhe doth bite, preſently ſhe cleaueth in ſunder. And in truth, the beſt & ſureſt means to cure the hurt, is to apply vnto the wound the very ſhrew it ſelfe that did the deed, if poſſibly ſhee may be had; and yet the reſt are very good: for which purpoſe they vſe to be kept in oile, or els to be dawbed ouer with clay, to ſerue in time of need: alſo the earth taken from a cart-rut where a wheele hath gon, is thought to be a proper remedie for the ſaid biting of a ſhrew, if it be applied thereto: for it is ſaid, that this creature is by nature ſo benummed or dull of mouing, that it will neuer go ouer a cart-tract.

As touching Scorpions, the lizard named Stellio (by way of a reciprocall counterchange) is
B the greateſt enemie they haue; inſomuch as at the very ſight only of the ſaid lizard, they wil be afrighted and aſtonied and fall into cold ſweats: and therefore people vſe to putrifie & reſolue Stelliona in oile, and therewith anoint the wounds that Scorpions haue made. Some there be who make a kind of plaiſtre of the ſaid oile and litharge of ſiluer boiled both together, wherewith they rub and anoint the grieued place. This lizard, which we name Stellio, the Greeks cal Colotes, Aſcalabotes, and Galeotes: * it breeds not in Italy: but call it what you will, & wherſoeuer it is to be found, full it is of little red ſpots like lentils; a ſhril noiſe it maketh, that pierceth the eares and goeth through ones head; it doth eat and graze like other beaſts, which be marks all contrary to our Stellions or ſtarre-lizards here in Italy. But to come againe vnto the pricke of ſcorpions: it is thought good to rub the ſame with the aſhes of hens dung, mixt with
C the liuer of a dragon: or to take a lizard that is burſten, and the ſame to apply vnto the affected place; or a mouſe likewiſe which is clouen in ſunder; alſo to lay to the ſore the very ſame ſcorpion that did the harm; or to eat him roſted: and laſt of all, to drinke it in two cyaths of pure wine of the grape. Moreouer, this proper qualitie haue ſcorpions alone by themſelues, That they neuer pricke the ball of ones hand, nor ſting at all vnleſſe they may touch ſome haire. Furthermore, take any little ſtone whatſoeuer, and apply that ſide which lay next the ground vnto the wound, it will eaſe the paine: likewiſe any ſhell or potſherd which lieth with ſome part of it couered with earth, if it be taken vp and laid vnto the ſore, with earth and all vpon it as it was found lying, is ſaid to heale the ſame perfectly: but in no wiſe they that haue the applying of it muſt looke behind them: they ought alſo to take heed and be very carefull that the Sun ſhine
D not vpon them when they are about this buſineſſe. Earth-worms or mads ſtamped and laid to, are very good to cure the biting of ſcorpions: and yet they ſerue beſides for many other remedies; in which regard they be ordinarily preſerued in hony.

For the ſting of Bees, Weſps, and Hornets; for the biting alſo of thoſe Horſeleeches called Bloudſuckers, the Howlat is counted a ſoueraigne remedie, by a certaine antipathy in nature: alſo whoſoeuer carry about them the bill of a Woodpecker or Hickway, ſhall neuer be anoied with any of the foreſaid vermin. The ſmalleſt kind of locuſts likewiſe, which are without wings and be called Attelabi, be aduerſe and contrarie vnto them all.

Ouer & beſides the Inſects aboue named, there be in ſome places certain piſmires alſo very venomous, which *Cicero* calleth Solpugæ: but they of Grenado in Spain, Salpugæ: howbeit few
E or none of them are to be found throughout all Italy. But what help is there for them and their poiſon? Surely the heart of a Reremouſe, otherwiſe called a bat, hath an operation which is aduerſe not only to them, but to all Ants beſides.

As for the flies named Cantharides, I haue ſhewed before how contrarie they be to the venom of the Salamander: and yet conſidering how hurtful they be themſelues, and a very poiſon to the bladder, cauſing intollerable pain if they be drunk down, much diſpute & queſtion there is among phyſitians, * how they ſhould be taken and vſed; for how venomous they be, it may appeare by the practiſe of a certaine Egyptian phyſitian, whom by occaſion that one *Coſſinus* a knight of Rome, a great fauorit of the Emperor *Nero*, was infected with the foule tettar called Lichene, the ſaid prince ſent for out of Egypt to cure of that diſeaſe: but he prepared ſuch a
F drink of Cantharides for his patient *Coſſinus*, that it quickly coſt him his life and brought him to his graue. Howbeit there is no doubt, but being applied outwardly they are not only harmleſſe, but alſo very good, eſpecially if they be incorporate in the juice of the blacke wilde Vine called Vva Taminia, and ſheeps ſuet or goats tallow. Moreouer, albeit well knowne it is that theſe Cantharides be venomous, yet thoſe Authors that write of them be not agreed and reſol-

* And yet *Matthiolus* vpon *Dioſc.* ſaith it is the *Terrantola* which is common in Tuſcan.

* Namely, whether they are to be vſed inwardly at all? whether with their wings, head & feet, or without them.

ued, in what part that venom lieth: for ſome there be who are of opinion, that their feet are poiſon; others thinke their miſchiefe is all in their head; and there be againe who deny both: but whereſoeuer the ſaid poiſon lieth, all conclude jointly vpon this point, that their wings be medicinable therefore, and do cure the ſame. As for the generation of theſe dangerous flies, they be ingendred of certaine little grubs or wormes; and moſt commonly vpon the ſpongeous bals which wee ſee to grow vpon the ſtalke or ſtem of the Eglantine: but ſurely the greateſt plenty of them breed in an Aſh tree. As for others that come of a white Roſe buſh, they are not ſo vehement in operation as the reſt: and of them all, thoſe worke moſt violently which are ſpotted and of diuers colours, ſtreaked with yellow lines ouerthwart their wings, and beſides are very plumpe and fat. The ſmaller ſort, which alſo are broad and hairy, are nothing ſo powerful and ſpeedy in their operation. But the worſt of all, and leaſt effectuall in phyſicke, be thoſe which are of one entire colour, and leane withall. Now for the manner of preparing and ordering of them for phyſical vſes; they would be gotten when Roſes be fully out: heaped vp together in one maſſe, and ſo beſtowed in an arthen pot not pitched, verniſhed or nealed, the mouth wherof is cloſe ſtopped with a linnen cloath: then are they to be hanged vp with the mouth of the ſaid pot downward ouer ſome vinegre boiling with ſalt, vntill ſuch time as by the fume or vapour thereof ſteeming through the ſaid linnen clout, they be choked and killed: and afterward they be layd vp and reſerued for vſe. Of a cauſticke and burning nature they are, inſomuch as they will raiſe bliſters, yea and leaue an eſchar vpon the exulcerat place.

Of the like force be the wormes Pityocampæ, breeding in pitch trees: ſo is the venomous flie or beetle called Bupreſtis: and after the ſame maner be they prepared as the Cantharides:

All the ſort of them in generall be moſt effectuall to kill the leproſie, and ilfauored tettars called Lichenes. Beſides, they haue the name to prouoke womens monethly termes, and vrine; which is the cauſe that *Hippocrates* preſcribed them to be vſed in a dropſie. To conclude with theſe Cantharides, I thinke it not amiſſe to note, That *Cato* ſyrnamed **Vticenſis*, was accuſed and endited for ſelling of poiſon; becauſe in the generall portſale of the kings goods, amongſt other moueables, he held Cantharides at threeſcore ſeſterces a pound, and made ſo much money of them.

* For that he killed himſelf at Vtica.

Chap. V.

¶ *Of the Oſtrich greace, and of a mad Dog: of Lizards, Geeſe, Doues, and Weaſils, with the medicines that they do yeeld.*

I Cannot chuſe but relate alſo by the way, vpon this occaſion miniſtred, that at the ſame time Oſtrich greaſe was ſold for * eighty Seſterces the pound: and in truth it is much better for any vſe it ſhall be put vnto, than gooſe greaſe.

* Some reade thirty.

As touching diuers ſorts of venomous hony I haue written already: but for to repreſſe the poiſon thereof, it is good to vſe other hony wherein a number of bees haue been forced to die: and ſuch hony ſo prepared and taken in wine, is a ſoueraign remedie for all thoſe accidents that may come by eating or ſurfeiting vpon fiſh.

For the biting of a mad dog take the aſhes of a dogs head burnt, and apply it to the ſore, it wil ſaue the Patient from that ſymptome of being afraid of water; which is incident to ſuch as be ſo bitten. [And now by occaſion of ſpeech know thus much once for all, That all things which are to be calcined require one and the ſame manner of burning, that is to ſay, within a new earthen pot neuer occupied before, well luted all ouer with ſtrong cley, and ſo ſet into an ouen or furnace vntill ſuch time as the contents be calcined.] The ſaid aſhes made of a Dogs head is ſingular good likewiſe to be drunke in the ſame caſe: wherfore ſome haue giuen counſell to eat alſo a dogs head. Others ſeeke after the wormes that breed in the carkaſſe of a dead dog, and hang the ſame faſt about the necke or arme of the party that is bitten: or els they lap within a cloath ſome of the menſtrual bloud of a woman, and put it vnder the cup or pots bottome out of which the patient drinketh. And there be ſome againe who burn the haires of the ſame mad dogs taile, and conueigh the aſhes handſomely in ſome tent of lint into the wound. Moreouer it is commonly ſaid, That as many as haue a Dogges head about them, no other Doggs will come neere to do them any harme. In like manner, if a man carry a dogs tongue in his Shooe vnder his great toe, there will no Dogges bay or barke at him. If hee haue

about

20030
copy 1

A about him a weazils taile,which hath beene let goe againe after it was cut away. There is to be found under the tongue of a mad dog, a certaine ſlimy and groſſe ſpittle, which being giuen in drinks to thoſe that are bitten,keep them from the feare of water;which ſymptome the Greeks call Hydrophobia: but the beſt and moſt ſoueraigne remedy of all other, is the liuer of the ſame dog that in his madneſſe bit any body,eaten raw,if poſſibly it may be;if not,yet ſodden or boiled any way;or elſe to cauſe the Patient for to ſup the broth that is made of the ſame dogs fleſh. There is a certaine little worme in dogs tongues, called by a Greeke name Lytta which if it be taken out when they be young whelpes, they will never after proue mad, nor loſe their appetite to meat. The ſame worme giuen to ſuch as are bitten with a mad dog,preſerueth them from beeing mad; but with this charge,that before they take the ſame,it muſt be carried three
B times about the fire. Alſo the braines of a Cocke,Capon, or Hen, is ſingular good againſt the biting of a mad dog: but if one haue eaten the ſame, the vertue thereof indureth but for that yeare onely,and no longer. It is commonly ſaid,that the creſt or combe of a Cocke well bruiſed and ſtamped,and ſo laid in manner of a cataplaſme to the place bitten, is very effectuall to cure it: as alſo the greaſe of a gooſe incorporate with honey. Furthermore,ſome there be who vſe to ſalt the fleſh of dogs which haue bin mad,and ſo keepe it to giue in meat vnto thoſe who chance to be bitten by others. There be,who take ſome young whelpes, male or female according to the ſex of dog or bitch that hath bitten any one, and preſently drowne them in water, cauſing the Patient to eat their liuers raw. The yellow or reddiſh doung of a cock or a hen,diſſolued in vineger,and applied to the ſore,is ſingular good. The aſhes alſo of an hardy ſhrewes
C taile;prouided alwaies,that the ſhrew were let go aliue,ſo ſoone as ſhe was curt-tailed. Moreouer,a piece of clay taken from a ſwallows neſt,made into a liniment with vineger: or the aſhes of young ſwallows newly hatched and burnt: the old skin alſo or ſlough which a ſnake vſeth to caſt off in the ſpring time,ſtamped with a male crab-fiſh,and with wine brought into a Cataplaſme,be all eſpeciall remedies for the biting of a mad dog. As for the skinne or ſpoile of a ſnake,if it be put alone in a chiſt,preſſe,or wardrobe,among cloaths,it will kil the moth. But to come again vnto a mad dog:his poiſon is ſo ſtrong,that whoſoeuer do but tread upon his vrine, eſpecially if they have any ſore or vlcer about them,they ſhall ſenſibly feele hurt therby. Now what remedy is there for ſuch? None better than the dung of a caple, well wet and tempered with vineger,and the ſame laid very hot within a fig to the foreſaid ſore. Theſe may ſeeme to
D ſome men ſtrange things & monſtrous;but leſſe will they wonder hereat, when they ſhall heare and conſider,that a ſtone which a * dog hath taken vp with his mouth and bitten,wil cauſe debate and diſſention in the company where it is:and yet this is held for a certain truth,inſomuch as it is growne into a common prouerbe and by-word,when we perceiue thoſe that dwel in one houſe together to be euermore jarring and at variance one with another,to ſay, You have a dog-bitten ſtone here among you. Againe,whoſoever maketh water in the ſame place where a dog hath newly piſſed,ſo as both vrines be mingled together,ſhall immediatly find a coldneſſe and aſtoniſhment in his loines,as folke ſay.

* For the manner of a dog is to bee angrie with the ſtone that is thrown at him, without regard of the party that flung it: whereupon grew the Prouerbe in Greeke, κύων εἰς λίθον ἐμεσεν κτῆνος.

That kinde of Lizard,which of ſome Greeks is called Seps,of others Chalidicum,hath a venomous tooth: howbeit, the ſame worme or ſerpent taken in drinke, cureth the bit which it
E ſelfe inflicted.

If wilde Weazils haue empoiſoned any body, let the patient take a large draught of the broth of an old Cocke,he ſhall finde it to bee a very ſoueraigne remedy therefore: but aboue all,it is moſt effectuall againſt the poiſon of the herbe Aconitum; hut then it muſt be given with a litle ſalt among.

Againſt the poiſon of venomous Tadſtoles and hurtfull Muſhromes, hens doung (I meane that part alone which is white) ſodden with * Hyſſope or honied wine,is ſingular good, for it repreſſeth and killeth the malice thereof. And the ſame otherwiſe keepeth downe ventoſities and ſtuffing of the ſtomacke,ready to choke one. Whereat I cannot chuſe but maruell much, conſidering that if any other liuing creatures do taſt never ſo little of the ſaid dung (but man
F or woman onely) they ſhall be exceedingly vexed with winde in the belly, and other grieuous wrings and torments.

* *In hyſopo decocta, aut mulſo*: ſome reade, *cũ œſypo decoctum in mulſo*. Boiled with tried greaſe of ſheeps wool, in honied wine.

The Sea-hare is knowne to be venomous;but gooſe bloud taken with an equall quantity of oile is a ſoueraign counterpoiſon for it. Of this bloud,incorporat with the beſt Terra Sigillata of the Iſland Lemnos,and the juice of the S. *Mary* thiſtle called Bedegnar, there be excellent

trochiſchs made weighing fiue drams apeece, which are vſually kept in a readineſſe for to bee drunke in three cyaths of water as a counterpoiſon and countercharme, againſt all venomous confections and divelliſh ſorceries: for which purpoſe ſerveth alſo a yong ſucking Weazill prepared in manner aforeſaid. The rennet in a lambs maw likewiſe, is paſſing good for any ſuch indirect means wrought by poiſon or witchcraft: like as the bloud of ducks and mallards bred in the realm of Pontus: and therefore their bloud is ordinarily kept dry in a thicke maſſe, and as need requireth is diſſolued and giuen in wine: but ſome think, that the bloud of the female duck is better than that of the mallard or drake. Semblably, the geſier of a ſtorke, and the rennet or read of a ſheep, is thought to be ſingular good for any poiſons whatſoeuer. The broth or decoction of Coleworts boiled with Rams mutton, hath a peculiar vertue againſt the Cantharides. Ewes milke alſo drunke warm, availeth much againſt all poiſons, vnleſſe it be the venomous flie Bupreſtis, or the deadly herb Aconitum. The dung of wild quoiſts or ſtockdoues taken in drink, hath a ſpeciall vertue to helpe thoſe that haue drunke quicke-ſiluer. Finally, the fleſh of the ordinary or common houſe weazill kept in ſalt, is a preſent counterpoiſon againſt all venome that goeth vnder the name of Toxicum, if one drinke of it the weight of two drams.

Chap. VI.

¶ *Medicines to bring haire againe in places that by ſome diſeaſe are bald: alſo to rid away nits: for to rectifie and keepe in order the Eye-lids, and the haire growing thereupon: for to cure the pearle in the Eye: and generally for all the accidents befalling to the Eyes: laſtly, for the impoſtumat kernels behind the eares.*

THe naked places in head or beard, are repleniſhed again with haire by a liniment made of the aſhes of ſheeps dung incorporat in Cyprin oile & hony: alſo with the aſhes of mules or mullets houſes, applied with oile of Myrtles. Our countryman and Latine writer *Varro* affirmeth moreouer, That the dung of mice (which he by a proper name calleth * Muſcerda) is a conuenient medicine for the ſaid infirmity and defect: he attributeth alſo the ſame operation to the heads of flies applied freſh to the bald place, if ſo be the ſame were before rubbed hard, and in ſome ſort fretted with a figtree leafe. Some vſe in this caſe the bloud of flies: others mingle their aſhes with the aſhes of paper vſed in old time, or els of nuts; with this proportion, that there be a third part only of the aſhes of flies to the reſt, and herewith for 10 daies together rub the bare places where the haire is gone. Some there be again, who temper and incorporat together the ſaid aſhes of flies with the juice of the Colewort and breſt-milk: others take nothing thereto but hony. Certes, a ſtrange thing it is of theſe flies, which are taken to be as ſenſeleſſe and witleſſe creatures, yea, and of as little capacity and vnderſtanding as any other whatſoeuer: and yet at the ſolemne games and plaies holden euery fifth yeare at Olympia, no ſooner is the bull ſacrificed there to the Idoll or god of Flies called * Myiodes, but a man ſhall ſee (a wonderfull thing to tell) infinit thouſands of flies depart out of that territory by flights, as it were thicke clouds. But to come again to the foreſaid infirmity of haire-ſhedding: the aſhes of the heads, tails, yea and the whole bodies of mice burnt, are very good to make it come again; eſpecially if the haire went off by occaſion of ſome venomous matter or poiſon: ſo are the aſhes of an vrchin or hedgehog medled with hony: or the skin therof burnt and applied with tar. As for the head alone of an vrchin conſumed into aſhes, it is thought ſo effectual for this purpoſe, that it will cauſe haire to grow again vpon a skar: but for the cure of the foreſaid defect of haire, called Alopecia, the places ought before the application of thoſe topicke medicines, to be wel prepared with the razour, and a ſinapiſme or rubificatiue made of muſtard-ſeed, vntill the place look red: howbeit, ſome chuſe rather to take vineger vnto it. Here note by the way, that whatſoeuer vertue we attribute vnto hedgehogs, the ſame is more effectuall in the porkeſpine. Moreouer, Lizards torrified yea and calcined as I haue ſhewed before, with the root of reeds or canes that be green and new drawn (which that it may burne the better with the Lizards, ought to be ſliced ſmall) yeeld aſhes, which being incorporat well in oile of myrtles, doe retaine the haire and keep it from ſhedding, if the place be annointed therwith: and the green lizards in this cure and operation be ſimply the beſt: but if you would haue this medicine to work more effectually, put thereto ſalt, Bears greaſe, and Onions ſtamped. Some there be, who in ten ſextars of old oile ſeeth ten greene Lizards, and therewith make a liniment, thinking it ſufficient therewith

to

*The Latines in old time after the ſame analogie called the dung of ſwine, *Sucerda*, of kine and oxen, *Bucerda*, like as the ordure of men, *Homerda*

* This Idoll of the Panims, I take to be called in the holy Scripture, *Beel-zebub*.

20030
copy 1

A to annoint the place once a moneth,and no oftener. The aſhes of vipers skins doth raiſe haire quickly againe and make it grow apace,where it was ſhed:ſo doth Hens dung that is freſh and new,if the place be plied with annointing. Take a rauens egge, and mix it with the dung aforeſaid in a veſſell of braſſe,and therewith rub and annoint the head (ſo that it were ſhauen before) it will cauſe the new haire to come vp blacke: but vntill this vnguent be dried vpon the head, the patient muſt hold oile in his mouth, for feare leſt the teeth alſo by this means turn blacke: and withall,this ought to be done in the ſhade or within houſe:and the foreſaid ointment not to be waſhed off in 4 daies ſpace. Others in this cure,vſe the bloud and brains of a rauen,together with ſome thick and deep coloured wine. Some boile a rauen throughly,vntill the fleſh be parted from the bones,and in the dead time of the night when euery body is found aſleepe, put
B him vp into ſome pot or veſſell of lead. There be again, who hauing prepared and rubified the skin with ſalnitre,do annoint the place where the haire is gone or groweth thin,with a liniment made of Cantharides and tar punned & incorporat together. Now foraſmuch as Cantharides be of a cauſtick quality and corroſiue,great heed would be taken that they doe not fret and eat into the skin over deep. Now when the place is thus prepared,and lightly exulcerat,they ordain to apply thereto a liniment made of mice heads and their galls, incorporat and wrought together with their dung,putting thereto Ellebore and Pepper.

The head many times is peſtered with nits;but for to rid them away, there is not a better thing than dogs greaſe. Some for this purpoſe make a diſh of meat with ſnakes, dreſſing and ordering them as eels and ſo eat them;or els they take their ſlough which they ſlip off in the
C ſpring time,and drinke the ſame.

Otherwhiles there be certaine branny ſcales called dandruffe,which ouer-ſpread the head:to cleanſe it from this ſcurfe and deformity,it were not amiſſe to annoint the head with ſheeps gal tempered with fullers * ſcouring clay,and let it remaine on the head vntill it be drie.

For the painfull head-ache,it is commonly thought,that the heads of naked ſnails(I meane thoſe that be found without ſhels,and are vnperfect yet and not fully made)plucked from their bodies are a ſingular remedy to be hung about the neck or tied to the head; with this charge, that there be taken forth of their heads firſt,a certain ſtony hard ſubſtance, which is made flat and broad like a thin grauell ſtone:and if the ſaid ſnails be but yong and ſmall,they vſe to ſtamp them, and in manner of a frontall apply them to the forehead. In like manner, the bones of a
D Vultures head,whether it be the common Geire,or that which the Greeks cal Ægypios, hanged about the neck or faſtned to the arms: alſo the brains of the ſaid foule tempered with the oile of Cedar-roſin,driueth away the head-ache,if either the head be throughly annointed, or the noſthrils within forth,therewith. The brains of a crow or of an owle,being ſodden and eaten wil do as much. Some think it good in this caſe,to lap the head and forehead with the feathers or plume pluckt from about the neck of a cocke, or with his creſted combe, but it muſt bee of ſuch a cock as hath bin cloſe ſhut vp as a priſoner and kept from meat and drinke a whole day and a night;but take this withall,the patient who is troubled with the head-ach, muſt faſt as long from all meat and drink. The aſhes of a rat or weazill applied to the forehead, eaſeth the pain,ſo doth a twig or ſtick taken from a puttocks neſt,laid under the pillow of the ſick perſon;
E yea and a liniment made of a mouſe skin burnt to aſhes,mixed with vineger,& ſo applied. Many do ſay,that the little hard bone in the head of ſnailes (ſuch eſpecially as are found betweene two cart-tracts) if it be put through the eare,and hanged thereto within a little box of Ivorie,or otherwiſe tied faſt and carried about one within a piece of a dogs skin,is a remedy for the head ach that never faileth,and may ſerue to do many good. If the head be hurt,or the crown crackt, lay to the wound a copweb with oile and vineger,and ſo let it lie,it will not lightly goe off vntill ſuch time as it be perfectly healed:this copweb is very good alſo to ſtaunch the bloud * of wounds in a Barbers ſhop. But ſay that the bloud guſh out of the head,and from the brain,what is to be done in that caſe? Surely there is not a better thing to ſtay the flux thereof, than to inſtill and drop thereupon the bloud of a gooſe or ducke,with the greaſe of the ſaid fouls,ſodden
F together with the oile of Roſes. And to returne once againe to the cure of the head-ach: Take a ſwallow feeding in a morning betimes,cut off his head (but let this bee done if poſſibly you can in the ful of the Moon)wrap it within a linnen cloth,and binde it to the head of the patient with the yarn that goeth to the ſelf edge or liſt of a piece of cloth:and yet ſome there be,who incorporat the ſaid head within white wax,and therewith annoint the forehead;and withall, baſt

* *Creta cimolia.* Tuckers earth.

* *Palearibus tenuiorum ſanguine ſiſtit.* Either when the barber would ſtop the orifice of a vaine after bloud letting: or when one that is newly wounded, craueth freſh bleeding to be dreſſed:or if his own raſor chance to go awry & ſhaue to the quicke, while he hath a man vnder his hand to trim.

dogs haire downe to a bend or peece of cloth, and faſten the ſame cloſe to the ſaid forehead.

Let vs come lower to the eielids: it is ſaid, that if one do eat the brains of a crow with meat, it will make the haire there to grow: ſo doth the tried greaſe of ſweatie wooll called Oeſypum, if the edges or brims of the eielids be annointed with it and myrrh hot, with a fine penſill. Many promiſe the ſame effect, if there be taken the aſhes of flies and mice dung, of each an equall portion; ſo as they both together amount to the weight of halfe a dram or denier Romane; adding thereto of Stibi or Antimonium * two ſix parts of a denier; ſo as they be all incorporat with Oeſypum aforeſaid, and therewith the eielids be annointed. Likewiſe young mice are imploied to the ſame purpoſe, being braied in a mortar with old wine to the conſiſtence of thoſe medicines which be called Acopa, and prepared to diſſolue laſſitudes. If any haires grow in the eie-lids vntowardly and be offenſiue to the eies, or otherwiſe, pluck them forth, and annoint the H place with the gall of an vrchin, they will neuer grow againe to trouble you: of the ſame operation and effect, is the humor or liquor that the egs of the Star-lizard called Stellio, doe yeeld from them: the aſhes of a Salamander: the gall of a green lizard, tempered with white wine and permitted in the Sun to thicken and dry vntill it haue gotten the conſiſtence of hony, lying all the while in ſome baſon or veſſell of braſſe: the aſhes of young ſwallows with the milky juice of the Tithymall: and laſt of all, the ſlime or froth that iſſueth from ſhel-ſnails.

* i. One whole ſcriptule or ſcruple.

To come nearer to the very eies; the fiery red ſpots or pearles appearing in the chryſtalline humor, which the Greeks cal Glaucomata, may be cured (as our Magitians ſay) with the brains of a yong whelp or puppie that is but 7 daies old; ſo as the Chyrurgian with his probe or inſtrument, do conuey the ſame gainly on the right ſide, if the right eye be amiſſe; and contrariwiſe on the left ſide, if the other eie be affected. And ſome of them affirme, that the freſh gall of a foule called Aſio will do as much: this Aſio, is of the biggeſt kind of owls, who haue certaine feathers pricking vp like ears. *Apollonius Pitanæus* was of opinion, that for to cure the cataract in the eie, the gall of a dog was better than that of the Hyæna, ſo that it were applied thereto with honey: and he was perſuaded, that the ſame would take away the white ſpots or pearles of the eie, called Albugines. It is a generall ſpeech, that to clarifie & quicken the eieſight that is dim and ouercaſt with a miſt or cloud, a collyrie or eieſalue made with the aſhes of mice heads and their tails, mixt with hony, is a ſingular medicine: but the ſame would bee much better in caſe the ſaid ſalve were made vp with the aſhes of heads and tails both, of dormice, or the wild field mice: or at leaſtwiſe with the brains or gall of an Ægle. The greaſe and aſhes of a rat burnt K and well incorporat in a mortar with the beſt Attick hony, is a ſoueraigne remedy for weeping and watery eies: ſo is Antimonium, otherwiſe called Stibi; but what it this, I meane to declare in my treatiſe of Minerals. The aſhes of a weazil is good for the cataract: ſo are the brains of a lizard or ſwallow: and if the ſame lizards & ſwallows be either braied in a morter or ſodden, and ſo applied to the forehead in manner of a liniment, they do repreſſe the violent rheume that taketh to the eies: which effect they worke either alone by themſelues, or els with fine floure of meale, or with Frankincenſe: and in this wiſe they help the eies and face * blaſted and bliſtered with ſun-burning. Moreouer, there is not of all others a better medicine to cleare the eie and to rid away all thick filmes and miſts that trouble the ſight, than to burn the ſaid lizards & ſwallows aliue, and with an eie-ſalue made of their aſhes and hony of Candy, to annoint them. The L ſlough or skin of an Aſpis, which ſhe likewiſe ſomtime caſteth, tempered with the own greaſe, mundifieth the eies of horſes and ſuch labouring beaſts, if they be annointed therewith. Alſo, there is not a more ſoueraigne thing in the world for to remoue the cataract, and diſpatch the miſts and cloudy films that dim the eies, than to burne and calcine a viper aliue in a new earthen pot neuer occupied before; putting thereto of the juice of fenell the meaſure of one cyath, and ſome corns or crums of Olibanum or frankincenſe: and this medicine is commonly called * Echion. Moreouer, There is a collyrie or ſpeciall eie-ſalue made of a viper ſuffered to putrifie in a pot of earth, ſo as the grubs or worms that come of the ſaid carrion be ſtamped and incorporat in Saffron. Some burn a viper with ſalt in an earthen pot; and they are of opinion, that whoſoeuer do lick the ſame ſalt, or let it melt at the tongues end, it clarifieth the eies: and that they M ſhall * keep the ſtomacke and all the body beſides in good temper, yea, and liue long by that meanes. They vſe to giue alſo of this ſalt vnto ſheepe when they are not well at eaſe, and it is thought to bevery wholſome for their health: yea, & it entereth into many antidotes & counterpoiſons deuiſed againſt the venome of ſerpents. Some there be who vſe to eat vipers ordinarily

* *Sicci ſolatia proſunt.* This, ſcorching & roughneſſe of the skin or face, is called by Phyſitians *Ephelis.*

* A stone would ſay, made of a viper.

* *Stomachi totiusque corporis temperiam, ſeruſque ætates, ex Dioſc.* ωφελησει γαστηρ

copy 1

A rily at their table, for to preſerue their eieſight. But for meat they prepare & order them in this wiſe: firſt, ſo ſoon as they haue killed a viper, they giue order to put ſalt into the mouth, vntill ſuch time as it hath ſucked out the venomous humor that lieth at the root of the teeth, and diſſolued or conſumed it: afterwards, when they haue cut away to the bredth of foure fingers from vnder the top of the head, and withall taken forth the intrails and garbage out of the belly, they ſeeth the reſt of the body in water, or oile, together with oile and dill ſeed: and this fleſh either they eat out of hand thus dreſſed, or els working it with ſome paſte, they reduce the ſame into troſches, that they may be preſerued for their vſe at ſundry times. As touching the broth that is made of this decoction, ouer & beſides that it is good in thoſe caſes before ſpecified, this quality it hath, namely, to rid and cleanſe both the head and all the body beſides of lice; yea, and to
B kill the itch that runnes aloft in the skin. The aſhes of a vipers head calcined, are by themſelues very effectuall without any thing els; but principally in clearing the ſight, if the eies be annointed therwith in ſome conuenient liquor: ſo is the greaſe alſo of the viper. As for their gal, I dare not be ſo bold as to approue that which others confidently haue aduiſed & preſcribed: becauſe (as I haue already ſhewed) the venome of ſerpents is nothing els but their gall. The greaſe of a ſnake mixed with verdegreece, healeth any part of the eye that is broken: but the ſlough or old skin which they caſt off in the ſpring, doth clarifie the eie-ſight, if the eies bee gently rubbed therewith. The gal of an Hulat likewiſe is highly commended for the white pearles, the cataracts and thick films which trouble the ſight: the fat alſo of the ſaid bird is as much praiſed for the clearing of the ſame. Moreouer, it is ſaid, that the gall of that * Eagle (which I ſaid hereto-
C fore, to proue and trie her yong birds, vſeth to force them for to looke directly vpon the Sunne) mingled with the beſt hony of Athens, ſerueth to annoint the eies, for the webs, filmes, & cataracts which trouble the eieſight. Of the ſame operation is the gall of a Vulture or Geire, incorporat with the juice of Porret and a little hony. The like vertue alſo there is in the gall of a cock or capon, for the pin and web, and for the pearle in the eie, if the ſame be diſſolued in water; yea and for the cataract, eſpecially if the ſaid Cock or Capon be all white. The dung likewiſe of cocks and capons, I mean that part only thereof which is ruddy and browne, they ſay, is ſingular good for thoſe that be pore-blind or ſhort ſighted, ſuch alſo as ſee not wel but about noon tide. They commend moreouer the gal of an hen (but the fat eſpecially) for the little bliſters or ſpots that otherwiſe ariſe in the apple of the eie: in regard of which vertue, many there bee that cram
D them fat, and for no cauſe els. But if there be put thereto the pouder of the red bloud-ſtone Hæmatites, and the yellow ſaffron-coloured Schiſtos, it is wonderfull how much better it will bee for that purpoſe; yea, and to heale the tunicles of the eies that be broken. Moreouer, Hennes dung, as much only of it I meane, as is white, many vſe to keep in old oile within certaine boxes of horne, for to cure the white pearles that grow in the apple of the eye. And ſince I am entered thus farre into the dung of Pullaine, I muſt aduertiſe you what is reported of Peacockes, That they doe eat and ſwallow downe againe the ſame dung which themſelues haue meuted for very enuie that they haue vnto mankind, knowing by a ſecret inſtinct of Nature how good it is for many vſes. Furthermore, it is an opinion commonly receiued, that all the race of Faul-
E cons, if they be boiled in oile Roſat, are ſoueraigne for any accidents of the eies whatſoeuer, if they be bathed with that decoction. Semblably, it is ſaid, that their dung reduced into aſhes and incorporat in the beſt hony of Athens, is very good therefore: as alſo the liuer of a Glede or Kite is much commended in thoſe caſes. Pigeons dung tempered in vineger, cureth the fiſtulaes which are between the lachrymall corners of the eies and the noſe: and otherwiſe is ſingular for the white pearls and the cicatrices or films growing in the eies. Gooſe dung and duckes bloud be both of them very ſoueraigne for to ſoake out the blacke bloud in the eies, occaſioned by ſome contuſion or bruiſe, with this regard, that they be afterwards annointed with * Hyſſope and Honey. The gall of a Partridge mixed with honey, of each a like weight, mightily cleareth the eieſight: ſo doth the gal of a fallow Deere applied ſimply alone, without any mixture or addition at all. But theſe galls ought to be kept in a ſiluer box, ſay they who ground vpon the au-
F thority of *Hippocrates* for their warrant. Partridge egs ſodden with honey in a braſen pan or poſnet, do cure the vlcers in the eies, and take away the red pearls ariſing in the blacke thereof. The bloud of Pigeons, Turtledoues, Stockdoues or Coiſts, & Partridges, is paſſing good for bloudſhotten eies. But they ſay, that the bloud of the cocke Pigeons is better for this purpoſe than that of the female. Now for to fit this cure, they muſt be let bloud in the vein vnder the wing or pinion,

* *Haliartos*, i. the ſea Ægle or Orfray.

* *Hyſſope*, vnleſſe we reade *Oeſypo*, which is the tried greaſe of vnwaſhed wool.

pinion, becauſe that bloud is hotter, and therefore by ſo much the better. But when the eies bee G
dreſſed with this bloud, it would not be forgotten, that there be a thin bolſter boiled in honey,
laid aloft, yea, and a lock of greaſie wooll vpon it, which had bin ſoaked either in oile or wine.
The bloud of the fouls abouenamed helpeth thoſe that cannot ſee toward a night: the liuer al-
ſo of a ſheep doth the ſame: but if the ſaid ſheep be of a ruſſet or browne colour, the medicine
will do the better: for as I obſerued before in Goats, thoſe that carry ſuch a coat, bee alwaies e-
ſteemed beſt. Many giue counſell to foment and waſh the eies with the decoction of the ſaid
liuer: and if they be in pain and ſwollen withall, they aduiſe to annoint them with the marrow
of a Mutton. They promiſe alſo, That the aſhes of ſcrich-owles eyes put into a collyrie, wil cla-
rifie the ſight. Indeed the dung of Turtles conſumeth the white pearles in the eyes; ſo doth the
aſhes of ſhell-ſnailes or hoddidods: as alſo the meuting of the keſtrell Cenchris, which the H
Greeke writers wil haue to be a kind of Hawke. As for the ſpot or pearle in the eie called Ar-
gema, it may be cured by all thoſe medicines aboue rehearſed, ſo that they be applied thereto
with hony. But the beſt hony ſimply for the eies, is that wherein a number of Bees were forced
to die. Whoſoeuer hath eaten a young ſtorke out of the neſt, he ſhall (they ſay) continue many
yeares together, and neuer be troubled with inflamed or bleared eies: like as they that carrie a-
bout them a Dragons head. It is ſaid moreouer, That the Dragons greaſe incorporat in honey
and old oile, diſpatcheth and ſcattereth the filmes and webs that trouble the ſight, if they bee
taken betimes before they be grown too thicke. Some there be who at the full of a Moone put
out the eies of yong ſwallowes, marking the time when they haue recouered their ſight againe:
for then they pluck off their heads and burne them to aſhes, which being tempered with hony, I
they vſe for to cleare their owne ſight, to eaſe the pains, and diſcuſſe the bleardneſſe of eies, yea
and to heale them, if they haue caught a blow or ruſh. As for Lizards, they vſe to prepare them
many and ſundry waies for the infirmities incident to the eies. Some take the green Lizard and
put her cloſe within a new earthen pot that neuer was occupied; and therewith 9 of thoſe little
*Becauſe they be found in the fiſh called Cinædi. ſtones which the Greeks call * Cinædia, (and theſe are vſually applied vnto the ſhare for the
ſwelling glandules and tumors that many times riſe there) marking euery one of them reſpe-
ctively by themſelues: which being done, they take forth of the pot euery day one; & when the
ninth day is come, they let out the Lizard, and then they keepe the ſaid ſtones thus ordered
and prepared, as ſoueraigne remedies to allay the pain and griefe of the eies. Others get a green
Lizard and put out her eies, and heſtow her in a glaſſe with a bed of earth vnder her in the bot- K
tome thereof, and withall, incloſe within the ſaid glaſſe certaine rings, either of ſolid yron or
maſſie gold: and ſo ſoon as they perceiue through the glaſſe, that the Lizard hath recouered her
ſight againe, they let her forth: but the ſaid rings they keep with great care and regard, as a ſpe-
ciall meanes for to helpe any bleared eies. There be moreouer who vſe the aſhes of a Lizards
head in ſtead of Stibium or Antimonium; for to make ſmooth the roughneſſe of the eye-lids.
Some hunt after green Lizards with long neckes, which breed in ſandy and gravelly grounds,
and when they be gotten, burne them to aſhes, with which they vſe to repreſſe the flux of wate-
riſh humors which begin to fall into the eies, yea, and therewith conſume the red pearls grow-
ing therein. It is ſaid moreouer, That if a Weaſels eies be pecked or plucked out of the head,
they will come againe, and ſhee will recouer her ſight: and therefore they practiſe the like with L
rings and them together, as I obſerued before in Lizards. Furthermore, it is ſaid, That as many
as carry about them the right eie of a ſerpent tied vnto any part, it is very good for to ſtay the
violent rheumes that haue taken to the eies, but then in any wiſe the ſerpent muſt be let goe a-
liue after that ſhe hath loſt her eie. As touching thoſe eies which be euermore weeping, and
do ſtand ful of water continually, the aſhes of the ſtar-lizards head called Stellio, together with
Antimonium, helpeth them exceeding much. The copweb which the common Spider ma-
keth, that vſeth to catch flies; but eſpecially that which ſhee hath wouen for her neſt or hole
wherein ſhe lieth her ſelfe, is ſoueraigne good for the flux of humours into the eyes, if the ſame
be applied all ouer the forehead, ſo as it meet with the temples on both ſides: but wot you
what, none muſt haue the doing hereof, either to get the ſaid copwebs, or to lay it vnto the M
place, but a young lad not as yet vndergrowne, nor foureteene yeares of age: neither muſt he be
ſeene of the partie whom hee cureth, in three daies after: ne yet during the ſpace of thoſe
three dayes muſt either hee or his Patient touch the ground with their bare feet: Which cir-
cumſtances and ceremonies being duely obſerued, it is wonderfull to ſee what a cure will

follow

20030
copy 1

A follow thereupon. Furthermore, it is ſaid, That theſe white ſpiders with the long and ſlender legs, being punned and incorporat in old oile, be ſingular for to conſume the white pearle in the eie, if the ſame be dreſſed with that compoſition. Alſo thoſe ſpiders that worke ordinarily vnder rooſes, rafters, and boorded floores of houſes, and weaue the thickeſt webs, if any of them be inwrapped within a piece of cloth and kept bound to the eies or forehead, do reſtraine for euer the ſaid rheumes and catarrhes that haue found a way to the eies. The greene Beetle hath a property naturally to quicken their ſight who do but behold them: and therefore theſe lapidaries and cutters or grauers in precious ſtones, if they may haue an eie of them once & looke vpon them, take no more care for their eie-ſight, how it ſhould ſerue their turnes when they are at their worke. Thus much of eies.

B As concerning the ears and the infirmities incident vn them, there is not a better thing to mundifie and cleanſe them than a ſheepes gall with hony: and a bitches milke if it be dropped into them, eaſeth their paine. Dogs greaſe tempered with Wormewood and old oile, helpeth thoſe that be hard of hearing, ſo doth Gooſe greaſe: howbeit, ſome put thereto the juice of an Onion & Garlick, of each a like quantity. In this caſe alſo there is much vſe of Ants egs alone without any thing els: for as little and ſilly a creature as it is, yet ſhe is not without ſome medicinable vertues: inſomuch, as Beares, when they feele themſelues ſickiſh or not well at eaſe, cure themſelues with eating Piſmires. As for the manner of preparing as well the greaſe of a gooſe as of all other fouls, this it is: firſt the fat ought to be clenſed and rid from all the skins, veines, and ſtrings that are among it, and then to be laid abroad to the Sun in an earthen pan, couered

C ouer with a new lid of earth likewiſe which had neuer bin vſed: this done, the foreſaid pan muſt be ſet ouer ſeething water, that the ſaid greaſe may melt: and then it is to paſſe through linnen bags that it may be tried from all the groſſe cratchens: and ſo they put it vp in a new earthen pot, & ſet it in ſome cold place againſt the time that it is to be vſed: howbeit, this is wel known, That if ſome hony be put therto, it is leſſe ſubject to corruption or putrifaction. Moreouer, the aſhes of burnt mice incorporat in hony, or els ſodden with oile of Roſes, allaieth the pain in the eares if it be inſtilled into them. But in caſe ſome earwig or ſuch like vermine be crept into the ears, there is not the like means to cauſe it to come forth again, as is the gall of mice diſſolued in vineger & dropped into them. Alſo when water is gotten into the head by the eares, Gooſe greaſe, together with the juice of an Onion, is ſingular good to draw it out. Moreouer, there is a

D notable medicine made of dormice for all infirmities of the ears, which otherwiſe could not be cured, but were giuen ouer by all Phyſitians: for the making whereof, they take a dormouſe and flea it, and after the guts and entrails be taken forth, they ſeeth the ſame with hony in a new earthen veſſell. Howbeit, ſome Phyſitians there bee who thinke it better to boile the ſame with Spikenard, vntill a third part be conſumed, and ſo reſerue it for their vſe: and whenſoeuer after there is need of it, the manner is to infuſe the ſaid liquour warme into the eare by a pipe or inſtrument called an Otenchyte. This is knowne by experience to heale all the accidents of the ears, though otherwiſe incurable. Alſo the decoction of earth worms boiled with Gooſe greaſe is ſingular good likewiſe to be poured into the ears. But if the ears be exulcerat, broken out, and do run matter, the red worms ingendred about trees ſtamped in a morter with oile, are very pro-

E per to heale the ſame, if they be applied therto. Lizards that haue hanged vp a long time a drying with their mouths downward, if they be punned with ſalt, ſerue to heale the eares that haue caught ſome hurt either by bruiſe, cruſh, or ſtripe. But aboue all other, the Lizards that haue brown ſpots vpon them like ruſty yron, and are ſtraked along the taile with lines, are moſt effectual for theſe infirmities. As touching the Wool beads or Caterpillers, which ſome cal Milleped æ, others, Multiped æ or Centiped æ, which are a kind of earth-wormes keeping vpon the ground, all hairy, hauing many feet, & courbing arch wiſe as they creep; and if you touch them, they wil gather round together: the Greekes, ſome call them * Oniſcos, others Tylos: theſe *worms (I ſay) are very effectual to aſſuage the pain of the ears, if they be ſodden with the juice of Porret in the rind of a pomgranat: ſome put therto oile of Roſes, & giue aduiſe to poure this

F medicine into the contrary eare that is not pained. As for that worm or vermin which riſeth not archwiſe with ſome part of the body in creeping, the Greeks, ſome cal it Seps, others Scolopendra; which though it be leſſe than the former deſcribed, yet miſchievous enough & venomous; The ſnails that carry ſhels vpon their backe, and are vſually dreſſed for good meat, applied with Myrrhe or the pouder of Frankincenſe, are very good for the eares that be crackt: ſo are the little

* *Pliny* confoundeth *Oniſcos* (which wee call a Sow or Wood-louſe) with the Caterpiller or wooll-bead Milleped æ.

* Indeed our Sows or wood-lice, called otherwiſe Porcelliones, and Multiped æ, but not Milleped æ, & which if one touch them, draw themſelues round, are good for the pain of the ears: but not the foreſaid Wooll beads or Caterpillers Milleped æ, which in their creeping riſe and fall, &c.

tle and broad ſnailes brought into the forme of a liniment with hony, and laid too accordingly. The ſloughs or skins that ſerpents caſt, calcined upon a tile or potſhard red hot, and ſo reduced into aſhes and incorporat with hony, are very medicinable for all the accidents of the eares, if the ſame be dropped into them; but principally when they ſtink or yeeld from them a ſtrong ſavour: but if they be full of purulent matter, and run withall, it were better to mingle the ſame with vineger in ſtead of hony: but beſt of all with the gall of a Goat, a Bœufe, or a ſea-Tortois. The foreſaid ſloughs or skins if they be above one yere old, or have caught much wet by raine and water, haue loſt their vertue, & do no good, as ſome are of opinion. Moreover, the bloudie humour that commeth from a ſpider, either tempered with the oile of Roſes, or els alone by it ſelfe vpon a locke of wooll, or with a little Saffron, is very good for the eares: ſo is the Cricket digged vp and applied to the place earth and all where it lay. *Nigidius* attributeth many properties to this poore creature, and eſteemeth it not a little: but the Magitians much more a fair deale: and why ſo? Forſooth becauſe it goeth as it were reculing backward, it pierceth and boreth an hole into the ground, and neuer ceaſeth all night long to creake very ſhrill. The manner of hunting and catching them is this, They take a flie and tie it about the midſt at the end of a long haire of ones head, and ſo put the ſaid flie into the mouth of the Crickets hole: but firſt they blow the duſt away with their mouth, for feare leſt the flie ſhould hold her ſelfe therein: the Cricket ſpies the ſilly flie, ſeaſeth vpon her preſently and claſpeth her round, and ſo they are both drawne forth together by the ſaid haire. The inner skin of a Hens giſier, which the cook vſeth to caſt away, if it be kept and dried, and ſo beaten to pouder and mingled with wine, is good to be dropped or poured hot into the eares that runne with matter: ſo is the fat alſo of an Hen. There is a certaine kind of fattineſſe to be found in the flie or inſect called * Blatta, when the head is plucked off, which if it be punned & mixed with oile of Roſes, is (as they ſay) wonderfull good for the eares: but the wooll wherein this medicine is inwrapped, and which is put into the eares, muſt not long tarry there, but within a little while be drawne forth againe; for the ſaid fat will very ſoone get life and proue a grub or little worm. Some writers there be who affirm, That two or three of theſe flies called Blattæ ſodden in oile, make a ſoueraigne medicine to cure the eares: and that if they be ſtamped and ſpread upon a linnen rag and ſo applied, they will heale the eares, if they be hurt by any bruiſe or contuſion: Certes this is but a naſtie and ill favoured vermine, howbeit in regard of the manifold and admirable properties which naturally it hath, as alſo of the induſtrie of our Anceſtors in ſearching out the nature of it, I am moved to write thereof at large and to the full in this place. For they have deſcribed many kindes of them. In the firſt place, ſome of them be ſoft and tender, which being ſodden in oile, they haue proued by experience to be of great efficacie in fetching off werts, if they bee annointed therewith. A ſecond ſort there is, which they call Mylœcon, becauſe ordinarily it haunteth about mils and bake-houſes; and there breedeth: theſe, by the report of *Muſa* and *Pyction* two famous Phyſitians, being bruiſed (after their heads were gone) and applied to a body infected with the leproſie, cured the ſame perfectly. They of a third kind, beſides that they be otherwiſe ill favoured enough, carry a lothſome and odious ſmell with them: they are ſharp rumped and pin buttockt alſo: howbeit, being incorporate with the oile of pitch called Piſſelæon, they haue healed thoſe vlcers which were thought, *Nunquam ſana*, and incurable. Alſo within 21. daies after this plaſtre laid too, it hath been knowne to cure the ſwelling wens called the Kings evill: the botches or biles named Pani, wounds, contuſions, bruiſes, morimals, ſcabs, and fellons: but then their feet and wings were plucked off and caſt away. I make no doubt or queſtion, but that ſome of vs are ſo dainty and fine eared, that our ſtomacke riſeth at the hearing onely of ſuch medicines: and yet I aſſure you, *Diodorus* a renowned Phyſitian, reporteth, That he hath giuen theſe foure flies inwardly with roſin and hony, for the jaundiſe, and to thoſe that were ſo ſtrait winded that they could not draw their breath but ſitting vpright. See what libertie and power ouer vs theſe Phyſitians haue, who to practiſe and trie concluſions vpon our bodies, may exhibite vnto their Patients what they liſt, bee it neuer ſo homely, ſo it goe vnder the name of a medicine. Howbeit, ſome of the more ciuile ſort, and who carried with them a better regard of man-hood and humanitie, thought it better and a more cleanely kinde of Phyſicke, to reſerue in boxes of horne the aſhes of them burnt, for the vſes aboue named. Others alſo would beat them (after they were dried) into pouder, and miniſter them in manner of a clyſtre unto thoſe that were * Orthopnoicke and Rheumaticke.

* which *Pliny* taketh for a kind of *Scarabæus* or Beetle.

* *Orthopnoici*: Such as cãnot take their wind but ſitting vpright.

Certes,

20030
copy 1

A Certes it is well knowne and confeſſed, that a liniment made of them will draw forth prickes, thorns, ſpils, and whatſoeuer ſticketh faſt within the fleſh. Moreouer, the honey wherein Bees were extinct and killed, is ſoueraigne for the diſeaſes of the eares. As for the impoſtumes and ſwellings ariſing behinde the eares, called Pacotides, Pigeons dung applied thereunto, either alone by it ſelfe, or with barly meale and oatmeale, driueth them backe or keepeth them down. Alſo the liuer or brains of an Owle being reſolued in ſome conuenient liquor, and applied accordingly, cureth the accidents of the lap of the eare, and the foreſaid impoſtumations, ſo doth a liniment made of the wormes called Sowes, together with the third part of roſin: and laſtly, the cricquets aboue rehearſed, either reduced into a liniment, or elſe bound to, whole as they be, are good in theſe caſes. Thus much concerning thoſe maladies aboue ſpecified: it remaineth
B now to proceed vnto other diſeaſes, and the medicinable receits reſpectiue vnto them, drawne either from the ſame creatures, or els from others of that kinde: whereof I purpoſe to treat and diſcourſe in the next booke enſuing.

C

THE THIRTIETH BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

D

The Proem.

CHAP. I.

¶ *The originall and beginning of Art Magicke. When it firſt began, and who were the Inventors of it. By whom it was practiſed and aduanced. Alſo other Receits or medicines drawne from Beaſts.*

E THE folly and vanitie of Art Magicke I haue oftentimes already taxed and confuted ſufficiently in my former books, when and whereſoeuer iuſt occaſion and fit opportunitie was offered; and ſtill my purpoſe and intention is to diſcouer and lay open the abuſe thereof in ſome few points behind. And yet I muſt needs ſay the argument is ſuch as deſerueth a large and ample diſcourſe, if there were but this only to enduce me, That notwithſtanding it be of all arts fulleſt of fraud, deceit, and couſenage, yet neuer was there any throughout the whole world either with like credit profeſſed, or ſo long time vpheld & maintained. Now if a man conſider the thing well, no marnell it is that it hath continued thus in ſo great requeſt and authoritie: for it is the onely Science which ſeemeth to compriſe in it ſelfe three profeſſions beſides, which haue the command and rule of mans minde aboue any other whatſoeuer. For to begin withall, no man doubteth but that Magicke tooke root firſt and proceeded from phyſicke, vnder the pretence of main-
F taining health, curing and preuenting diſeaſes: things plauſible to the world crept and inſinuated farther into the heart of man, with a deepe conceit of ſome high and diuine matter therein more than ordinarie, and in compariſon thereof all other phyſicke was but baſely accounted. And hauing thus made way and entrance, the better to fortifie it ſelfe, and to giue a goodly colour and luſtre to thoſe faire and flattering promiſes of things, which our nature is moſt

giuen

giuen to hearken after, on goeth the habit also & cloke of religion: a point I may tel you that G
euen in these days holdeth captiuate the spirit of man, and draweth away with it a greater part
of the world, and nothing so much. But not content with this successe and good proceeding, to
gather more strength and win a greater name, she intermingled with medicinable receits & Re-
ligious ceremonies, the skill of Astrologie and arts Mathematical; presuming vpon this, That
all men by nature are very curious and desirous to know their future fortunes, and what shal be-
tide them hereafter, perswading themselues, that all such foreknowledge depends on the course
and influence of the starres, which giue the truest and most certain light of things to come. Being
thus wholly possessed of men, and hauing their sences and vnderstanding by this meanes fast e-
nough bound with three sure chaines, no maruell if this art grew in processe of time to such an
head, that it was and is at this day reputed by most nations of the earth, for the paragon & chief H
of al sciences: insomuch as the mighty kings and monarchs of the Levant are altogether ruled
thereby. And verily there is no question at all, but that in those East parts, and namely in the
realme of Persia, it found first footing, and was inuented and practised there by * *Zoroastres*, as
all writers in one accord agree. But whether there was but that one *Zoroastres*, or more afterward
of that name, it is not yet so certainly resolued vpon by all Aurhors: for *Eudoxus* (who held art
Magicke to be of all professions philosophicall and learned disciplines, the most excellent and
profitable science) hath recorded, that this *Zoroastres*, to whom is ascribed the inuention therof,
liued and flourished * 6000 yeares before the death of *Plato*. And of his minde is *Aristotle* also.
Howbeit *Hermippus*, who rot of that art most exquisitely, and commented vpon the Poëme of
Zoroastres, containing * a hundred thousand verses twenty times told, of his making; and made I
besides a Repertorie or Index to euery booke of the said Poësie: this *Hermippus* (I say) reports,
That one *Azonaces* taught *Zoroastres* Art Magick; which master of his liued 5000 yeres before
the war of Troy. Certes I cannot chuse but maruell much, first, That this Science and the me-
moriall thereof should so long continue, and the Commentaries treating of it not miscary and
be lost all the while, during such a world of years: considering besides, that neither it was ordi-
narily practised and continued by tradition from age to age; nor the successors in that facul-
tie were professors of the greatest name, and renowned by any writings. For what one is there
thinke you among so many thousands, that hath any knowledge, so much as by bare heare-say,
of those who are named for the only Magitians in their time, to wit, *Apuscorus* & *Zaratus* Medi-
ans, *Marmaridius* of Babylon, *Hippocus* the Arabian, and *Zarmocenidas* of Assyria. For bookes K
haue we none extant of their writing, nor any monuments which beare record and giue testimo-
nie of such clerks. But the greatest wonder of all is this, that *Homer* the Poet in his Ilias (a poem
composed purposedly of the Trojan war) hath not so much as one word of Magick; and yet in
his Odyssæa, where he discourseth of the aduentures, trauels, & fortunes of prince *Vlysses*, such
a do and stirre there is with it, as if the whole work consisted of nothing else but magicke. For
what is meant by the variable transformations of * *Proteus*, or by the songs of the * Meremaids,
whereof he writeth so much; but that the one was a great sorcerer, the other famous witches or
Inchantresses. As for that which he relateth of lady *Circe*, how shee wrought her feats by conju-
ration only, and raising vp infernal spirits; surely it sauoreth of art Magick and nothing else. I
muse much also, that after *Homers* time there is no writer maketh mention how this art arriued L
at Telmessus, a city [in the marches of Lycia] wholly addicted to religion, & so famous for the
colledge of priests and soothsayers there: or at what time it made a voiage and passed ouer into
Thessaly; where it reigned so rife, and was so vsually practised in euery towne & city, that with
vs here in these parts of the world it tooke the denomination of * that countrey, and retained
the same a long time, notwithstanding that the word Magicke indeed was appropriate vnto a
strange and far remote Nation. And verily, considering how about the time of the war and de-
struction of Troy, there was no other phy sick in vse but that which *Chiron* the Surgeon practi-
sed, and that during the heat and bloudy wars only; it seemeth very strange and wonderfull to
me, That the nation of Thessaly, and the natiue country of *Achilles* [and *Chiron*] should become
so famous for magick: insomuch as *Menander* also (a Poet by all mens iudgement so framed by M
nature for deep learning and excellent literature, as that he had no concurrent in his time that
came neere vnto him) entituled one of his Comœdies, Thessalica; wherein he deciphered and
depainted liuely vnto vs the whole order and manner of witches, with all their charmes and in-
cantations, by the vertue wherof they would seem to pull the Moon down from heauen. I would
haue

* K. of the Bistrians, which some take to be *Abraham*.

* It seems that in thi calculation of yeares, *Pliny* mistakes the number: for *Plutarch* saith hee liued 600 yeres before the Trojan war, or els that hee means *Lunares annos*.

* *Vicies centũ, millia versum, i*, two millions of verses.

* *Diodorus Siculus* saith that this was meerly a fiction, arising herupon, That *Proteus* being a king of Egypt, according to the custome of the Egiptian kings for greater maiesty and state, shewed himself abroad adorned with the ensigns, representing a Bull, Dragon, Lion, tree, fire, and such like: altering eftsoones those ornaments, which contained some hierogliphy call mysteries appropriat to the person of a King.

* Three daughters of *Achelous* & *Calliope* whose names were *Parthenope*, *Ligia*, and *Leucosia*, reputed witches, & able to doe great matters by charmes.

* For properly the *Magi* were the wise men of Persia, and yet at Rome they vsually termed Magitians by the name of Thessalians.

copy 1

A haue thought that *Orpheus* ſoon after and in the age next inſuing, had brought in firſt theſe ſuperſtitious ceremonies, by reaſon of the propinquity and neighborhood of that region, and that he proceeded therewith to the aduancement of phyſick, but for one thing which plucketh me back; namely, that Thrace his naturall country and the place of his birth, was altogether ignorant of Magick, and knew not what it meant. But as far as euer I could finde, the firſt that is recorded to haue commented and written of this art, was *Oſthanes*, who accompanied *Xerxes* K. of the Perſians, in that voiage and expedition which (in warlike manner) he made into Greece: and to ſay a truth, he it was that ſowed the ſeeds of this monſtrous Art, and infected therewith by the way, all parts of the world whereſoeuer he went and came. Howbeit, thoſe Authors, and hiſtoriographers who haue ſearched more neerly into the matter, ſet down another *Zoroaſtres*, born
B in the Iſle Proconneſus, who wrote ſomewhat before *Oſthanes*, of that argument: neuertheleſſe, this is held for certain, That *Oſthanes* was the man, who moſt of all other ſet the Greeke nations not onely in a hot deſire, but alſo in a madding fit and inraged as it were after Magick. And yet I muſt needs ſay that I haue obſerued, that not only at firſt, but alſo from time to time, the greateſt name that went of learned men and great philoſophers, for their ſingular skil and profound knowledge, aroſe from the opinion that was of their inſight in this Science. Certain it is, that *Pythagoras*, *Empedocles*, *Democritus*, and *Plato*, were ſo far in loue therewith, that for to attaine the knowledge thereof, they vndertooke many voiages and journies ouer ſea and land, as exiled and baniſhed perſons, wandring from place to place, more like trauellers than ſtudents; and beeing returned againe into their owne countries, this Art they blazed abroad and highly praiſed; this
C they held as a ſecret and diuine myſterie. As for *Democritus*, he raiſed a great name of *Apollonices Captidenes*, and *Dardanus* of Phœnicia, as well by the Books of *Dardanus* his maſter (which he fetched from out of his ſepulchre where they were beſtowed) as alſo by publiſhing commentaries of his owne, which were extracts and draughts out of thoſe authors and their writings; which afterwards, receiued and learned by others, ſo paſſed from hand to hand, and were ſo deeply ingrauen and imprinted in the minds and memories of men, that I aſſure you I wonder at nothing in the world ſo much; for ſo full they are of lyes, & ſo little or no truth, godlineſſe, and honeſty is contained in them, that men of iudgement and vnderſtanding who approue and eſteem his other Books of Philoſophie, will not beleeve that theſe workes were of *Democritus* his making: howbeit, this is but a vaine conceit and perſuaſion of theirs; for well it is knowne &
D confeſſed, that *Democritus* led away an infinite number of people by this means, & no man ſo much; filling their heads with many faire promiſes, and the ſweet impreſſion thereof rauiſhed their ſprits after this Art. Moreouer, there is yet one point more, whereat I wonder as much as at any other; to wit, that theſe two profeſſions (Phyſicke I mean and Magick) flouriſhed both together in one age, and ſhewed themſelues in their greateſt glory; which was about the Peloponneſiack war in Greece, 300 yeares after the foundation of our citie of Rome; at what time as *Hippocrates* profeſſed the one, and *Democritus* for his part publiſhed the other. Now there is another faction (as it were) of Magitians, which tooke the firſt foundation from *Moſes*, * *Iamnes*, and *Iotapes*, Iewes; but many thouſands of yeares after *Zoroaſtres*: and yet the * Cyprian Magicke is later than ſo by as many yeres. But to come againe vnto our Magicke abouesaid: there was a ſecond
E *Oſthanes* in the daies of K. *Alexander* the Great, who (by reaſon that he attended vpon him in his train, during his journies and voiages that he made) was himſelf in great reputation abroad, and by meanes thereof gaue no ſmall credit and authoritie to his profeſſion; for that hee had opportunity thereby (as no man need to doubt) to trauell and compaſſe the globe of the earth, and ſo to ſpread and divulge this learning in all parts. And verily, that this doctrine hath bin heretofore receiued in ſome nations of Italy, it appeareth as well by good euidences and records extant at this day in the body of our Law written in the 12 Tables, as by other arguments and teſtimonies which I haue alledged in the former Booke. Certes, in the 657 yeare after the foundation of Rome citie, and not before (which fell out to be when *Cn. Cornelius Lepidus* and *P. Licinius Craſſus* were Conſuls) there paſſed a decree and act of the Senat, forbidding expreſſely the
F killing of mankinde for ſacrifice: whereby we may euidently ſee, that vntill this inhibition or reſtraint came forth, our progenitors and anceſtours were giuen to thoſe inhumane and monſtrous ſacrifices. No queſtion there is verily, but that this Art of Magicke was profeſſed in France, and continued vntill our daies: for no longer is it agoe than ſince the time of *Tiberius Cæſar*, that their Druidæ (the Prieſts and Wiſemen of France) were by his authority put down,

* It ſhould ſeeme that theſe were the Magicians of *Pharao*, of whom S. *Paul* 2. *Tim.* 3. *chap.* maketh mention, who would haue counterfeited the miracles wrought by *Moſes*: where note, that *Pliny*, ignorant in the holy Scriptures, and void of true religion, rangeth *Moſes* the prophet and faithfull ſeruant of almighty God, with ſuch ſorcerers and enchaunters. For the Painims, wanting the light of the goſpell, attributed all effects and operations aboue nature, to Magick: & were not able to diſtinguiſh between miracles done by the finger of God or his miniſters, and the illuſions practiſed by the diuell and his lims.

* Some interpret this to be meant of Chriſtianity, which was receiued with the firſt in Cypros by the preaching of the Goſpell, and as it is thought, by S. *Barnabas*: for that during the infancie of the primitiue Church, many miracles were wrought by the Apoſtles and Diſciples of our Sauiour Ieſus Chriſt, the heathen hold that Religion of Chriſtians to be a kind of Magicke. Other vnderſtand this place of the Prieſt of *Cyprian Venus* called *Cynaretans*.

together with all the pack of ſuch Phyſitians, prophets, & wizards. But what ſhould I diſcourſe any longer in this wiſe, of that Art which hath paſſed ouer the wide ocean alſo, & gone as far as any land is to be ſeene, even to the vtmoſt bounds of the earth; and beyond which, there is nothing to be diſcouered but a vaſt proſpect of Aire and Water. And verily in Brittaine at this day it is highly honored, where the people are ſo wholly deuoted vnto it, with all reuerence and religious obſeruation of ceremonies that a man would think, the Perſians firſt learned all their Magick from * them. See how this Art and the practiſe thereof is ſpread ouer the face of the whole earth! and how * thoſe nations were conformable enough to the reſt of the world in giuing entertainment thereto, who in all other reſpects are far different & diuided from them, yea and in manner altogether vnknowne to them. In which regard, the benefit is ineſtimable that the world hath receiued by the great prouidence of our Romanes, who haue aboliſhed theſe monſtrous and abhominable Arts, which vnder the ſhew of religion, murdred men for ſacrifices to pleaſe the gods; and vnder the colour of Phyſicke, preſcribed the fleſh to bee eaten as moſt wholſome meat.

* As it appeareth by our old Engliſh Chronicles, which write of K. *Arthur*, the knights of the round table, and *Merlin* the prophet or magitian.

* No doubt hee meaneth England, Scotland, & Ireland, which ſeemed to be ſeperat from the reſt of the world; where, in old time Magicke bare a great ſway, and witches ſtill ſwarm too much.

Chap. II.

¶ *The ſundry kinds of Magicke. The execrable acts of Nero: and the deteſtation of Magitians.*

MAgicke may be practiſed after diuers ſorts, according as *Oſthanes* hath ſet downe in writing: for it worketh by the means of (1) Water, (2) Globes or Balls, (3) Aire, (4) Starres, (5) Fire-lights, (6) Baſons, and (7) Axes: yea, and many other means there bee, that promiſe the foreknowledge of things to come: beſides the raiſing vp and conjuring of ghoſts departed, the conference alſo with Familiars and ſpirits infernall. And all theſe were found out in our daies, to be no better than vanities & falſe illuſions, and that by the Emperor *Nero*: and yet was he neuer more addicted to play vpon the cythern, nor took greater pleaſure to hear & ſing tragicall ſongs, than to ſtudy art Magick: and no maruell if he were giuen to ſuch ſtrange courſes, hauing wealth & world at wil; and his fortunes beſides attended vpon & accompanied with many deep corruptions of the mind. But amid thoſe manifold vices whereunto he had betaken and ſold himſelfe, a principall deſire he had, to haue the gods (forſooth) and familiar ſpirits at his command; thinking that if he could haue attained once to that, hee had then climbed vp to the higheſt point and pitch of magnanimity. Neuer was there man that ſtudied harder, and followed any Art more earneſtly, than he did Magick. Riches he had enough vnder his hands, and power he wanted not to execute what he would; his wit was quicke and pregnant, to apprehend and learn any thing, ouer and beſides other means that he practiſed to bring about this deſſeine of his, which were ſo intollerable, that the world could not indure them: and yet he gaue it ouer in the end without effect: an vndoubted & peremptory argument to conuince the vanity of this Art, when ſuch an one as *Nero* rejected it. But would to God he had conferred with familiars & ſpirits, yea & taken counſel of all the diuels in hell, for to be reſolued of thoſe ſuſpitions which were gotten into his head, rather than giuen commiſſion as he did to the profeſſed bawds and common harlots in ſtinking ſtewes and brothell houſes, for to make inquiſition from houſe to houſe after thoſe whom he had in jealouſie. Certes, no bloudy and deteſtable ſacrifices (how inhumane and barbarous ſoeuer) he could haue performed, but they had beene far more eaſie and tollerable, than thoſe cruel imaginations which he conceiued, and wherupon he murdered moſt piteouſly ſo many good citizens, & filled Rome with their reſtleſſe ghoſts. But to return again to Art Magick, which *Nero* would ſo fain haue learned: what might be the reaſon that he could not reach vnto it? Surely theſe Magitians are not without their ſhifts & meanes of euaſion to ſaue the credit of their art, if haply they miſſe and come ſhort at any time of their purpoſe: for otherwhiles they beare vs in hand, that ghoſts and ſpirits will not appeare, nor yeeld any ſeruice to thoſe perſons who are * freckled & full of pimples: and haply * *Nero* the Emperor was ſuch an one. As for his lims otherwiſe, he had them all, & ſound they were: beſides, the ſet daies and times fit for this practiſe, and preſcribed by Magitians, he might chuſe at his good will & pleaſure. Moreouer, an eaſie matter it was for him to meet with ſheep, cole black, & ſuch as had not a ſpeck of white or any other colour; for him (I ſay) who when he liſt could ſacrifice men, and took greateſt delight in thoſe ſacrifices: furthermore, he had about him *Tyridates*, the K. of Armenia, a great Magitian, to giue him inſtructions. This prince *Tyridates* being vanquiſhed and ſubdued

A dued by the Romane captains vnder *Nero*, and forced by their capitulations to preſent himſelfe perſonally at Rome for to do homage vnto the Emperour; trauelled thither all the way by land (which was a ſore charge to the countries & prouinces through which he paſſed, bringing with him as he did the whole pompe and train for the triumph ouer Armenia and himſelfe) & came vnto *Cæſar*. And why would not this *Tyridates* paſſe the ſeas and ſaile ouer into Italy, the neareſt and moſt expedit way? Forſooth, ſo preciſe he was, that he made a ſcruple, and thought it vnlawful (as all magicians do) either to ſpit into the ſea, or otherwiſe to diſcharge into it the neceſſary excrements that paſſe from mans body, therby to pollute and defile that Element. Many other magicians he brought with him in his traine. He inſtructed *Nero* in the principles of Magick, yea and admitted him to their ſacred feaſts, and ſolemne ſuppers, and all to enter him into that
C profeſſion: but it would not be: for albeit *Nero* enthronized and enſtalled *Tyridates* in his kingdome, and gaue him his roialties againe, all would not ſerue; for neuer could he receiue at his hands by way of remuneration and recompence, the skill of this Science. And therfore we may be fully aſſured and boldly conclude, That it is a deteſtable and abhominable Art, grounded on no certaine rules; full of lies and vanities, howſoeuer it carry ſome ſhew or ſhadow rather of veritie: and to ſay a truth, that certitude which it hath in effecting any thing, proceedeth rather from the diuelliſh caſt of poiſoning practiſed therwith, than from the Art it ſelfe of Magicke. But what needs any man to ſeek & hearken after the lies which the magitians in old time haue let flie and ſent abroad? When I my ſelfe in my youth haue ſeen and heard *Apion* (that great and famous Grammarian) tell ſtrange tales of the herbe Cynocephalia, which the Ægyptians call
C Oſyrites, and namely that it hath a diuine and heauenly vertue, and was a ſingular preſeruatiue againſt all poyſons, charmes, and enchantments; but whoſoeuer plucked or drew it out of the ground (ſaith he) could not eſcape preſent death. The ſame *Appion* reported in my hearing, that he hath conjured and raiſed vp ſpirits, to *enquire and learne of *Homer*, what countryman borne he was? and from what parents deſcended? mary hee durſt not report what anſwer was made againe, either vnto him or them.

* *Ad ſciſcitandum Homerum.*

Chap. III.

¶ *Of Mould-warps: and of many other medicines taken from ſundry beaſts, which are in their kind either tame or wilde: and the ſame medicines digeſted according*
D *to diſeaſes as they orderly follow.*

ONe ſpeciall argument this may be, to prooue the follie and vanitie of magicians, becauſe of all other liuing creatures, they do admire & ſet greateſt ſtore by theſe wants or mouls, which Nature ſeemeth to haue condemned to perpetuall blindneſſe and priſon, ſhutting them vp as it were euermore in a dark dungeon, or keeping them rather vnder the earth, like as they were buried and enterred. And yet for all this, theſe Wiſe men giue more beleefe to thoſe ſignes which they ſpie in their bowels and entrails when they be opened, than to the inwards of any beaſt whatſoeuer. This opinion moreouer they haue of a mould-warpe, that there is not a creature more capable of religion, and fitter to be emploied in ſacrifice and diuine ſeruice, than
E it: nay they baſh not to auouch & warrant, That whoſoeuer ſwallowes down al whole the heart of a moule freſh killed, whiles it is yet warme and panting with life in it, ſhall haue the gift of diuination, and foretell the euent and iſſue of any buſineſſe in hand. Moreouer, they affirm, that the tooth of a moule-warpe taken out of her head whiles ſhee is aliue, is ſingular to allay the tooth-ach, if it be hanged about the necke, or tied to any part of the body. They talke of many other wonders wrought by this poore creature, which I purpoſe to deliuer as occaſion ſhall be offered, in place conuenient. And yet when they haue all ſaid that they can of them, that which carrieth the greateſt likelihood and probabilitie, is this, That they ſhould be good againſt the biting of theſe muſets or hardiſhrews, for as you haue heard me ſay before, the very earth that is preſſed down with the wheels in a cart-tract, is proper for that purpoſe. But to leaue theſe mouls
F and to follow on ſtill with this maladie of tooth-ach; the ſaid magitians tel vs a medicine made of the aſhes of a dogs head (dying of madneſſe) that it ſhould be paſſing good therefore, if it be mixed with the oile Cyprinum, & ſo dropped into the ear on the pained ſide: howbeit this care would be had, That the ſaid dogs head haue no fleſh at all ſticking to the ſcalp or ſcull, when it is burned and calcined. They ſay moreouer, that the greateſt eie-tooth of a dog growing on the

left ſide of his head ſerues well for this grieuance, if the tooth that is in pain be ſcarrified round G
about therewith. Alſo a bone growing out of the ridge or chine of a Dragon, will do as much;
or that of the ſerpent called Enhydris. Now are theſe ſerpents white of colour, and held al to be
the male. The greateſt tooth of this Enhydris is thought to be ſingular for to ſcarrifie or to let
the painfull tooth bloud therwith: but in caſe the teeth in the vpper chaw do ake, they take two
of the vpper teeth of this ſerpent, & apply them faſt therto; but contrariwiſe if the nether jaw.
They that hunt after crocodils, vſe to greaſe themſelues with the fat of this ſerpent. Moreouer,
it is good by their ſaying, to ſcarrifie the gums about the teeth with the bones taken out of a
lizards forhead at the ful of the moon; with this regard, that the ſame in any wiſe touch not the
ground. Some of them there be who make a collution with dogs teeth ſodden in wine till the
one halfe be conſumed, and therwith waſh the teeth that ake: but the aſhes of the ſaid teeth in- H
corporat in hony, are ſingular good for little children which haue much a do in breeding their
teeth. The ſame medicine is holden to be an excellent dentifrice for to make teeth look white.
If the teeth that ake be hollow, they vſe to put into the concauity thereof, the ſaid aſhes incor-
porat in mice dung, or els the liuer of a lizard dried. Alſo if one that is troubled with tooth-ach,
ſet his teeth in a ſnaks heart & bite it, or hang the ſame about the neck or otherwiſe, it is thought
to be an effectuall remedy for the ſaid diſeaſe. Others there be of the magicians, who preſcribe
to chew and eat the fleſh of a mouſe twiſe in a month, and they aſſure vs by this means that we
ſhall preuent and auoid the tooth-ach. Moreouer, it is ſaid that a decoction of earthworms boi-
led in oile & poured into the eare on that ſide where the tooth-ach is, doth giue great eaſement
of pain. The aſhes of the ſame mads burnt, put into the hole of a tooth that is rotten and worm- I
eaten, cauſeth it to fall out of the head with eaſe: and if the teeth that do ake be ſound, rub them
with the ſaid aſhes and the pain will ceaſe. Now the ſaid worms ought to be burnt or calcined
vpon a tele or potſheard. Alſo a decoction of this kind of wormes ſodden in ſquillitick vinegre
with the root of a mulberie tree, is a ſoueraigne medicine to waſh the teeth withall when they
*Ventriſ Labij. be in pain. Furthermore, the little grub or worue which is found in the herb Tazill, called *Ve-
nus Lauer, hath a wonderful operation to cure the tooth-ach, if it be put into the hole of a faulty
tooth: and no maruaile, for the caterpillars that breed in coleworts, will preſently fal off if they
be but touched with this worm. The punaiſes alſo or wall-lice that come from mallows, infuſed
into the ears with oile roſat, aſſuage the tooth-ach. The ſmall ſandy grit that is found in the
horns of ſhel-ſnails, conueied into an hollow tooth, preſently allaies the pain. The bare ſhels of K
the ſaid ſnails, hollow as they be and void, calcined and reduced into aſhes, and incorporat with
myrrhe, are paſſing good for the gubs: but the aſhes of a ſerpent burnt and calcined in an ear-
then pot, with ſalt among, helpeth the tooth-ach, if it be inſtilled into the eare on the contrary
ſide, with oile of roſes. The skin of a ſnake which ſhe hath caſt in the Spring, made hot in oile
& the roſin of torchwood, is ſingular in this caſe to be diſtilled into eather of the ears, it makes
no matter which: ſome put therto frankincenſe and oile of roſat. The ſaid ſlough or skin of a
ſnake thus prepared and put into an hollow tooth, cauſeth the ſame to fall out of their head
without any pain or griefe at all. As touching white ſnakes, how they caſt their ſlough at the ri-
ſing or apparition of the Dog-ſtar, I hold to be a meere fable; for it was neuer ſeen or knowne,
that they did ſo in Italy: much leſſe therfore it is credible, that in hot countries they ſhould be L
ſo late ere they caſt their ſlough. Moreouer, it is commonly beleeued, that the ſaid ſlough kept
long and incorporat with wax, draweth out a tooth moſt ſpeedily, if it be applied thereto. Alſo,
ſnakes teeth, either worn about the necke, or laid to teeth in pain, aſſuage their griefe. Some are
of opinion, that a very ſpider all whole as it is, caught with the left hand, bruiſed and incorporat
in oile of roſes, and ſo dropped into the eare of the ſame ſide that the teeth ake, is very good to
mitigat the pain. It is ſaid alſo, that if a man take all the little bones of an hen (and ſaue thoſe
onely of the legs whole that be hollow) and keepe them in the hole or crany of a wall, and with
one of the ſaid bones either hit the tooth that aketh, or ſcarrifie the gumbe about it, and then
preſently caſt it away when he hath done with it, the paine will immediately be gon. The like
effect hath the dung of a rauen, applied hard vnto the place within a locke of wooll: likewiſe of M
ſparrowes, tempered in oile hot and poured into the eare that is next vnto the pained tooth; but
ſurely it will cauſe an intollerable itch: and therefore many thinke it a more ſafe and eaſie re-
medy, to burn young ſparrowes in a fire made of Vine-twigs, and the aſhes that commeth from
them to temper with vinegre, and therewith to rub the ſaid teeth.

CHAP.

Chap. IIII.

¶ *How to procure a ſweet breath. Meanes to take away the ſpots that blemiſh the face: and to amend the infirmities incident to the throat.*

IT is ſaid, that for to rectifie the offence of a ſtrong and ſtinking breath, and to make it ſweet and pleaſant, it is good to rub the teeth with the aſhes of mice burnt, and incorporat with honey. Some there be, who mingle therewith the root of fennell. If the teeth be pricked or ſcraped with a vulturs quill, it will cauſe the breath to be ſowre: but to doe the ſame with the quill or prick of a porkepine, is a ſingular thing to ſtrengthen the teeth and keepe them faſt in the head. As touching the ſores in the tongue, or the ſcabs and little vlcers breaking out about the lips, a decoction of ſwallowes ſodden in honied wine, healeth them: but if the lips be chapped, there is not a better thing than to annoint them with the greaſe of a gooſe or hen. For the ſame purpoſe ſerueth the tried or rindled greaſe of ſweatie wooll, being incorporat with the pouder of gall-nuts: alſo the white cobwebs that ſpiders doe weave, or elſe the little fine ones which they work vnder the planks and floors of high loſts, or rouſes of houſen. * If one chance to burne his mouth inwardly with ſome ſcalding broth or otherwiſe, the milke that a bitch giueth is a preſent remedie therefore.

* *Si ferentia os intus exuſſerint*: peraduenture he meaneth the hot ſores within the mouth, called ἐφθα.

As touching the ſpots that infect the skin of the face, the foreſaid tried greaſe of wool vnwaſhed, called œſypum, incorporat with the hony of the Iſland Corſica (which of al other is counted moſt vnpleaſant and vntoothſome) is proper to ſubtiliat and ſcoure them: the ſame alſo laid to the face vpon a lock of wooll, cauſeth the ſcurfe or ſcales whereby the skin ſeemeth to pill, for to fall away: howbeit ſome thinke it better to put hony thereto. But ſay there appeare vpon the face any foule and thick morphew that hath pierced deep into the skin, it is good to rub the ſame with dogs gall; but firſt the place ought to be pricked thick with a needle that the medicine may enter in. If the skin look wan, or black and blew, take the light of rams or other ſheep, cut them into thin ſlices like to skins, and lay them hot to the place; or els apply therto pigeons dung. The fat of a gooſe or hen, is a ſingular thing to preſerue & keep ſoft, ſmooth, and dilicat, the skin of the face. As for the ringworms or illfauoured tetters called Lichenes, there is a proper liniment made either of the dung of mice incorporat with vinegre, or the aſhes of an vrchin tempered with oile. But in this cure, the face ought to be bathed and fomented before with vinegre and ſalnitre. For to take away any ſpots or pimples ariſing in the face, there is not a better thing to apply to them than the aſhes of the little broad ſnails which are commonly found in euery place, incorporat with honey. And in truth, the aſhes of any ſnails whatſouer, are aſtringent and hot, by reaſon of a certain abſterſiue qualitie that they haue; which is the reaſon that they enter into potentiall cauteries, or cauſtick & corroſiue medicines: and therfore they ſerue in liniments for to kill ſcabs, ſcurfs, mange, and leproſie; yea and to ſcoure away the foule ſpots called Lentils. Moreouer, I read in authors of certain piſmires greater than the reſt, called Herculaneæ, the which being ſtamped with a little ſalt put to them, are good for all the infections of the skin mentioned in the former receit. There is a kind of inſect or flie called Bupreſtis, paſſing like to a long legged beetle, but ſeldom or neuer be any ſuch found in Italy: kine and oxen catch much harme by this flie; for many times as they graſe, they lick it vp with the graſſe and ſwallow it down: and hereupon it tooke that name Bupreſtis: for no ſooner commeth it to the gall, but it inflameth and ſetteth the beaſt into a great heat, wherupon it ſwelleth vntill it burſt againe. So corroſiue it is (as I haue ſaid before) that being incorporat with goats ſewet, and ſo reduced into a liniment, it takes away the tettars called Lichenes that be in the face. The bloud of a vultur [*i.* a geire] tempered with the root of white Chamæleon (I mean the herb ſo called) and the roſin of cedar, heales the leproſie, ſo that this liniment be couered with colewort leaues. Of the ſame effect are the feet of locuſts braied in a mortar and incorporat with goats tallow. The greace of a cock, capon, or hen, wel ſtamped & wrought with an onion, is ſingular to ſcoure the ſpots and ſpecks of the viſage: alſo the hony wherin a number of bees were ſtifled and killed is proper for the ſaid purpoſe: But aboue all, the greace of a ſwan is commended both for to cleanſe the skin of the face from all flecks and freckles, and alſo take away wrinkles. As for the markes remaining after the cauterie or hot yron, there is no better means to take them out, than a plaſtre of pigeons dung and vinegre. If the rheume cauſe the mur, the poſe, or heauineſſe in head, I find a pretie medicine to rid it away, by kiſſing only the little hairie muzzle of a mouſe.

As touching the uvula and paine of the throat, they may be both of them eaſed and cured with lambs ordure, which paſſeth from them before they haue bitten graſſe dried in the ſhade. The juice or ſlimie humor that ſhel-ſnails yeeld when they be pricked through with a pin or needle, is ſingular good in a liniment for to be applied vnto the uvula; prouided alwaies, that thoſe ſnailes do hang after, in the ſmoke. The aſhes that come of ſwallows calcined & burnt, is likewiſe very ſoueraign, being laid to the grieued place with hony: and in that ſort prepared, it ſerueth alſo for the inflammation and ſwelling of the tonſils or amygdals of the throat. For the ſaid tonſils and other accidents of the throat, a gargariſme of ewes milke is right ſoueraigne. There is a certain creeper called, a* Cheeſlip, which if it be bruiſed or ſtamped, is good for the ſaid infirmities: ſo is pigeons dung gargariſed with wine cuit, or applied outwardly with ſalnitre & dried figs. If the throat be troubled with hoarſneſſe, occaſioned by rheume or catarrhe, the foreſaid ſhel-ſnailes do greatly mitigat the ſame infirmitie, being firſt ſodden in milke (all ſaue the earthy or muddy ſubſtance which they muſt be cleanſed from) and then giuen in wine cuit to the patient for to drink. Some hold opinion, that the ſnails found in the Iſle Aſtypalæa, are the beſt of all other for this purpoſe, but principally the abſterſiue ſubſtance that is found in them. The cricquet called Gryllus, doth mitigat catarrhs & all aſperities offending the throat, if the ſame be rubbed therewith: alſo if a man doe but touch the amygdals or almonds of the throat, with the hand wherwith he hath bruiſed or cruſhed the ſaid cricquet, it will appeaſe the inflammations thereof. To come now vnto the Squinancie: a gooſe gall incorporat with the juice of the wild cucumber, and hony together, is a moſt ſpeedie and preſent remedy for it: alſo the brains of an owle, and the aſhes of a ſwallow drunk in water wel and hot, is good for the ſaid diſeaſe: But for this medicine we are beholden to the Poët *Ouid*. Note that when I ſpeak of any medicine (for what maladie ſoeuer) made of ſwallows, the yong wild ones are alwaies the better and more effectuall in operation: *and thoſe you may know eaſily by the faſhion of their neſts where they do build: But if you would haue the beſt indeed, the young ones of that kind which are called Ripariæ, paſſe al the reſt for medicinable vſes, for ſo they are commonly named which build in the holes of banke ſides. Howbeit, ſome there be who aſſure vs, that we ſhal not need to feare that diſeaſe for a yeare together, if we do but eat any young ſwallow, it skills not of what kind ſoeuer it be. Now the order of calcining them from their aſhes, is to ſtrangle them firſt, & ſo to burn them in their bloud within an earthen veſſell: and the aſhes thus made, is vſually giuen either wrought in paſt for bread, or elſe to be drunk: and ſome there be who mingle withall, the like quantity of the aſhes which come of weazils. And this kind of medicine thus prepared, they giue in drink euery day againſt the kings euill, and falling ſickneſſe. Moreouer, ſwallowes kept and condite in ſalt, are paſſing good for the Squinancie, taken in drinke to the weight of a dram at a time: and it is ſaid, thet their very neſt giuen in drinke, cureth the ſaid maladie. It is a common opinion, that a liniment made with the creepers called Sowes or Multipedes, is moſt effectuall to cure the ſaid Squinancie. And ſome there be who aduiſe to take one and twenty of theſe worms ſtamped, and to giue them in one hemine of mead or honied water for the ſaid diſeaſe; but they muſt be conceiued downe the throat by a pipe or tunnell, for if this medicine touch the teeth once it will do no good. It is ſaid moreouer, that if one drinke the decoction of mice ſodden with veruaine, it is a ſoueraign remedy for that diſeaſe: as alſo that a leather thong made of a dogs skin put thrice about the necke, will doe the deed. And ſome there be, who in this caſe vſe pigeons dung mixed with oile and wine.

*Multipeda.

* For the martinets or ſwallowes called *Apodes*, build not, but lay and breed in chinks and cranies of old walls.

As touching the cricks of the nerues or ſinewes that ſerue the nape of the necke; as alſo for the cramps that draw the head backward, they ſay, that a twig or branch of a vine taken out of a puttocks neſt, and carried about one hanging to the necke or arme, is a ſpeciall remedie for the abouenamed accidents.

Chap. V.

¶ *Medicines for the Kings euill that is broken and doth run: for the paines lying in the ſhoulders: as alſo for the griefe of the bowels about the midriffe and precordiall parts.*

THe bloud of a weazill is good for the wens called the king euill, when they be exulcerat & do run: ſo is the weazill it ſelfe ſodden in wine and applied; prouided alwaies, that they run

not

20030
copy 1

A not by occaſion of any launcing or inciſion made by the Chirurgions hand. And it is commonly ſaid, that to eat the fleſh of a Weazill, is effectuall for the cure. So are the aſhes of a Weazil calcined vpon a fire made of Vine-twigs, if they be incorporat with Hogs greaſe. *Item*, Take a green Lizard and binde it to the ſore; but after thirty daies you muſt do ſo with another, & this will heale them. Some make no more ado but in a little box of ſiluer keep the heart of a Weazil & wear it about them. If women or maids be troubled with the kings euil, it were good to make choiſe of old ſhel-ſnailes, and to ſtamp them ſhels and all into a plaiſter or liniment: but eſpecially ſuch as be found ſticking to the roots of ſhrubs and buſhes. The aſhes of the ſerpent Aſpis calcined, are likewiſe very good for this diſeaſe, if they be incorporat with buls tallow, & ſo applied. Some vſe ſnakes greaſe and oil together: alſo a liniment made with the aſhes of ſnakes
B burnt, tempered either with oil or wax. Moreouer, it is thought that the middle part of a ſnake, after the head and taile both be cut away, is very wholſome meat for thoſe who haue the kings euill: or to drink their aſhes, being in the ſame manner prepared and burnt in a new earthen pot neuer occupied; mary if the ſaid ſnakes chanced to be killed between two cart-tracts, where the wheeles went, the medicine will look much more effectually. Some giue counſell to apply vnto the affected place Crickets digged out of the earth, with the mould and al that commeth vp: Alſo to apply Pigeons dung only without any thing els, or at the moſt to temper it with Barley meale or Oatmeale in vinegre. Likewiſe to make a liniment of a Moldwarps aſhes incorporat with hony. Some there be who take the liuer of a Moule, cruſh and bruiſe it between their hands, working it into a liniment, and lay the ſame to the ſore, and there let it drie on the place
C and waſh it not off in three daies. And they affirme, That the right foot of a Moule, is a ſingular remedie for this diſeaſe. Others catch ſome of them, cut off their heads, ſtampe them with the mould that they haue wrought and caſt vp aboue ground, & reduce them into certain trochisks which they keep in a box or pot of tinne, and vſe them by way of application to all tumors and impoſtumes which the Greeks call Apoſtemata, and eſpecially thoſe that riſe in the necke: but then they forbid the patient to eat porke or any ſwines fleſh during the cure. Moreouer, there is a kind of earth-beetles called tauri, *i.* Buls: which name they took of the little hornes that they carry; for otherwiſe (in colour) they reſemble tickes; ſome tearme them, Pedunculos terræ, earth-lice: Theſe alſo worke vnder the ground like wants, and caſt vp mould, which ſerueth in a liniment for the Kings euil, & ſuch like ſwelling, as alſo for the gout in the feet, but it muſt not
D be waſhed off in three daies ſpace. Howbeit, this is to be noted, that this medicine muſt be renued euery year, for the ſaid mould will continue no longer in vertue than one year. In ſum, there be attributed to theſe beetles, all thoſe medicinable properties which I haue aſſigned vnto the crickets called Grylli. Moreouer, ſome there be who vſe in manner and caſes aforeſaid, the *mould which ants do caſt vp. Others for the Kings euil take iuſt as many mads or earthworms in number as there be wens gathered and knotted together, and bind the ſame faſt vnto them, letting them to drie vpon the place: and they are perſuaded that the ſaid wens will drie away and conſume together with them. There be again who get a Viper about the riſing of the Dog ſtar, cut off the head and taile, as I ſaid before of ſnakes, and the middle part betweene they burne: the aſhes that come thereof, they giue afterwards to be drunke for three weeks together,
E euery day as much as may be comprehended and taken vp at three fingers ends: and thus they cure and heale the kings euill. Moreouer, there be ſome that hang a Viper by a linnen thread faſt tied ſomewhat vnder the head, ſo long till ſhe be ſtrangled and dead, and with that thread bind the foreſaid wens or Kings euill, promiſing vnto their patients aſſured remedie by this meanes. They vſe alſo the Sowes called Multipedæ, and incorporat the ſame with a fourth part in proportion to them, of true Turpentine: and they be of opinion, That this ointment or ſalue is ſufficient to cure any impoſtumes whatſoeuer.

*Of which being raiſed more & more, come Maure-hils, corruptly called Mouſe-hils; for Ants were in old Engliſh called Maures: and Moules neuer caſt vp ſuch.

As touching the paines that lie in the ſhoulders, there is a proper medicine made in forme a liniment, with the aſhes of a Weazill tempered with wax, which eaſeth the ſame.

To keepe young boies from hauing any haire growing on their face, that they may ſeem al-
F waies young, it is good to annoint their cheekes and chin with Ants egges. Alſo the marchants or huckſters that buy yong ſlaues to ſell them againe for gaine, vſe to hinder the growth of hair as well of the viſage, as in the armeholes and vpon the ſhare, that they may be taken for young youths ſtill, by annointing thoſe parts with the bloud that commeth from lambs when they be libbed, which ointment doth good alſo to the armpits, for to take away the ranke and rammiſh

ſmell

ſmell thereof: but firſt the haire there growing ought to be pulled vp by the roots. G

Now that I am come to ſpeake of the precordiall region of the body, know this, That by this one word *Præcordia*, I meane the inwards or entrailes in man or woman, called in Latine * *Exta*, whenſoeuer then there ſhall be pain felt in theſe parts or any of them, apply thereto a yong ſucking whelpe, and keepe it hard huggled to the place, doubtleſſe the ſaid griefe will paſſe away from the part to the puppie it ſelfe, as men ſay: and this hath been found true by experience in one of thoſe whelpes * ripped and opened aliue, and the ſaid bowels taken forth: for looke what part in man or woman was grieued, the very ſame was ſeene infected thereupon, in the puppie. And ſuch whelpes thus vſed for the curing and taking vpon them our maladies, were wont to be enterred with great reuerence and ceremoniall deuotion. As touching the pretty little dogs that our daintie dames make ſo much of, * called Melitæi in Latine, if they be euer and anon H kept cloſe vnto the ſtomacke, they eaſe the paine therof. And in very truth a man ſhall perceiue ſuch little ones to be ſicke, yea, and many times to die thereupon: whereby it is euident, that our maladies paſſe from vs to them.

* The bowels, as heart, liuer, lights, &c.

* *Præciſſos, viuo, non profuſos, vino.*

* Becauſe they were brought from the Iſle Melita, lying within the Sclavonian ſea

Chap. VI.

¶ *Of the diſeaſes incident to the lights and liuer. Of thoſe that vſe to caſt and reach vp bloud at the mouth.*

Mice are very good for the infirmities of the lungs, eſpecially thoſe of Barbarie, if they be I firſt flaied, then ſodden in oile and ſalt, and ſo giuen to the patient for to eat: Thus prepared and vſed, they cure them that either ſpit purulent and filthy matter, or elſe reach vp ſhere bloud. But a diſh of meat made of ſnailes with ſhels, is moſt excellent for the ſtomacke. But for the better ordering and dreſſing of them: firſt they ought to ſiver ouer the fire and take a few waulmes till they be parboiled, without touching or medling one jot with their body: afterwards they muſt be broiled vpon the coales, without putting any thing in the world vnto them, and then to be ſerued vp in wine and fiſh pickle or brine called Garum, and ſo eaten. But the beſt for this purpoſe are thoſe of Barbarie. It is not long agoe, that this experiment was found: but ſince it was once known, many haue done themſelues much good thereby. But (that which I had well neare forgotten) many obſerue to take them in ſome od number. Howbeit, as holeſome as they are ſuppoſed to be otherwiſe, this diſcommoditie is found by them, That they K cauſe thoſe to haue a ſtrong and ſtinking breath that vſe to eat them. Being ſtamped without their ſhels, and ſo drunk in water, they helpe them that reach bloud vpward. But that you may know that there be degrees of them in goodnes: The beſt ſnailes ſimply are they of Barbary, and namely, thoſe about the quarter neere Soli: Next to them are much eſteemed ſuch as are gathered in the Iſlands Aſtypelæa, and Sicilia, for they are of a meane bigneſſe; for ſuch as be grown very great, haue their fleſh hard, and be void of humidity. Then are ranged in a third place, thoſe that come from the Baleare Iſlands, called Cavaticæ, becauſe they breed in caues and holes. There be good alſo brought from the Iſlands Capreæ. Holeſom theſe ſhel-ſnailes may be well ynough: but toothſome ſurely they are not, whether they be old kept, or new taken. Thoſe that be found in riuers, & which haue white ſhels, cary a rank and ſtrong ſauour with them: ſo do the L wild ſort that are not kept vp and fed in ſtewes & pits, and be hurtfull to the ſtomack, but good to looſen the bellie: euen ſo are all the ſort of the little ones. But contrariwiſe, thoſe that breed in the ſea are better for the ſtomack than others: and moſt effectuall to allay the pains therof. Moreouer, it is ſaid, that they do moſt good, of what kind ſoeuer, if they be ſwallowed downe aliue & all whole with vinegre. Moreouer, there be of theſe ſnailes called * Aceratæ, of a broad making, and growing in many and ſundry formes; of whoſe properties, and how they are to be vſed, I wil write elſwhere in place conuenient. The inner skin of a Hen or Capons geſier, preſerued till it be drie, and reduced into pouder, and ſo put into a cup of drinke like ſpice; the ſame alſo eaten freſh, & newly roſted or broiled, is ſingular for the catarrhes that fall into the breaſt, and for a moiſt cough. Shel-ſnails punned raw & giuen in a ſupping with three cyaths of warm M water, ſerue wel to appeaſe & ſtay the cough. Take a piece of a dogs skin, and tie the ſame about any one of your fingers, which you will, it ſtaies all rheumes and diſtillations. The broth made of Patridges, is ſoueraigne to comfort and refreſh the ſtomack. As touching the griefe or pain of the liuer, it is ſaid, That the fleſh of a wild Weazill, or her liuer eaten, is a ſingular meat therfore.

* Haply ſo named, becauſe they haue little or no hornes, *quaſi* ἀκέρατα. *Interp.*

20030
copy 1

A fore: ſo be Ferrets roſted in manner of little pigs. The worms with many feet called ſowes or cheſelips, are very proper for them that draw their wind ſhort; but there muſt be one and twentie of them, neither more nor leſſe, diſſolued in the beſt Atticke hony, and ſo giuen in drink and ſwallowed down by a pipe or tunill: the reaſon why they muſt be thus conueied through ſuch a cane or tunill is this, becauſe looke what cup or boule they ſo touch, they ſtaine the ſame black. Some take of them to the quantitie of one ſextar, and torrifie them vpon a pan or platter, vntill they looke white and be calcined, and then incorporat them in hony: [there be Latine writers who call this worme Centipeda, as if it had an hundred feet] and then giue direction, that they ſhould be taken in hot water. Furthermore, it is ſaid, That if the patient do either eat or drinke for the ſpace of nine daies together one ſnaile hot, ſtamped ſhell and all in three cyaths of wine
C cuit he ſhall find helpe, if he were giuen either to faint and ſwoune, or to be lunatick and to go beſide himſelfe, or elſe be ſubject to the dizzineſſe of the head. Others giue order to take them after another maner, namely, one the firſt day, the morrow twain, the third day three, the fourth two, and the fift one again: and in this wiſe they cure thoſe who are ſhortwinded, or haue an impoſtume broken within their bodie. There is a kinde of Inſect reſembling a Locuſt, but that it hath no wings, which in Greek is called *Tryxalis; a Latine name it hath not found yet, as ſome do thinke: and writers there be not a few, who are of opinion, That it is the ſame that our Grylſ. or criquet. Call it what you will: let there be twenty of them torrified and drunk in honied wine, it is reported for to be a ſingular medicine for thoſe that cannot take their breath but ſitting vpright: and for ſuch as ſpit bloud. There is one writer who ordaineth to take ſnailes vn-
C waſhed, and to poure vpon them either the Mere-gout of the grape that runneth ont firſt without preſſing, or elſe ſea-water, and ſo to boile them therein, and afterwards to eat them for a cough. And the ſame Authour giueth counſell, to pun them ſhels and all, and to take them with the foreſaid Mere-gout to the ſame effect.

* or *Troxalis*; according to *Ælianus*.

Touching inward impoſtumes broken, the hony wherein a numbet of Bees haue bin drowned to death, hath a peculiar vertue to heale them. The lungs of a Vulture burned to pouder in a fire made of Vine-cuttings, giuen in wine morning & euening, if the patient be free from the ague; ſo there be put thereto one moitie of Pomegranat floures, and the floures of Quinces and Lillies as much of each, is a very ſoueraign remedie for thoſe that caſt vp bloud out of their bodie: but if he be in a feauer, the ſame medicine would be taken in the decoction of Quinces.

D As for the paine of the ſpleene, if we may beleeue the receits and preſcriptions of the Magicians, the patient ought to haue the milt or ſpleen of a ſheep ſpread and laid ouer the place: but the patient that hath the application thereof, muſt ſay theſe words withall, *This I do to cure the ſpleene:* Which done and ſaid, the ſame milt of the ſheep muſt be laid vp cloſe and hidden within the wall or behind the ſeeling of the bed chamber where the ſick body lieth, and ſealed vp with a ſignet, for feare it ſhould be taken away: with this charge, that he or ſhe that hath the beſtowing of it, repeat the foreſaid charme nine times thrice ouer. If a dogs bellie be ripped aliue, and the ſpleen taken forth, whoſoeuer eateth thereof, ſhall find it very good to eaſe them of the ſaid maladie. But ſome content themſelues with laying it freſh and warme to the region of the ſpleen. Others giue the ſpleen of a young whelpe but two daies old, in ſquillitick vinegre, to the
E patient, but they make not the patient acquainted with the medicine what it is; or elſe they miniſter the ſpleen of an Hedgehog in the ſame manner. Likewiſe they giue the aſhes of ſhell-ſnailes with Line ſeed and Nettle ſeed, putting thereto ſome hony: and this cure they continue vntill the patient be throughly whole. It is ſaid moreouer, That a green Lizard taken aliue, and hanged ſo in a pot iuſt before the dore of the patients bedchamber: with this charge, that euer as he goes in and out he touch the ſame with his hand, will worke the ſame effect. The aſhes of a ſcritch-owls head reduced into an vnguent with oile, is good for this purpoſe, ſo is the hony wherein Bees were ſtifled: and laſtly a ſpider, but eſpecially that which they call Lycos.

The heart of the bird called a * Houpe, is highly commended for the pain of the ſides. Alſo * *Vpupæ.*
the aſhes of ſhell-ſnailes boiled in Ptiſane or huſked Barley water: and ſome in this caſe apply
F the ſame otherwhiles in a liniment onely without any thing elſe. The aſhes of a dogs head (I meane the bare ſkalpe or ſkull onely) dying enraged and mad, is good to ſpice a cup of drinke withall for this diſeaſe.

If the loines be pained, it is ſaid, That the ſtarre-Lizards called Stellions, comming from beyond ſea ſodden in wine together with the ſeed of black Poppie to the weight of halfe a denier

is very good, ſo the decoction be drunk: howbeit, this care muſt be had, that the head be cut off G
firſt, and the garbage taken forth. The green Lizards are good meat in this caſe, if they be dreſſed accordingly, and their feet and head cut away: ſo are ſhell-ſnailes, braied ſhels and all together, and ſodden in wine with fifteen grains of pepper. Some vſe the feet and legs of an Ægle in this diſeaſe, pulling them away backeward from the knees: and the right foot they apply faſt to the paine of the right ſide: but the other if the contrary ſide be grieued. The many-foot Sowes or Cheeſlips, which I called before Oniſcos, help the ſame pains, if they be taken to the weight of halfe a denarius in two cyaths of wine.

To conclude with the Sciatica, the magitians giue order to put an earth-worm in a treene or wooden diſh, which hauing bin cleft, was ſtitched vp again with iron wier, or bound with a plate or hoope of yron: then to lade vp ſome water therwith, and in it to waſh & rince the ſaid worme H
very well, and then to enterre or burie the ſame again in the very place from whence it was digged forth: which done, to giue the ſaid water anon to the patient for to drinke out the ſaid wooden diſh: and this they hold to be a wonderfull medicine.

Chap. VII.

¶ *Remedies for the dyſenterie or bloudie flix. And generally for all diſeaſes of the belly.*

THe decoction of a leg of mutton ſodden in water with Line ſeed, is ſingular good for to be ſupped off to ſtay a bloudie flix. So is old Cheeſe made of Ews milke: and ſheeps ſuet ſodden together in ſome auſtere wine. The ſame is ſingular for the Sciatica paſſio, and an old cough. The ſtarre-Lizard Stellio, which breeds beyond ſea, being flaied, garbaged, and dreſſed for meat, ſo that the head and feet be taken away, and ſo ſodden and eaten, is commended alſo in this caſe. Moreouer it is ſaid, That two ſnailes and one Hens egg, ſtamped the one as wel as the other with their ſhels, and afterwards gently ſodden in a new earthen pot with ſome ſalt & two cyaths of wine cuit, or elſe with the juice of Dates & 3 cyaths of water giuen to the patient to drink who is tormented with the dyſentery or bloudy flix, wil bring great alleuiation of the ſaid diſeaſe. It is thought alſo, That the aſhes of the ſaid ſhell-ſnailes calcined, if they be taken in wine with a little roſin, are ſoueraign therfore. As touching naked ſnails without any ſhels, they be found plentifully in Affrick. Paſſing good they be for the bloudie flix, if 5 of them be burnt K
and calcined together, with halfe a denier weight of Acacia, & 2 ſpoonfuls of their aſhes taken in Myrtle wine or ſome other auſtere & aſtringent wine, and a like quantity of hot water. Some there be who in this ſort vſe all the ſnailes of * Barbary. Others thinke it better to take fiue of the ſaid ſnailes of Affricke, or rather as many of the broad and flat ſort, and to clyſterize them for the dyſenterie. But if the flux be exceeding vehement, then they put thereto of Acacia the quantitie of a beane. It is ſaid moreouer, That the ſpoile or ſlough of a ſerpent boiled with oile roſat in a veſſell of tinne, is ſingular for the * Dyſenterie and * Tineſme, to be injected by a clyſter: Or if it be ſodden in any other veſſell, yet with an inſtrument or pipe of tin it is to be conueighed into the fundament, that the tiwill thereby may be annoinied. The broth of a Cocke cureth theſe infirmities: but if it be of an old Cocke, it is the more effectuall. And yet if the L
ſaid broth be any thing ſaltiſh, it ſtirreth the bellie & prouoketh to the ſeege. The inward skin of an Hens giſier broiled and giuen with ſalt and oile, doth mittigat and appeaſe the * wrings cauſed by the flux of the ſtomacke. But then this regard muſt be had before, That neither the Hen haue any corne giuen her, nor the patient feed vpon any graine ſome time before. Pigeons dung being burnt, and the aſhes taken in drinke, is of great effect and vertue in theſe caſes. The fleſh of a Quoiſt or Stock-doue ſodden in vinegre, is good both for the bloudie flix, and alſo for the looſeneſſe, proceeding from the imbecilitie of the ſtomacke. The Thruſh or Mauis roſted with Myrtle berries, is ſoueraigne for the dyſenterie: ſo is the Merle or black-bird. In which reſpect, great account alſo is made of the honey boiled, wherein bees were killed. [Of all the paines that be, the * Iliacke paſſion is moſt ſharpe and grieuous to be endured. But it M
is ſaid, That the bloud of a Bat, torne and plucked in peeces aliue, is very good againſt it; yea, and if the bellie be annointed therewith, it eaſeth the torment thereof.] But to come againe vnto the flux of the bellie, ſhell-ſnailes prepared and made in manner aforeſaid for thoſe that be ſhort winded, are ſingular good for to ſtop the ſame, and to knit the bodie. So are their aſhes

* Or Affricke.

* Vlcer of the guts or bloudie flix.
* A continuall deſire to the ſtoole without doing ought.
* *Dolores cœliacorum.* Some read *Colicorum*, of the Collicke.

* Which is the torture or inflammation of the vpper ſmall guts.

20030
copy 1

A aſhes (if they were burnt and calcined aliue) taken in ſome auſtere or aſtringent wine. The liuer of a cocke roſted, together with the skin of the giſier, which ordinarily the cooke caſteth away, dried and kept, and ſo taken with a little of the juice of Poppy mixed with it, is of great power to remedy theſe accidents: others take the ſame skin whiles it is new and freſh, which they broil and torrifie, for to be giuen in wine to drink. A Partridge broth, yea, and the giſier of the bird alone beaten to pouder and taken in ſome groſſe and aſtringent wine, is ſingular to ſtay a flux of the belly. The wild Ring-doue or Quoiſt, boiled in vineger and water, is of the ſame effect. The milt of a ſheep firſt torrified, then puluerized and taken in wine, helpeth much this infirmitie. A liniment likewiſe made of Pigeons dung and hony, is of great vertue, if the patients belly be annointed therewith.

B Touching thoſe that haue feeble ſtomacks, and cannot concoct and digeſt their meat. It is ſaid, That the maw or giſier of that kind of Geire or Vulture, which is called in Latine Oſſifragus, dried, puluerized and drunk, is right ſoueraigne. Nay, if the patient doe but hold the ſame giſier in his hand whiles he is at his repaſt, it will help digeſtion. And in truth there bee diuers that for this cauſe weare theſe giſiers ordinarily about their necks: but I think it not wholſome to do ſo, long, for it maketh them leane as many as vſe it, and ſpendeth their body.

To ſtay a flux of the belly, the bloud of Mallards or Drakes is thought alſo to be ſingular good. The meat made of ſhell-ſnailes, diſcuſſeth and ſcattereth ventoſities. The Milt of a Mutton broiled to aſhes and giuen in wine, is ſingular good to allay the wrings and torments of the belly. Of the ſame operation is the wild Quoiſt or Ringdoue, ſodden in vineger and water. The
C greater kind of Swallows or Martins called Apodes, are no leſſe powerfull, if they bee ſodden and taken in wine. The aſhes of the bird Ibis plucked & burnt without his feathers, & ſo giuen to drink, work the ſame effect. But ſtrange it is and wonderfull, if that be true which is reported as touching this malady, namely, that if a Ducke bee applied aliue vnto the belly which is tormented with ſuch wrings, ſhe ſhal draw away the diſeaſe into her own body, and die of the torment, but the patient ſhal be eaſed by that means. Theſe painful gripes likewiſe are cured with ſodden hony, wherein Bees ſometimes wete drowned to death.

As for the Collick, there is nothing ſo good to aſſuage the paine thereof, as to eat Larkes, which the Latines name Galeritæ. Howbeit, ſome giue aduiſe and think it better to burne and calcine them in their feathers within a new earthen veſſel, & ſo to ſtamp them to aſhes or pou-
D der, and to drink therof foure daies together in water by three ſpoonfuls at a time. Others make no more ado, but take the heart of a Lark, and bind it to the inward part of the thigh: and there be againe who would haue the ſame to be ſwallowed downe whole newly taken out of the bird while it was warme. There is a family of the Aſprenates, men of good quality and reputation, for that they had bin ſomtimes Conſuls of Rome: in which houſe, of two brethren, the one was fully cured of the collick by eating theſe birds, and by wearing ordinarily the heart of one of them about his arme, incloſed within a bracelet of gold: the other being likewiſe troubled with the ſaid diſeaſe, found remedy by a kind of ſacrifice which he offered in a little chappell made with vnbaked brickes, piled vp archwiſe in manner of a furnace: and ſo ſoon as the ſacrifice was finiſhed, he ſtopt vp the ſame againe. That Vulture which is called Oſſifragus, hath one gut of
E wonderfull nature, for it is able to concoct and digeſt whatſoeuer the ſaid foul deuoureth. And for certain this is known and generally receiued, that the nethermoſt end therof cureth the collick, if the patient do but carry it about him. There are other ſecret and hidden diſeaſes incident to the guts, wherof there be wonders told: and namely, that in theſe caſes, if yong whelpes before they can ſee be applied for 3 daies together vnto the ſtomack eſpecially, and the breſt, ſo that they ſuck milke from out of the patients mouth the while: the ſaid diſeaſe ſhall paſſe into the body of the poore whelps, whereof in the end they ſhall die. Let the ſame be ripped & opened, then it wil appear euidently what the cauſe was of the foreſaid ſecret malady of the patient But ſuch whelps ought when they are dead to be enterred & buried. As for the Magitians, they auouch, That if the belly be annointed lightly with the bloud of a Bat, the party thus dreſſed,
F ſhall not need to feare any paine of that part for one whole yeare after: or if it chance that one be pained in the belly, let him (ſay they) indure to drinke the water that runneth down from his feet when his legs be waſhed, and he ſhall find help anone.

CHAP.

Chap. VIII.

¶ Medicines againſt the ſtone and graucll: the paines of the bladder. The ſwellings in the cods and the ſhare. Alſo for the biles and botches called Pani.

For them that are troubled with the ſtone, it is good to annoint the region of the belly with Mouſe dung. It is ſaid, that the fleſh of an Vrchin or Hedgehog is very good meat & pleaſant in taſt, if ſo be he were killed outright in the head at one blow, before that he had time to ſhed his owne vrine vpon himſelfe: and looke whoſoeuer eat this fleſh, ſhall neuer be ſubiect to the diſeaſe of the ſtrangury. The fleſh of an Vrchin killed in this ſort, helpeth the bladder, in H caſe the vrine paſſe by dropmeale from it. But contrariwiſe, if the Vrchin chance to wet and drench himſelfe with his owne vrine, as many as eat of the fleſh ſhal fal into the infirmity of the ſtrangury or piſſing dropmeale. Moreouer it is ſaid, That earthworms drunke either in wine or cuit, is of great efficacy to breake or diſſolue the ſtone: as alſo that ſnailes, prepared in that ſort as they are ordained to be dreſſed for ſhortneſſe of wind, work the like effect. Take ſnails naked out of their ſhels, and ſtamp them; giue 3 of them to the Patient to drinke in a cyath of wine the firſt day, two the morrow after, and the third day one againe, you ſhall ſee how it will helpe the ſtrangurie or piſſing dropmeale. But let the empty ſhels be burnt, the aſhes therof wil ſcoure away and expell the ſtone. Semblably, it is ſaid, that the ſame effect followeth vpon drinking the liuer of a water-ſnake: the eating of the aſhes of ſcorpions calcined, either in bread, or with I locuſts. Likewiſe, to take the little ſtones or grit that be found in the craw of a cocke, or in the giſier or maw of a ſtock-doue: to beat the ſame to pouder, and therewith to ſpice the drinke, is ſingular good for the infirmity aforeſaid. To do the like with the skin of a Cocks or Hens giſier, dried: or if it be new and freſh, to roſt and eat it. Alſo for the ſtone and other difficulties or impediments of the bladder, it is good to take the dung of Quoiſts or Stock-doues, with Beane meale. In like manner there is much help found by the aſhes of Quoiſts feathers, ſuch as be of a wilder kind than the reſt, taken with Oxymell. Moreouer, the aſhes of the guts of this bird giuen to the quantity of three ſpoonfuls: as alſo the neſt of ſwallows: and Cricquets infuſed and diſſolued in hot water, are commended for this purpoſe. Some helpe themſelues with the giſier of Oſſifragus dried: others vſe the decoction of Turtles dung boiled in honied wine; or els the K broth of the Turtle it ſelfe. Furthermore, for the difficulty of vrine, it is wholſome to eat blacke birds or Merles, boiled with Myrtle berries: or Graſhoppers fried in a pan: & to drink the ſows or Cheeſlips called Oniſcoi, folke make it not ſtrange to do themſelues good. But if there be pain in the bladder, it is ſaid, That the broth made of Lambs feet, is ſoueraigne. If the body bee bound or coſtiue, a Cocke-broth cauſeth it to be ſoluble: and the ſame doth withall lenifie the acrimony of humors that cauſe the foreſaid griefe of the bladder. The dung of Swallows likewiſe procureth looſneſſe of belly, in caſe it be tempered with hony to the forme of a ſuppoſitarie, and ſo put vp.

Touching the infirmities incident to the ſeat, the tried greaſe of vnwaſhed wooll, (whereunto ſome adde Tutie and oile of Roſes) the aſhes alſo of a dogs head are ſoueraign medicines: the L ſlough likewiſe which a ſerpent hath caſt, applied with vineger, is good, in caſe there be chaps and fiſſures in that part. Likewiſe, the aſhes of dogs dung, which looketh white, incorporat with oile of Roſes: & this receit (they ſay) was the inuention of *Æſculapius*, and is beſides moſt effectuall to take away werts. The aſhes of Mice dung, Swans greaſe, & the tallow of Oxe or Cow, are helpfull for this infirmity. If the tuill or gut Longaon be ralaxed and hang forth, it is good to annoint the ſame with the moiſture iſſuing forth of ſhel-ſnailes that is pricked through with a pin or needle, for it *driueth it back again to the right place. If the ſeat be galled, it is thought that the aſhes of the wood-Mouſe tempered with hony, cureth the ſame: or els the aſhes of an Vrchin, together with the brains of a Bat, Allum, and the greaſe tried out of vnwaſhed wool, wil skin it againe. In like manner, Pigeons dung with hony: for the ſwelling blind hæmorrhoids or M piles called Condylomata, there is a proper remedy; namely, to rub the place with a ſpiders body, after the head and legs be caſt away. Againſt the acrimony and ſharpneſſe of humors, that they ſhould not fret and burne thoſe parts, there is a faire liniment made with Gooſe greaſe, incorporat with Barbary wax, white lead, and oile roſat. So is the fat of a Swan. Theſe medicines

*Repellit.

alſo

20030
copy 1

A alſo are ſaid to heale the hæmorrhoids that run.

For the pain of the Sciatica, it is thought that raw ſhell-ſnailes bruiſed are good, if they bee taken in Amminean wine and pepper: alſo a greene lizard eaten as meat, without the feet, garbage, and head: ſo is the ſtarre-lizard Stellio, but thereto ought to be put the weight of three oboli of black poppy ſeed.

For ruptures, inward ſpaſmes and convulſions, it auaileth much to take ſheeps gal with breſt milk. In caſe the priuities haue an itch & a fretting humor vpon them, or if ſome offenſiue werts ariſe in thoſe parts, the dripping or grauie that commeth from a rams lights roſted, doth much good, if the place be therewith annointed. As touching other accidents which happen to thoſe parts, the wooll of a ram calcined and reduced into aſhes, euen with all the filthineſſe that is
B therein, is thought to be very good, ſo that the aſhes be applied to the affected place with water. The ſewet of the kell of a mutton, but eſpecially that which groweth to the kidnies, incorporat with the pouder of a pumiſh ſtone and ſalt, is much commended in this caſe: alſo greaſie and vnwaſhed wooll ſoked in cold water, is good to be applied to the place.: the fleſh moreouer of a mutton calcined, ſo as the aſhes be incorporat with water. *Item*, the aſhes of a mules houſe: and the pouder of caples teeth braied & puluerized, if the grieued place be ſtrewed therewith.

To come lower to the infirmities of the cods: the pouder of the bones of a dogs head without any fleſh vpon it, puluerized, is ſingular therfore. If it fal out that one of the genitoirs be relaxed & hang down lower than his fellow, it is good to annoint the ſame with the wateriſh ſlime and ſome that commeth from ſhel-ſnails; ſo they ſay it is an excellent remedy: if there be
C any foule and malignant vlcers in thoſe parts running with filthy matter, the aſhes of a dogges head freſh killed are ſingular to heal the ſame: ſo are the little broad and flat ſhel-ſnails bruiſed and incorporat with vineger, if either the ſame or the aſhes be applied thereto, alſo the honey wherein bees haue been killed mixt with roſin: the naked ſnailes likewiſe which bred (as I ſaid in Barbarie, in caſe they be ſtamped & incorporat with the pouder of Frankincenſe & the white of an egg; with this charge, that the ſaid cataplaſme be not taken off in 30 daies, by which time it will be ready to fall away of it ſelfe. Some in ſtead of frankincenſe, put the bulbous roots of ſmall onions or ſcallions. For thoſe who be troubled with the * wateriſh rupture, it is thought * *Hydrocelicis.*
that the ſtar-lizards Stilliones be wonderfull good, in caſe their head, feet, and guts, bee taken forth, and the reſt of the body roſted; but the patient had need to eat of this meat often, and ſo it
D helpeth thoſe who cannot hold their water. The like opinion there is of dogs greaſe incorporat with * Alume de plume, if the patient take thereof to the quantity of a bean: as alſo the ſnailes * *Alumine ſcbiſto.*
of Barbary burnt, fleſh, ſhell and all, ſo as the patient drink their aſhes. Furthermore, it is ſaid, that the tongues of three geeſe roſted and eaten, is a ſpeciall remedy for this infirmity: and *Anaxilaus* is he that deuiſed this receit.

Touching the biles called Pani, ſheepes tallow incorporat with ſalt torrifacted, is ſingular good to breake them: but mice dung, with the fine pouder of frankincenſe & orpiment or red Arſenicke, is as proper to reſolue them: likewiſe the aſhes of a lizard, and the lizard it ſelfe ſplit aliue and applied hot thereto. In like maner cheeſlips or ſows ſtamped and incorporat with the right terpentine, to the quantity of a third part, & ſo brought into a cataplaſme. Some there be
E who to ſhell-ſnailes punned, adde the common bole-armoniack. Alſo the aſhes of the void ſhels only alone without the ſnailes mixt with wax, are of a reſolutiue and diſcutient facultie. In like manner, a liniment made either of pigeons dung only, or els incorporat with barly meale or oatmeale. The flies called Cantharides mixed with quicklime, are a good potentiall cauterie, and open ſuch biles as well as the Chirurgians launcet. The botches or ſwellings in the ſhare, a liniment made with the ſmall ſhel-ſnailes and hony, doth aſſuage and mitigate. Finally, to keepe down the veins from ſwelling which be called Varices, it is good to anoint the legs of children with the blond of a lizard, but this muſt be don, whiles both the children and the party who hath
t he doing thereof be faſting.

F

Chap. IX.

¶ *Receits for the gouts of feet and hands: and generally for the pains or diſeaſes of ioints whatſoeuer.*

THe tried greaſe of vnwaſhed wooll incorporat with womans milk and white lead, is a very proper liniment to mitigate the pain of the gout: ſo is the liquid dung of ſheep when they

run out behind. Their lights likewiſe, or a rams gal incorporat with their ſuet. Some ſplit mice G
and lay them hot to the place: alſo the bloud of a weazil reduced into a liniment with Plaintain:
and the aſhes of a weazill burnt aliue, tempered with vineger and roſe water, and brought into a
thin liniment, ſo that the place affected may be dreſſed with a feather. Others temper wax and
oile of roſes together. And there be again who vſe dogs gal for this purpoſe, but in any wiſe the
hand muſt not touch it, but the place ought to be annointed with a feather: likewiſe hens dung,
and the aſhes of earthworms mixt with hony, with this charge, that this cataplaſme be not vn-
done or remoued before the third day. Howbeit it is thought better by ſome, to apply the ſame
aſhes with water: but by others to vſe vineger in meaſure and with moderation, together with
3 cyaths of hony, hauing before hand annointed with oile roſat the gouty feet. It is ſaid moreo-
uer that to drink broad ſnails, is a ſingular medicine to take away the gout of the feet, or the pain H
of any other ioint: the manner wherof is to ſtamp 2 at a time, and drink them in wine: ſome ap-
ply the ſame in a liniment with the juice of the herb Parietary. Others content themſelues to
bruiſe them and ſo to incorporat them into a cataplaſme with vineger. Many are of opinion,
that the gout may be cured, if the patient vſe oftentimes to take the ſalt, which together with a
Viper was calcined in a new earthen pot: as alſo that it is very good to annoint the feet with Vi-
pers greaſe. And they affirme conſtantly of a Kite that hath bin kept long dried, if the patient
reduce it into pouder, and drink thereof in water as much as three fingers will well take vp, it
cureth the gout throughly. But if the feet be full of bloud and ſwollen withall, they vſe Nettles
thereto. Some there be that take the yong feathers of a Kite ſo ſoon as they put forth, and ſtamp
the ſame with Nettles to a liniment. The very dung likewiſe that theſe foules do meut, ſerueth I
in ſtead of a good liniment to annoint the painful gout in any joint whatſoeuer: ſo do the aſhes
of a weazill or of ſhell-ſnailes burnt or calcined and incorporate either with Amydum or gum
Tragacanth.

If a man haue gotten a rap or ruſh vpon any joint, there is not a better thing for to cure it than
copwebs: ſome chuſe for this intention, thoſe which be wouen by the ſpiders of aſh colour: like
as to vſe the aſhes of Pigeons dung with parched barly groats and white wine. In any diſlocati-
on of joints, the moſt preſent remedy that is knowne, is ſheepes ſuet tempered with the aſhes of
of womens haire burnt. This ſuet likewiſe ſerueth well to bee applied with allum to the kibes
*Pura, vlcera. of the heels: ſo do the aſhes of a dogs head, or of mice dung. But in caſe there be any *vlcer there
not yet putrified, adde wax thereto, and it will skin vp and heale the ſame: and the like effect is K
wrought by the light aſhes of criquets burnt and tempered with oile, or els with the aſhes of
the wild wood-mice mixt with hony: of earth-worms alſo incorporat with old oile: & laſtly, ma-
ny apply therto the ſnails that be found naked & without their ſhels. And verily, the aſhes of
ſuch ſnails burnt aliue, heale all ſores of the feet: howbeit, if the feet be galled & but lightly ex-
coriated, there is not a better thing for them than the aſhes of hens dung, or pigeons dung in-
corporat with oile. If the ſhoo hath rubbed off the skin, or fretted any part of the foot, the aſhes
of an old ſhoo-ſole are ſingular good to heal the ſame: ſo are the lights of a ram or lambe. The
pouder of a caples teeth is a ſoueraigne and ſpeciall remedy for the feet, if there ouſe out any
matter from vnder the nailes. The bloud of a green lizard healeth the galls vnder the foot, yea,
and cureth throughly the ſore feet both of man and beaſt, if they be dreſſed therewith. L

As for the corns and agnels which ariſe about the feet, it is good to beſmeare them with the
*Muli mulæue: vrine of * Mule or mulet, together with the mire in the very place where they ſtaled: alſo with
Some take *mu-* ſheeps dung. The liuer or bloud of a greene lizard applied vpon ſome flocke to the place, or vp-
lus to be the on a locke of wooll. Some vſe in that order, earth-wormes ſtamped with oile, or the head of the
mule ingen- ſtar-lizard Stellio, incorporat in oile with a like quantity of Agnus Caſtus. Laſt of all, others
dred by a male take Pigeons dung ſodden in vineger, and lay the ſame to the place.
aſſe & a mare:
but *Mula*, to be Touching werts, of what ſort ſoeuer they be, there is not a more proper thing to make them
that mule that fall off, than to bathe them well with the vrine, durt and all, of a dog where he lately piſſed: or
commeth of to apply thereto a ſalue of dogs dung aſhes and wax: it is not amiſſe alſo to lay to them ſheepes
an horſe and dung, or to rub them wel with Mice-bloud new killed: or to apply a Mouſe ſplit along the mids M
female aſſe, aliue: the gall likewiſe of an Vrchin: the head of a lizard: or the bloud: or laſtly, the aſhes of a li-
zard calcined: the old ſlough of a ſnake alſo. Laſtly, hens dung incorporat with oile and ſalnitre.
If all theſe medicines fail, begin the cure new with Cantharides incorporat with wilde grapes
called Vvæ taminæ: this is a corroſiue, & wil eat them out: but when they be thus fretted & ex-

ulcerat

20030
copy 1

A ulcerat, the cure muſt be followed with thoſe appropriat means which I haue ſet downe before in the healing of vlcers.

Chap. X.

¶ *Medicines appropriate for diuers and ſundry diſeaſes which poſſeſſe the whole body.*

Returne we now to the cure of thoſe maladies which are incident not to this or that member, but to the whole body. Firſt and foremoſt, the Magitians ſay, that the gall of a blacke dog (a dog I ſay and not a bitch) is a ſingular countercharme and preſeruatiue againſt all
B ſorceries, inchantments, and poiſons, which may indanger a whole houſe, in caſe there be a perfume made therewith to purifie the aire thereof; yea, and to hallow and bleſſe it againſt all ſuch dangers. The like effect (ſay they) we are to look for, if the walls of the ſaid houſe be ſprinckled or ſtriked with the bloud of the ſaid black dog; with this charge, To burne vnder the threſhold or dore ſell at the entry of the ſaid houſe the genitall member of the ſame dog. Men may maruell well enough at theſe fooleries and abſurdities of theirs: but ſurely wonder leſſe will they thereat, who know what ſtore they ſet by illfauored ticks, the fouleſt and naſtieſt creatures that be: and why do they thus magnifie ſo filthy a vermine? becauſe (forſooth) this creature onely of all others hath no paſſage at all for the voidance of excrements, ſucke it neuer ſo much: and no way there is but death with them when they are thus full, but ſo long only as they continue hun-
C gry and faſting: and yet they ſay, that they wil indure ſo a long time, euen a whole ſeuen-night together with abſtinence and ſpary feeding: mary let them feed ſtil to the ful, they wil not hold out ſo long, but burſt again in fewer daies ſpace. Well, this tick, ſo filthy as it is, and of ſo admirable and ſtrange a nature in their conceit, they hold to bee of exceeding vertue to appeaſe all paines and torments of the body whatſoeuer, in caſe a man take one of them, with the left eare of a dog, and carry them hanging to ſome part about him. And more than that; theſe Magitians take marks by it, & preſage of the life or death of their patients; for they hold it for a certain and aſſured ſigne of life, if one hauing a ticke about him, ſtand at the beds feet where the ſicke man lieth, and when he asketh him how he doth, and where he is amiſſe, &c. if the patient make anſwer readily vnto him; but in caſe hee make no anſwer at all, then ſurely hee ſhall die there is
D no remedy. But take this withall: this ticke muſt be plucked likewiſe from the left eare of a dog, and the ſame dog ought to be cole-blacke without any ſpecke of other colour. And *Nigidius* hath left in writing, that dogs will not all day long come neare vnto a man nor abide to ſee him, who hath plucked a ticke from an hogge. But to returne vnto our Magitians: they affirm, that ſuch as be lunaticke and beſide themſelues, ſhall come againe to their right wits and ſences, in caſe they be ſprinckled with the bloud of a moule. They auouch moreouer and ſay, that if one ſeeth the tongue, eies, gall, and guts of a Dragon in wine and oile, and permit this decoction to coole all night abroad in the open aire, it is a ſoueraigne medicine to chaſe away ſuch bugs, ſpirits, and goblins, wherewith folke be haunted and affrighted in the night ſeaſon, if they bee annointed therewith all ouer their bodie, morning and euening. *Nicander* writeth, that whoſoeuer
E carry about them the ſerpent Amphisbæna dead, or no more but the very skin thereof hanging faſt to any part of their bodies, they ſhall finde it to bee a moſt ſoueraigne remedy for any through cold or chilling fitt that hath ſurpriſed them. Nay hee ſtaieth not there, but addeth moreouer and ſaith, that if the ſaid ſerpent be bound vnto any part of a tree that is to bee felled and laid along, the workemen that hew at the butt thereof, ſhall feele no cold all the while; and the tree by that meanes ſhall the ſooner and more eaſily bee cut downe and ouerthrowne. No maruell therefore, if this ſerpent aforeſaid dare leaue his neſt, and commit himſelfe to the cold weather; for he ventureth firſt to come abroad, and is to be ſeene aboue ground before the Cuckow begins to ſing. But ſince I haue made mention of the Cuckow, there comes into my minde a ſtrange and miraculous matter that the ſaid Magitians report of this bird; namely, that if a
F man the firſt time that he heareth her to ſing, preſently ſtay his right foot in the very place where it was when he heard her, and withal marke out the print and juſt proportion of the ſayd foot vpon the ground as it ſtood, and then digge vp the earth vnder it within the ſaid compaſſe, looke what chamber or roome of the houſe is ſtrewed with the ſaid mould, there will no fleas breed there.

They ſay moreouer, that the fat which is fleeted or skimmed from the broth wherin dormice G
and rats be ſodden, is excellent good for thoſe that be affraid of the palſie, and ſubiect thereto:
alſo that Sowes or Cheeſlips called Milliped æ, prepared and taken in drink, in manner as I ap-
pointed for the ſquinancie, are ſingular for thoſe that find themſelues to be falne into a phthy-
ſick or conſumption of the lungs: ſo is a green Lizard (by their ſaying) ſodden in three ſextars
of wine, till there be but one remaining, if the patient take thereof a ſpoonfull at a time euery
day, vntill he feele himſelfe wariſhed and fully cured. Others aſſure vs of as great effect, by drin-
king the aſhes of ſhell-ſnailes in wine.

As for the falling ſickneſſe, the tried greace of ſweatie and vnwaſhed wooll tempered with a
little myrrhe, ſo that the quantitie of them both ariſe to the bigneſſe of an hazell nut, cures the
ſame, if it be taken infuſed and diſſolued in two cyaths of wine, preſently after the patient haue H
ſwet and be come out of the baine. For the ſame diſeaſe, they ordaine the cullions or ſtones of a
ram which haue bin kept long and dried, to be reduced into pouder to the weight of halfe a de-
nier Romane, and ſo to be taken in water, or elſe in one hemine of aſſes milke; howbeit with this
charge, That the patient forbeare drinking of wine fiue daies after, and as many before. Fur-
thermore, they do highly commend the drinking of ſheeps bloud: likewiſe their gall in milke, but
principally if it be the gall of a lambe: a ſucking whelpe is very good in this caſe, if it be taken
with wine & myrrhe; but firſt the head and feet muſt be cut away. Some for this purpoſe drink
the ſurots or rough werts growing to the legs of a mule, in three cyaths of oxymell: others giue
order to drinke in vinegre the aſhes of the ſtar-lizard Stellion, which breedeth beyond-ſea: and
the tender skin or ſlough of the ſaid Lizard (which ſhe caſts in the ſame maner as a ſnake doth) I
taken in drink, helpeth much. Some Phyſitians are ſo venturous and bold, that they haue giuen
to thoſe who be ſubiect to the falling ſickneſſe, the verie Stellion it ſelf, after it is rid and clen-
ſed from the garbage or guts, and ſo kept dried; appointing their patients to drinke the pouder
thereof in ſome conuenient liquor, through a pipe of a cane: others appoint it to be roſted vpon
a wooden broch or ſpit, and ſo to be eaten for meat. And ſeeing I haue occaſion thus to write
of this Stellio, and the skin thereof, it were very conuenient and neceſſarie in this place to ſhew
the manner how the ſaid ſlough (which is growne ouer him in winter) may be gotten from him
when he hath turned himſelfe out of it, conſidering that he vſeth commonly to deuoure and eat
it himſelfe, becauſe it ſhould not do any man good; for there is not a beaſt againe more ſpight-
full to mankind, and enuious of our commoditie: inſomuch as this word * Stellio is growne to K
be a reprochfull tearme among vs. Well, to meet with this skin of his (as craftie as he is to be-
guile men of it) they vſe to obſerue in hot ſummer daies, his neſtling hole into which he is wont
to retire himſelf: and ordinarily they find it to be in ſome hollow crannies about doors & win-
dows, or elſe vnder vaults and ſepulchres: when they haue eſpied where it is, they wait for the
prime of the Spring, they ſet iuſt againſt his hole certaine little cages or leaps made of clouen
and ſliued reeds, and the ſame wrought and wouen good and thicke: and in very truth he delight-
eth to get betweene the ſtreights and narrow paſſages of the ſtaues and windings, whereof the
ſaid cages are made, for by means therof he may the better ſlip himſelfe out of that coat which
cloggeth his body and maketh him vnweldie: and thus in getting through the ſaid lattices, he K
leaueth the ſame behind him: but after he hath thus done, hard beſted he is, for back he cannot
the ſame way again for to eat the ſaid ſlough. Certes, there is not a medicine preferred before
it, for the falling ſicknes: and yet good reckoning there is made of the brains of Weazles which
haue bin kept and dried: yea and of the liuer ſo prepared, if they be reduced into pouder and ſo
taken in drinke: yea their very genetoirs, and bagg or matrice wherein they beare and breed
their young; or their maw likewiſe ſaued, dried and condite with coriander ſeed, are ſingular
good for this maladie, as I haue heretofore noted: and ſo are their aſhes. Some are of opinion,
that it is good eating of them whole as they be, eſpecially the wild kind, without any ſuch pre-
paring & dreſſing, but others eſteem ferrets to be as effectual as they, for the falling euil. More-
ouer, it is ſaid: that the green lizard eaten with ſome ſharp ſauce that quickneth appetite, is ſin-
gular good in this caſe, but the heads and feet muſt be firſt taken away. Moreouer, the aſhes of M
ſhel-ſnailes together with line-ſeed & nettle-ſeed, brought into the form of a liniment with ho-
ny, cure thoſe throughly of this diſeaſe who are all ouer annointed therewith. But I like better
yet, that for this maladie one ſhould carrie about him the taile of a dragon bound within a buck
or does skin to ſome part of his body, with the ſinews of a ſtag or hind: or els to tie vnto the left

arme

* *Stellionatus crimē* as much as conſenage, or cony-catching.

20030
copy 1

A arme the little ſtones that be taken out of the craw or giſier of yong ſwallows: for it is ſaid, that ſo ſoone as the old ſwallow hath hatched her birds, ſhe giueth them ſuch little ſtones to ſwallow downe: but in caſe this doſe be taken in the very beginning, and that the firſt time that one is falne of this diſeaſe, there be giuen to him for to eat, the yong ſwallow that the dam hatched firſt, he ſhall be deliuered from it clearly and neuer haue more fits. But at any time after, ſwallowes bloud and frankincenſe, or els the heart of a ſwallow freſh killed, cureth them that be ſurprized with this malady, if they ſwallow the ſame downe. Moreouer, it is ſaid, that the little ſtone found in a ſwallows neſt, if it be but applied vnto man or woman that is falne of this ſickneſſe, it will raiſe them out of the fit, and bring them againe to themſelues immediatly; but if they carry it tied to any part about them, they ſhall neuer haue fit againe. Much talke there is
B alſo of a kites liuer, that it ſhould be of ſingular operation to this effect, if it be eaten: as alſo of a ſerpents old skin which ſhe hath caſt off, that it wil do no leſſe. The heart of a vulture ſtampt together with the own bloud, and giuen in drink 3 weeks together, worketh wonders in this diſeaſe. So doth the heart of the yong bird of a vulture, if the patient weare it about his arme, or hang it at his necke: but then they giue counſel, to eat the fleſh of the vulture it ſelfe, & eſpecially when he hath eaten his ful of mans fleſh. Some of them ordaine the breſt of a vulture to be drunk, but it muſt be out of a cup or maſer made of the wood of Cerrus: and others there be who to this purpoſe cauſe the ſtones of a cock to be kept and dried, and the ſame to be giuen to the patient in water and milk, after he hath abſtained fiue daies from drinking wine. To conclude, there haue bin of them, that preſcribed vnto their patients in this caſe, 21 of theſe ſandy or red-
C diſh flies (but they muſt be dead ones) for to be taken in drinke: howbeit, if they were but of a feeble complexion, they gaue fewer of them.

CHAP. XI.

¶ *Againſt the Iaundiſe and Phrenſie. Againſt Feauers and the Dropſie.*

THe excrement ingendred in the eares, called commonly Eare-wax, mightily withſtandeth the jaundiſe: ſo doth that ordure alſo which gathereth about the vdders & teats of ſheepe and goats, if the patient drink thereof to the weight of one denier in two cyaths of wine, with ſome myrrh, though it be neuer ſo little. the aſhes of a dogs head calcined, taken in honied
D wine: one of theſe ſows or Cheeſlips with many feet, in one hemine of wine: earthworms in honied vineger with myrrh, be all excellent for the ſaid diſeaſe. Moreouer, it is ſaid, that a hen with yellow feet is very good therfore; in caſe the ſaid feet be cleanſed and waſhed firſt in faire water, afterwards bathed and rinſed in the wine that the patient is to drink. The brains of a Partridge Ægle, or other birds of prey, taken in three cyaths of wine, is very proper alſo therefore. The aſhes of dates; thoſe alſo of the entrails of ſtock-doues, giuen in honied wine to the quantity of three ſpoonfuls, are ſoueraigne in this malady: likewiſe the aſhes of ſparrows burnt in a fire made of vine-wood, work the ſame effect, if they be taken in mead to the quantity of 3 ſpoonefuls. A bird there is called in Greeke Icterus, of the yellow colour which the feathers carry; which if one that hath the jaundiſe do but looke vpon, he or ſhe ſhall preſently be cured thereof, but the
E poore bird is ſure to die for it: I ſuppoſe that this is the ſame bird which in Latine is called Galgulus.

As for the Phrenſie, it ſeemes that the lights of a mutton, applied hot round about the head, and ſo kept faſt, is ſoueraigne to bring their heads againe into temper, who are beſides themſelues. Say that true it were, that not only the brains of mice giuen in water to drink, or the aſhes of a weazil, but alſo the fleſh of an vrchin kept in ſalt or dried, are very good for ſuch as are bereft of their right wits; who will venture to giue them theſe medicines, be they neuer ſo certain and aſſured? For as touching the aſhes verily of Scrich-owls eies calcined (which theſe Magitians ſo highly commend for the phrenſie) I take it to be one amongſt many other of their illuſions, whereby they mocke and abuſe the world. But aboue all, the courſe that they take in the
F cure of Feuers, ſauoreth nothing at all of Phyſick, which indeed is oppoſite to all their rules and proceedings: for they haue diuided and digeſted the ſame into all the 12. ſignes in the Zodiack, according as the Sun or Moone paſſeth through any of them. All which, is nothing els but a meere mockerie to be rejected and vtterly condemned, as I will plainely proue and ſhew to the view of the eye by ſome few examples and inſtances gathered out of many. For in the firſt

place they ordain, that when the Sun is in Gemini, the combs, the eares, the nailes, and clawes of G
cocks ſhould be burned, and the aſhes thereof tempered with oile, wherewith the ſicke perſons are to be annointed all ouer: but if the moon do paſſe through the ſaid ſign, the ſame cure (they ſay) is to be done with the aſhes that come of their barbs & ſpurs: whiles either Sun or Moone be in Virgo, the cure doth alter, and is to be wrought with barly corns in the ſame manner vſed. But how if either of theſe 2 planets bee in Sagittarius? then the wings of a Bat muſt ſerue the turne. In caſe the moone be entred into Leo, they imploy the leaues and branches of the Tamariske; mary it muſt be the tame and garden Tamarisk in any caſe. Laſtly, if ſhe be in Aquarius, they preſcribe the coles made of box wood, punned and puluerized. Certes, I purpoſe not to run through all their receits: ſuch onely as are found and approued good, or at leaſtwaies carry ſome ſhew and probability thereof, I am content to ſet downe: as namely, when they giue order for H
ſtrong odours and perfumes to be applied vnto patients lying of a lethargy, for to awaken and raiſe them out of their dead ſleepe: among which peraduenture, the ſtones of a weazill dried and long kept, or their liuer burnt, may doe ſome good. And whereas they thinke it conuenient to apply hot vnto their heads all about, the lungs of a Mutton, they ſpeake not altogether beſides ſenſe and reaſon.

As for quartane agues, foraſmuch as it is often ſeen, that all the phyſicke that is vſed about them doth little good or none at all, be a Phyſitian neuer ſo Methodical, Rational, & Diligent, yea, though he viſits ſuch patients ordinarily, & be preſent with them by their bedſides: in that regard I wil not ſtick to relate many of their medicines and receits for this diſeaſe; beginning
firſt with thoſe that are locall, and outwardly to be applied, hanged, or worne about any part of I
the body. *Imprimis*, they ſay, that the duſt or ſand wherein any hawke or bird of prey hath basked or bathed her ſelfe, is ſingular good for the quartane ague, if the patient weare it in a linnen cloth tied with a red thred. *Item*, the longeſt tooth in the head of a cole-black dog, is very proper for this purpoſe. There is a kind of baſtard weſps, which the Greeks thereupon cal Pſeudoſpheces, and ordinarily they do flie alone, and not in troupes as others doe; which, if they be caught with the left hand, and hanged about the neck vnder the chin, do cure quartans, as ſome Magitians ſay: howbeit, others attribute this effect to one of theſe weſpes, which a man ſaw firſt the ſame yeare. Cut the head of a Viper off, or take out the heart aliue, and wrap the one or the other within a little linnen rag, and carry it about you, the quartane ague will be gone anon, by their ſaying. Some of them take only the little pretty ſnouts end of a mouſe, or the very tips of K
the eares, and injoin the patient to lap the ſame in a red carnation coloured cloth, and ſo to carry it about him; but then the mouſe muſt in any caſe be let go again and not killed. Others pluck out the right eie of a green lizard aliue; which done, within a while after they chop off the head: then they infold them both in a piece of goats skin, and giue the patient in charge to haue the ſame about him: and many there be, who by the direction of magitians carry about them in like manner for the ſame purpoſe, one of theſe flies or Beetles that vſe to roll vp little bals of earth: and in very truth, in regard of this kind of beetle, the greater part of Ægypt honour all beetles, and adore them as gods, or at leaſtwiſe hauing ſome diuine power in them: which cerimoniall deuotion of theirs, *Appion* giueth a ſubtill and curious reaſon of, for he doth collect, that there
is ſome reſemblance between the *operations and works of the Sun, and this flie: and this hee L
ſetteth abroad, for to colour and excuſe the ſuperſtitious rites of his countrymen. Howbeit, the Magitians imploy in the cure of a quartan ague, another kind of them *which hath little horns turning backward, but they muſt be gotten likewiſe with the left hand, or els they will doe no good. As for the third ſort, ſpotted with white, and called in Latine by the name of Fullo, they appoint one of them to be ſlit through in two, and the 2 pieces to bee tied to both armes of the patient; whereas thoſe of other kinds, they bind to the left arme only. Semblably they ſay, that the heart of a ſnake taken out of her body aliue with the left hand, cureth the quartan, if the patient carry it about him: as alſo, that who ſoeuer taketh foure of the knots or joints of a ſcorpions taile, together with the ſting, and carrieth the ſame about him inwrapped within a piece of
black cloth, with this charge, That for 3 daies ſpace hee doe not ſee either the ſcorpion which M
was let go, nor the party who tied the ſaid cloth and that which is within it about him, he ſhal be deliuered from the quartan ague: but after the returne of the third fit, the patient muſt hide this clout and the joints aforeſaid, & bury them in the ground: ſome there be who lap a caterpiller in a little piece of linnen cloth, & bind the ſame thrice about with linnen thred, making three

* Haply, becauſe all theſe beetles be coſiſted of the male ſex, & none of them female: for in thoſe little roundles of earth there breed grubs, which turne to be in the end beetles.

* This beetle he called before *Taurus*, i. Bull.

20030
copy 1

A three knots thereof, ſaying at the knitting of euery knot, that this they do to cure him or her of a Quartane feuer. Others carry about them a naked ſnaile in a little piece of fine leather: or elſe foure heads of ſnails cut off and incloſed within a ſmall reed. Many thinke it better to infold one of theſe ſows or Cheeſlips within a locke of wooll, and ſo to carry it about them againſt the quartane, or els the little grubs or worms whereof come the oxe-flies, before their wings bee grown. And there be that for this purpoſe fit themſelues with thoſe ſmal worms couered al ouer with a kind of down or Cotton, which are found in thickets, & among buſhes or ſhrubs. Some of theſe Magitians giue direction otherwhiles to take 4 of the ſaid wormes incloſed within a wal-nut ſhel, & to bind them to ſome part of the patient, or els the ſnails which be found naked without their ſhels. Others put a liue Stellion or ſtar-lizard in ſome little casket or box, & lay
B the ſame vnder the pillow or bolſter where the patient laieth his head: but when the ague beginneth to decline and is like to go away, they let the Stellion go againe at liberty. They preſcribe likewiſe to ſwallow downe the heart of a ſea-gull or cormorant, taken forth of the bodie without any knife or inſtrument of yron: if not ſo, to keepe the ſame dried, to beat it to pouder, and then to drink it in hot water. The hearts of ſwallows condite in hony, and ſo eaten, bee excellent good for the quartane ague, as our Magitians ſay. And yet ſome of them make no more ado, but giue of their dung to the weight of one dram, in 3 cyaths of goats milke and ews milk, or els of wine cuit, before the acceſſe come. Howbeit, others would haue the Swallowes themſelues to be eaten whole without any dreſſing at all. The people of Parthia drink for the quartan ague the ſixt part of a denier weight of an Aſpis skin, with the like poiſe of pepper, & they hold
C it to be a ſoueraigne remedy. *Chryſippus* the Phyloſoper was of opinion, and ſo he hath put down in writng, That to carry one Phryganium tied to ſome part of the body, is excellent for the quartan. But what liuing creature he would meane by that ſame Phryganium, neither hath he himſelfe deſcribed, nor euer could I meet with any man that knew it: howbeit, I thought it good to ſet downe this remedy, being thus deliuered by ſo graue an Author as *Chryſippus* was, to ſtir vp the diligence of others, if haply there be any ſo induſtrious as will take paines to ſearch farther into the thing, and learne what it might be.

In any of theſe long diſeaſes which be called Chronique, it is commonly thought, That to eat the fleſh of a Crow, & to apply vnto their body their * neſt, is moſt excellent to bring them to an end.

* *Nidum.* Some reade *Nitrum.*

D As for Tertian agues, it were an eaſie matter to try the experiments of ſuch receits as are giuen out for them: conſidering how the poore patients in hope of eaſe are willing enough & delighted to be doing and working concluſions: and namely to ſee whether the copweb, neſt, and all, of that ſpider which they cal * Lycos, incorporat with roſin and wax, & ſo appliedas a frontale to the forehead and temples on both ſides of the head, will do any good to rid them away? Certes, ſome vſe to wear about them the ſpider it ſelfe, incloſed within a quil or piece of a reed: in which ſort it is reported to auaile much in the cure of other feuers. Alſo it is thought, That a green lizard hung about the neck aliue in ſome box ſufficient to receiue it, is as effectuall. And theſe kind of medicines they affirm to be of great efficacy for to driue away thoſe agues which by way of relapſe vſe often to return againe when they were thought to be cleane gone.

* *i.* Wolfe. Supposed to be our common ſpider that hunteth flies.

E Touching the dropſie, the tried greaſe of ſweaty wooll taken in wine with a little Myrrh, ſo that the whole ariſe to the quantity of an Hazel nut, is ſuppoſed to be a ſingular receit: but ſome put thereto Gooſe greaſe alſo and oile of Myrtles. The filthy ordure that gathereth about Ewes vdders, hath the ſame effect. Likewiſe, the fleſh of an vrchin long kept in pouder or otherwiſe, and eaten, doth much good. To conclude, it is thought, that if the belly be rubbed well and annointed with that which a dog doth vſe to caſt by way of vomit, it helpeth thoſe that bee in a dropſie, for it is reported to haue a ſpeciall vertue to draw a water, and to drie vp the ſuperfluous humidity ingendring that diſeaſe.

CHAP. XII.

F ¶ *Medicines for S. Anthonies fire, Carbuncles, fellons, burns, crampes, or contractions of ſinewes.*

THe ſuet or greaſe of vnwaſhed wooll incorporat with oile of Roſes and Tutie, is a proper liniment for S. *Anthonies* fire: ſo is the bloud of a tike, and earth-wormes reduced into an vnguent with vineger: but eſpecially theſe Cricquets, cruſhed and wrought within ones

hand

hand to the conſiſtence of an vnguent and ſo applied. And this medicine laſt mentioned, is paſ- G
ſing effectuall for the party himſelfe that hath the handling of it: for it aſſureth him aforehand,
that he ſhall not fal into the ſaid diſeaſe in a whole yere following: but this Criquet muſt bee
digged out of the ground with ſome inſtrument of yron, and the earth & all to be taken vp with
it, for to ſerue in this cure. Moreouer, it is ſaid, That gooſe greaſe is very good in this caſe: ſo are
the aſhes of a Vipers head kept dried & then calcined, if the ſame be afterwards applied in form
of a liniment with vineger. The old ſloughs that ſnakes caſt off, reduced into an vnguent with
Bitumen and Lambs ſuet, quencheth this burning humor of S. *Anthonies* fire, if the body be an-
nointed therewith tempered in water, preſently after the baine.

As for Carbuncles, the means to rid them away, is to annoint them either with Pigeons dung
alone, or els mixed with Lineſeed and honied vineger: likewiſe, it is good to make a cataplaſme H
of thoſe Bees which haue bin drowned or killed in their own honey, and lay the ſame vpon the
ſore. Others apply vnto them either a pulteſſe of fried Barley groats, or elſe a pouder made with
their meale. If there be a carbuncle riſen in their priuities, the fattineſſe of greaſie and vnwaſhed
wooll, incorporat in hony and the skales refuſe or cinders of lead, into a ſalue, cureth it: and the
ſame healeth generally all other botches or vlcers in thoſe parts. Sheeps dung that is freſh and
greene, they hold to be ſingular for carbuncles, taken in the very beginning.

All tumors and hard ſwellings, which had need to be mollified, are made ſoft and brought
downe moſt effectually with Gooſe greaſe, or the fat of a Swan.

Moreouer it is ſaid, That a ſpider laid to any fellon, before it be once named what thing it is I
cureth the ſame; but it muſt not be remoued from the place before the third day. The mouſe
called an Hardiſhrew hanged vp aliue vntill it be dead, is very good for theſe fellons, in caſe it
touch not the ground afterward, and that there be 3 circles or turnes made with it round about
the ſore, ſo that withall both the patient and the party that hath this cure in hand, ſpit vpon the
floore three times in the doing thereof. Alſo the dung of Cocke or Henne (that which looketh
reddiſh eſpecially) tempered with vineger & laid to a fellon, healeth it: but the ſaid dung ought
to be freſh and newly meuted. Of the ſame operation and effect is the giſier of a Storke boiled
in wine. Some there be that take certain flies of ſome odde and vneuen number, bruiſe and work
them into the conſiſtence of a ſalue, with their *ring-finger, and therewith apply them to the
fellon. Others vſe for the ſaid purpoſe the filth ingendred in ſheeps ears: old ſheeps tallow mix- K
ed with the aſhes that come of womens haire, reduced into a liniment, ſerueth to cure the ſayd
accident; ſo doth rams ſuet mixed with the aſhes of a pumiſh ſtone calcined, and a like quantity
in weight of ſalt.

* *Medico*, i. the fourth or next to the little finger.

As for burns and ſcaldings, the aſhes of a dogs head burnt, are ſingular good to cure the ſame:
ſo be the aſhes of Dormice tempered with oile: ſheeps treddles alſo mixed with wax: the aſhes
of mice and ſhel ſnails; and this medicine will skin them ſo cleane, that there ſhall no ſcarre re-
maine afterwards to be ſeen. In like manner, the greaſe of Vipers: or the aſhes of Pigeons dung
calcined and reduced into a liniment with oile.

Touching the nodoſities of the ſinewes, the aſhes of a Vipers head burnt and brought into
an vnguent with the oile Cyprinum, is thought to be a ſouereign medicine for to reſolue them. K
Likewiſe, earth-wormes made into a cataplaſme with honey, and ſo applied vnto the affected
place. But if the ſaid ſinews do ake and be pained, bind vnto them the ſerpent called Amphiſ-
bæna dead, and it will eaſe the griefe. The like effect you may looke for of Vultures greaſe, to-
gether with the giſier of the ſaid foule, dried or ſtamped with old ſwines greaſe or lard, and ſo
reduced into a liniment. And if we may giue any credit to the Magitians, a drinke made of ho-
nied wine, ſpiced with the aſhes of a ſcrich-owles head, together with a Lillie root, will work the
ſame effect.

In contractions of the ſinewes, it is good to eat the fleſh of ſtock-dooues, eſpecially if the ſame
hath bin poudered and kept in ſalt. The fleſh likewiſe of an Hedgehog is as good for crampes
and ſpaſmes: as alſo the aſhes of a Weazil. The old ſlough that ſnakes leaue off, infolded with-
in a piece of a Buls skin or leather made thereof, is good to be worne tied about one for to pre- M
uent this diſeaſe: and more particularly for thoſe ſpaſmes or conuulſions that draw the ſinews
of the neck ſo, as the head is pluckt backward, there is not a better medicine than to drinke the
poiſe of three oboli of a kites liuer dried, in as many cyaths of mead or honied water.

When the skin turneth vp about the roots of the nails, or the excreſcence of the fleſh putteth
the

20030
copy 1

A the fingers to pain,which accidents be called in Latine Reduviæ,and in Greek Pterygia:it were good to vse to them the ashes of a dogs head calcined,or the matrice of a bitch sodden in oile; with this charge,to annoint them aloft with a liniment of butter,made of ewes milke and hony incorporat together. The burse likewise or little bladder, which containeth in it the gall of any beast,is good for this purpose.

If the snailes be ragged and rugged, it is not amisse to apply vnto them Cantharides incorporat with pitch,without reemooving this plaister before the third day:or els to lay vnto them Locusts fried in Goats suet:sheeps tallow also is good therefore. Some mix therwith Birdlime made with Misselto and Purcelane tempered together: others take Verdegris or rust of brasse and the foresaid birdlime,but they remoue not the plaister off in three daies.

B

Chap. XIII.

¶ *Receits for stanching bloud: repressing or smiting backe the swelling incident to wounds: healing of vlcers and greene wounds: and generally for curing of many other maladies. Remedies all taken from dumbe creatures.*

THe suet that commeth from the kell of a mutton,staies any flux of bloud,if it be conueied into the place from whence it issueth: so is their rede, especially if it be the rennet of a yong Lambe tempered with water,either drawn vp into the nosthrils or poured into them:
C this is thought to be such a soueraigne remedie, that when all others haue failed, it hath done the deed. The earthie substance sticking to shell-snailes,hath the same effect:yea,and their verie flesh when they are pulled out of their houses. In case the nose do bleed excessiuely, take the said shell-snailes,bruse them and lay them to the forehead: they will stanch the bleeding: the copwebs also put vp into the nosthrils. As for the brains of a Cocke or Capon,they stop a flux of bloud issuing from the braine. But say that bloud do gush immoderately out of a wound: it is wonderfull how the ashes of horse dung, together with egg-shels, will stop the same, if it be laid thereto.

As for*wounds,the grease of vnwashed wool, incorporat with the ashes of torrified and calcined Barley and Verdegris,of each a like quantitie, and so made into a plaistre,healeth them.
D The same is a soueraign salue for any corrosiue vlcers,be they neuer so maligne & cankerous. It eateth and consumeth the dead flesh about the brims and edges of vlcers, yea,and brings down the excrescence of proud flesh, reducing the same to be euen with the rest about it. The same doth incarnat likewise and skin the place after it is filled vp with yong flesh. If the vlcers proue to be ilfauoured cankers,it is thought,that the ashes of sheeps dung mixed with salnitre, is an effectuall pouder for the same:and as great operation is attributed to the ashes of a Lambs leg bones, but principally if the said sores be of the nature of *Nunquan sana*,and will not skin vp, but scorne all healing plaisters whatsoeuer. Much vertue also is attributed vnto Rams lights in these cases, for it eateth away all the excrescences of ranke flesh in vlcers, and there is not the like againe vnto it,for reducing all vnto an equalitie. The very dung also of sheep heat vnder an
E earthen pan and afterwards wrought into a masse or paste, assuageth the tumour of any vlcers: And it serueth likewise to mundifie and heale fistulaes, as also to rid away the chil-blanes or bloudy fals,which are our night-foes. But of al other,the ashes of an horse head is most forcible in this case,for it consumes all superfluous flesh growing in sores,and heales vp the same afterwards,no Spodium better. And yet it is said,that mice dung is very good therfore:like as the ashes of Weazils dung. The hard callosities in the bottome of vlcers,the Cheeslips or Sowes if they be stamped fresh and reduced drie into pouder,do search throughly:like as all cankers also they cure,if they be incorporat with the right Turpentine and common*Bole-Armoniacke. And these medicines aboue said are singular for those vlcers that be giuen to breed worms,and thereby are dangerous. And seeing I am light vpon the mention of wormes, it would be noted,
F that there be diuerse sorts of wormes which haue wonderfull properties in these cases: For first and formost,the grosse and fat wormes breeding in wood & timber,which the Latins call Cossi, are soueraigne healers of any vlcers whatsoeuer. But if the same be burnt with an equall weight of Annise seed, and reduced into a liniment by meanes of oile, they haue a speciall vertue to cure those sores that be corrosiue,which the Greeks call Nomæ. Earthwormes are great healers, and

**Vulneribus.* Some read: *Vlceribus,i.* Vlcers.

**Sinopide*some take it for *Terra Sigillata*:but it skill th not much,seeing that *Rubrica Sinopica,Terra Sigillata,& Bolus Armena*, yea, and *Terra Lemnia*, little differ in operation,*vis secundum magis & minus*,as the learned think, *Vid. Encelium de re Metallia.*

and ſoon do ſouder greene wounds: in which operation they are ſo effectuall and ſpeedy withal, G
That if the ſinewes be cut quite aſunder, it is a common opinion, that they will conſolidat and vnite them again in leſſe ſpace than a week: and therefore, becauſe they ſhould be ready and euer at hand, many preſerue them for this purpoſe condite in hony. Indeed, when they be reduced into aſhes, they are effectuall to eat downe the hard calloſities growing in the ſides and edges of vlcers, if they be incorporat with Tarre, or the Sicilian hony called Hyblæum. Some vſe them dried in the Sun and tempered with vineger, for wounds: but this cataplaſme they doe not remoue vntill 2 daies be paſt. After the ſame maner, the terrene or earthly ſubſtance of ſhel-ſnails do much good: yea, and taken forth whole as they be out of their ſhels, ſtamped and ſo applied, they conglutinat greene wounds, and ſtay the running farther of corroſiue vlcers. Alſo there is a certain liuing creature, which is called Herpes by the Greeks; the ſame hath a peculiar proper- H
ich alſo is Herpes: ngles and ty to heale any ſore that * runneth on ſtill and corrode as it goeth. For which kinde of vlcers, ſnails, bruiſed ſhells and all, be paſſing good: and the ſame incorporat with Myrrh and Frankincenſe, haue the name to heale ſinewes that be cut in two: Moreouer, the fat of a Dragon dried in the Sun, is very effectuall: like as the brains alſo of a Cock, to heale green wounds, if the patient withall eat ſalt to his meat, which was calcined together with Vipers fleſh: and by this means (they ſay) that any vlcers will ſooner yeeld to the cure, and be healed with more ſpeed. The renowned Phyſitian *Antonius Muſa*, hauing certain Patients in cure vnder his hand, who had vlcers that were thought incurable, preſcribed them to eat Vipers fleſh; and wonderfull it is how ſoone he healed them cleane by that means.

The aſhes of certain Locuſts without wings, called by the Greeks Tryxalides, cauſe the thick I
roufs and eſcars that grow about the brims of vlcers to fall off, and they conſume the hard calloſities thereof applied with honey. The aſhes likewiſe of Pigeons dung tempered with Orpiment or Arſenick and hony, ſerue as a corroſiue to eat away any excreſcence that ought to bee conſumed: the brains of ſchrich-owls incorporat with greaſe, doth wonderfully conglutinat any wounds. As for thoſe morimals, named by the Greekes Cacoethe, the aſhes of a rams ſhanke-bones & legs mixt with breſt milk, is ſingular to heale them, ſo that the ſaid ſores were firſt well and throughly waſhed and bathed with fine linnen cloaths ſoked in ſome conuenient liquour. There is a bird called an Hulat, which if it be ſodden in oile, & ſo reſolued, is good therefore, in caſe the ſame be incorporat with butyr made of ewes milk and hony. If the ſides or brims of any K
vlcer be growne callous and hard, the Bees that are ſtifled and killed in hony, doe mollifie very well. The bloud and aſhes of a Weazill calcined, doe cure the white filthy leproſie called Elephantiaſis. The wounds occaſioned by whipping and ſcourging, the marks alſo and wales remaining to be ſeen black and blew after ſuch laſhes and ſtripes, are done away and go preſently out, with applying thereto a ſheeps skin freſh and newly flaied. If there be any joint bruiſed or cracked, the aſhes of a Sheeps leg bone, burnt, haue a ſpecial vertue to help the ſame: but much better, if they be incotporat into a cerot with wax. Of the ſame operation there is another plaſter made; namely, if there be calcined with the former the jaws of the ſaid Sheep, and a Harts horn: and if the wax be ſoftened and reſolued with oile roſat. When bones bee broken, it is good to K
apply vnto the fracture the brains of a dog ſpread vpon a linnen cloth or inwrapped therein, couering the ſaid cataplaſme with wooll laid aloft, and the ſame eft-ſoones moiſtened and wet throughly [* in ſome aſtringent liquor:] this manner of cure doth ſouder them lightly in
* As oile of roſes, or red wine
14 daies at the fartheſt. The aſhes alſo of field-mice work the like effect as ſpeedily, if the ſame be tempered with honey, or mingled with the aſhes of earth-wormes: which alſo is able to draw forth ſpils of bones, and make them to worke out. The lights of a Mutton and of a Ram eſpecially, reduce skars to their liuely colour againe, ſutable vnto the skinne about: their tallow alſo mixed with ſal-nitre: ſo do the aſhes of a greene lizard: the ſlough that ſnakes caſt off in the Spring boiled in wine: and Pigeons dung tempered with honey, and ſo applied. The ſame medicines do take away the filthy white Morphew, called in Latine Vitiligo, if they be vſed with wine: for which Morphew or infection of the skin, it is good to apply Cantharides, with twice as much of Rue leaues, which the patient muſt indure and abide, lying ſtil vpon the place in the M
Sunne, vntil ſuch time as the skinne begin to riſe in pimples and little bliſters. Afterwards it is needfull to foment and bathe the ſaid place thus offended, yea, and to annoint it wel with oile: which done, to returne againe to the former emplaſtration, and ſo hold on this courſe by turnes for many daies together, but in any wiſe to take heed that the exulceration in this cure

goe

20030
copy 1

A go not ouer deep. For t he ſame morphew, many giue order to make a liniment with flies & the root of docks, and herewith to annoint the places infected with this morphew : alſo, to apply thereto hens dung, I mean as much thereof as is white: for which purpoſe they keep the ſame in oile within horne boxes, for to ſerue the turne as need requireth. Likewiſe, to annoint them with the bloud of bats, or the gall of an Vrchin tempered with water. As for the running ſcalls, the brains of a ſchrich-owle is very good, incorporat with ſalt-petre: but dogs bloud hath no fellow to repreſſe the ſame: like as to kill the itch, the little broad ſnailes ſtamped and brought into a liniment, are ſoueraigne. If there be any ſpill or ſhiuer of arrowes, if any piece of a dart or whatſoeuer els ſtick within the fleſh, which would bee gotten forth, ſplit a liue mouſe in the middeſt, and lay the ſame hot to the place, you ſhall ſee how it will draw the ſame out. But a Li-
C zard paſſeth all the reſt, being in this wiſe ſlit along and diuided: or if the head onely be ſtamped with ſalt, and applied accordingly. There be certain ſhel-ſnailes that creep in troups together for to deuour the yong ſpring and green leaues of plants, which ſerue to this effect, if they be punned with their ſhels and laid to the place. Thoſe alſo that we vſe to dreſſe and eat, if they be taken forth of their ſhels: but if you put thereto the rennet of a yong hare or leueret, it is wonderfull to ſee how effectually they will worke. Snakes bones incorporat with the rennet of any foure-footed beaſt whatſoeuer, within leſſe than 3 daies ſhew the ſame effect, and draw forth any thing that ſticketh within the body. Finally, the flies called Cantharides are much commended for this operation, if they be ſtamped and incorporat with barly meale.

CHAP. XIIII.

¶ Proper remedies for the cure of womens maladies: and to help them for to goe out their full time, and bring forth the fruit of their womb fully ripe and accompliſhed.

THe skin or ſecundine which an Ewe gleaneth after ſhe hath yeaned, and which inlapped the lambe within her belly, prepared, ordered, and vſed (as I ſaid before) as touching goars, it is very good for the infirmities that properly bee incident vnto women and occaſioned by their naturall parts. The dung likewiſe of ſheep, be they rammes, ewes, or weathers, hath the ſame operation. But to come vnto particulars, the infirmity which otherwhiles putteth them to
D paſſe their vrine with difficulty and by dropmeale, is cured principally by ſitting ouer a perfume or ſuffumigation of Locuſts. If a woman after that ſhe is conceiued with child, vſe eft-ſoons to eat a diſh of meat made of cock-ſtones, the infant that ſhe goeth with ſhall proue a man child, as it is commonly thought and ſpoken. When a woman is with childe, the meanes to preſerue her from any ſhift and ſlip that ſhe may tarry out her full terme, is to drink the aſhes of Porkepines calcined: alſo the drinking of a bitches milk maketh the infant within the womb to come on forward & to grow to perfection, before it ſeek to come forth vntimely: alſo, if the child ſtick in the birth, or otherwiſe make no haſte to come forth of the mothers body when the time is come: the skin wherein the bitch bare her whelps within her body, and which commeth away from her after ſhe hath puppied, haſteneth the birth, if ſo be it were taken away from her before
E it touch the ground.

If women in labour drinke milke, it will comfort their loins or ſmal of the back, Mice dung delaied and diſſolued in rain water, is very good to annoint the breſts of a woman, new laied, to break their kernel, and to allay their ouermuch ſtrutting preſently after childbirth. The aſhes of hedgehogs preſerueth women from abortion or vntimely births, if they be annointed with a liniment made of them and oile incorporat together. The better ſpeed and more eaſe ſhall thoſe women haue of deliuerance, which in the time of their trauell drinke a draught of Gooſe dung in two cyaths of water: or elſe the water that iſſueth out of their owne body by the naturall parts a little before the child ſhould be borne, and that out of a weazils bladder. A liniment made of earth-wormes, if the nouch or chine of the necke and the ſhoulder blades be annointed there-
F with, preſerueth a woman from the pain of the ſinews, which commonly followeth vpon childbearing: and the ſame ſend away the after-birth, if when they bee * newly brought to bed, they drink the ſame in wine cuit. A cataplaſme made of them ſimply alone without any other thing, and applied to womens ſore breſts which are impoſtumat, bring the ſame to maturation, breake them when they are ripe, draw them after that they runne, and in the end heale them vp cleane

* *Grauidis, & puerperis.*

and

and skin all again. The ſaid earthwormes alſo if they be drunk in honied wine, bring down milk G
into their breſts. There be certain little wormes found breeding in the common Coich-graſſe,
called Gramen, which if a woman weare about her neck, ſerue very effectually, to cauſe her for
to keep her infant within the wombe the ordinary terme: but ſhe muſt leaue them off when ſhe
drawes neere to the time when ſhe ſhould cry out: for otherwiſe, if they be not taken from her,
they would hinder her deliuerance. Great heed alſo there muſt be taken, that theſe wormes bee
not laid vpon the ground in any hand. Moreouer, there be Phyſitians who giue women to drink
5 or 7 of them at a time, for to help them to conceiue. If women vſe to eat ſnailes dreſſed as
meat, they ſhall be deliuered with more ſpeed, if they were in hard labour: let them be applied
to the region of the matrice or naturall parts with Saffron, they haſten conception. If the ſame
be reduced into a liniment with Amylum and gum Tragacanth, and laid too accordingly, they H
do ſtay the immoderat flux of reds or whites. Being eaten in meat, they are ſoueraigne for their
monthly purgations. And with the marrow of a red Deere they reduce the matrice againe into
the right place, if it were turned a to-ſide: but this regard muſt be had, that to euery ſnaile there
be put a dram weight of Cyperus alſo. If the matrice be giuen to ventoſities, let the ſame ſnails
be taken forth of their ſhels, ſtamped and laid too with oile of Roſes, they diſcuſſe the windi-
neſſe thereof. And for theſe purpoſes before named, the ſnailes of Aſtypalæa be choſen for the
beſt. Alſo for to reſolue the inflation of this part, there is another medicine made with ſnailes,
eſpecially thoſe of Barbarie, namely, to take two of them and to ſtampe them with as much Fe-
nigreeke ſeed as may be comprehended with three fingers, adding thereto the quantity of four I
ſpoonfuls of hony, and when they be reduced all into a liniment, to apply the ſame to the regi-
on of the womb, after the ſame hath been well and throughly annointed all ouer with the iuice
of Ireos, i. Floure-de-lis. There be moreouer, certaine white ſnailes that be ſmall and long with-
all, and theſe be commonly wandering here and there in euery place. Theſe beeing dried in the
Sun vpon tiles, and reduced into pouder, they vſe to blend with bean floure, of each a like quan-
tity. And this is thought to be an excellent mixture for to beautifie their body, and make the
skin white and ſmooth. Alſo, if the itch be offenſiue, ſo as a woman be found euer and anone to
ſcratch and rub thoſe parts, there is not a better thing therefore than the little flat ſnails, if they
be brought into a liniment with fried Barly groats. If a woman with child chance to ſtep ouer
a Viper, ſhee ſhall be deliuered before her time of an vnperfect birth. The like accident wil be-
fal vnto her, in caſe ſhe go ouer the ſerpent Amphisbæna, if the ſame were dead before. And yet K
if a woman haue about her in a box one of them aliue, ſhee ſhall not need to feare the going o-
uer them, though they were dead. And one of theſe Amphisbænes dead as it is, and preſerued
or condite in ſalt, procureth ſafe and eaſie deliuerance to a woman that hath it about her. A
wonderfull thing, that it ſhould be ſo dangerous for a woman with childe to paſſe ouer one of
them which hath not bin kept in ſalt: and that the ſame ſhould be harmeleſſe and do no hurt at
all, if immediatly after it hath bin ſo kept, ſhe ſtept ouer it. A perfume made with a ſnake long
kept and dried, procureth the deſired ſickneſſe of women. The old ſlough of a ſnake, which ſhe
hath caſt, applied vnto the loines of a woman that is in labour, helpeth her to better ſpeed: but
it muſt be remoued preſently after that ſhe is deliuered. Many vſe to giue it vnto women with K
child for to be drunk in wine with frankincenſe: for being taken otherwiſe it cauſeth abortion.
The rod or wand whereby one hath parted or taken off a frog or toad from a ſnake, helpeth wo-
men that be in trauell of childbirth. And a liniment made with the aſhes of the vnwinged Lo-
cuſts called Tryxalides & hony tempered together, helpeth forward their monthly purgations.
The ſpider likewiſe that commeth downe ſpinning from aloft, hanging by her fine thred which
ſhe draweth in a length, if ſhe be caught with the hollow of the hand, bruiſed & applied accor-
dingly, worketh the ſame effect: but take the ſame ſpider winding vp her yearne, and returning
back to her neſt vpward, it wil worke contrariwiſe, & ſtay the fleurs of women. The Ægle ſtone
called A tites, becauſe it is found in an Ægles neſt, preſerueth & holdeth the infant ſtill in the
mothers womb to the ful time, againſt any indirect practiſe of ſorcery or otherwiſe, to the con-
trary. If a woman be in hard labor of childbirth, put a Vultures quill vnder her feet, it will helpe M
her to a more ſpeedy deliuerance. Great bellied women, as it is well knowne & found by proofe,
ought to be very chairy and to beware of rauens egs, for if they chance to goe ouer one of them,
they ſhall fall to labour preſently, aud ſlip an vntimely birth with great danger of their life. It
ſeemeth to many, that the meuting of an Hawke drunke in honied wine, maketh women which

were

20030
copy 1

A were barren before, to be fruitfull. Certes, the greaſe of a gooſe or ſwan doth mollifie any hard rumors, ſchirrhs, and impoſtumations of the matrice and ſecret parts. Gooſe greaſe mixt with the oile of roſes and * Ireos, * preſerueth womens breſts after they be newly brought to bed. In Phrygia and Lycaonia it is found by experience, that the fat of the Biſtard or Horn-owle is verie good for greene women lately deliuered, if they be troubled with the pricking or ſhooting paines of their breſts: but for women that are in danger to be ſuffocated with the riſing of the mother, they haue a liniment alſo made with the beetils or worms called Blattæ. The aſhes of Partridge egs calcined, mixed with braſſe ore called Cadmia, and wax, and ſo reduced into a cerot, preſerueth womens breſts plumpe and round, that they ſhall not be riueled or flaggie: and it is thought, that if a woman make three imaginary circles round about them with a partridge B egg, they ſhall continue knit vp and well truſſed, and not hang downward ilfauoredly: let a woman vſe to ſup them off, ſhe ſhall be both a fruitfull mother of many children, and alſo a good milch nurſe for to reare them vp. Alſo it is a generall receiued opinion, that if womens paps be anointed all ouer with gooſe greaſe, it will allay the griefe and paine thereof: likewiſe there is not a better thing for to diſſolue and ſcatter Moon-calues and ſuch like falſe conceptions in the wombe: or to mitigate the ſcurfe or mangineſſe incident to that member, than to apply to thoſe parts a liniment made of punaiſes bruiſed or ſtamped to the purpoſe.

* *Irino*, as followeth in the next chapter: not *aranео*, as it is in moſt prints.

* From ſwelling, hardneſs, or the ague, as women call it.

Bats bloud hath a depilatorie facultie to fetch off haire, and lett the growing thereof; howbeit ſufficient it is not alone to worke that feat in boies cheeks and chins whom we would keep ſmooth and beardleſſe, except the place be rubbed afterward with the ſeed of rocket or hem-
C lock: and in this manner if they be dreſſed, either no haire at all will come vp there, or els it wil neuer be but ſoft down: it is thought that their brains alſo wil work the ſame effect. Now theſe brains be of two ſorts, to wit, red and white: howbeit ſome giue counſell to mingle with the ſaid brains both the bloud and the liuer. Others there be who ſeethe in 3 hemines of oile a viper, vntill her fleſh be throughly ſodden, and as tender as may be, hauing before rid her from all her bones; and it they vſe for a depilatorie: but firſt they plucke vp all thoſe haires by the roots which they would not haue to grow any more. The gall of an vrchin is a depilatorie, eſpecially if it be mixed with the brains of a Bat, and goats milke. *Item*, the aſhes thereof ſimply, mingled with the milk of a bitch of her firſt litter; ſo that the haires which we would not haue to come againe be plucked vp; or if thoſe places be anointed therewith where neuer yet grew any, none
D ſhall ſpring there afterwards. The ſame effect (by report) hath the bloud of a tick that was taken from a dog: and finally, the bloud or gall of a ſwallow.

Chap. XV.

¶ *Many Receits handled together diſorderly one with another for ſundry maladies.*

IT is ſaid, that Ants eggs ſtamped & incorporat with flies likewiſe punned together, wil giue a louely black colour to the hairs of the eie-browes: alſo if a woman be deſirous that her infant ſhould be born with black eies, let her eat a rat while ſhe goes with childe. To preſerue the haire from being gray and griſle, anoint them with the aſhes of earth-worms and oile oliue
E mixt together. If ſucking babes be wrung or gnawne in the belly, by reaſon of ſome cruddled milk which they draw from their nurſes, or doth corrupt ſo in their ſtomack, it is good to giue them in water the rennet of a yong lambe to drink: but in caſe this accident commeth by cailling of the milk, they vſe ro giue vnto them the ſaid rennet in vineger for to diſcuſſe the ſame. For the paine that they abide in toothing, the brains of an * hare is ſoueraigne to anoint their gumbs withall. It falleth out that yong infants many times be tormented with an vnnaturall heat and burning of their head, called Siriaſis; for to eaſe and cure them thereof, they vſe to take the bones that are found in dogs dung, and to hang them about their necks or arms. Yong infants are ſubiect to ruptures and deſcents of the guts, in which caſe it is good (ſome ſay) to apply a greene lizard vnto their bodies whiles they lie aſleepe, and to cauſe it to bite the place:
F but then afterward the ſaid lizard muſt be tied faſt to a reed and hung vp in the ſmoke: for look how it decaieth and dieth by little and little, ſo ſhall the rupture knit and heale again. The foamie moiſture that ſhel-ſnails yeeld, if childrens eies be anointed therewith, doth not onely rectifie and lay ſtreight the hairs of the eie-lids which grow crooked into the eies, but alſo nouriſheth & cauſeth them to grow. The aſhes of burnt ſhell-ſnailes reduced into a liniment with

* *Leporis* or *pecoris*, (i.) of a Sheepe.

kincenſe and the white of an egg,doth in the ſpace of 30 daies cure thoſe that are burſten belli- G
ed. In the little horns of ſhell-ſnails there is found a certaine hard ſubſtance reſembling grit or ſand,which if it be hanged about a youg infant,is a means that it ſhall breed teeth with eaſe. The aſhes of ſnail ſhels when the ſnails are gon,incorporat in wax,and applied to the ſeat of the fundament,putteth backe the end of the tiwill that is fallen down and ready to hang out of the body: but you muſt not forget to mingle with the ſaid aſhes the bloudy ſubſtance that is let out of a vipers brains when her head is pricked. The braines of a viper if they be put in a little fine skin,& worn by a yong child,helpeth it to breed teeth without any great pain:for the ſame purpoſe ſerue alſo the teeth of ſerpents,ſo they be choſen the biggeſt that are in their heads:ra-uens dung wrapped in wool and hung to any part of yong infants,cureth the chin-cough.

Some things there remain as touching this argument,which hardly methinks I ſhould not H
handle ſeriouſly & deliuer in good earneſt:howbeit ſince there be diuers writers who haue put them down in writing,I muſt not paſſe them ouer in ſilence. They are of opinion and doe giue order,to cure the rupture and deſcent of the guts in little children,with a lizard:but how? firſt it ought to be of the male kind which is taken for this purpoſe;and that may ſoone be knowne,if vnder the taile it haue one hole and no more:then there muſt be vſed all means poſſible that the ſaid lizard do bite the tumor of the rupture through a piece of cloth of gold, cloth of ſiluer, or purple: which done,the ſaid lizard muſt be tied faſt within a new cup or goblet that neuer was occupied,& ſo ſet in ſome ſmoky place where it may die. If little infants piſſe their beds,a rea-die way to make them containe their water,is to giue them ſodden mice to eat. If there be any ſuſpition of ſorcerie,witchcraft, or inchantment practiſed for to hurt young babes, the great I
horns of beetles, ſuch ſpecially as be knagged as it were with ſmal teeth,are as good as a coun-tercharm and preſeruatiue,if they be hanged about their necks. There is (as they ſay) a little ſtone within the head of an ox or cow,which they vſe to diſcharge and ſpit out when they be in danger of death;the ſame if it be taken out of one of their heads which is ſuddenly ſtricken off before the beaſt be ware therof, & hanged about an infants necke or other part of the body, is wonderful good for breeding of teeth. Semblably they preſcribe their brains to be caried about them in like maner,& for the ſame purpoſe:alſo the little bone or ſtone found in a naked ſnails back. Moreouer,the anointing of childrens gumbs with the brains of a yong ſheepe, is ſingular good and effectual to cauſe them to breed their teeth with facilitie:like as gooſe greaſe inſtil-led with the juice of baſil into their ears,cureth the infirmities therof. There be in many prick- K
ly herbs certain rough & hairy worms,which if they be hung about the necks of yong infants, do preſently cure them,if haply there were any thing in their meat that ſtucke and lay hard in their ſtomack,for they wil cauſe them to puke it vp. To prouoke ſleep there is not a better thing than the tried greaſe of vnwaſhed wool,with ſome myrrh,be it neuer ſo little infuſed & diſſol-ued in two cyaths of wine;or els incorporat with gooſe greaſe and wine of myrtles: for which intent they vſe to take the bird called a Cuckow,and within a hares skin tie it to the patient;or els to bind the bil of a yong heron to the forehead,within a piece of an aſſe skin:and they are of opinion,that the ſame bill alone is as effectuall,ſo it be well waſhed in wine: contrariwiſe, the head of a bat dried and hanged about the neck,keeps one from ſleep altogether. A lizard drow-ned to death in the vrin of a man,diſableth him from the vſe of venery,who * drank the liquour L
whereof that vrine came:and no maruel;for why? the magitians repoſe a great thing in a lizard in loue matters. The excrements of ſnailes which reſemble dung,as alſo the dung of pigeons, tempered in a cup of wine and giuen to drink,coole fleſhly luſt. The right lobe or ſide of a vul-tures lungs prouoke men to *Venus* ſports,if they cary it about them enwrapped within a cranes skin. In like maner the yelks of fiue pigeons egs incorporat with ſwines greaſe to the weight of one denier Roman,and ſo ſupped off,work the ſame effect. Some eat ſparrowes vſually for this purpoſe;or ſup their egs. Alſo there be who carry about them the right ſtone of a cock,incloſed faſt within a piece of leather made of a rams skin,and to good effect, if all be true that magiti-ans ſay: who affirm alſo,that thoſe women who are anointed with a liniment made of the aſhes of the bird Ibis,incorporat with gooſe greaſe and the oile Ireos,ſhal if they be conceiued with M
child go out their full time: and they ſay,that whoſoeuer be anointed with a liniment made of the ſtones of a fighting cocke and gooſe-greaſe, ſhall haue but little mind to performe the act of generation: or if the ſame be tied vnto any part of them within a piece of leather made of a rams skinne. In like manner,it is ſaid that the ſtones of any other dunghill cock are of the ſame

effect,

* *Biberit*,ſome reade *fecerit*, i. who made the ſaid water.

20030
copy 1

A effect, if together with the bloud of the ſaid cock, they be but laid vnder ones bed. If one pluck the haires out of a mules taile while the ſtallion couereth her, and bind the ſame together in a wreath or knot, & apply them to the legs or loins during the act of generation, they will cauſe (women) to conceiue whether they will or no. Whoſoeuer maketh water vpon the very place where a dog hath lift vp his leg and piſſed, ſo as both vrines be mingled together, folke ſay, he ſhall find himſelfe therby more vnluſtie to the worke of *Venus*. A wonderfull thing it is (if it be true) which they report likewiſe of the aſhes of a ſtar-lizard or Stellion; that if the ſame be enwrapped within ſome lint or linnen rag, & held in the left hand, it ſtirreth vp the heat of luſt; but ſhift the ſame into the right hand, it wil coole one as much. Moreouer, that if one put vnder the pillow where a woman laies her head, a few flockes, or locke of wooll ſoked well in batts bloud,
B it wil ſet her on to deſire the company of a man; or if ſhe do take a gooſe tongue either in meat or drink. The old skin or ſlough that ſnakes do caſt off in the Spring, whoſoeuer drinketh in his ordinary drink, it will kil all the vermin or lice of the body within three daies: ſo doth the whey of milke after the cheeſe is gathered, if one drinke the ſame with a little ſalt. If the braines of a weazill be put into the rendles or rennet that goeth to the making of cheeſe, they ſay that the cheeſe ſo made, ſhall neither corrupt all ſummer long, nor be eaten by the mouſe. The aſhes of the ſame weazill giuen to chickens or young pigeons among the paſt that is made for to feed them, ſecureth them from the weazill. Furthermore, it is ſaid, that if a batt be tied vnto a horſe or mare or ſuch labouring beaſts that are pained in their ſtaling, they ſhall ſoon haue an end of that griefe and impediment: if they haue the wringing of the guts, or be troubled with the bots,
C there will enſue eaſe of their paine, preſently vpon the making three turns or compaſſes round about their ſhap and naturall parts with a ſtockdoue. But ſee a maruellous matter! the doue being let go, dieth forthwith; and the beaſt immediatly is deliuered from paine. Moreouer, if you would know a remedy againſt drunkenneſſe, marke this experiment; Giue for three daies together to great drunkards the eggs of an owle continually in their wine, they will take a loathing thereto and forbeare drinking. Whoſoeuer taketh the lights of a mutton roſted, and eateth the ſame before he ſit downe to drinking, ſhall not be ouertaken or drunken, how freely ſoeuer he powreth downe the wine. The aſhes of ſwallowes bills incorporat with myrrhe, will ſecure any man from drunkenneſſe, and cauſe him to beare his drinke well, in caſe the wine that he drinketh be ſpiced therewith: And *Horus* king of the Aſſyrians, deuiſed firſt this receit againſt drun-
D kenneſſe.

Ouer and beſides all this, there by many other ſingular properties behind, worthy to be noted, which are attributed vnto ſundrie beaſts, and doe properly pertaine to this preſent treatiſe handled in this booke: for theſe magitians tel vs of a certain bird in Sardinia called Gromphæna, like vnto a crane, but I beleeue verily that the Sardinians at this day know not what bird it is. Within the ſaid Iſland and prouince, there is a beaſt called *Ophion, which in haire only reſembleth a ſtag, but in no place els doth it breed: and the very ſame authors haue told vs of another by the name of Sirulugus, but they ſet not downe in writing either the deſcription what manner of beaſt it ſhould be, nor the place where it ſhould breed. I doubt not verily but ſuch ſometime there were, conſidering that they haue ſhewed diuers medicines that they do affourd.
E And *M. Cicero* writeth of a beaſt named Byturos, which gnaweth the vines in Campania.

* A Muffle, as *Munſter* taketh it.

Chap. XVI.

¶ *Strange wonders reported of certaine beaſts.*

THere remaines yet certain wonderfull things to be ſpoken of, depending vpon thoſe brute creatures, of which I haue treated already: namely, that whoſoeuer haue about them the ſecondine of a bitch, that is to ſay, the skin wherin her whelps lay within her belly; or hold in their hands either the hair or dung of an hare, no dogs will bark at them whereuer they come. Alſo that there be a kind of gnats called Muliones, which liue not aboue a day. Moreouer,
F as many as haue about them the bill of a woodſpecke when they come to take hony out of the hiue, ſhall not be ſtung by Bees: againe, let a man giue to ſwine among their meat, or in a morcell of paſt or bread, the brains of a rauen, they will follow him whitherſoeuer he goes. Furthermore, that if one be ſtrewed with the duſt wherin a mule hath wallowed & tumbled her ſelf, he ſhal be wel cooled in loue, how amorous ſoeuer he were before. Ouer & beſides, take a rat & cut

out his ſtones, and ſo let him go againe, he will make all other rats to run away. Make a maſh or drench of a ſnakes skin, ſalt, red wheat called Far, with ſome wild running thyme, ſtamped all together, in one and the ſame day; put all into wine and conuey the ſame into the throat of a cow or ox, about the time that grapes begin to ripen vpon the vine, the ſaid beaſts will ſtand to health for a whole yeare after: or giue them young ſwallowes, and cauſe them to let the ſame downe their body in ſome paſt or bread at three ſeuerall times. Gather the duſt together out of the place where you ſee a ſnake hath gone and made a tract, ſling the ſame vpon a ſwarme of bees, they ſhall returne againe to their hiue. Tie vp the right ſtone or cullion of a ram, he ſhall get none but ram-lambs. And looke whoſoeuer haue about the ſtrings or ſinewes taken from the wings and legs of a crane, they ſhall not be tired and faint in any labour that they take. If you would haue mules not to winſe and fling out with their heels, giue them wine to drinke. Laſt of all, I cannot ouerpaſſe one notable and memorable example as touching the houſe of a mule: when *Antipater* ſhould ſend the venomous water of the fountaine Styx for to poyſon king *Alexander* the great, he could meet with no matter that would hold this poyſon, without piercing and running through it, but onely the houſe of a mule: and to the knowledge hereof hee came, by the direction of *Ariſtotle* the Philoſopher, who deuiſed a cup to be made thereof. A foule ſtaine and blot of *Ariſtotles* name, for being priuie to ſuch vilanie, and ſetting it forward as he did. Thus much of Land-creatures: it remaineth now to returne againe to thoſe of the Waters, and their vertues in Phyſicke.

THE XXXI. BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

The Proem.

CHAP. I.

¶ *The medicinable vertues of creatures liuing in water. The admirable nature of waters.*

NOw followeth the diſcourſe of Water-beaſts, and how beneficiall they be vnto vs in regard of Phyſicke: wherein verily dame Nature (the mother and workemiſtris of of all things) ſheweth how little idle ſhee is, not ceaſing euen there alſo by her continuall operations to make knowne her wonderfull power, among the waues and ſurging billowes, amid the reciprocall tides of the ſea, ebbing and flowing in their alternatiue turnes; yea and in the ſwift courſe and ſtreames of great riuers. And verily, to ſay a truth and ſpeak as it is, there is no part of the World wherein the might and majeſtie of Nature more appeareth, than in the waters: for this one Element ſeemeth to rule and command all the reſt. Waters deuoure and ſwallow vp the earth: waters quench and kill the flames of fire: they mount vp aloft into the aire, and ſeeme to challenge a ſeignorie and dominion in the heauens alſo; whiles by a thick ſeeling and floore as it were of clouds, cauſed by the dim vapours ariſing from them, that vitall ſpirit which giueth life vnto all things, is debarred, ſtopped,

20030
copy 1

A ſtopped and choaked. And what might the reaſon els be of thunder and lightnings flaſhing and breaking forth in that violence, and cauſing ſuch trouble and broils, as if the world were at war within it ſelfe? And can there bee any thing more wonderfull and miraculous, than to ſee the waters congealed aboue in the aire, and ſo to continue pendant in the skie? And yet as if they were not contented to haue riſen thus to that exceeding height, they catch and ſnatch vp with them into the vpper region of the aire, a world of little fiſhes: otherwhiles alſo they take vp ſtones, and charge themſelues with that ponderous & weighty matter which is more proper to another Element. The ſame waters falling downe againe in raine, are the very cauſe of all thoſe things here below which the earth produceth and bringeth forth. And therefore conſidering the wonderfull nature thereof, and namely, how the corne groweth vpon the ground, how trees
B and plants doe liue, proſper, and fructifie by the means of waters, which firſt aſcending vp into the skie, are furniſhed from thence with a liuely breath, and beſtowing the ſame vpon the herbs, cauſe them to ſpring and multiply; we cannot chuſe but confeſſe, that for all the ſtrength and vertue which the Earth alſo hath, ſhee is beholden to the Waters, and hath receiued all from them. In which regard, aboue all things, and before I enter into my intended diſcourſe of Fiſhes and beaſts liuing in this Element, I meane firſt to ſet down in generality the maruellous power and properties of water it ſelfe, and to illuſtrat the ſame by way of ſundry examples: for the particular diſcourſe of all ſorts of waters, what man liuing is able to performe?

Chap. II.

C ¶ *The diuerſitie of waters: their vertues and operations medicinable: and other ſingularities obſerued therein.*

THere is in maner no region nor coaſt of the earth, but you ſhall ſee in one quarter or other waters gently riſing and ſpringing out of the ground here and there, yeelding fountains in one place cold, in another hot; yea and otherwhils there may be diſcouered one with another neere adioyning: as for example, about * Tarbelli a towne in Guienne, and the Pyrenæan hills, there do boile vp hot and cold ſprings, ſo cloſe one vnto the other, that hardly any diſtance can be perceiued between. Moreouer, ſources there be, which yeeld waters neither cold nor hot but luke-warme, and the ſame very holeſome and proper for the cure of many diſeaſes; as if Na-
D ture had ſet them apart for the good of man only, and no other liuing creature beſide. To theſe fountains ſo medicinable, there is aſcribed ſome diuine power, inſomuch as they giue name vnto ſundry gods and goddeſſes, and ſeeme to augment their number by that means: yea & otherwhiles great towns & cities carrie their names: like as Puteoli in Campane; Statyellæ in Liguria; Aquæ Sextiæ in the prouince of Narbon or Piemont: but in no countrey of the world is there found greater plenty of theſe ſprings, and the ſame endued with more medicinable properties, than in the tract or vale Baianus within the realm of Naples, where you ſhall haue ſome hold of brimſtone, others of alume; ſome ſtanding vpon a veine of ſalt, others of nitre, ſome reſembling the nature of Bitumen, and others again of a mixt qualitie, partly ſoure, and partly ſalt. Furthermore, you ſhall meet with ſome of them, which naturally ſerue as a ſtouph or hot-
E houſe; for the very ſteeme and vapour only which ariſeth from them, is wholeſome and profitable for our bodies: and thoſe are ſo exceeding hot, that they heat the bains, yea and are able to make the cold water to ſeeth & boile again which is in their bathing tubs: as namely, the fountaine Poſidianus whithin the foreſaid territory Bajanus, which name it tooke of one *Poſidius* a ſlaue ſometime, and enfranchiſed by *Claudius Cæſar* the Emperour. Moreouer, there be of them ſo hot, that they are able to ſeeth an egg or any other viands or cates for the table. As for the Licinian ſprings, which beare the name of *Licinius Craſſus*, a man may perceiue them to boile aud reeke again, euen out of the very ſea. See how good Nature is to vs, who amid the waues and billows of the ſea, hath affourded healthfull waters! But now to diſcipher their vertues in Phyſick according to their ſeuerall kinds: thus much in generality is obſerued in theſe baths, That
F they ſerue for the infirmities of the ſinews, for gout of the feet, & ſciatica. Some more properly are good for diſlocations of ioints, and fractures of bones: others haue a property to looſen the bellie & to purge: and as there be of them which heale wounds and vlcers, ſo there are again that more particularly be reſpectiue to the accidents of the head and ears: and among the reſt, thoſe which beare the name of *Cicero* and be called Ciceronianæ, beſoueraign for the eies. Now there

* Some thinke Baion in France.

is a memorable manour or faire houſe of plaiſance, ſituat vpon the ſea ſide in the very high way G
which leadeth from the lake Auernus to the cittie Puteoli; much renowmed for the groue or
wood about it, as alſo for the ſtately galleries, porches, allies, and walking places adioyning ther-
unto, which ſet out and beautifie the ſaid place very much: this goodly houſe, *M. Cicero* called
Academia, in regard of ſome reſemblance it had vnto a colledge of that name in Athens, from
whence he tooke the modell and patterne: where he compiled thoſe books of his which carrie
the name of the place, and be called * *Academicæ quæſtiones*: and there he cauſed his monument
or ſepulchre to be made, for the perpetuitie of his memoriall, as who would ſay, he had not ſuffi-
ciently immortalized his name throughout the world, by thoſe noble works which he wrote and
commended vnto poſteritie. Well, ſoone after the deceaſe of *Cicero*, this houſe and forreſt both
fell into the hands and tenure of * *Antiſtius Vetus*; at what time, in the very forefront as it were H
and entrie thereof, there were diſcouered certaine hot fountaines breaking and ſpringing out of
the ground, and thoſe paſſing medicinable and wholeſome for the eies. Of theſe waters, *Laurea
Tullus* (an enfranchiſed vaſſall of *Cicero*) made certaine verſes, and thoſe carying with them ſuch
a grace of majeſtie, that at the firſt ſight a man may eaſily perceiue how affectionat and deuout
he was to the ſeruice of his lord and maſter: and for that the ſaid Epigram is worthy to be read
not onely there, but alſo in euery place, I will ſet it downe here as it ſtandeth ouer thoſe baines
to be ſeene, in this Decaſticon.

* Like as *Tuſculanæ quæſtiones*, which hee made in Tuſculano, i.a ferm or houſe that he had in Tuſculum.

* A noble man of Rome, Conſull with D. *Lælius Balbus, anno ab vrbe condita* 747.

Quo tua, Romanæ vindex clariſſime linguæ,
Sylva loco melius ſurgere juſſa viret, I
Atque Academiæ celebratam nomine villam.
Nunc reparat cultu ſub potiore Vetus
Hîc etiam apparent lymphæ non ante repertæ,
Languida quæ infuſo lumina rore levant.
Nimirum locus ipſe ſui Ciceronis honori
Hoc dedit, hac fontes cum pateſecit ope,
Vt quoniam totum legitur ſine fine per orbem,
Sint plures, oculis quæ medeantur, aquæ.

O prince of Romane Eloquence, loe here thy Groue in place
How greene it is, where planted firſt it was to grow apace: K
And *Vetus* now, who holds thy houſe, Faire Academie hight,
Spares for no coſt, but it maintains and keeps in better plight.
Of late alſo, freſh fountains here brake forth out of the ground,
Moſt wholeſome for to bath ſore eies, which earſt were neuer found.
Theſe helpfull ſprings, the Soile no doubt, preſenting to our view,
To *Cicero* her ancient lord, hath done this honour due;
That ſince his books throughout the world are read by many a wight,
More waters ſtill may cleare their eyes, and cure decaying ſight.

In the ſame tract of Campaine, and namely toward Sinueſſa, there be other fountains called L
Sinueſſan waters: which haue the name not only to cure men of lunacie and madnes, but alſo to
make barrain women fruitfull and apt to conceiue. In the Iſland Ænaria there is a ſpring which
helpeth thoſe that be troubled with the ſtone and grauell: like as another water which they call
Acidula, within 4 miles of Teanum in the Sidicins country, and the ſame is actually cold: alſo
there is another of that kind about Stabij, called by the name of Dimidia: like as in the territory
of Venafrum, that which proceeded from the ſource Acidulus, and gaue name to the foreſaid
water Acidula. The ſame effect they find who drink of the lake Velinus, for it breakes the ſtone.
Moreouer, *M. Varro* maketh mention of ſuch another fountain in Syria at the foot of the moun-
taine Taurus. So doth *Callimachus* report the foreſaid operation of the riuer Gallus in Phrygia:
howbeit they that take of this water muſt keep a meaſure, for otherwiſe it diſtracts their vnder- M
ſtanding, & driues them beſides their right wits: which accident hapneth to thoſe (ſaith *Cteſias*)
who drink of the red fountain (for ſo it is called) in Æthiopia: as touching the waters neer Rome
called Albulæ, they are known to heale wounds: theſe waters are neither hot nor cold: but thoſe
which go vnder the name of Cutiliæ in the Sabins country, are exceeding cold, & by a certain
mordi-

20030
copy 1

A mordication that they haue, ſeem to ſuck out the humors & ſuperfluous excrements of the body; being otherwiſe moſt agreeable for the ſtomacke, ſinewes, and generally for all parts. There is a fountain at Theſpiæ, a city in Bœotia, which doth great pleaſure to women that would fain haue children; for no ſooner drinke they of the water, but they are ready to conceiue: and of this propertie is the riuer Elatus in Arcadia. In which region alſo the Spring Linus yeeldeth water, which if a woman with child do drink, ſhe ſhall go out her full time & not be in danger to ſlip an vnperfect birth. Contrariwiſe, the riuer Aphrodiſium in Pyrrhæa, cauſeth barrenneſſe. The lake or meere *Alphion is medicinable, and cures the foule Morphew. *Varro* mine author makes mention of one *Titius*, a man of good worth and ſometime lord Prætour, who was ſo bewraied & painted all ouer his face with ſpots of Morphew, that he looked like an image made of ſpot-
B ted marble. Cydnus, a riuer of Cilicia, hath a vertue to cure the gout; as appeareth by a letter written from *Caſſius* the Parmezan vnto *M. Antonius*. Contrariwiſe, the waters about Trœzen are ſo bad, that all the inhabitants are thereby ſubject to the gout and other diſeaſes of the feet. There is a citie in *Gaule named Tungri, much renowned for a noble *fountaine, which runneth at many pipes: a ſmacke it hath reſembling the ruſt of yron, howbeit this taſt is not perceiued but at the end & looſe only: This water is purgatiue, driues away tertian agues, expels the ſtone and cureth the Symptomes attending thereupon. Set this water ouer the fire or neare to it, you ſhall ſee it thick and troubled, but at the laſt, it looketh red. Between Puteoli and Naples, there be certain wels called Leucogæi, the water wherof cureth the infirmitie of the eies, and healeth wounds. *Cicero* in his booke entituled Admiranda, *i.* Wonders, among other admirable things
C hath ranged the moores or fens of Reate; for that the water iſſuing from them, hath naturally a propertie from all others, to harden the houſes of horſes feet. *Eudicus* reporteth, That in the territorie of Heſtiæa, a citie in Theſſalie, there be two ſprings, the one named Ceron, of which, as many ſheepe as drinke, proue black: the other Melas, the water wherof, maketh black ſheep turn white: let them drink of both waters mingled together, they will proue flecked and of diuers colours. *Theophraſtus* writeth, That the riuer Crathis in the Thuriaus countrie, cauſeth both kine and ſheep as many as drink thereof, to looke white: whereas the water of Sybaris giueth them a black hew. And by his ſaying, this difference in operation is ſeene alſo vpon the people that vſe to drink of them: for as many as take to the riuer Sybaris, become blacker, harder, and withall of a more curled hair than others: contrariwiſe, the drinking of Crathis cauſeth them to look white
D to be more ſoft skinned, & their buſh of haire to grow at length. Semblably in Macedony they that would haue any cattell to grow white, bring them to drinke at Aliacmon the riuer: but as many as deſire they ſhould be brown or black, driue them to water at Axius. The ſame *Theophraſtus* hath left in writing, That in ſome places there is no other thing bred or growing but brown and duskiſh, inſomuch as not only the cattel is all of that lere, but alſo the corne on the ground, & other fruits of the earth; as among the Meſſapians. Alſo, at Luſæ, a city of Arcadia, there is a certain wel, wherin there keep ordinarily land-mice. As for the riuer Aleos, which paſſes through Erythræ, it makes them to grow hairie all their bodies ouer as many as drink therof. In Bœotia likewiſe, neare to the temple of the god *Trophonius* & hard by the riuer Orchomenas, there be two fountains; the one helps memory, the other cauſeth obliuion, wherupon they *tooke their names.
E In Cilicia, hard at the town Creſcum, there runs a riuer called *Nus: & by the ſaying of *M. Varro*, whoſoeuer drink therof, ſhall find their wits more quicke, and themſelues of better conceit than before. But in the Iſle *Chios there is a ſpring, which cauſeth as many as vſe the water to be dull and heauie of ſpirit. At Zamæ in Affrick, the water of a certain fountain, makes a cleare & ſhrill voice. Let a man drink of the lake Clitorius, he ſhall take a miſliking and loathing of wine, ſaith *M. Varro*. And yet *Eudoxus* & *Theopompus* report, That the water of the fountains beforeſaid make them drunk that vſe it. *Mutianus* affirmes, That out of the fountain vnder the temple of father *Bacchus*, within the Iſle Andros, at certaine times of the yere for 7 daies together, there runneth nothing but wine; inſomuch as they call it the wine of god *Bacchus*: howbeit, remoue the ſaid water out of the proſpect and view (as it were) of the ſaid temple, the taſt wil turn
F to be wateriſh again. *Polyclitus* writeth of a certaine fountaine of Cilicia neere vnto the citie Soli, which yeeldeth an vnction or oleus water, that ſerueth in ſtead of oile. *Theophraſtus* reports the ſame of another fountain in Æthyopia, which hath the like quality. And *Lycus* ſaith, That among the Indians there is a fountaine, the water whereof is vſed in lampes to maintaine light. And the like is reported of another water about Ecbatane [the capitall citie of Media.]

Theopompus

* Otherwiſe called *Aniger*: but this name it tooke of *Alphi*, which ſignifieth a kind of white morphew.

* He meaneth the Low-conutries, called ſomtime Belgica Gallia

* Called now the bath of Spaugh or Spaw.

* For the former is called μνήμη, or μνημοσύνη, the latter λήθη.

* *Quaſi* wit and vnderſtanding.

* In Chio.

Theopompus writeth, That neere to Scotusa [in Macedonie] there is a lake, the water wherof is ſo- G
ueraign for the healing of wounds. Moreouer, king *Iuba* hath left in writing, That in the Troglodites country there is a lake, for the hurtful water that it beareth, called the Mad lake, which thrice a day becommeth bitter and ſalt: and as many times ſoſ, it turneth to be freſh and ſweet: which courſe it keeps alſo in the night ſeaſon, breeding otherwiſe white ſerpents twenty cubits long, of which it is crawling full. The ſame Prince (mine author) reports, That in Arabia there is a ſpring boiling out of the ground with ſuch a force, that it ſcorneth and checketh any thing that is throwne into it, and canot be kept downe with any weight whatſoeuer. *Theophraſtus* maketh mention of the fountain Marſyas in Phrygia, neere vnto the town Celænæ, which caſteth vp great ſtones. And not farre from it be two other ſprings *Claeon and Gelon, ſo called by the Greeks for the contrary effects which they worke. At Cizicum there is a fountain of *Cupid*, and H
whoſoeuer drinke of the water thereof, ſhall lay aſide and forget all affection of loue, as *Mutianus* doth both report and beleeue. At Cranon there is a hot ſpring, and yet not ſo boyling as many others be: the water thereof, if it be put into a bottle or flaggon of wine, will maintain the heat thereof for three daies together, that it ſhall drinke hot. In Germany beyond the riuer Rhene, there be waters ſo hot, that whoſoeuer drinketh therof, ſhall ſenſibly find the heat in his body 3 daies after: The ſprings that yeeld this water be called Mattiaci. This peculiar property beſides hath this water, that about the edges and brims thereof there engender pumiſh ſtones. Mow if any man ſuppoſe ſome of theſe ſtrange reports to be incredible, let him learne & know, that in no part of the world Nature hath ſhewed more admirable works than in this element of I
Water. And albeit in the beginning of this mine hiſtorie I haue written in ample manner of many a wonder obſerued in the waters, yet ſomewhat remaineth ſtill to be related. For *Cteſias* ſaith, That the Indians haue a lake or poole, wherin nothing will ſwim, but all ſinks to the bottome. And *Cælius* alſo our countryman auoucheth, That the leaues which fall into the lake Auernus will ſettle downeward and not flote aboue. And *Varro* auoucheth moreouer, That what birds ſoeuer flie ouer it, or approch the aire and breath thereof, they will die preſently. Contrariwiſe, in Apuſcidamus a lake of Affrick, nothing goes down, but all ſwims aloft. The like doth *Appion* report of Phinthia, a fountain in Sicilie: as alſo of a lake in Media, and namely the pit or well of *Saturne*. The fountaine Limyra is wont ordinarily to change his ſeat, and to paſſe into places adjoyning, but neuer for nought, preſaging alwaies thereby ſome ſtrange accident to enſue. And wonderfull it is, that the fiſhes therein ſhould follow and do the like. Now when this K
water is thus remoued, the inhabitants of the country, deſirous to know the iſſue of things to come, repaire thither as to an Oracle, and ſeek to be reſolued by the foreſaid fiſhes, and therwith offer to them ſome meat: if they come vnto it and ſwim away with all, it is a good token, & this they take for an affirmatiue anſwer, as if they ſaid, Yea, to their demands: but in caſe they refuſe the meat and flirt it away with their tailes, they collect the contrary, and this is their flat nay. There is a riuer in Bithynia called Olachas, running cloſe to Briazus (which is the name both of a temple, and alſo of the god therein honoured) the water whereof will diſcouer and detect a perjured perſon: for if he that drinketh thereof, feele (as it were) a burning fire within his body, take him for a falſe forſworne villaine. Furthermore, in Cantabria or Biſcay the fountains of the riuer Tamaricus, are endued with a ſecret vertue to preſage and foretell future euents: and three L
heads or ſources there be of them, eight foot diſtant one from another: they meet all at length in one channell, and maintaine the great and mighty riuer Tamaricus. Howbeit, twelue times euery day, yea and otherwhiles twenty times they are dry, and haue no ſhew at all or appearance of water; notwithſtanding there be another fountain or well neere to them, that yeeldeth plenty of water, and neuer giueth ouer running. And this is held for an ominous and fearefull preſage, if when folke are deſirous to ſee them, they ſeeme not to run at all: as it was ſeene of late daies by *Lartius Licinius*, ſometime lord Pretour and afterwards Lieutenant Generall vnder the Conſuls. For within a ſeuen-night after, a great misfortune happened vnto him. In Iurie there is a riuer which euery Sabbath day is dry. Thus much of waters medicinable and miraculous, and yet not ſimply hurtfull. Contrariwiſe, there be others of as wonderfull a nature, but dangerous M
they are and deadly withall.

Cteſias writeth, That there is a fountaine in Armenia, breeding and bringing forth black Fiſhes: wherupon, as many as feed, are ſure to die for it immediatly. I haue heard the like reported of ſuch dangerous fiſhes about the head of the riuer Danubius, vntill a man come to a fountaine

* Ἀπὸ τῦ κλαίειν, i. fleta, ἢ γελᾶν, i. Riſu. For the one cauſeth weeping, the other moueth to laughter.

20030
copy 1

A taine which preſently diſchargeth it ſelfe into the channell of the ſaid riuer; for beneath that place ſuch fiſhes go not, nor enter lower into the riuer. And hereupon the fountaine is by the generall voice of people taken to be the very ſource and head of Danubius aforeſaid. The ſelfe-ſame accident as touching fiſh, is reported by a poole in Lydia, called the poole of the nymphs. In Arcadia neere vnto the riuer Pheneus, there floweth a water out the rockes called Styx, which is preſent death to as many as drink thereof, as heretofore I haue ſhewed: And *Theophraſtus* ſaith moreouer, that in this water there be certaine ſmall fiſhes (a thing that a man ſhall neuer ſee in any other venomous fountains) and thoſe likewiſe are as deadly as the water. *Theopompus* writeth, That in Thraſia there be waters about the place called Chropſos, which kill thoſe that drinke thereof. And *Lycus* maketh report of another fountaine in the Leontines countrey,
B wherof as many as drink die within three daies. *Varro* hath left in writing, That neare to the hill Soracte there is a fountaine foure foot large, which at the riſing of the Sunne ouerfloweth like boyling water: but the birds that haue taſted of the water die preſently, and are there to be ſeen lying dead. For this ſecret miſchiefe there is beſides in many of theſe waters, that they are faire and cleare to ſee to, and thereby ſeeme to allure both man and beaſt to drinke thereof, for their owne bane and deſtruction: as we may ſee by Nonacris in Arcadia; for ſurely this fountaine giueth no ſuſpition at all, wherby we ſhould miſtruſt a venomous quality; and yet ſome are of opinion, That the hurt which commeth thereby, proceedeth from exceſſiue cold; and they ground their reaſon vpon this, That the water iſſuing out of it into riuerets and rils, will congeale and grow to a ſtony ſubſtance. It fareth otherwiſe about the vale of Tempe in Theſſalie, where the
C water of a certaine fountaine is fearfull to ſee to, and there is no man but abhorreth the ſight therof, beſides the corroſiue quality that (by folks ſaying) it hath, to fret and eat into braſſe and yron: the beſt is, that (as I haue ſhewed before) it runneth not farre, and the courſe that it holdes is but ſhort. But wonderfull it is, that a certaine wild Carob ſhould enuiron this ſource round about with his roots, and the ſame continually beare purple flours, as it is reported to do. Alſo, in the very brinke and edge of this fountaine there is another herbe of a kind by it ſelfe, which abideth freſh and greene from one end of the yeare to another. In Macedonie, not far from the tombe of *Euripides* the Poët, there be two riuers run together, the one yeelds water moſt wholeſome for to be drunke: the other is as noiſome and deadly. Neare to Perperenæ, a towne in Troas, there is a ſpring the water whereof giueth a ſtonie coat or cruſt to all the earth that it either
D ouerfloteth or runneth by: of which nature are the hot waters iſſuing out of a fountaine neare Delium in Eubœa; for look what way ſoeuer the riuer runs, you ſhal ſee the ſtones to grow ſtill in height. About Eurymenæ, which is in Theſſalie, there is a well, caſt into it any chaplets or guirlands of floures, they will turne to ſtones. There runneth a riuer by Coloſſi, a city in Phrygia, into which if you throw brickes or tiles that be raw and vnbaked, you ſhall take them forth againe as hard as ſtones. Within the mines of the Iſle Scyros there is a riuer, which conuerteth into ſtone all the trees that it runneth by or toucheth, as well the boughs as the bodies. In the famous and renowned caues called Corycia, all the drops of water that diſtill from the rocke, turne to be as hard as ſtones: and no maruell, for at Meza in Macedonie, a man ſhall ſee the drops of water become ſtone, as they hang to the very vaults of the rocke, much like to yſickles
E from the caues of houſes in Winter time: whereas at Corycum abouenamed, the ſaid drops turn into ſtone when they are fallen downe, and not before. In certain caues they are to be ſeen conuerted into ſtones both waies, and ſome of them are ſo big, as they ſerue to make columnes and pilaſtres of, and thoſe otherwhiles of diuers colours to the eye: as may be ſeen in the great caue of Phauſia, which is within the Cherſoneſe of the Rhodians. Thus much may ſuffice by way of examples, to ſhew the varietie of waters, with their ſundry vertues and operations.

Chap. III.

¶ *The qualitie that is in waters. How a man may know which be good and wholeſome from ſuch as be naught and vnwholeſome.*

F

MVch queſtion there is & controuerſie among phyſicians, What kind of water is beſt? and yet with one generall conſent they condemne, and that iuſtly, all dead and ſtanding waters; ſuppoſing thoſe that rnn to be better: for it ſtandeth with good reaſon, that the very agitation and beating vpon the banks as they beare ſtreame in their current, maketh them more ſubtile,

ſubtile, pure, and cleare, and by that meanes they get their goodneſſe. Which conſidered, I G
In water. maruaile very much at thoſe who make moſt account of the * water gathered and kept in ceſternes: But they ground their opinion vpon this reaſon, becauſe raine water is of all others lighteſt, as conſiſting of that ſubſtance which was able to riſe and mount vp aloft, and there to hang aboue in the aire. Which is the cauſe alſo, that they preferre Snow water before that which commeth downe in ſhoures: and the water of yce diſſolued, before the other of melted Snow; as if the water were by yce driuen together and reduced to the vtmoſt point of fineneſſe. They collect hereby, that theſe waters, to wit, raine, ſnow, and yce, bee all of them lighter than thoſe that ſpring out of the earth: aud yce among the reſt farre lighter than any water, in proportion. But this opinion of theirs is to bee reputed as erronious, and for the common good and profit of mankinde to be refuted: For firſt and formoſt, that leuitie whereof they ſpake, can H
hardly and vnneath bee found and knowne by any other meanes than by the ſence and feeling of the ſtomacke: for if you goe to the weighing of waters, you ſhall perceiue little or no difference at all in their poiſe. Neither is it a ſufficient argument to prooue raine water to be light, becauſe it aſcendeth on high into the aire, for wee may ſee ſtones likewiſe drawne vp into the clouds: and beſides, as the raine falleth downe againe, it cannot chuſe but be infected with the groſſe vapours of the earth. Whereby it commeth to paſſe, that wee find raine water ordinarily to bee moſt charged and corrupted with ordure and filthineſſe: and by reaſon thereof it heateth moſt quickly and corrupteth ſooneſt. As for ſnow and yce, that they ſhould bee thought to bee compoſed of the ſubtile parts of this Element, and yeeld the fineſt water, I
I wonder much, conſidering the neare affinitie which is betweene them and haile, which might induce vs alſo to thinke the ſame of it: but all men confeſſe and hold, that the ſame is moſt peſtilent and pernicious for to bee drunke. Moreouer, there are amongſt them not a few, who contrary vnto the opinion of other Phyſicians their fellowes, affirme flatly and confidently the water of ſnow and yce to bee the vnwholeſome drinke that is, for that all the puritie and fineneſſe thereof hath beene drawne and ſucked out. And in very truth, wee find it by experience, that any liquor whatſoeuer doth diminiſh and conſume greatly by beeing frozen and congealed into an yce. Wee ſee beſides, That ouer-groſſe and foggie deawes breed a kinde of ſcurfe or ſcab in plants: white froſts burne and ſendge them: and both of theſe, the hore froſt as well as the deaw, proceed from the ſame cauſes in a manner that ſnowes doe.
Certes, all Philoſophers agree in this one point, That raine water putrifieth ſooneſt of any K
other, and leaſt while continueth good in a ſhip, as ſaylers know full well. Howbeit, *Epigenes* auoucheth and affirmeth, That the water which hath beene ſeuen times putrified and as often purified againe, is ſubiect no more vnto putrifaction. And as for ceſterne waters, the Phyſicians alſo themſelues confeſſe, That they breed obſtructions and ſchirrhoſities in the bellie, yea, and otherwiſe be hurtfull to the throat. As alſo, that there is not any kinde of water whatſoeuer, which gathereth more mud or engendreth more filthie and illfauoured vermine than it doth. Neither followeth it by and by, that all great riuer waters indifferently are the beſt: no more than thoſe of any brooke, or the moſt part of ponds and pooles are to
bee counted and eſteemed moſt wholeſome. But of theſe kinds of water wee muſt conclude L.
and reſolue with making deſtinction, namely, That there be of euery ſort thereof thoſe which are ſingular and very conuenient, howbeit, more in one place than in another. The kings and princes of Perſia bee ſerued with no other water for their drinke but from the two riuers, Choaſpes and Eulæus onely: And looke how farre ſoeuer they make their progreſſe or voyage from them two riuers, yet the water thereof they carry with them. And what might the reaſon be therefore? Certes, it is not becauſe they be riuers which yeeld this water, that they like the drinke ſo well: for neither out of the two famous riuers, Tygris and Euphrates, nor yet out of many other faire and commodious running ſtreames doe they drinke. Moreouer, when you ſee or perceiue any riuer to gather abundance of mud and filth, wote well, that ordinarily the water therof is not good nor wholeſome: and yet if the ſame riuer or running ſtreame bee giuen to breed great ſtore of yeeles, the water is counted thereby wholeſome and good M
* Which ſome take for Sows. ynough. And as this is a token of the goodneſſe, ſo the wormes called * Tineæ, engendered about the head or ſpring of any riuer, is as great a ſigne of coldneſſe. Bitter waters of all others bee moſt condemned: like as thoſe alſo which ſoone follow the ſpade in digging, and by reaſon that they lie ſo ebbe, quickly fill the pit. And ſuch be the waters commonly about

Trœzen.

20030
copy 1

A Trœzen. As for the nitrous, brackiſh, and * ſalt waters found among the deſarts, ſuch as trauell through thoſe parts toward the red ſea, haue a deuiſe to make them ſweet and potable within two houres, by putting parched barley meale into them; and as they drinke the water, ſo when they haue done they feed vpon the ſaid barly grots, as a good and wholſom gruel. Thoſe ſpring waters are principally condemned, which gather much mud and ſettle groſſe in the bottome: thoſe alſo which cauſe them to haue an il colour who vſe to drink thereof. It skilleth alſo very much to mark if a water ſtaine any veſſels with a kinde of greene ruſt; if it be long before pulſe will be ſodden therein; if being poured vpon the ground, it be not quickly ſucked in and drunk vp; and laſtly, if it fur thoſe veſſels with a thicke ruſt wherein it vſeth to be boiled: for all theſe be ſignes of bad water. Ouer and beſides, it is a fault in water, not only to ſtink, but alſo to haue C any ſmack or taſt at all, yea though the ſame be pleaſant and ſweet enough, and inclining much to the rellice of milk, as many times it doth in diuers places. In one word, would you know a good and wholſome water indeed? Chuſe that which in all points reſembleth the aire as neere as is poſſible. At Cabura in Meſopotamia there is a fountaine of water which hath a ſweet and redolent ſmel: ſetting it aſide, I know not any one of that qualitie in the whole world againe: but hereto there belongs a tale, namely that this ſpring was priuiledged with this extraordinary gift, becauſe queen *Iuno* (forſooth) ſometimes bathed and waſhed her ſelfe therein: for otherwiſe, good and wholeſome water ought to haue neither taſt nor odor at all. Some there be who iudge of their wholſomneſſe by their ballance, and they keep a weighing and poiſing of waters one againſt another: but for all their curioſitie they miſſe of their purpoſe in the end; for C ſeldom or neuer can they find one water lighter than another. Yet this deuiſe is better and more certain, namely, to take two waters that be of equal meaſure and weight: for looke whether of them heateth and cooleth ſooner, the ſame is alwaies the better. And for to make a trial herof, lade vp ſome ſeething water in a pale or ſuch like veſſel, & ſet the ſame down vpon the ground out of your hand, to eaſe your arm of holding it hanging long in the aire; and if it be good water, they ſay it will immediatly of ſcalding hot become warm and no more. Well, what waters then, according to their ſundry kindes in generalitie, ſhall we take by all likelihood to be beſt? If we go by the inhabitants of cities and great towns, ſurely, wel-water or pit water (I ſee) is ſimply the wholſomeſt. But then ſuch wels or pits muſt be much frequented, that by the continual agitation and often drawing thereof, the water may be more purified, and the terren ſubſtance D paſſe away the better by that means. And thus much may ſuffice for the goodneſſe of water reſpectiuely to the health of mans body.

But if we haue regard to the coldneſſe of water, neceſſarie it is that the Wel ſhould ſtand in ſome coole and ſhadowie place not expoſed to the Sun, and natheleſſe open to the broad aire, that it may haue the full view and ſight (as it were) of the ſky. And aboue all this, one thing would be obſerued and ſeen vnto, that the ſource which feedeth it ſpring and boile vp directly from the bottom, and not iſſue out of the ſides: which alſo is a main point that concerns the perpetuitie thereof, and whereby we may collect that it will hold ſtil, and be neuer drawn dry. And this is to be vnderſtood of water cold in the owne nature. For to make it ſeem actually cold to the hand, is a thing that may be done by art, if either it be forced to mount aloft, or fal from on E high, by which motion and reuerberation it gathers ſtore of aire. And verily the experiment hereof is ſeene in ſwimming; for let a man hold his winde in, he ſhall feele the water colder by that means. *Nero* the Emperor deuiſed to boile water, & when it was taken from the fire to put it into a glaſſe bottle, and ſo to ſet it in the ſnow a cooling: and verily the water became therby exceeding cold to pleaſe and content his taſt, and yet did not participate the groſſeneſſe of the ſnow, nor draw any euill qualitie out of it. Certes, all men are of one opinion, that any water which hath been once ſodden, is far better than that which is ſtill raw. Like as, that after it hath been made hot, it will become much colder than it was before, which I aſſure you came firſt from a moſt ſubtil and witty inuention. And therefore if we muſt needs occupy naughty water, the only remedy that we haue to alter the badneſſe thereof, is to ſeeth it wel vntil the one halfe F be conſumed. Now if a man deſire to know the vertue and commoditie of cold water: firſt, it ordinarily ſtancheth any flux of bloud, if it be caſt vpon the place. Alſo if one be not able to endure the heate in a bain or hot-houſe, the beſt way to auoid this inconuenience, is to hold in his mouth cold Water all the while. Moreouer, many a man hath found by a verie familiar experience,

* *Salſas*, although ſome reade *Salmacidas*, which be holden for waters that will effeminat the that drinke thereof. But ſuch waters be impertinent to this place: neither doe we reade of the fountain Salmacis to be in this deſart.

rience, that the coldeſt water in the mouth is not alwaies the coldeſt in the hand. And contrariwiſe, when it is exceeding cold without to be felt, it is not ſo ſenſibly cold within to be drunk. G

Of all Waters in the world, that which wee call here in Rome Martia, carrieth the greateſt name by the generall voice of the whole City, in regard both of coldneſſe and wholeſomneſſe. And verily we may eſteeme this water for one of the greateſt gifts that the gods haue beſtowed vpon our city. In times paſt it was called Auffeia, and the very fountaine from whence it commeth, Piconia. The head or ſource thereof ariſeth at the foot of the vtmoſt mountains of the Pelignians: it runneth through the Marſians country, and paſſing through the lake Fucinus, it tendeth no doubt euen then directly toward Rome; but anon it is ſwallowed vp within a hole vnder the ground, ſo as it is no more ſeen vntill it ſhew it ſelfe againe in the territorie of the Tiburtines; from which place it is conueyed vnder vaults, and ſo carried through to Rome by H arch-worke for the ſpace of nine miles. The firſt that began to bring this water to the city, was *Ancus* * *Martius* one of the Roman Kings. Afterwards *Qu.* * *Martius Rex*, in his Pretorſhip finiſhed the ſaid worke: and when in proceſſe of time it was fallen to decay, *M. Agrippa* repaired it againe: who alſo brought the water named Virgo to the city, which hath her head eight miles from Rome, in a certaine nouke or by-corner about two miles turning from the great port way leading to Prænеſte. Neere vnto it runneth the riuer Herculaneus: but this water keepeth ſtil behinde, as though it fled from it, whereupon it tooke the name Virgo. Compare theſe two riuers together which are conueyed to Rome, you ſhall ſee the difference beforeſaid as touching the coldneſſe of waters; for looke how cold Virgo is to the hand, ſo much is Martia in the mouth. But long ago haue wee of Rome loſt the pleaſure and commoditie of theſe two Rills, I through the ambition and auarice of ſome great men, who haue turned away theſe waters from the City, where they yeelded a publique benefit to the Commonwealth; and deriued them for their priuat delight and profit, into their owne mannors and houſes in the country, for to water their gerdens, and ſerue to other vſes.

* No maruell then if it were called Martia.

And here in this place I thinke it not impertinent to adioine to this preſent treatiſe, the maner and skill of ſearching and finding out waters. And firſt to ſpeake in general terms: ſprings ordinarily be found in Vallies, in the pitch or creſt of ſome little hill where it hath a fall and deſcent, or elſe at the foot of great mountaines. Many are of opinion, That in any tract whatſoeuer, that ſide or coaſt which regardeth the North is giuen to haue water in it. And verily it were not amiſſe to ſhew how Nature diſporteth her ſelfe and worketh variably in this be- K halfe. Firſt, a man ſhall neuer ſee it raine on the South ſide of the mountaines in Hyrcania, which is the reaſon, that on that part onely which lieth to the North they are giuen to beare wood, and be full of forreſts. But Olympus, Oſſa, Pernaſſus, Apenninus, and the Alpes, be repleniſhed with Woods on all ſides, and are furniſhed with their Springs and Riuers euerie where. In ſome countries the hills be greene, and watered on the South ſide onely. As for example in Candy, the mountaines called * Albi: ſo that there is no heed to be taken by this, for the rule holdeth not alwayes. But to come now vnto particulars: Looke where you ſee growing Ruſhes, Reeds, or the * Herbe whereof I made relation before, be ſure you ſhall find water vnderneath. *Item*, Whereſoeuer you finde Froggs lying in any place vpon their breaſts, make account of good ſtore of water there. As for the wilde and wandering Sallow, the Aller tree, L Agnus-Caſtus, or Yvie, they come vp many times of their owne accords, in ſome low grounds where there is a ſetling or ſtay of raine water fallen from higher places: inſomuch as they that goe by theſe ſignes to finde ſome Spring may ſoone be deceiued. A ſurer aime yet by farre, is a miſt or exhalation, which a man may diſcouer a farre off a little before the Sunne riſing. And for to eſpie it the better, ſome there be who get vp into an high place, and lay themſelues grouelong with their chinnes touching the ground; and by that meanes diſcerneth where any ſuch ſmoke or vapor doth ariſe. There is alſo another ſpeciall means beſides to find out Waters, but knowne it is vnto thoſe onely who be skilfull and expert in this feat. For they that are guided by this direction to Water, goe forth in the hotteſt ſeaſon of the yeare, and about the noone-tide of the day to marke the reuerberation of the Sunne beames in any M place: for if this repercuſſion and rebounding appeare moiſt, and namely when the face of the earth looketh dry and thirſtie, they then make no doubt but to finde Water there. But they had need to looke ſo intentiuely and earneſtly, that oftentimes their eyes ake

and

*Διυκτιάσεις, i White.

*To wit, wild Folefoot, *ca.* 6. *lib.* 26.

20030
copy 1

A and be pained withall. For auoiding which trouble and inconuenience, ſome betake themſelues to other experiments, and namely, they dig a trench or ditch fiue foot deep within the ground; the mouth wherof they couer all ouer with earthen veſſels of potters worke vnbaked, or els with a barbars braſen baſon well enhuiled; and withall a lamp burning: ouer all which, they make a little arch-work of leaues and boughs, and mould thereupon. Now if they come within a while after to this place, and either ſee the earthen pots broken or wet, or perceiue a dew or ſweat ſtanding vpon the braſſe, or finde the lamp aforeſaid gon out, and yet no want of oile to maintaine light, or if they feele a lock of wool which they hung within the trench to be moiſt, they aſſure themſelues they ſhall find water if they ſink the pit deeper. Some there be, who for better aſſurance hereof make a fire in the place, and burne it throughly; for then the veſſels aforeſaid if
B they proue to be wet, giue a more infallible hope of a ſpring. Moreouer, the very leire it ſelfe of the ſoile, if it be ſpotted with white ſpecks, or be altogether of a reddiſh bright colour, promiſeth ſpring water to be vnderneath; for if the ground look black, lightly the water wil ſoon fail if there be any ſpring there found. If you chance to light vpon a vein of potters clay or chalk, make account you ſhall meet with no ſpring there, ſink as deep as you will: and therfore workmen when they come to it giue ouer preſently. For a great regard they haue to obſerue the change of euery coat (as I may ſo ſay) of the earth as they dig, to wit from the black delfe, vntil they meet by degrees with the veins aforeſaid. Furthermore it is to be noted, that the water which is found in cley grounds is alwaies ſweet and potable: like as that which a ſtony and * *In Tophis.*
gritty ſoile doth yeeld, is commonly colder than any other: and ſuch a kinde of ground alſo is
C allowable for the proofe of good waters; for it ingendreth ſweet and wholſome water, light alſo of digeſtion, and pure withal, by reaſon that as it paſſeth by a ſoft grit as it were, through a ſtrainer, all the groſſeneſſe thereof it leaueth behind ſticking thereto. As for * thicke ſand & gra- * *Sabulum.*
uell, it affordeth ſmall and ſlender ſprings, and thoſe not durable; beſides, the water wil quickly gather mud. Ground giuen to beare * pibbles or the groſſer ſort of grauell, giue vs no ſecurity * *Glarea.*
that the ſprings therein wil hold all the yeare long, howbeit the water is very good & pleaſant. The hard and compact grauell called the male grauel, and the land which ſeemeth ful of black and burnt carbuncle ſtones, bringeth forth wholſome waters, and the ſources be ſure and perdurable. But red ſtones yeeld the beſt ſimply, and thoſe that we may be ſure will neuer giue ouer and faile. And therefore when wee ſhall perceiue the foot of a mountaine ſtanding vpon ſuch
D ſtone, or vpon flint, wee may boldly reckon of wholeſome and euerlaſting ſprings; and this gift they haue beſide, to be paſſing cold. Moreouer, in digging and ſinking pits marke this for an aſſured and infallible ſigne that you approch vnto water; namely, if the earth appeare and ſhew moiſt more and more, ſtill as you go lower and lower: alſo if the ſpade enter more willingly, and goe downe with eaſe and facilitie. When pioners haue wrought deepe vnder the ground, and then chance to meet with a veine of brimſtone or alume, the dampe will ſtop their breath and kill them preſently, if they take not the better heed: and therefore to foreſee and preuent this danger, they vſe to let downe into the pit a candle or lampe burning; for if it goe out, they may be ſure it hath met with the dampe. Therefore if pits be ſubiect to the riſing of ſuch vapours, cunning and expert workemen make on either ſide of ſuch pits, both on the right hand
E and the left, certaine out-caſts, tunnels, or venting holes, to receiue thoſe hurtfull and dangerous vapours, whereby they may evaporat and breathe forth another way. Otherwhiles it falls out, that the aire which they meet with in digging very low, doth offend the pioners, albeit there be no brimſtone nor alume neere: but the ready meanes to amend the ſome and auoid the danger, is to make winde and freſh aire with continuall agitation of ſome linnen cloathes. Now when the pit is ſunke and digged as far as to the water, the bottome muſt be layd, and the loweſt ſides of the wall reared of ſtone ſimply without any mortar made of [lime and] ſand, for feare leſt the veines of the ſource be ſtopped. Some waters there are, which in the verie prime and beginning of the ſpring are of this nature, That they grow to be exceeding cold, namely ſuch as haue their ſource or ſpring lying but ebb; for they are maintained only of winter rain:
F Others againe begin to be cold at the riſing of the Dog-ſtarre. And verily we may ſee the experience both of the one and the other about Pella the capitall city of Macedonie: for the water of the meere or marriſh there before the towne in the beginning of Summer is cold; and afterward when the weather is at the hoteſt, the ſpring water in the higher parts of the Citie is ſo extreame cold that it is readie to bee frozen. The ſemblable happeneth in Chios, where

there is the ſame reaſon of the hauen and towne it ſelfe. At Athens, the great and famous fountain named Enneacrunos, in a rainy or ſtormy ſummer is colder than the pit water or wel in *Iupiters* garden, within that city; and yet the ſaid Well water if it be a dry ſeaſon, will ſtand with an ice at Midſummer. G

Chap. IV.

¶ *The reaſon of certaine Waters that appeare and be hid againe ſuddenly.*

*i. about the beginning of Iune.

BVt aboue all others, the waters of pits or wels be ordinarily moſt cold about the * retreat or occultation of Arcturus, yea and many times they faile in the mids of ſummer, and all of them in maner grow very low for the ſpace of foure daies, at the time of the ſetting of the foreſaid ſtar. Many there be which haue little or no water in them all winter long, and namely about the hil Olympus, where it is ſpring firſt ere the waters return and find the way into their pits. And verily in Sicilia, about the cities Meſſana and Mylæ, during winter the ſprings are altogether dry; but in ſummer time they run ouer the brinks of their Wels and pits, maintaining pretty riuers. At Apollonia a city in Pontus there is a fen neere the ſea ſide, which in Summer only ouerfloweth, and eſpecially about the riſing of the great Dog-ſtar; mary if the ſummer be colder than ordinarie, it is not ſo free and plentifull of water. Some Springs haue this qualitie with them, to be drier for ſhoures and raine water: as for example, in the territorie of Narnia, a city in the duchy of Spoleto; which *M. Cicero* hath not forgot to inſert among other admirable things, in his treatiſe of Wonders: for of this territorie hee writeth in theſe tearmes, That in a drought it was durty, and in rainy weather duſty. Moreouer this is to be noted, That all waters are ordinarily more ſweet in winter than in ſummer, but in autumn leaſt of all; and in a dry ſeaſon leſſe than at other times. Neither are the riuer waters moſt times of like taſte, by reaſon of the great difference that is in their chanels; for commonly the water is ſuch as the earth & ſoil through which it paſſeth, and doth participat the qualitie and taſt of thoſe herbs always which it paſſeth and runneth by. No maruell therefore if the water of one and the ſelfe-ſame riuer be found in one place more vnwholſome and dangerous than in another. It falls out many times, that the brooks and rills which enter into great riuers, do alter their water in the very taſte (as we may ſee by experience in the famous riuer Boryſthenes) inſomuch as ſuch great riuers be ouercome with the influence of ſuch riuerets, and either their owne taſte is delaied by them, or clean drowned and loſt. And ſome riuers there be which change by occaſion of rain: the prooſe wherof was thrice ſeen in Boſphorus, when by reaſon of the fall of ſome ſalt ſhoures, the flouds that ouerflowed the fields deſtroyed all the corne vpon the ground. The like alſo fell as often in Egypt; for the rain that fel cauſed all the waſhes ariſing from the riuer Nilus, which watred the grounds, to be bitter, whereupon inſued a great plague and peſtilence to the whole region. It chanceth many times, that preſently vpon the cutting and ſtocking vp of Woods, there ariſe and ſpring certaine fountaines which beforetime appeared not, but were ſpent in the nouriſhment of the tree roots; as it fell out in the mountain Hæmus, when as *Caſſander* held the *Gallogreeks beſieged; for when the woods thereupon were cut down to make a palaiſad for a rampier, preſently there iſſued forth ſprings of water in their place. Moreouer, it hath bin oft times known, that by occaſion of ſpoiling ſome hils of the wood growing therupon, the ſprings haue met altogether in one ſtreame, and done much hurt in ſudden ouerflowing the vaile beneath; whereas the trees before-time had wont to drink vp, digeſt, and conſume all the moiſture & wet that fell and fed the ſaid waters. And verily it auaileth much for the maintenance of water, to ſtirre with the plough, and to till a ground; thereby to break vp and looſe the vppermoſt calloſitie and hide (as it were) of the earth, that kept it clunged and bound. Certes it is recorded for a truth, that vpon the raſing and deſtroying of Arcadia (a towne ſo called in Creet) wherby the place was diſpeopled, all the fountaines waxed dry, and the riuers in that tract (which were many) came to nothing: but ſix yeares after, when the ſaid town was re-edified, euen as the inhabitants fell to earing and ploughing any grounds within their territorie, the foreſaid fountains appeared again, and the riuers returned to their former courſe. Chap. V.

¶ *Divers historicall obseruations touching this point.*

MOreouer, Earthquakes, as they discouer sometimes new springs and sources of water, so otherwhiles they swallow them vp that they are no more seene: like as it hapned (as it is well knowne) 5 times about the riuer Pheneus in Arcadia. And in manner aboue sayd, there issued forth a riuer out of the mountaine Corycus, so soone as the peisants of the country began to break it vp for tillage. But to return again to the change and alteration of waters: wonderfull they must needs be (no doubt) when there is no euident cause thereof to be knowne: as namely in Magnesia, where al the hot waters of the bains suddenly became cold, without any other change besides of the tast: also in Caria, where standeth the temple of *Neptune*, the riuer which was knowne before to be fresh and potable, all on a sudden turned into salt water. Ouer and besides, is not this a strange miracle, that the fountain Arethusa in Syracuse, should haue a sent or smell of dung, during the solemne games and exercises at Olympia? But there is some probable reason to be rendred hereof, Because the riuer Alpheus passeth from Olympus vnder the very bottom of the sea into that Island [of Sicily] where Syracuse standeth, and so commeth to the foresaid fountain. The Rhodians haue a fountain within their * Chersonese, which euery ninth yere purgeth it self & sends out an infinit deale of ordure and filthines. And as the tast & smell of waters do alter, so their colours also do change: as for example, there is a lake in the country of Babylon, which euery summer for the space of 11 daies, looketh red: and Borysthenes also in the summer time, runneth with a blewish colour like * violets, or the sky; and yet a most pure and subtill water it is of all other: which is the reason, that it swims aloft and floteth naturally vpon Hypanis the riuer. In which two riuers, there is another maruell reported, That all the while a Southern wind bloweth, the riuer Hypanis is discerned aboue it. But there is one argument more besides, that proueth the water of Borysthenes to be passing light & thin, for that there arise no mists out of it; nay it is not perceiued to yeeld any exhalation or breath at al from it. To conclude, they that would seem to be curious and skilfull in these matters, do obserue and affirme, That generally all waters grow to be heauier after that mid-winter is once past.

* *i.* their demy-iland, or rather a place inuironed round about with sea, saue only that it hath one banke or narrow causey leading to the continent.

* *Lesbos.-Athen.*

Chap. VI.

¶ *The maner of water-conduits. How and when those waters which naturally are medicinable, ought to be vsed. Also for what diseases it is good to sdile and take the aire of the Sea. The vertues and properties of sea waters as touching Physicke.*

IF a man would convey water from any head of a spring, the best way is to vse pipes of earth made by potters art; and the same ought to be 2 fingers thick, and one jointed within another, so as the end of the vpper pipes enter into the nether, as a tenon into a mortaise, or as a box into the lid: the same ought to be vnited and laid euen, with quicklime quenched and dissolued in oile. The least leuell for to carry and command water vp hill from the receit, is one hundred foot; but if it be conueyed but by one canel and no more, it may be forced to mount the space of two Actus, *i.* 240 foot. As touching the pipes by means whereof the water is to rise aloft, they ought to be of lead. Furthermore, this is to be obserued, That the water ascend alwaies of it self at the deliuerie, to the heigth of the head from whence it gaue receit: if it bee fetched a long way, the worke must rise and fall often in the carriage thereof, that the leuell may bee maintained still. As for the pipes, ten foot long apiece they would bee, if you do well. Now if the said pipes of lead be but * fiue fingers in compasse, ordinarily they should weigh sixty pound: * if they be of eight fingers size, they must carry the weight of one hundred pound: but in case they bear a round of * 10 fingers, their poise would be at the least 120 pound; and so the rest more or lesse according to this proportion. Those pipes be called properly in Latine Denariæ, the web or sheet whereof beareth ten fingers in breadth, before it be turned in and brought to the compasse of a pipe: like as Quinariæ, when the same is halfe so broad. Moreouer, this is to be obserued, That in euery turning and twining of an hill, the pipe ought of necessity to be fiue fingers round and no more, for to represse and breake the violence of the water in the current. Likewise the vaulted heads which receiue and contain water from all the sources meeting together, must

* *Quinariæ.*
* *Octonariæ.*
* *Denariæ.*

be of that capacity, as need requireth. G

And since I am falne into the treatise and discourse of fountains, I wonder much at *Homer*, that he hath made no mention at all of hot springs, and yet otherwise throughout his whole poëme, hee bringeth in oftentimes those who bathed and washed in hot baines. But it may verie wel be, that the reason therof is, because in those times there was not that vse of them in physick as at this present: for now adays, if folk be amisse or il at ease, straightwaies they run to the bains and bath for remedy. And in truth, those waters which stand vpon brimstone, be good for the sinews: such as come from a veine of alume, are proper for the palsie, or such like infirmities proceeding from resolution of the nerues. Moreouer, they that hold of bitumen or nitre (such as be the fountains Cutilie) be potable and good to be drunke, and yet they are purgatiue.

To come to the vse of natural bains and hot waters: many men in a brauery sit long in a bath, H and they take a pride in it, to indure the heat of the water many hours together; and yet is there nothing so hurtfull for the body: for in truth, a man should continue little longer in them than in ordinary artificiall bains or stouphs; and then afterwards when he goeth forth, hee is to wash his body with fresh cold water, not without some oile among. Howbeit, our common people here, thinke this to be very strange, & will not be brought to to it: which is the reason, that mens bodies in no place are most subject to diseases: for the strong vapours that steme from thence, stuffe and fil their heads; and although they sweat in one part, yet they chil in another, notwithstanding the rest of their bodies stand deep within the water. Others there are besides, who on the like erronious conceit, take great joy in drinking a deal of this water, striuing avie who can poure most of it downe the throat. I haue my selfe seen some of them so puffed vp and swolne I with drinking, that their very skin couered and hid the rings vpon their fingers; namely, when they were not able to deliuer again the great quantity of water that they had taken in. Therefore this drinking of much water is not good to be vsed, vnles a man do eftsoons eat * salt withall. Great vse there is and to good purpose, of the mud which these fountains do yeeld; but with this regard, that when the body is besmeared and bedawbed outwardly therwith, the same may dry vpon it in the Sun.

* For to irritat and prouoke the expulsiue faculty to send all forth againe.

Well, these hot waters be commonly full of vertue; howbeit, this is not generall, That if a spring be hot, by and by we should think it is medicinable; for the experience of the contrary is to be seen in Egesta of Sicily, in Lariſſa, Troas, Magnesia, Melos, and Lipara. Neither is it a K sure argument of a medicinable water (as many are of opinion) if a piece of siluer or brasse which hath bin dipped therein, lose the colour: for there is no such matter to be seene by the naturall baths of Padua; neither is there perceiued in them any difference in smell from others.

Concerning Sea waters, the same order and mean is to be obserued, especially in such as bee made hot, for to help the pains and infirmities of the sinews: and many hold them good to souder fractures of bones, yea and to cure their bruises and contusions: likewise they haue a desiccatiue vertue, wherby they dry rheumaticke bodies; in which regard, men bath also in sea water actually cold. Moreouer, the sea affoor deth other vses in diuers and sundry respects, but principally the aire therof is wholsome for those who are in a phthysicke or consumption (as I haue beforesaid) and cureth such as doe reach or void bloud vpward: and verily, I remember of late L daies, that *Annæus Gallio* after that he was Consull, tooke this course; namely, to saile vpon the sea for this infirmity. What is the cause think ye, that many make voiages into Ægypt? surely it is not for the aire of Egypt it self, but because they lie long at sea, and be sailing a great while before they come thither. Furthermore, the vomits also which are occasioned at sea by the continual rolling and rocking of the ships neuer standing stil, are good for many maladies of head, eies, and brest; and generally they doe cure all those accidents, for which the drinking of Ellebore serueth. As for sea water to be applied simply of it selfe vnto the outward parts, physitians are of opinion, that it is more effectual than any other, for to discusse & resolue tumors: & more particularly, if there be a cataplasme made of it and barly meale sodden together, it is singular for the swellings behind the ears, called Parotides. They mingle the same likewise in plasters, such especially as be white and emollitiues: and if the head be hurt, and the * brain touched and M offended, it is soueraigne to be infused into the wound. It is prescribed also to be drunke: for albeit the stomack take some offence and hurt thereby, yet it purgeth the body well, and doth euacuat melancholick humors and black choler; yea, and if the bloud bee cluttered within the body, it sendeth it out one way or other, either vpward or downeward. Some haue ordained it to

be

20030
copy 1

A be giuen for the quartan feuer; others aduiſe to ſaue and keep it a time, for to ſerue the turne in caſe of Tineſmes, which are vnordinat ſtrainings at the ſtoole to no effect: alſo for all gouts and pains of joints: and in very truth, by age & long keeping, it forgoeth al that brackiſh taſt, which it had at the firſt. Some boile it before: but all in generall agree in this, To vſe for theſe purpoſes that ſea water which was taken out of the deep far from the land, ſuch as is not corrupt with any mixture of freſh water with it; and before their patients do drink it, enjoyne them to vomit: and then alſo do they mingle with it, either vineger or wine for that purpoſe. They that giue little thereof, and by it ſelfe, appoint radiſhes to be eaten preſently vpon it, with honied vineger or oxymell, for to prouoke the patient to vomit againe. Moreouer, they vſe otherwhile to miniſter a clyſtre made of ſea water, firſt warmed: & verily there i not a better thing than it for to bath
B and foment the cods withall, if they be ſwelled either with ventoſities or wateriſh humors. Alſo it is much commended for kibed heels, if they be taken before they are broken and exulcerat: and in like manner they kill the itch, cure ſcabs, tettars, and ringwormes. Sea water ſerueth wel to waſh the head, & to rid it of nits and filthy lice: yea, and reduceth black and blew marks in the skin, to the freſh and liuely colour againe. In all theſe cures, after the vſe of ſalt-water, it is paſſing good to foment the place affected, with vineger hot. Ouer and beſides, it is thought to be very wholſome and good againſt the venomous ſtings of ſerpents; and namely, of the ſpiders Phalangia and ſcorpions. Semblably, it cureth thoſe that be infected outwardly with the noyſome ſaliuation or ſpittle of the Aſpis called Ptyas: but in theſe caſes it muſt be taken hot: furthermore, a perfume made with ſea-water and vineger, is ſingular for the head-ach. If it be cly-
C ſterized hot, it allaieth the wrings and grindings of the belly; yea, and ſtaieth the violent motions of cholericke humors working vpward and downward. Thoſe that be once chafed and ſet into an heat with ſea water, ſhall not ſo eaſily feele cold againe. When womens paps are ouergrowne, and ſo exceeding great that they meet and kiſſe one another, there is not a better thing to take them downe, than to bath in a tub of ſea-water: the ſame alſo may ſerue to amend the griefe of the bowels and precordiall parts, yea, and to reſtore thoſe that be exceeding leane and worn away. The fumes and vapors of this water boiling together with vineger, are ſoueraign for thoſe that be hard of hearing, or troubled with the head-ach. Sea water hath this eſpeciall property, that of all things it ſcoureth away ruſt of yron ſooneſt. The ſcab that annoieth ſheepe, it healeth, and maketh their wooll more ſoft and delicat. But what meane I to ſay thus much of ſea
D water, knowing as I do full well, that for thoſe who dwell far vp into the maine, and inhabit the inland parts, all this may ſeem needleſſe, and ſuperfluous? And yet there hath bin means deuiſed to make artificiall ſea-water, wherewith euery man may ſerue his own turn when he will. In which inuention, one wonderfull thing is to be ſeen; namely, if a man put more than one ſextar of ſalt to foure of water, the nature of the water will be ſo ſoone ouercome, that ſalt ſhall not diſſolue nor melt therein: but if you mingle one ſextar of ſalt juſt with foure ſextars of water, you ſhall haue a brine as ſtrong as the ſalteſt water that is in the ſea: but to haue a kind & moſt mild brine, it is thought ſufficient to temper the foreſaid meaſure of water with 8 cyaths of ſalt: and this water thus proportioned, is very proper for to heat the ſinewes, without any fretting of the skin at all. There is a certain compound ſea water kept in manner of a Syrrupe, which they call
E Thalaſſomeli, made of Sea-water, hony, and raine water, of each a like quantity. Now the foreſaid ſea-water they ſerch for this purpoſe out of the very deep, and this compoſition they put vp in earthen veſſels well pitched or varniſhed, and reſerue it for their vſe. An excellent purgatiue this is; for beſides that it cleanſeth the ſtomacke without any hurt or offence therof, the taſt and ſmell both are very pleaſant and delectable. As touching the mead called Hydromell, it conſiſted in times paſt of rain water well purified, and hony: a drink ordained and allowed onely to ſick and feeble perſons when they called for wine, as being thought leſſe hurtfull to be drunke: howbeit, rejected it hath bin theſe many yeares, and condemned: for by experience it was found at length, to haue the * ſame diſcommodities that wine, but farre ſhort it was of the good and wholeſome qualities of wine.

* Namely, aduerſe to the head & ſinews

F Moreouer, foraſmuch as ſea-faring men and ſaylers be many times at a fault for freſh water, and thereby much diſtreſſed, I think it good to ſhew the means how to be prouided for the ſupply of this defect. Firſt and foremoſt therefore, if they ſpread and diſplay abroad certaine fleeces of wooll round about a ſhip, the ſame will receiue and drinke in the vapours of the Sea, and become moiſt and wet withall; preſſe or wring them well, you ſhall haue water freſh enough.

Item, let downe into the ſea within ſmall nets, certain pellets of wax that be hollow, or any other void and empty veſſels wel cloſed & luted, they will gather within them water that is freſh and potable: for we may ſee the experience hereof vpon the land: take ſea-water & let it run through cley, it will become ſweet and freſh. G

But to proceed vnto the other medicinable properties of water: let there be any diſlocation in man or beaſt; by the ſwimming in water (it matters not of what kind it be) the bones wil very quickly and with great eaſe be reduced into joint againe.

It falleth out many times that trauellers be in feare and danger of ſome ſickneſſe, by change of waters, and ſuch eſpecially as they know not the nature and quality of. To preuent this inconuenience, they drink the water cold which they doubt and ſuſpect, ſo ſoone as euer they be come out of the baine; for then they ſhall find it preſently. H

As touching the moſſe which is found in the water, ſoueraigne it is for the gout, in caſe it be applied outwardly: mix oile thereto, and reduce it into the forme of a cataplaſme or liniment, it caſeth the paine, and taketh down the ſwelling of the feet about the ankles. The ſome & froth that floteth aboue the water, cauſeth warts to flie off, if they be well rubbed therewith.

The very ſand likewiſe vpon the ſea ſhore, eſpecially that which is ſmall and fine, & the ſame burnt as it were with the heat of the Sun, is a ſoueraigne remedy to dry vp the watery humors in a dropſie, if the body be couered al ouer therewith; and to that purpoſe it ſerueth alſo for rheums and catarrhs. Thus much may ſuffice concerning water it ſelf: it remaineth now to treat of ſuch things as the water yeeldeth. In which diſcourſe, begin I wil (as my order and manner hath bin in all the reſt) with thoſe matters which be chiefe and principall, and namely, ſalt and ſpunges. I

Chap. VII.

¶ *The ſundry kinds of ſalt: the making thereof: the vertues medicinable of ſalt: and diuers other conſiderations reſpectiue thereto.*

SAlt is either artificiall or naturall: and both the one and the other is to be conſidered in many and diuers ſorts, which may be reduced all into 2 cauſes: for ſalt commeth either of an humor congealed, or els dried. In the gulfe or lake of Tarentum, the ſalt is made of the ſea water dried by the heat of the ſummer Sun; for then you ſhall ſee the whole poole converted into a maſſe of ſalt: and verily the water there, is otherwiſe very low & ebbe, and not aboue knee high. K The like is to be ſeen in Sicily within a lake called Cocanicus; as alſo in another neare to Gelas: but in theſe, the brims & ſides only about the banks, wax dry and turn into ſalt, like as in the ſalt-pits about Phrygia and Cappadocia. But at Aſpenchum, there is more plenty of ſalt gathered within the poole there, for you ſhall haue the ſame turn into ſalt, euen the one halfe to the very mids. In which lake, there is one ſtrange and wonderful thing beſides, for look how much ſalt a man taketh out of it in the day, ſo much ordinarily will gather againe by night. All the ſalt of this ſort is ſmall, and not growne together in lumpes. Now there is another kinde of ſalt, which of the owne accord commeth of ſea-water, and it is no more but the ſome or froth which is left behind ſticking to the edges of the banks, or to rocks. Both the one & the other become L thick and hard in manner and form of a candied dew: howbeit, that which is found in the rocks, is more quicke and biting than the other. There is beſides of ſalt naturall, a third diſtinct ſort from the former: for in the Bactrians country there be two great and huge lakes, which naturally do caſt vp a mighty quantity of ſalt: the one lieth toward the Scythians, and the other bendeth to the Arians country: like as neere to Citium, a city in the Iſle Cypros, and about Memphis in Ægypt, they draw forth ſalt out of lakes, and afterwards dry the ſame in the ſun. Moreouer, there be certain riuers which beare ſalt, and the ſame congealed aloft in their vpper part, in manner of yce, and yet the water runneth vnderneath and keepeth the courſe wel enough. As for example, about the ſluces and ſtraits of the mount Caſpius; and thereupon they be called the Riuers of ſalt: as alſo in other riuers of Armenia, and about the Mardians countrey. Moreouer, Oxus and Othus, two riuers paſſing through the region Bactriana, carry ordinarily downe with M them in their ſtreame, great peeces and fragments of ſalt, which fall from the mountaines adjoining vnto them. There are beſides in Barbary, other lakes, and thoſe verily thicke and troubled, which ingender and beare ſalt. But what will you ſay, if there bee certaine Fountaines of hote Waters which breed Salt? And yet ſuch bee the Baynes or Springs called Pagaſæi.

Thus

20030
copy 1

A Thus far forth haue I proceeded in thoſe kinds of ſalt which come of waters naturally. There are beſides certain hils alſo which are giuen by nature to bring forth ſalt, and ſuch is the mountain Oromenus among the Indians, wherein they vſe to hew ſalt as out of a quarry of ſtone, and yet the ſame groweth ſtill: inſomuch, as the kings of that country make a greater reuenue by far out of it, than either by their mines of gold, or the pearles which thoſe coaſts do yeeld. Furthermore it is euident, that in Cappadocia there is ſalt * Minerall, digged out of the earth: and it appeareth plainly, that it is a ſalt humor congealed within. And verily, they vſe to cut it out of the ground after the maner of *glaſſe ſtone in lumps: and thoſe exceeding heauy, which the peaſants commonly call * crums of ſalt. At Carrhæ, a city of Arabia, all the walls thereof, as alſo the houſen of the inhabitants, be reared & built of hard ſtones: and the ſame be laid by Maſons worke, and the joints cloſed and ſoudered by no other morter but plain water. K. *Ptolomæus*, at what time as he incamped about Peluſium, a city of Egypt, and caſt vp a trench to fortifie the ſame, found ſuch a mine or quarrey of ſalt as theſe, which was a preſident to others afterward to ſinke pits betweene Ægypt and Arabia, euen in the waſte and dry quarters, where vnder the delfe of ſand they met with ſalt. After which manner alſo they practiſed to dig in the deſart & dry ſands of Africk, and found more as they went, euen as far as to the Temple and Oracle of *Iupiter Ammon*. And verily they might perceiue this ſalt to grow in the night ſeaſon, according to the courſe of the Moone. As for all the tract and country of Cyrenæ, famous it is, and much ſpoken of, for the ſalt * Ammoniacum, ſo called, by reaſon that it is found vnder the ſands. In colour and luſtre it reſembleth that Alume de Plume, which the Greeks call Schiſtos: It groweth C in long lumps or pieces, and thoſe not tranſparent: the taſt is vnpleaſant, howbeit, this ſalt is of good vſe in Phyſicke. The cleareſt thereof is taken for the beſt, eſpecially when it wil cleaue directly into ſtreight flakes. A ſtrange and wonderfull nature it hath if it be right: for ſo long as it lyeth vnder ground within the mine, it is paſſing light in hand, and may be eaſily welded; take it forth once, and lay it abroad aboue ground, a man would not beleeue or imagine how exceeding heauy it is. But ſurely the reaſon thereof is euident: for the moiſt vapors contained within thoſe mines where it lieth, beare vp the ſaid pieces of ſalt, and are a great eaſe to thoſe that deale therwith, much like as the water helpeth much to the ſtirring and managing of any thing within it, be it neuer ſo weighty. Well, this Ammoniacke ſalt is corrupted and ſophiſticate, as well with the pit-ſalt of Sicily called Cocanicus, as alſo with that of Cypreſſe, which is wonderfull like D vnto it. Moreouer, neare Egelaſta, a city in high Spaine, there is a kind of ſal-gem or Minerall ſalt digged: the peeces or lumps wherof are ſo cleare, as a man may in a maner ſee through them: and this hath of long time bin in great requeſt and of ſuch name, as the Phyſitians giue vnto it the price and praiſe aboue all other kinds. But here is to be noted, that all places where ſalt is found, are euer barren, and will beare no good thing els. And thus much may bee ſaid concerning ſalt that commeth of the own accord.

As touching ſalt artificiall, made by mans hand, there be many kinds thereof. Our common ſalt, and whereof we haue greateſt ſtore, is wrought in this manner: firſt they let into their pits a quantity of ſea-water, ſuffering freſh water to run into it by certain gutters, for to bee mingled therewith for to help it to congeale, whereto a good ſhower of raine auaileth very much, but aE boue all the Sun ſhining therupon, for otherwiſe it wil neuer dry & harden. About Vtica in Barbary they vſe to pile vp great heaps of ſalt in manner of Mounts: which after that they bee hardened and ſeaſoned in the Sun and Moone, ſcorne all raine and foule weather, neither will they diſſolue, inſomuch, as folke haue enough to doe for to break and enter in with pick-axes. Howbeit, in Candy the Salt is made in the like pits, but of Sea-water onely, without letting in any freſh water at all. Semblably, in Ægypt, the Sea it ſelfe ouerfloweth the ground which (as I take it) is already ſoked and drenched with the water of Nilus, and by that means their Salt is made. After the ſame manner they make ſalt alſo out of certain wels, which are diſcharged into their Salt-pits. And verily in Babylon, the firſt gathering or thickening of the water in their ſalt-pits, is a certain liquid Bitumen or Petroleum, an oleous ſubſtance, which they vſe in their lamps, as F we do oile: and when the ſame is ſcummed off, they find pure ſalt vnderneath. Likewiſe in Cappadocia they do conuey and let in water out of certain wels and fountaines into their Salt-pits. In Chaonia there be certaine * Springs of ſaltiſh water, which the people of that countrey doe boile, and when it is cooled againe, it turneth into Salt: but it is but dull and weak in effect, and beſides, nothing white. In France and Germany the maner is when they would make ſalt, to caſt Sea-

* *Sal Gemma.*

* *Lapis ſpecularis, vitrum vel glacies Martis* or *Lapis Arabicus.*
* *Micæ Salis.*

* Of ἄμμος in Greeke, which is ſand.

This ſeemeth to be our Bay-ſalt.

* This is the order of ſalt with vs in our wiches here in England.

ſea-water into the fire as the wood burneth. [In ſome parts of Spain there be ſalt ſprings, out of G
which they draw water in maner of that brine, which they cal Muria.] But thoſe verily of France
and Germany be of opinion, that it skilleth much what wood it is that ſerueth to the making of
ſuch fire. Oke they hold the beſt, as being a fewell, the ſimple aſhes whereof mixt with nothing
els, may go for ſalt. And yet in ſome places they eſteeme Hazell wood meeter for this purpoſe.
Now when the ſaid wood is on fire and burniug, they poure ſalt liquor among, wherby not only
the aſhes but the very coales alſo will turne to be ſalt. But all ſalt made in this ſort of wood, is
black. I reade in *Theophraſtus*, That the Iſlanders of Imbros were wont to boile in water, the a-
ſhes of reeds and canes, vntill ſuch time as there remained little moiſture vnconſumed, and that
which was left they vſed for ſalt. The brine or pickle wherein fleſh or fiſh hath bin kept ſalt, if
it be boiled a ſecond time vntil the liquor be ſpent and conſumed, returneth to the own nature, H
and becommeth ſalt again. Certes, we find, That the ſalt thus made of the pickle of Pilchars or
Herings, is of all others moſt pleaſant in taſt. As touching the ſalt made of ſea-water, that of the
Iſle Cypres, and namely, that which comes from Salamis, is commended for the beſt. But of
poole ſalt, there is none comparable to the Tarentine and Phrygian, eſpecially that which they
cal Tatteus, of the lake Tatta: and in truth, both theſe kinds of ſalt be good for the eies. The ſalt
brought out of Cappadocia in little earthen pipes, hath the name to make the skinne ſlick and
faire: but for to lay the ſame plain and euen, and make it look full and plump without riuels, the
ſalt which I called Cittieus hath no fellow. And therefore women after they be newly deliue-
red of child, vſe to annoint and rub their bellies with this ſalt, incorporat together with Gith or
Nigella Romana. The drieſt ſalt is euermore the ſtrongeſt in taſt: the Tarentine ſalt is taken for I
to be moſt pleaſant and whiteſt withal. Otherwiſe, the whiter that ſalt is, the more brittle it is,
and readier to crumble and fal to pouder. There is no ſalt but raine water wil make it ſweet and
freſh. The more pleaſant it wil be & delicat to the taſt, in caſe the dew fal therupon: but North-
eaſt winds ingender moſt plenty therof. In a Southerly conſtitution of the weather, and namely
when the wind is ful ſouth, you ſhall ſee no ſalt ingendred. The * floure of ſalt (commonly cal-
led Sperma-Ceti) is neuer bred but when the Northeaſt winds do blow. The ſalt Tragaſæus wil
neither ſpit, crackle, leap, nor ſparkle in the fire; no more will Acanthius (ſo called of a towne of
that name:) neither doth the ſome of ſalt, nor the gobbets and fragments, ne yet the thin leaues
or flakes thereof. The ſalt of Agrigentum, a city in Sicily, will abide the fire and make no ſpark-
ling: put it into water, it will keep a ſpitting and crackling. Great difference there is in ſalt, in re- K
gard of the colour. At Memphis [i. Caire] in Egypt, the ſalt is of a very deep red: but about the
riuer Oxus in Bactriana, more tawny or inclining to a ruſſet. And the Centuripine ſalt within
Sicily is purple. About Gela in the ſame Iſland, the ſalt is ſo bright and clear, that it wil repre-
ſent a mans face, as in a mirroir. In Cappadocia, the Minerall ſalt which they dig, is of a yellow
Safron colour, tranſparent, and of a moſt redolent ſmell. For any vſe in Phyſicke, the Tarentine
ſalt was in old time highly commended aboue the beſt: after which they eſteemed moſt, all the
ſea ſalts; and of that kind the lighter, and that which eſpecially is of the nature of ſome: for the
*eies of horſes and Bœufes, they made great reckoning of the Tragaſæan ſalt, and that of Gra-
nado or Bœtica in Spaine. For dreſſing of viands and cates; for to be eaten alſo with meat; the
better is that ſalt, which ſooner melteth and runneth to water. That alſo which by nature is moi- L
ſter than others, they hold to be better for the kitchin or the table (for leſſe bitterneſſe it hath)
and ſuch is that of Attica and Eubœa. For to pouder and keep fleſh meat, the dry ſalt, & quicke
at tongues end is thought to be meeter than other, as we may ſee in the ſalt of Megara. Moreo-
uer there is a certain confite or condited ſalt, compounded alſo with ſweet ſpices & aromaticall
drugs: which may be eaten as a dainiy kind of gruel or ſauce; for it ſtirreth vp and whetteth ap-
petite, eat the ſame with any other meats: inſomuch, as amongſt an infinit number of other ſau-
ces, this carrieth away the taſt from them all; for it hath a peculiar ſmatch by it ſelfe, which is
the cauſe, that the pickle Garum is ſo much ſought after for to giue an edge to our ſtomack: &
not only we men are ſolicited & moued by ſalt more than by any thing els to our meat; but mut-
tons, Bœufes, and horſes alſo haue benefit therby in that reſpect: they feed the better, giue more M
ſtore of milke, and the cheeſe made thereof hath a more dainty and commendable taſte by that
means. And to conclude all in one word, the life of mankind could not ſtand without ſalt, ſo ne-
ceſſary an element (if I may ſo ſay) it is for the maintenance of our life, that the very delights &
pleaſures of the mind alſo are expreſſed by no better term than Salt: for ſuch gifts and conceits
of

* *Halos-anthos* which he rendreth *flos-ſalis*: whereas indeed *Flos-ſalis*, i. the floure of ſalt, is another thing, as himſelf ſheweth elſwhere by the name of *tenuiſſima faville ſalis*.

* *Sandivere*.

copy 1

A of the ſpirit as yeeld moſt grace and contentment, we vſe in Latine to call Sales. All the mirth of the heart, the greateſt cheerfulneſſe of a lightſome mind, & the whole repoſe & contentment that a man findeth in his ſoule, by no other word can be better ſhewed. Moreouer, this terme in Latine of Sal, is taken vp and vſed in war, yea, and diuers honours and dignities beſtowed vpon braue men for ſome worthy ſeruice, go vnder this name, and be called Salaries. And how highly our anceſtors accounted therof, it may appeare by the name of that great port-way or ſtreet Salariæ, ſo called, becauſe all the ſalt that went into the Sabines country, paſſed that way. Moreouer, it is ſaid that *Ancus Martius* K. of Rome, was the firſt that erected the ſalt-houſes, and gaue vnto the people a congiary or largeſſe of 6000 Modij of ſalt. And *Varro* writeth, That our anceſtors in times paſt vſed ſalt ordinarily in ſtead of an houſhold gruell: for they were wont to eat
B ſalt with their bread & cheeſe, as may appeare by the common prouerb that teſtifieth ſo much. But moſt of all we may gather in what requeſt and account ſalt was in ſacrifices and oblations to the gods, by this, that none are performed and celebrated without a cake of meale and ſalt. Furthermore, where ſalt is truly made without any ſophiſtication, it rendereth a certain fine and pure ſubſtance (as it were) the moſt ſubtill cinders of aſhes: which as it is lighteſt, ſo none is ſo white as it. There is that alſo which is called the Floure of ſalt, altogether different from ſalt, as being a kind of dew, of a moiſter nature; reſembling ſafron in yellow colour, or els inclining rather to a ſad red or ruſſet colour, and is as a man would ſay, the ruſt of ſalt: the ſtrong & vnpleaſant ſmell likewiſe, which commeth neere vnto that of the pickle Garum, bewraieth, that it is a diſtinct thing from ſalt, as well as from the froth thereof. This Floure of ſalt came firſt from
C Ægypt, and it ſeemeth as though it floted vpon the riuer Nilus, & were carried down the ſtream thereof. And yet there be ſome fountains which doe beare and put vp the ſame, vpon which it ſwimmeth aloft. Of this kind, the beſt is that which yeeldeth a certain fatty and vncteous oyle: for this you are to think, that ſalt is not without a kinde of fattineſſe, wonderfull though it be. This floure of ſalt is ſophiſticated & commonly coloured with red ocre, or els many times with potſhards reduced into pouder: but this deceit may be quickly known and found by water; for if it be a falſe and artificiall colour, water will waſh it off: wheras the true floure of ſalt indeed, will reſolue by nothing but by oile, and verily the Apothecaries & confectioners of ſweet oiles and ointments, vſe it moſt of all for the colour ſake, when they would giue a freſh & liuely hue to their compoſitions. Being put vp in any veſſell, it ſeemeth white & hoarie aloft: but the mid-
D dle part within, is as I haue ſaid, more moiſt ordinarily. As touching the properties of this flour of ſalt, by nature it is biting, hot, and hurtfull to the ſtomack; it moueth ſweat, and looſeth the belly taken in wine & water; good alſo it is for to enter into thoſe ointments which are deuiſed for laſſitude and wearineſſe: and by reaſon of the abſterſiue faculty that it hath, fit for ſope and ſcouring bals. Nothing ſo effectuall to cauſe the haire to fall from the eie-lids. As for the reſidence or grounds therof, ſetling in the bottom of the pot where this floure is kept; they vſe to ſhog and ſhake the ſame together, to bring it again to the colour of Safron. Ouer and beſides, there is in ſalt-houſes another ſubſtance like brine, which in Latine is called Salſugo or Salſilago, altogether liquid; ſalter in taſt than ſea-water, but in ſtrength far ſhort of it, and different, and yet is there one kind more of an exquiſit and dainty liquor in manner of a dripping, called Ga-
E rum, proceeding from the garbage of fiſhes, and ſuch other offall as commonly the cooke vſeth to caſt away as it lieth ſoking in ſalt: ſo as if a man would ſpeak properly, it is no other but the humor that commeth from them as they do lie and putrifie. In old time this ſauce was made of that fiſh which the Greeks called Garon. Where by the way this commeth to my mind, that if a woman ſit ouer the perfume or ſuffumigation of the head of this fiſh whiles it burneth, it is of power to fetch away the afterbirth that ſtaieth behind when the child is borne.

Chap. VIII.

¶ *Of the fiſhes called* * *Scombri. Of fiſh pickle: and the fiſh ſauce, named in old time Alex.*

* Commonly taken for Maquerels.

F NOw adaies the moſt dainty and exquiſit Garum is made of the fiſh called Scomber; and that in new Carthage, where there groweth ſuch ſtore of Spart or Spaniſh broome; and namely, in the ſtews and ponds by the ſea ſide where fiſhes are kept ſalted. In times paſt, and yet it beareth the name of the * Allies ſauce, as their Garum, ſo coſtly and ſo much in re-

* Garſſoiens

queſt,

queſt, that every 2 gallons thereof might not be bought much vnder the price of a thouſand ſeſterces. Certes ſetting aſide ſweet perfumes & odoriferous ointments, there was not a liquor almoſt in the world that began to grow vnto a higher rate & reckoning; inſomuch as ſome places and people carried the name thereof, and were ennobled thereby. And verily in all Mauritania, Granade in Spaine, and Carteia, the inhabitants lie in wait to fiſh for theſe Scombri, and to take them as they enter out of the Ocean into the ſtraits of Gilbretar, and all for this Garum, being indeed good for nothing els. The city Clazomenæ in Aſia, the townes Pompeij & Leptis, are much renowned for this ſauce: like as Antipolis, Thurij, and of late daies, Dalmatia for their pickle. The groſſe grounds or dregs of this ſauce, before it be ſtrained, purified, and fully finiſhed, is called Alex, euen the very defect & imperfection therof. Howbeit, of late time men haue gone in hand to make the ſaid Alex or Garum of one kind of fiſhes apart by themſelues, which otherwiſe are good for little or nothing, & of all others be ſmalleſt: this fiſh we in Latin call Apua, the Greeks Aphye, for that it is engendered of raine and ſhowers. In the the territory of Forojulium, the fiſh whereof they make this ſauce they call * Lupus. But in proceſſe of time Garum aroſe to exceſſe, both in price & varietie of vſe: inſomuch as there grew an infinit number, of diuers kinds: for one ſort there was of Garum that in colour reſembled old honied wine, and became ſo cleare and ſweet withall, that it might wel enough haue bin drunk for wine: another kind there was, which our ſuperſtitious votaries vſe, for to keep themſelues chaſte & continent; & the Iews alſo in their holy ſacrifices imployed the ſame, eſpecially that which is made of skaly fiſhes. In like manner, the other ſauce, Alex, is come to be made of Oiſters, ſea Vrchins, ſea Nettles, Crabfiſhes, Lobſtars, and the liuers of ſea Barbles. In ſum, thus wee haue deuiſed a thouſand waies to diſſolue ſalt with the conſumption of the ſubſtance of fiſh, and all to procure appetite to meat and to content the belly.

G

H

I

* Which ſome take to be our Pike.

Thus much I thought good to note curſarily, as touching thoſe ſauces which are ſo greatly longed after in the world; & the rather for that in ſome ſort they ſerue in the practiſe of Phyſick: for the groſſe liquor or ſauce Alex, healeth the ſcab in ſheep, if the skin be ſcarified or skiced, and the ſame Alex poured therupon. Alſo it is ſingular againſt the biting of a mad dog, or the prick of the ſea dragon: the ſame likewiſe ſerues to ſoke linnen wreaths to be laid in wounds or tents made of lint to bee put into ſores. As for Garum, it healeth any freſh burne, if a man drop it vpon the place, without naming it, or ſaying that it is Garum: good it is beſides for the biting of mad dogs, but eſpecially for the Crocodiles tooth: as alſo for running vlcers which be either corroſiue or filthy. Of wonderful operation & effect beſides for the ſores of the mouth, and ears, as alſo for their pains. The pickle Muria likewiſe, or that ſalt liquor that commeth from ſalt-fiſh, called in Latin Salſugo, is aſtringent, biting, diſcuſſiue, and drying: ſingular for to cure the dyſentery or bloudy flix, yea, though there were an eating vlcer within the guts: for the Sciatica and inueterat fluxes of the ſtomack, it is ſoueraign: and to conclude, thoſe that dwell far from the ſea in the midland parts of a country, vſe to bath and foment themſelues with it in lieu of ſea water.

K

Chap. X.

¶ *The nature of Salt, and the medicinable vertues thereof.* L

SAlt, by nature ſtandeth much vpon fire, & yet an enemy it is and contrary vnto fire, it flieth from it, eating and conſuming al things whatſoeuer: aſtringent it is, deſiccatiue, binding, and knitting. It keeps from putrifaction, bodies that be dead, and cauſeth them to indure ſo a world of yeares. In phyſick it is held for mordant, burning, cauſtick, and mundificatiue. It doth ſubtiliat, extenuat, and diſſolue. Contrary it is to the ſtomack, and ſerueth not but only to prouoke appetite. With origan, hony, and hyſſope, it is ſingular againſt the ſting of ſerpents: and more particularly of the horned ſerpent Ceraſtes, if it be applied with origan, cedar-roſin, pitch or hony. Being drunk with vineger, it helpeth thoſe that be pricked with the Scolopendre: and applied as a liniment with oile or vineger, and a fourth part of line ſeed, it is good againſt the ſting of ſcorpions: alſo with vineger alone, for the ſting of hornets or waſps & ſuch like. Incorporat with calues tallow, it ſerues much to cure the migrim, skals in the head, ſmall pocks, meaſels, & werts which begin to breed: alſo for the accidents of the eies, to wit, the excreſcence of ſuperfluous fleſh in thoſe parts, or the turning vp of skin about naile roots of fingers or toes.

M

But

20030

Bu principally for the eyes, and therefore it entreth into collyries and eie-ſalues. Howbeit for
A theſe purpoſes aboue named it is thought that the ſalt named Tattæus, of the lake Tatta, is moſt commended, as alſo the other lake like it, called Caunites. If the eies be bloud ſhotten, or look black and blew vpon ſome ſtripe, apply ſalt with an equal weight of Myrrh, & with hony, or els with * Hyſſop & hot water; with this charge, to foment or bath the place afterward with a kind of ſalt brine. But aboue all, Spaniſh ſalt would be choſen for this effect: & it is alſo good againſt cataracts and ſuffuſions of the eies: if it be ground with milke vpon ſome touch-ſtone, whetſtone, or hard porphyrit marble. More particularly, it is ſingular for the black bloud gathered in the eies, if it be folded within a little linnen cloth, & ſo applied: but the ſame ought to be dipped eftſoons in hot water, and ſo the place to be oft times patted withall. For the cankers or ſores in the mouth, it is good to lay ſalt vpon fine lint. In caſe the gumbs be ſwelled, it were not amiſſe to rub them therewith. Being beaten and reduced into ſmall pouder, it ſerueth for the roughneſſe of the tongue. Moreouer it is ſaid, That whoſoeuer hold euery morning vnder his tongue while hee is faſting a little ſalt vntill it be melted, hee ſhall by that meanes preſerue his teeth from being worm-eaten or rotten. The ſame incorporat in raiſins without ſtones, and in bœuf ſuet, with a little origan, leuen, or bread, is ſoueraign for the leproſie, fellons, tettars, ring-worms, and the wild ſcab. But in all theſe accidents, the ſalt of Thebais in high Egypt is moſt commended: and of this they make choice alſo to kil the itch. A gargariſm or collution ther-of with hony, is paſſing good for the inflammation of the amygdals and the uvula. There is no kind of ſalt but it helpeth the ſquinancie, and the rather if it be vſed inwardly with oile and vi-
C neger, ſo as at the ſame time it be applied without the throat alſo in a liniment with tar. If a cup of wine be dreſſed therewith it ſoftneth the belly being coſtiue. The ſame alſo taken in Wine chaſeth out of the body all worms and any hurtful vermin beſides. Held vnder the tongue, it inableth them that haue bin weakned with ſome long diſeaſe, and newly recouered, to indure the heate of bains or ſtoues the longer. Singular it is for the grief of the ſinues: but in the practiſe and vſe of this receit, it would be obſerued eſpecially, that there be applied about the ſhoulders and reins of the back, ſachels or bags full of ſalt, and the ſame made hot oftentimes in ſeething water: for ſo it eaſeth the pain. Being giuen in drink, or laid to exceeding hot in the ſaid bags, it aſſwageth the collique and other wrings in the belly, yea and the ſciatica. Beaten ſmall, and applied in manner of a cataplaſme, with meale, honey, and oile, it is ſoueraigne for the gout in
D the feet. Where I may not forget the obſeruation of this ſoueraign receit, which putteth vs in mind, that there is nothing better for the whole body [of ſuch eſpecially as be ſubiect to the gout] than * ſalt and Sun together. For thus we ſee, That our fiſhers at ſea ordinarily haue bodies as hard and tough as horne. A principall thing this is therefore to be nominated and ſet downe for the gout in the feet. But ſalt moreouer takes away cornes of the feet, and kibes in the heels. Being chewed in the mouth and ſo applied, or els with oile, it healeth any burn or skald, and keeps the skin from riſing into bliſters. With vineger and hyſſop it cureth S. *Anthonies* fire and all vlcers that be corroſiue. It heals likewiſe cankerous ſores, if it be applied with wild vine grapes. Reduced into fine pouder and laid to with barly meale, it is ſouerain for vlcers corroſiue ſuch as be called Wolues, and do eat deep to the very bone; ſo there be laid ouer the ſame and
E the part affected, a linnen cloath well ſoked and bathed in wine. A proper remedy it is for the jaundiſe, and riddeth away the itch occaſioned thereby, if the patient be rubbed all the bodie ouer with it, oile, and vineger; againſt a good fire vntill hee doe ſweat. But with oile alone it ſerues for thoſe that feel themſelues weary. Many phyſitians haue cured thoſe that be in a dropſie with ſalt; and haue ordained to rub their bodies with oil & ſalt together, who are in an ague, for to auoid the extremitie of heat: and they hold opinion, That there is not a better thing to diſpatch an old cough, than to be licking euer and anon of ſalt. They haue giuen order alſo by way of cliſtre to miniſter ſalt vp into the body, for the Sciatica. To apply the ſame alſo to eat away proud or dead fleſh in any vlcers. Being lapped within a linnen cloath, and applied to the biting of Crocodiles, it is ſouerain, ſo that the place affected were well patted withal, and preſ-
F ſed hard before. Moreouer, good it is to be taken in honied vineger againſt the dangerous Opium. Brought into a cataplaſme with honey and meale, it is of great effect to rectifie any diſlocation of bones which be out of joint: and in that ſort it taketh downe all tumors or ſwelling bunches. A collution or fomentation therewith allayeth the tooth-ache: and a liniment alſo made with it and Roſin worketh the ſame effect. For all theſe accidents beforenamed,

* *Hyſſopo.* Some read *Oeſypo.*

* *Sale & ſole.*

the

the fome of ſalt found ſticking to rockes, or floting vpon the ſea water, is thought to be more G
conuenient than any other ſalt. But to conclude, any ſalt whatſoeuer it is ſerueth well for thoſe medicines that be ordained either to take away laſſitudes, or to enter into thoſe ſope balls that are to poliſh the skin and to rid it from wrinkles. If either a bœufe or mutton be rubbed with ſalt, it will kill the skab or mange in them: for which purpoſe alſo they giue it vnto the ſayd beaſts for to lick: and more particularly it is ſpurted out of ones mouth into horſes eies. Thus you ſee what may be ſaid as touching ſalt.

Chap. X.

¶ *Of Nitre, and the ſundry kindes thereof. The manner of making Nitre. The medicines and obſeruations to it belonging.* H

I May not put off the treatiſe concerning the nature of Salnitre, approching ſo neer as it doth to the nature of ſalt: and the rather am I to diſcourſe of it more exactly, becauſe it appeares euidently, that the phyſitians who haue written thereof were altogether ignorant of the nature and vertues of it: neither is there any one of them who in that point wrote more aduiſedly, than *Theophraſtus*. In the firſt place this is to be noted, That among the Medians there is a little Nitre ingendred in certain vallies which in time of drought became all hoary & grey therwith and this they call Halmirrhaga. There is found alſo ſome of it in Thracia neere vnto the Citie Philippi, but in leſſe quantitie, and the ſame all fouled and bewraied with the earth, & this they name Agrion. In times paſt men haue practiſed to make Nitre of oke wood burnt; but neuer I
was there any great ſtore of it made by that deuiſe: and long it is ſince that feat was altogether giuen ouer. As for waters & fountains of nitre, there be enow of them in many places, howbeit the ſame haue no aſtringent vertue at all. But the beſt Nitre is found about Clytæ in the marches of Macedonie, where there is moſt plenty thereof, and they call it Chalaſtricum: White and pure it is, and commeth neereſt to the nature of ſalt. And verily a lake or meer there is ſtanding altogether vpon nitre, and yet out of the midſt thereof there ſpringeth vp a little fountain of freſh water. In this lake there is ingendred Nitre about the riſing of the Dog-ſtar for 9 dayes together: then it ſtayeth as long, and beginneth freſh againe to flote aloft: and afterward giues ouer. Whereby it appeareth that it is the very nature of the ſoile that breedeth it; for knowne K
it is by experience, That if it ceaſe once, neither heat of Sun nor ſhoures of rain wil ſerue or do any good. Beſides, there is another wonderful propertie obſerued in this lake, that notwithſtanding the foreſaid ſpring or ſource do ſeeth and boile vp continually, yet the lake neither riſeth nor ouerfloweth. But during thoſe nine daies wherein it is giuen to yeeld Nitre, if there chance to fall any ſhoures, they make the nitre to taſte the more of ſalt. And ſay that the North-Eaſt winds do blow the while, the Nitre is nothing ſo good and cleere, by reaſon of the mud mingled withall, which thoſe winds do raiſe. Thus much of Nitre naturall.

As for artificiall Nitre, great aboundance there is made of it in Egypt, but far inferiour in goodneſſe to the other: for brown and duskiſh it is, and beſides full of grit and ſtones. The or- L
der of making it is all one in manner with that of ſalt, ſauing onely that in the ſalt houſes they let in ſea water, wheras into the boiling houſes of Nitre they conuey the water of the riuer Nilus. Whiles Nilus doth riſe and flow, you ſhal haue the ſaid nitre-pits or workhouſes dry: but as it falleth and returneth again toward the channel, they are ſeen to yeeld a certaine moiſture, (which is the humor of nitre) and that for the ſpace of forty daies together, with no reſt or intermiſſion between, as there is about Clytæ in Macedonie aboueſaid. Moreouer, if the weather be diſpoſed to rain during that time, they imploy not ſo much of Nilus water to the making of Nitre. Now ſo ſoon as the ſaid humor beginneth to thicken, preſently they gather it in all haſt, for feare it ſhould reſolue again and melt in the nitre pits. In this nitre, as well as in ſalt, there is to be found between whiles a certaine oleous ſubſtance; which is held to be ſingular good for the farcin and ſcab of beaſts. The nitre it ſelfe is laid vp and piled in heaps, where it hardeneth and continueth a long time. But admirable is the nature of the lake Aſcanius, and of certaine M
fountaines about Chalcis, where the water aboue, and which floteth vppermoſt, is freſh and potable; but all beneath and vnder it toward the bottome is nitrous. The lighteſt of the Nitre and the fineſt is reputed alwaies the beſt; and therefore the fome and froth therof is better than any other part. And yet for ſome vſes the groſſe and foule ſubſtance is very good, and namely,

for

20030
copy 1

A for the ſetting of any colour vpon cloth, and eſpecially the purple die. As touching the vertues of nitre it ſelfe, & how it is imploied many wayes, I wil write in place conuenient. But to return againe to our nitre pits, and their boiling houſes, there be of them very faire and goodly in Ægypt. In old time, they were wont to be about Naucratis and Memphis only; but thoſe at Memphis were nothing ſo good as the other: for there, the nitre lying vpon heapes, groweth to the hardnes of a ſtone; inſomuch, as by this means, you ſhall ſee mountaines thereof like rockes. Of this nitre they vſe to make certain veſſels to vſe in the houſe: and many times they melt it with ſulphur, & boyle it ouer the coles for to giue a tincture vnto the ſaid veſſels: look alſo when they would keep any * thing long, they vſe this ſtone-nitre. Moreouer, there be in Ægypt other nitre pits alſo, out of which there iſſueth a reddiſh kind of nitre, reſembling the color of the earth B from which it ſweateth and ooſeth out. As for the ſome of nitre (which is commended for the beſt of all) the antient writers were of opinion, that it could not be made but when the dew fell: at what time as the nitre pits were (if I may ſo ſay) great bellied and ful of nitre within, but not ready to be deliuered thereof: and therefore if they be neare (as it were) to their time, there can no ſuch froth be gathered, notwithſtanding the dew do fall. Others there be of this minde, that the ſaid vppermoſt coat or cruſt aloft, is ingendred by reaſon of the fermentation of the ſayd nitre: but the modern Phyſitians of late daies haue thought and taught, That * Aphro-nitrum is gathered in Aſia, and found within certain ſoft and gritty caues diſtilling out of rocks: [Theſe caues becauſe they be vaulted and arched ouer head, the inhabitants call * Cochlacas] which afterwards they doe drie in the Sun: and the beſt is thought that of Lydia. The true marke to C know good ſal-petre, is to be very light in hand, exceeding brittle, & eaſie to crumble; inclining alſo much to the colour of purple: this is brought from thence to vs in trochiſchs. As for the Ægyptian Aphro-nitre or Salt-petre, it comes in veſſels wel pitched, becauſe it ſhould not melt and reſolue into water. Thoſe veſſels alſo beforenamed, ought to be throughly dried & dreſſed in the Sun. As for nitre, the beſt is choſen by theſe marks; namely, if it bee paſſing fine & cleare, but withal, ſpongious & very ful as it were of pipes and holes. Many do ſophiſticat it in Ægypt with quicklime; but this deceit may be eaſily found by the taſt: for the good and true ſal-nitre will ſoone melt and diſſolue at the tongues end; whereas the other that is not right, pricketh and biteth in the mouth: moreouer, if it haue a ſprinckling of lime among, it carrieth a ſtrong ſmell with it. When it is calcined in ſome earthen pot, it ought to be well couered with a lid, leſt it D leap or fly out; otherwiſe, in the fire it ſelfe, it ſparkleth not nor leapeth forth: neither groweth any thing els in thoſe places where ſal-nitre is ingendred, wheras in ſalt-pits gräſſe commeth vp. As for the Sea, what a number of liuing creatures breedeth it? and what plenty of reike and weeds beſides? And not only by this argument appeareth it, that there is more acrimonie and ſharpneſſe in ſal-nitre than in ſalt, but alſo herein, That no ſhooes will abide the nitre pits, but preſently fret and weare; for otherwiſe wholſome they be and ſoueraign for the eies: neither was it euer ſeen, that any men who handled theſe pits of nitre, and wrought therein, were euer blind. Moreouer, this commodity they haue, That if a man come thither hauing a ſore or vlcer vpon him, the ſame will ſoone be healed vp and skinned cleane: but if one chance to bee wounded or hurt there, long it will be ere he be cured thereof. Salnitre prouoketh ſweat, if the body be annointed with it and oile together; aud it maketh the skin ſoft and tender. That which is called E Chalaſtræum, ſerueth in lieu of ſalt, in making bread, whereas the Ægyptian nitre is vſed with radiſhes, for it maketh them more tender. As for cates and meats, if they bee powdred withall, they will look white and be worſe for it: whereas all woorts either for pot or ſallad, will ſeeme the greener.

To come now vnto phyſick and the medicinable vertues of ſalnitre: hot it is of temperature, and doth extenuat; biting beſides and aſtringent: a great drier it is, & doth exulcerat. In regard of which qualities, imployed it is in thoſe accidents which require either drawing to the exterior parts, or to be diſcuſſed and reſolued: ſuch alſo as need ſome gentle mordication, or would be lightly extenuated; as meazils, ſmall pocks, wheals, and pimples. Some for this purpoſe, firſt F make it red hot in the fire, and then quench it with ſome aſtringent wine: which done, they beat and reduce it to pouder, and therewith rub and chauſe the body in the bains, without any addition of oyle to it: mixt with the pouder of dried flour-de-lis, & incorporat in green oile oliue, it repreſſeth immoderat ſwets: a liniment made therwith & figs together, doth extenuat the films in the eies; and the aſperity of the eie-lids it doth ſubtiliat: the ſame operation hath it beſides,

* As dead bodies.

* This is our Sal-petre.

* Some reade *Colytas.*

if it be ſodden in wine cuit to the conſumption of the one halfe: and ſo is it good for the ſpots G
that ariſe in the eies. The decoction of nitre boiled within the rind of a pomegranat in wine cuit, cure the ſore nails and the raggedneſſe thereof: and reduced into an ointment with honey, it clareth the eie-ſight: a collution made therof, ſodden in wine with pepper, eaſeth the tooth-ach if the mouth and gums be waſhed therewith: ſo doth the decoction thereof with leeks. Burn or calcine nitre into pouder, it maketh an excellent dentifrice for blacke teeth, and reduceth them again to their naturall whiteneſſe: annoint the head with nitre & Terra Samia incorporat together in oile, it killeth the lice and nits that breed therein: diſſolued in wine, and poured into the ears that run attyr, it cureth them: dropt into them with vineger, it eateth and conſumeth the filthy excrements of that part: conueied dry into the ſaid ears, it diſcuſſeth the ſinging & ringing therein. A liniment made of nitre and fullers earth, of each a like weight, incorporat with vine- H
ger, taketh away the foule morphew, if the skin be annointed therwith: mixed with roſin, or with raiſons of white grapes ſtamped ſtones and all, it draweth vncoms and fellons to an head, and breaks them: reduced into an ointment with ſwines greaſe, it preſerueth the genitoirs from inflammation, & cureth them: good likewiſe for the meaſils and ſmall pocks which break out in all parts of the body: put roſin thereto, and incorporat them both in a liniment with vineger, it healeth the biting of a mad dog, ſo it be taken betimes at the beginning: and in this manner, it cureth alſo the ſores occaſioned by the ſting of ſerpents, eating vlcers, which conſume to the bone; ſuch likewiſe as be corroſiue and apt for putrefaction, ſo it be mixed with quick-lime and tempered with vineger. Stamp nitre with figs, and bring it into the form of a cataplaſme or liniment, it doth much good for the dropſie: the ventoſities cauſing wringings and painful gripes I
of the belly, it diſcuſſeth, if the decoction thereof be drunk; namely, when to the weight of one dram, it is ſodden with rue, dill, or cumin. Annoint their bodies all ouer who are weary, with nitre, oile, and vineger, you ſhal ſee how effectuall it is to refreſh them and driue away their laſſitude. Rub and chauſe both hands and feet, with nitre & oile wrought together, is ſingular good againſt quaking and ſhiuering cold: giuen with vineger, eſpecially in a ſwet, to thoſe who are painted with the jaundiſe, it repreſſeth the itch that troubleth them: if a man be poiſoned with taking venomous muſhroms, he ſhall find means to auoid the danger thereof by drinking nitre in oxycrat or vineger & water mingled together. Hath one ſwallowed down the hurtfull fly Bupreſtis? let him take a draught of ſal-nitre in water, it wil ſaue him, for it cauſes vomit: to thoſe that haue drunk buls bloud, it is vſually giuen with the ſpice Laſer: incorporat with honey and K
cow milk, it healeth the breaking out and the exulcerations in the face. Torrifie nitre vntill it begin to look blacke, beat it then to pouder and caſt the ſame vpon a raw place that is burnt, it wil take out the fire and skin it vp again: for the pain of the belly and the kidnies, for the ſtiffeneſſe and ſtarkneſſe of the lims, the grieuance alſo of the ſinews, it ſerueth well in a clyſtre: lay it to the tongue with bread, it is ſoueraigne for the palſie or reſolution of the ſinews: it helpes thoſe that be ſhort-winded, if they take it in a Ptiſan, or with husked barly. The floure of nitre incorporat in Galbanum, and the roſin called terpentine, of each an equall weight, and reduced into a lohoch, ſo as the patient ſwallow down the quantity of a Bean at once, cures an old cough

Vritur, not Coquitur, ex Dioſc.

* Burn or calcine nitre, temper it afterwards with liquid pitch or tar, and giue it to drink, it cu- L
reth the ſquinancy. The floure of nitre incorporat with the oile Cyprinum, makes a pleaſant liniment to annoint the body withal in the Sun, for the gout or any paine of joints: drunk in wine it doth exterminat and driue away for euer, the jaundiſe; it ſcattereth and diſcuſſeth ventoſities; it ſtoppeth bleeding at the noſe, if the patient receiue into the noſthrils the vapour of it out of boiling water: mixed well with alume, it riddeth away an itch: foment or bath the arme pits duly euery day therewith in water, it correcteth the ranke ſmell thereof. Make a liniment or cerot of nitre and wax tempered together, it healeth the vlcers occaſioned by fleam: after which maner it is good alſo for the ſinews. Being injected by a clyſtre, it helpeth the flux of the belly, proceeding from a feeble ſtomack. Many Phyſitians haue giuen direction to annoint the body all ouer with ſal-nitre and oile, before the cold fits of agues: which ointment ſerueth likewiſe for the leproſie, and the vnſeemly ſpots or freckles that blemiſh the skin. To ſit in a tub of nitre within M
the bains, & therwith to bath the body, is a ſoueraigne thing for thoſe that haue the gout, be in conſumption, and either draw backward with the crampe, or ſtretched and plucked ſo ſtrait and ſtiffe therewith, that they ſeem all of one entire piece. Sal-nitre, if it bee boiled together with ſulphur, turneth to be as hard as a ſtone.

Chap. XI.

¶ *The nature of Spunges.*

MAny ſorts there be of Spunges, according as I haue ſhewed already more amply in my treatiſe of water-beaſts, and thoſe eſpecially of the Sea, and their ſeuerall natures: howbeit ſome writers diſtinguiſh them after another manner, into male and female: for ſome of them they haue thought to be of the male ſex, to wit, thoſe which haue ſmaller pipes or concauities, and thoſe growing thicker and more compact, whereby they ſucke vp more moiſture; and theſe, our delicat and dainty people, die in colours, and otherwhile giue them a purple tincture. Others they count of the femal ſex, namely ſuch as haue bigger pipes, & the ſame running throughout one continuity without interruption. Of the male kind, ſome be harder than others, which they call Tragos; the pipes whereof are the fineſt, and ſtand thickeſt together. There is an artificiall deuiſe to make ſpunges look white; to wit, if the ſofteſt and tendreſt of them be taken whiles they be freſh in ſummer time, and ſo bathed & ſoked wel in the ſome of ſalt: after which they ought to be laid abroad in the moon-ſhine, to receiue the thick dew or hoary froſts (if any fall) with their bellies vpward into the aire, I meane that part whereby they cleaue faſt to rocke or ſand where they grew, that therby they may take their whitening. That ſpunges haue life, yea and a ſenſible life, I haue proued heretofore; for there is found of their bloud ſettled within them. Some writers report, that they haue the ſenſe of hearing, which directs them to draw in their bodies at any ſound or noiſe made, and therwith to ſquize out plenty of water which they contained within; neither can they eaſily be pulled from their rocks, and therefore muſt be cut away; wherby they are ſeen to ſhed a deale of bloud, or that which reſembleth bloud very neer. Many do prefer the Spunges growing in places expoſed to the North-wind, before any other: neither doe any hold and maintaine longer in any place their owne breath, as Phyſicians doe hold; who affirme, that for this regard they be good for our bodies, namely, if wee entermingle their breath with ours by application: for which purpoſe, the freſher taken and the moiſter they be, the better they are thought: but this their operation is leſſe perceiued, in caſe they be wet in hot water, and ſo applied: likewiſe if they be ſoked in any vnctuous liquor, or bee laid vpon any part of the body anointed. This alſo is obſerued by them, that the thickeſt of them, to wit, ſuch as haue the leaſt pipes, ſticke not ſo hard to a place as others. As touching the ſofteſt and fineſt ſpunges, called Penicilli, if they be applied vnto the eies after they haue beene ſoked in honyed wine, they do allay and bring down any ſwelling in them. The ſame are abſterſiue and ſingular good to clarifie and cleanſe the eies that be giuen to bleerednеſſe: but thoſe (I ſay) ought to be of the fineſt and ſofteſt kind. For to ſtay the violent flux of rheumaticke humors into the eies, there is nothing better than to apply ſpunges of any ſort with oxycrat, that is to ſay, vinegre and water: but with vinegre alone actually hot, they be ſingular for the head-ach: and otherwiſe, any ſpunge that is freſh gotten, doth diſcuſſe, mollifie, & mitigat. Old ſpunges do conglutinat and ſouder any wounds. There is a generall vſe of all ſpunges, to wipe and mundifie any place, to foment and bath withall: to keep off the aire alſo and to couer it after fomentation, vntill another medicine be made ready for to be laid on freſh. Moreouer, they be deſiccatiue, & therfore if they be applied to rheumatick and moiſt vlcers, and namely in old folke, they dry vp the ſuperfluous humors that find a way thither: neither is there any thing ſo fit for to foment a fracture or green wound, as ſpunges. Alſo, when any part of the body is cut off or diſmembred, what is ſo handſome to ſuck and ſoke away the bloud quickly, (that the cure may be throughly ſeen, & the order thereof) as a ſpunge? Furthermore, ſpunges themſelues ſerue to be laid to wounds, ſomtime drie and ſomtime dewed or ſprinkled with vinegre, one while wet in wine, another while moiſtened with cold water, and all to defend them from inflammation: but if they be bathed in raine water, and ſo applied to members new cut, they will not ſuffer them to ſwell and impoſtumat. They are beſides laid vſually to the ſound parts, where no skin is broken, if there be any hidden and ſecret humor that runs vnder the place, and puts it to paine and trouble, ſuch as needeth to be diſcuſſed or reſolued: alſo to impoſtumes, if they be firſt annointed with boiled hony. In like manner, for the paine of the joints they are proper to be applied, one while wet in vinegre with ſalt, another while dipped in vinegre and water: and if the gout be hot, they would be laid to ſoked in water only. The ſame ſpunges ought for the diſſoluing of hard calloſities, to be wet with

ſalt water: & againſt the ſting or prick of ſcorpions, with vinegre. In the cure of wounds, ſpunges G
may be vſed in ſtead of vnwaſhed greaſie wooll, ſomtimes applied with wine and oile, and ſom-
times alſo with the ſaid wooll: this only is the difference, That ſuch wooll doth mollifie, wher-
as ſpunges do reſtrain and ſmite back: and yet a facultie they haue, to fetch out and ſucke away
the filthy excrements, attyr, and quitter, that gather in ſores and wounds. They may be bound
about the body of thoſe that haue a dropſie, either drie, or elſe wet in warme water or vinegre;
according as need requireth, either to goe gently to worke, or to couer and dry the skin. Ouer
and beſides, good it is to apply ſpunges to thoſe accidents and infirmities of the body which
require euaperation; namely, if they be well ſoked and throughly wet in hot water, and then
preſſed and ſtrained between two tables or bords. After which manner, they are good to be laid
to the ſtomack; and in a feauer, againſt extremitie of heat. For thoſe that be troubled with the H
oppilation or hardnes of the ſpleen, there is not a more effectual remedy, than to apply ſpunges
to the place affected, wet in oxycrat or vinegre & water together: like as for ſhingles and S. *An-
thonies* euill, with vinegre only. But in this application of them, conſideration muſt be had that
they couer the ſound parts alſo round about as well as the other. Spunges wet in vinegre and
cold water, ſtaunch any flux of bloud. If there be any place of the skin blacke and blew, vpon a
freſh or new ſtripe, lay thereto ſpunges well drenched in ſalt water, changing them often one af-
ter another, and it ſhall recouer the naturall colour againe: in which order, they bring down the
ſwelling of the cods, and allay their paine. Being hacked and cut ſmall, they ſerue to good pur-
poſe for to be laid to the biting of mad dogs; ſo that eftſoones and euer and anon they be wet
and refreſhed with vinegre, cold water, or hony good ſtore, one with another. The ſpunges of I
Africke or Barbarie being burnt or calcined, doe make ſoueraigne aſhes for to be drunke with
juice of vnſet leeks in cold water (ſo there be put vnto a draught thereof, a quantitie of ſalt) by
ſuch as caſt or reach bloud vpward at the mouth. The ſame aſhes reduced into a liniment, ei-
ther with oile or vinegre, and ſo applied as a frontall to the forehead, driue away tertian agues.
Theſe African ſpunges haue this peculiar qualitie, to diſcuſſe any tumors, if they be applied to
them well ſoked in oxycrat or water and vinegre mixed together. The aſhes of any ſpunges
whatſoeuer, burnt together with pitch, ſtaunch the bleeding of any wound: and yet ſome there
be who in this caſe burn thoſe only with pitch which are of a groſſe and looſe making, and not
ſo compact as the reſt. Moreouer, for the accidents of the eies, ſpunges are many times burnt
and calcined, in an earthen pot vnbaked: and the aſhes which come thereof, do much good alſo K
vnto the pilling and aſperitie of the eie-lids, the excreſcenſe of fleſh, and whatſoeuer in thoſe
parts needeth aſtriction, or otherwiſe to be vnited, ſowdred or incarnat: and for theſe effects, it
is much better to waſh the ſaid aſhes. Furthermore, ſpunges, in friction and rubbing of craſie
bodies, may well ſtand in ſtead of currying combs, and courſe linnen cloaths: beſides, they ſerue
right handſomely and fitly, to couer and defend the head againſt the extreame heat of the Sun.
Moreouer, the ignorance of our Phyſitians, is the cauſe that all ſpunges be reduced to two only
kinds, to wit, vnder the name of Affrican, which be of more tough and firme ſubſtance; and the
Rhodiacke, which are ſofter, and therefore meet for fomentations. At this day the tendreſt and
moſt delicat ſpunges are found about the walls of the citie Antiphellus. And yet *Trogus* wri-
teth, that about Lycia, the ſofteſt ſpunges called Penicilli, do grow in the deep ſea, and namely L
in thoſe places, from whence other ſpunges beforetime had been plucked and taken away. Fi-
nally, *Polybius* doth report, that if ſpunges be hung about the teſter or ſeeling of a bed ouer
ſicke perſons, they ſhall take the better reſt and repoſe all night for it. Now is it time for me to
returne vnto Beaſts of the Sea, and other creatures liuing and bred in the waters.

THE XXXII. BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

The Proem.

¶ *Medicines taken from liuing creatures of the Sea.*

HAuing so far proceeded in the discourse of Natures historie, that I am now arrived at the very height of her forces, and come into a world of Examples, I cannot chuse but in the first place consider the power of her operations, and the infiniteneſſe of her secrets which offer themselues before our eies in the Sea: for in no part elſe of this vniuersall Frame, is it possible to obserue the like majestie of Nature: in so much as we need not seeke any further, nay we ought not to make more search into her diuinitie, considering there cannot be found any thing equall or like vnto this one Element, wherein she hath surmounted and gone beyond her owne selfe in a wonderfull number of respects. For first and formost, Is there any thing more violent than the Sea, and namely, when it is troubled with blousting winds, whirlpuffs, stormes, and tempests? Or wherein hath the wit of man beene more employed (seeke out all parts of the whole world) than in seconding the waues and billowes of the Sea, by saile and ore? Finally, Is there ought more admirable, than the inenarrable force of the reciprocall tides of the Sea, ebbing and flowing as it doth, wherby it keepeth a current also, as it were the streame of some great riuer?

Chap. I.

¶ *Of the fish Echeneis, and her wonderfull propertie. Of the Crampe-fish Torpedo, and the Sea-hare. The wonders of the Red sea.*

THe currant of the Sea is great, the tide much, the winds vehement and forcible; and more than that, ores and sails withall to helpe forward the rest, are mighty and powerfull: and yet there is one little sillie fish, named Echeneis that checketh, scorneth and arresteth them all: let the winds blow as much as they will, rage the stormes and tempests what they can, yet this little fish commandeth, their fury, restraineth their puissance, and maugre all their force as great as it is, compelleth ships to stand still: A thing, which no cables, be they neuer so big and strong, no ankers, how massie and weightie soeuer they be, sticke they also as fast and vnmouable as they will, can performe. Shee bridleth the violence, and tameth the greatest rage of this vniuersall world, and that without any paine that she putteth her selfe vnto, without any holding and putting backe, or by any other meanes, saue only by cleauing and sticking fast to a vessell: in such sort, as this one small and poore fish, is sufficient to resist and withstand so great power both of sea and nauie, yea and to stop the passage of a ship, doe they all what they can possible to the contrary. What should our fleets & armadoes at sea, make such terrets in their decks and forecastles? what should they fortifie their ships in warlike maner, to fight from them vpon the sea, as it were from mure and rampier on firme land? See the vanity of man! alas, how foolish are we to make all this adoe? when one little fish, not aboue halfe a foot long, is able to arrest and stay perforce,

perforce, yea and hold as priſoners our goodly tall and proud ſhips, ſo well armed in the beake-head with yron pikes and braſen tines; ſo offenſiue and dangerous to bouge and pierce any enemie ſhip which they do encounter. Certes, it is reported, that in the nauall battell before Actium, wherein *Antonius* and *Cleopater* the queene were defeated by *Auguſtus*, one of theſe fiſhes ſtaied the admirall ſhip wherein *M. Antonius* was at what time as he made all the haſt & means he could deuiſe with help of ores, to encourage his people from ſhip to ſhip, and could not prevaile, till he was forced to abandon the ſaid admirall and go into another galley. Meane-while the armada of *Auguſtus Cæſar* ſeeing this diſorder, charged with great violence, and ſoone inueſted the fleet of *Antony*. Of late daies alſo, and within our remembrance, the like happened to the roial ſhip of the Emperour *Caius Caligula*, at what time as he rowed back and made ſaile from Aſtura to Antium; when and where, this little fiſh detained his ſhip, and (as it fell out afterward) preſaged an vnfortunat euent thereby: for this was the laſt time that euer this Emperor made his returne to Rome: and no ſooner was he arriued, but his owne ſouldiers in a mutinie fell vpon him, and ſtabbed him to death. And yet it was not long ere the cauſe of this wonderful ſtay of his ſhip was knowne: for ſo ſoon as euer the veſſell (and a galliace it was, furniſhed with fiue banks of ores to a ſide) was perceiued alone in the fleet to ſtand ſtill, preſently a number of tall fellows leapt out of their ſhips into the ſea, to ſearch about the ſaid galley, what the reaſon might be that it ſtirred not? and found one of theſe fiſhes ſticken faſt to the very helme: which being reported vnto *Caius Caligula*, he fumed and fared as an Emperour, taking great indignation that ſo ſmall a thing as it, ſhould hold him back perforce, and checke the ſtrength of all his mariners, notwithſtanding there were no fewer than foure hundred luſty men in his galley that laboured at the ore all that euer they could to the contrary. But this prince (as it is for certaine known) was moſt aſtonied at this, namely, That the fiſh ſticking onely to the ſhip, ſhould hold it faſt; and the ſame being brought into the ſhip and there laid, not worke the like effect. They who at that time and afterward ſaw the fiſh, ſay, it reſembled for all the world a ſnaile of the greateſt making: but as touching the forme and ſundry kindes thereof, many haue written diuerſly, whoſe opinions I haue ſet downe in my treatiſe of liuing creatures belonging to the waters, and namely in the particular diſcourſe of this fiſh. Neither do I doubt but all the ſort of fiſhes are able to doe as much: for this wee are to beleeue, that Pourcellans alſo be of the ſame vertue, ſince it was well knowne by a notorious example, that one of them did the like by a ſhip ſent from *Periander* to the cape of Gnidos: in regard whereof, the inhabitants of Gnidos doe honour and conſecrate the ſaid Porcellane within their temple of *Venus*. Some of our Latine writers do call the ſaid fiſh that thus ſtaieth a ſhip, by the name of Remora.

As touching the medicinable properties of the ſaid ſtay-ſhip Echeneis or Remora (call it whether you will) a wondrous matter it is to ſee the varietie of Greek writers: for ſome of them (as I haue ſhewed before) do hold, that if a woman haue it faſtened either about her neck, arme, or otherwiſe, ſhe ſhal go out her full time if ſhe were with child: alſo, that it will reduce her matrice into the right place, if it were too looſe and ready to hang out of her body. Others againe report the contrary, namely, That if it be kept in ſalt and bound to any part of a woman great with child and in paine of hard trauell, it will cauſe her to haue preſent deliuerance; for which vertue, they call it by another name *Odinolion. Well, howeuer it be, conſidering that mighty puiſſance which this fiſh is wel known to haue in ſtaying ſhips, who wil euer make doubt hereafter of any power in Nature her ſelfe, or of the effectuall operation in Phyſicke, which ſhe hath giuen to many things that come vp by themſelues. But ſay we had no ſuch euidence by the example of this Echeneis; the Cramp-fiſh Torpedo, found and taken likewiſe in the ſame ſea, were ſufficient alone to proue the might of Nature in her workes, if there were nothing elſe to ſhew the ſame: for able ſhe is to benum and mortifie the arms of the luſtieſt & ſtrongeſt fiſhers that be; yea and to bind their legs as it were, how ſwift and nimble ſoeuer they are otherwiſe in running: and how? euen by touching only the end of a pole, or any part of an angle rod, which they hold in their hands, although they ſtand aloft and a great way from her. Now if we cannot will nor chuſe, but muſt needs confeſſe by the euident inſtance of this one fiſh, that there is ſome thing in nature ſo penetrent and powerfull, that the very ſmell only or breath and aire proceeding from it, is able thus to affect, or infect rather the principall lims and members of our bodie; what is it that we are not to hope for and expect from the vertue of all other creatures that Nature (through her bounty) hath endued with medicinable power for the remedy of diſeaſes?

* i. Looſe-throws, or eaſe-paine.

And

20030
copy 1

And in very truth, no leſſe admirable be the properties which are reſpected of the ſea-Hare: for to ſome a very poyſon it is, taken inwardly either in meat or drinke: to others againe, the onely aſpect and ſight thereof is as venomous. For if a woman great with child chance but to ſee the female only of this kind, ſhe ſhal ſenſibly therupon feele a ſicke wambling in her ſtomacke, ſhe ſhall preſently fall to vomiting, and anon to vntimely labour, and the deliuerie of an abortiue fruit. But what is the remedy? Let her weare about her arme in bracelets, any part of the male, which ordinarily for this purpoſe is kept dry and hardened in ſalt, ſhee ſhall paſſe theſe dangerous accidents. The ſame fiſh is hurtfull alſo in the ſea, if it be touched only. Neither is there any liuing creature that feeds vpon this fiſh, but it dieth theron, vnleſſe it be the ſea Barbell only: al the harme that this fiſh catches by eating of it is this, that the fleſh is more tender by that
B means, and nothing ſo faſt as it was before; beſides, the meat is more vnpleaſant, & not ſo much ſet by in the market, nor bought vp by Caters for the kitchin. If man or woman chance to be infected by eating of the ſea-Hare, they preſently ſmell and ſent of the ſaid fiſh; and this is the firſt ſigne and argument to proue that they be impoiſoned therby; howbeit, they die not immediatly but may continue ſo many daies as the ſaid Hare liued after it came out of the ſea. And therfore (according as *Licinius Macer* hath left in writing) this poyſon hath no ſet and prefinit time wherin it killeth any body. As touching the ſea-Hares among the Indians, it is conſtantly affirmed, that taken they cannot be aliue; and that by way of counterchange, a man is their poyſon: for if he do no more but touch one of them with his finger in the ſea, it will forthwith die: And it is ſaid withall, that far bigger he is there than in other ſeas: like as all other beaſts whatC ſoeuer. King *Iuba* in thoſe bookes which he wrote to *C. Caſar*, ſonne to *Auguſtus* the Emperor, as touching the hiſtorie of Arabia, ſaith, That their limpins, muskles and cockles, are ſo big in thoſe ſeas, that one of their ſhels wil contain a meaſure of three hemines. Alſo that there haue been known Whales ſix hundred foot long, and carrying a breadth of three hundred and ſixtie foot, to haue ſhot themſelues out of the ſea into the great riuers of Arabia: the fat of which Whales, (like as the greaſe of all other ſea-fiſhes there) is much ſet by and ſought after by merchants, who in all thoſe quarters vſe it for to annoint their trauelling cammels, for to driue away the Breeſe or Gad Bee from them, which indeed cannot abide the ſmell of that oile.

Chap. II.

D ¶ *The naturall wit, docilitie, and gentleneſſe of ſome fiſhes. Alſo where they be ſo tractable, that they will take meat at a mans hand. Finally, in what part of the World fiſhes giue anſwer by way of Oracle.*

WOnderfull in my conceit is the wit and ſubtiltie of ſome fiſhes, if all bee true which *Ouid* the Poët hath reported of them, in that booke of his which he intituled Halieuticon: For firſt and formoſt he ſaith, That the Goldenie *Scarus* perceiuing himſelfe to be taken in a weire, or encloſed within a wicker-net or leape, neuer ſtriueth to get out again with the head forward, or to thruſt his muffle betweene the oiſiers, for feare he ſhould be caught by
E the head: but turning his taile vnto them, keepeth ſuch a flapping therwith, that he makes himſelfe way by that means, and ſo breakes forth of priſon backward. Now, in caſe whiles he ſtrugleth and laboureth thus to get out, another Coldenie that is without happen to eſpie him thus a priſoner, the ſame will take hold with his mouth of his fellowes taile, and helpe to get him forth out of the ſaid net, which he endeauoures to break through. Alſo that the ſea pike Lupus, when he ſeeth that hee is compaſſed about with nets, maketh a furrow with his taile into the ſands, wherin he coucheth and lieth cloſe, that when the fiſhers draw their nets vnto them, they may glide and paſſe ouer him. As for the Lampreis, knowing what a ſmooth, round, and ſlipperie back they haue, they make no more adoe, but ſeeing themſelues within the net, get between the very maſhes, which with their much winding and wrigling they will wreſt wider and wider
F ſtill, vntill they be gotten through and eſcaped.

The Pulpe fiſh or Pourcuttell, maketh at the very fiſhooks which hee ſearcheth after, and thoſe he biteth not at, but claſpeth hard and gripeth round about with his clees and armes that he hath: and neuer letteth he his hold goe, vntill hee hath gnawne and eaten off the bait cleane, vnleſſe before he haue done, he perceiue that he is like to be drawne vp out of the water by the angle;

angle. The Mullet alſo knoweth that the bait hath a hook within it, neither is he ignorant that G
it is laid for to entrap and catch him; howbeit, ſo greedie he is thereof by nature, that he neuer
linneth beating it with his taile, vntill he hath ſhaken off the meat from the hook. The Pike is
not ſo wary and prouident in forecaſt, as to keep himſelfe from the danger of the hooke: but of
great ſtrength and force he is, when he bethinketh himſelf and repenteth that he was ſo fooliſh
as to be caught: for no ſooner hangs he by the hooke, but he runneth and girdeth with it in his
mouth too and fro, forcing and wreſting his wound ſo wide, vntill the ſaid hooke which had faſt
hold on him before, be fallen out of his mouth againe.

The Lampreies deuoure the hookes, yea, they gobble in and ſwallow more than ſo, vntil they
come to the very lines, which they ſet their ſharpe teeth vnto, and neuer reſt vntill they haue
fretted and gnawne them aſunder. And *Pytheas* is mine Authour, who writeth thus of them be- H
ſides, That if they find themſelues to be once vpon the hooke, they turne their bodies and writh
with their backs, as knowing the ſame to be armed with trenchant and keene edged fins like
kniues, & ſo with their very ſharp chine & fins cut the lines atwo. *Licinius Macer* writes of Lam-
pries, that they be all of the female ſex onely, and doe conceiue by ſerpents engendring with
them, as I haue heretofore obſerued: which is the cauſe, that fiſhes lure them with hiſſing like
vnto ſerpents, and by that meanes call them forth of their holes and catch them. Hee ſaith
**Lactatu* ſome reade *jactatu* others *luctatu*, i. with much ſtriuing and ſtrugling. moreouer, That they will feed fat with *milk: and if a man giue them a good knock with a cud-
gill, they will not die thereupon: rap them onely with a Fennell ſtalke or ſome ſuch wand, you
ſhall ſee them dead forthwith. And verily it is held for certaine, that their life lieth in the taile:
which if it be ſmitten, they are very ſoone gone and bereft of vitall breath: ſtrike them vpon the I
head, you ſhall hardly and with much adoe kill them.

There is a fiſh called a Raſoir: looke whatſoeuer toucheth it, ſenteth preſently of yron.

Confeſſed it is and knowne for certaine, that the Lompe, Paddle, or ſea-Owle, a fiſh called in
Latine Orbis, of all others hath the tougheſt and hardeſt body. Shaped round it is without
skales: a man that looketh vpon it, would ſay it were all head.

Trebius Niger mine authour affirmeth, That ſo often as the ſea Kite is ſeene to lance himſelfe
and flie without the water, it threateneth tempeſts.

The Sword-fiſh, called iu Greeke Xiphias, that is to ſay in Latine Gladius, *i.* a ſword, hath a
beake or bill ſharpe pointed, wherewith hee will driue through the ſides and plankes of a ſhip,
and bouge them ſo, that they ſhall ſinke withall. The experience whereof is ſeene in the ocean, K
neere vnto a place in Mauritania called Gotta, which is not farre from the riuer Lixos. And the
foreſaid writer *Trebius Niger* reporteth, That the ſea-cats or Cuttle fiſhes, called Loligines, wil
flie out of the ſea, and ſettle vpon ſhips in ſuch multitudes, that they force them vnder water
and ſo drowne them.

The Emperour *Ceſar* had many faire houſes of pleaſure in the country, where he kept fiſhes
that would ordinarily come to hand and take meat. Our anceſters made no ſuch maruell there-
at, namely, that they ſhould be ſo gentle & tractable in ſmall ſtewes and fiſh-ponds where they
be kept to feed: but they haue written the like of fiſhes in great lakes and ſtanding pooles: And
namely, about Florus, a caſtle in Sicilie, not farre from Syracuſa: likewiſe, in a well or fountaine
of *Iupiter Labradius*, there be yeels wil take meat at ones hand, & theſe wear ear-rings alſo about L
them. Semblably, in Chios neere vnto the chappell of the ancients or elders called Veterum
Delubrum: as alſo in a certaine ſpring of Meſopotamia, called Cabura, whereof I haue alreadie
written. As for the fiſhes which keep about Myræ in Lycia, within the wel or fountain of *Apollo*,
called Curius, they wil ſhew themſelues of purpoſe to giue preſage & foreknowledge of things
to come: and the manner is, to call them to the top of the water with three whiſtles, of a fife or
ſuch like pipe. The order is among thoſe that come to be reſolued by them in ſome future e-
uents, to caſt peeces of fleſh to them: if they ſnatch the ſame & ſwim away therwith, it is a lucky
and fortunat ſigne, preſaging a good iſſue of their affaires about which they come; but in caſe
they reject the ſame, & flurt the meat from them with their taile, that is an ominous token, and
foreſheweth ſome vnhappie euent to follow. About Hierapolis, a citie in Syria, the fiſh within M
the lake or poole of *Venus*, obey the voice of the wardens or ſextons who haue the keeping of her
chappell there; and orderly they come at their call, garniſhed with their ornaments of gold a-
bout them: they will abide to be ſcratched and clawed, they will wag their tailes like a dog in a
fawning and flattering maner; nay, they will gape with their mouths wide open, and ſuffer them

to

20030
copy 1

A to thruſt their hands or fingers into them. At Stabianum neere to the rocke or cape of *Hercules*, the blacke-tailed ruffles or ſea-breames, which the Greekes name Melanuri, if a man caſt crums of bread into the ſea to them, they will catch the ſame, and ſcud away withall: throw them any other meat or bait with a hooke in it, they will not once come neer therto. Neither are theſe to be reckoned among the leaſt wonders and in the laſt place, namely, That about the Iſland Pele and the citie Clazomenæ, all the fiſh that is, taſteth bitter: Contrariwiſe, thoſe that keep about the rock Scylla in Sicilie be ſweet, as alſo at Leptis in Affrick, Eubœa, and Dyrrhachium. Again ſome are ſo ſalt, that they may well be taken for ſalt fiſh that hath lien in brine or pickle, to wit, neer the Iſlands Cephalenia, Ampelos, and Paros: likewiſe about the rockes and cliffes of Delos: and yet in the Bay or hauen of the ſaid Iſland, their meat is ſweet ynough. This difference
B in the taſt of fiſh, proceedeth no doubt from the diuerſitie of their food. Moreouer, *Apion* ſaith, That the greateſt of all other fiſhes is the Mole-bout, which the Latines call Porcus, the Lacedæmonians Orthragoriſcos; and that when he is taken, he will grunt like an Hog, whereupon it ſhould ſeeme he tooke the name Porcus. But as touching the foreſaid accident of the variety in the taſt of fiſh, how ſome be ſweet, others ſalt, that it ſhould be a naturall thing (and therefore the more to be maruelled at) appropriat to certaine places, it may appeare by this inſtance, which fitly proueth the ſame: For take the ſalt fiſh of Italie, what kind ſoeuer you will, for certaine it is knowne, That at Beneuentum they may be made freſh againe, as if they had neuer beene ſalted.

That ſea-fiſh hath been vſed at Rome from time to time, and euer ſince the very foundation
C of the citie, it may appeare by the teſtimony of *Caſſius Hemina*: which I will ſet downe word for word as touching that point, in this very place. King *Numa* (quoth hee) ordained, That fiſhes without skales ſhould not be bought vp by Caters for the furniſhing of any ſolemne funerall feaſt. By which inhibition his policie and purpoſe was, that the great dinners, as well publique as priuat; the feaſtiuall ſuppers alſo which were kept at the ſhrines of the gods, ſhould not be ſo coſtly and chargeable: for feare alſo leaſt the caters who made prouiſion for ſuch ſumptuous feaſts, ſparing for no coſt, nor ſticking at the price were it neuer ſo high, might foreſtall the markets and buy the ſame vp beforehand.

As touching Corall, we (here at Rome) ſet not more by the Indian orient pearles (whereof I haue written at large in place conuenient) nor eſteem them at a greater price than thoſe Indians
D do our Corall. And verily, if we deeme aright, it is the opinion and perſuaſion of people only, that ſetteth the price of theſe and ſuch like things. True it is verily, that there is Corall bred in the red ſea, but blacker it is than that which we haue: likewiſe in the Perſian gulfe, & that is named Iace. Howbeit, the beſt ſimply is that which is found in the gulfe of Marſiles in France, about the Iſlands Stœchades: as alſo in the narrow ſeas of Sicily, toward Helia and Drepanum. There is alſo therof growing at Grauiſcæ, & juſt before Naples in Campaine. But the reddeſt of all other, ſoft & tender withall, and therfore moſt commodious, is engendred about Erythræ in Barbary. Corall reſembles a buſh or ſhrub in forme, & of it ſelfe within the water, is of color greene. The berries therof vnder the water be white and ſoft: no ſooner be they taken forth, but preſently they wax hard and turne red: much like both in ſhape and in bigneſſe to the grains or
E fruit of the gentle garden Corneil tree. It is ſaid that this plant whiles it grows and is aliue, if a man touch it neuer ſo little, becomes as hard immediatly as a ſtone. The fiſhers therfore to preuent that inconuenience (as knowing the nature therof) either pluck it vp with their nets, or cut it with ſome ſharpe edged yron tooles: which is the cauſe that it is commonly called *Curalium, as ſome make interpretation of the word. The reddeſt Corall is taken to be the beſt: the ſame alſo branched moſt, is not rough and ragged vnder the hand to feele to, or ſtone-hard: ſolide likwiſe it is and maſſie, not void and hollow. The berries or beads which it beareth, is of no leſſe account & price with the men of India, than the Indian pearls with our coſtly dames here. And verily among them, their Wiſards, Southſaiers, Prieſts, & Prophets, haue a religious opinion of them, and attribute great holineſſe to the vſe thereof; as being perſuaded, that whoeuer
F weare them, ſhall be ſecured againſt all perils and dangers whatſoeuer; and therefore a ſpeciall reckoning they make of them, as wel in regard of beautie as deuotion. Before that it was known in what eſtimation Coral was with the Indians, the Frenchmen adorned & ſet out their ſwords, targuets, ſhields, morrions, and head peeces therewith: But ſince time that there was a vent into India of this commoditie ſo vendible, great ſcarſitie there is of it, and hardly ſhall a man meet with

*ἀπὸ τῆς κείρω, becauſe it is cut and ſhorne (as it were) in the ſea.

with any Corall,euen in that part of tne world where it growes naturally. The branches of Co- G
rall hanged about the neckes of infants and young children, are thought to be a ſufficient pre-
ſeruatiue againſt all witherafte and ſorcerie. Calcined by fire,and ſo reduced into aſhes or pou-
der and giuen to drinke in water,it helpeth thoſe who are troubled with the wringing paines of
the belly, the griefe of the bladder,and the diſeaſe of the ſtone. The like effect it hath if it be
drunk in wine;or if the patient haue a feauer vpon him,in water for to procure ſleep. This would
be noted, that Corall doth withſtand the power of fire, and long it is before it be burned and
reduced into aſhes: But ſurely a ſingular medicine it is,ſo prepared and vſed,inſomuch as(by re-
port) if a man keepe to it ſtill and continue it long, the ſame will conſume the hardneſſe and
ſchirroſitie of the ſpleen. The pouder of Corall is ſoueraign for ſuch as reach and caſt vp bloud
at the mouth. The aſhes enter into many mixtures and medicines for the eies : for aſtringent H
they be,and cooling withall. Hollow vlcers and fiſtulaes they incarnat and fill vp againe with
new fleſh. Skars and cicatrices they do extenuat.

If I ſhould ſpeak of the repugnancie and contrariety in Nature (which the Greekes call an-
tipathie) found in many creatures, there is not to be ſeen in the whole world any thing more ve-
nomous and aduerſe to plants than the Puffens or Forke fiſh of the ſea,called Paſtinaca:for as I
heretofore noted;it hath a pricke in the tail, which is able to kill any trees that be pierced or
wounded withall. And yet a concurrent and enemie this hath, which doth perſecute & plague
it,and namely the Lamprey called Galeos; ſo eager is it and greedy of the venome and poyſon
of that fiſh. There be other fiſhes alſo which it pnrſueth, but thoſe Puffins eſpecially : and no
Weazill hunteth more after ſerpents. In ſumme, whoſoeuer be hurt or wounded by the ſaid I
Puffin,this Galeos is a preſent remedy; ſo is the Barble alſo,and the gum Laſer or Benjoin.

Chap. III.

¶ *Of certaine creatures which liue as well vpon the land as the ſea. Of Caſtoreum, or the genetoirs of a Bever : the medicinable vertues thereof,and other properties obſerued therein.*

THe power and majeſtie of Nature is very conſpicuous and viſible, euen in thoſe creatures
alſo which liue indifferently on land and in the water: and namely in the Beuers, which
commonly the phyſicians call Caſtores, like as their ſtones alſo Caſtorea. Some hold,that K
theſe Beuers when they be neer driuen and preſſed by hunters,and at the point to be taken, bite
off their owne ſtones. But *Sextius*, who hath written moſt exactly in Phyſicke, denieth it flatly.
He ſaith moreouer, that theſe cods be ſmall,knit ſhort and truſſed vp,ſo as they ſtick cloſe vnto
the chine bone,and canot poſſibly be taken from the beaſt but the life goes away withall. By his
ſaying alſo they are ſophiſticated,and the kidnies of the Beuer which are big,be obtruded and
foiſted to vs many times in ſtead of their ſtones,which indeed are neuer found but very little &
ſlender. Furthermore he affirmeth, That they be not the right ſtones of a Beuer when they are
ſeene without a twofold burſe or skin,which no liuing creature hath beſides. In theſe two bags
there is found (ſaith he) a certain oleous liquor,which ordinarily is kept & preſerued with ſalt:
And therefore among other marks to know falſe and ſophiſticat Caſtoreum,is this, If you ſee a L
paire of cods,hanging (as it were) knit together by one ſtring in one bag. And yet the beſt may
be falſified by the fraud and cunning of ſuch as put gum therto with ſalt Ammoniack,becauſe
the true Beuers ſtones ought to beare the colour of Ammoniacke; to be encloſed alſo within
their ſeuerall tunicles;and to lie in a certaine liquor reſembling cereous hony, ſtanding much
vpon wax;to haue a ſtrong and rank ſmell,a bitter,hot and fiery taſt;and withall,apt to crumble
between the fingers. The beſt Caſtoreum & moſt effectuall,is brought out of Pontus and Gala-
tia:next to it is that of Affrick or Barbarie. The vertue of Caſtoreum is to prouoke ſneeſing,if a
man hold it to his noſe and ſmell thereto. If the head be annointed with Caſtoreum incorporat
with oile of roſes and Harſtrang,it will procure ſleep:ſo will it do alone by it ſelfe giuen in wa-
ter to drinke:in which reſpect,proper it is for the frenſie. And yet the perfume or vapor there- M
of will raiſe thoſe that lie in a ſleepy lethergie:like a ſuffumigation*or peſſarie put vp into the
natural parts of women,is ſoueraign for the riſing of the mother;in which fit they lie as it were
in a trance and out of the world. Coſtoreum giuen to the weight of two drams with Peniroyall
in water to drink,moueth womens monthly ſicknes,and forceth the afterbirth to com away. It

hel-

* *Vulvarum, exanimationes Vel ſubdici.* We practiſe the contrary.

20030
copy 1

helpeth thoſe that haue the dizzineſſe or ſwimming of the braine; bee drawne backeward with cramps, tremble and ſhake; are plucked with ſpaſmes and convulſions, diſeaſed in their ſinews; troubled with the Sciatica, ſick of a weak and feeble ſtomacke that keepeth nothing which it takes, and lie bed-rid of the palſie, if they be annointed throughly therewith in parts conuenient. Or if Caſtoreum be reduced into pouder, and together with the ſeed of Agnus Caſtus, be incorporat with vineger or oile roſat, and ſo reduced to the conſiſtence of hony: which being taken as an electuarie, is ſingular not only for the former maladies, but alſo for the falling ſicknes: and if the ſame be giuen in drink, it diſcuſſeth ventoſities, appeaſeth the wrings and torments of the belly, yea, and repreſſeth the malice of any poiſons. But in this caſe of poiſons it ought to be prepared, mixed, and vſed diuerſly, according to the ſundry kinds thereof: for againſt the venome of ſcorpions it would be drunk in meere wine: to withſtand the danger of the Phalangia and ſuch venomous ſpiders, it ought to be giuen in honied wine eſpecially, if the intention bee to caſt vp the ſaid poyſons by vomit; or with Rue, if the drift and purpoſe be to hold and retain all ſtill. To preuent the perill of the Lizards or venomous wormes Chalcidicæ, it ſhould be taken in Myrtle wine. Againſt the ſting of the horned ſerpent Ceraſtes, or the fierie vermine Preſter, with Panax or Rue in wine. But generally for all other ſerpents, the only liquor to receiue it in, is wine. Two drams at a time is thought to be a ſufficient doſe of Caſtor it ſelf, in any of theſe compoſitions: but of other drugs that are put thereto, there ought to be a proportion of the half, to wit, one dram. Moreouer, a peculiar vertue it hath, if it be drunk in vineger, to reſiſt the venomous gum Ixias, growing vpon the plant Chamæleon: but ſoueraigne it is for the poiſon of the herb Aconitum or Libard bane, in milk or faire water. Againſt white Ellebore it is good to be taken with mead of honied water and ſal-nitre. Alſo, if it be pulueriſed and incorporate with oile, a ſoueraigne remedy it is to eaſe the tooth-ach, if it be dropped or poured into the eare of the ſame ſide where the griefe is: but better it were to temper it with the juice of Poppy for pain of the ears. Mix Caſtoreum with the beſt hony of Attica, and bring it into an eie-ſalue, it is paſſing good for to cleare the ſight. Giuen in vineger, it ſtaieth and keepeth downe the yex or hicquet. Furthermore, the vrine of a Beuer is a good counterpoiſon: and therefore it goeth to the making of Antidotes and preſeruatiues. But the beſt way of keeping it (as ſome think) is in the owne bladder.

Chap. IIII.

¶ *Of the Tortoiſe. The medicines taken from many fiſhes, and diuers obſeruations to them pertaining.*

SEmblably, Tortoiſes liue in two places, and haunt both land and waters. Their effectual properties beſides are ſuch as deſerue like honour, as well in regard of their manifold vſes in ſumptuous buildings (whereby they carry a great price) as of their ſundry vertues and operations which Nature hath giuen them: now of theſe Tortoiſes there be many kinds, to wit, land Tortoiſes, and ſea Tortoiſes. Tortoiſes found in muddy waters & marraies: Tortoiſes alſo that keep in freſh riuer water; and theſe laſt named, ſome Greeke writers call Emydes. The fleſh of land Tortoiſes ſerueth wel in perfumes & ſuffumigations, for ſo it is as good as a countercharm to put by and repell all ſorceries and inchantments: a ſingular counterpoiſon alſo to reſiſt any venome whatſoeuer. Great ſtore of Tortoiſes be found in Affricke: where they vſe to cut away the head and feet, and then employ the reſt of the body as a ſoueraigne remedy againſt all poyſons. If their fleſh be eaten together with the broth wherein they are ſodden, it is held to be very good for to diſcuſſe and ſcatter the wens called the kings euil, & to diſſipat or reſolue the hardneſſe of the ſwelled ſpleene: likewiſe to cure the falling ſicknes, and to driue away the fits thereof. The bloud of Tortoiſes clarifieth the eyeſight & diſpatcheth the cataracts, if they be anointed therewith. Many incorporat the ſaid bloud in meale, and keep them reduced into the forme of pils; which when need requireth, they giue in wine as a preſent help for the poyſon of all ſerpents, ſpiders, and ſuch like, yea, and the venome of toads. The gall of Tortoiſes mixt with Atticke hony, ſerueth to cure the fiery redneſſe of the eyes, if they be annointed therewith: The ſame is good to be dropt into the wounds inflicted by the prick of ſcorpions. The aſhes of the Tortoiſe ſhel incorporat with wine and oile and ſo wrought into a ſalue, heals the chaps & vlcers of the feet. The skales ſcraped lightly from the vpper part of the ſhell giuen in drink, coole

the

the heat of luſt. And I maruell the more hereat, becauſe the pouder of the whole ſhell indeed G
hath the name to heat the appetite and deſire to venery. As touching their vrin, I hold it impoſ-
ſible to meet with the ſame, vnleſſe it be found in their bladder when they be cut in twaine.
And yet the Magitians hold this to be one of the moſt rare things in the world, and that which
worketh wonders, ſaying it is right foueraigne for the biting or ſtinging of the Aſpis, howbeit,
much more effectuall (ſay they) if punaiſes be mixed with it. Tortoiſe egs dryed and hardened,
are good to be applied to the wens called the kings euill; to any exulcerations, cauſed either by
extreame cold or burning: The ſame being ſoft, are ſingular to be ſupped off in the paine of the
ſtomacke.

The fleſh of ſea Tortoiſes, mixed and incorporat with the fleſh of frogs, is a ſoueraign reme-
dy againſt the venome of Salamanders: neither is there any thing more contrary in nature to H
the Salamander, than is the Tortoiſe. The bloud of the ſea Tortoiſe ſerueth to recouer haire in
places naked and bare, by occaſion of the diſeaſe called Alopecia: it riddeth away likewiſe the
skales and dandruffe, yea, and healeth all the ſcalds of the head: but the ſame muſt dry vpon the
head, and be waſhed off at leiſure by little and little. If it be dropped into the eares with breaſt-
milk, it eaſeth their paine. If it be chewed or eaten, tempered with the fine floure of wheat, it cu-
reth the falling ſicknes. But for the better preparing and ordering of this bloud in theſe caſes,
it ought to be mingled in 3 hemines of vineger, one hemine of wine put thereto, with an additi-
on alſo of Barly meale, and the ſame tempered with vineger: of which compoſition the patient
is to take and ſwallow down the quantity of a bean euery day, morning and euening; and after
ſome daies paſt, in the euening only: this bloud is likewiſe ſingular to be dropt into the mouths I
of thoſe that be fallen of the epilepſie or falling ſicknes, ſo the fit be but ſmal, for which purpoſe
they muſt be forced to gape. In caſe of cramps & convulſions, the ſame is to be clyſterized with
Caſtoreum. Whoſoeuer rubbeth their teeth with Tortoiſe bloud, and vſe ſo to do a whole yeare
together, ſhal be freed from the pain therof for euer. If it be mixed with barly groats, and giuen
to them that draw their winde ſhort, it diſcuſſeth the cauſe of that difficulty; yea, helpeth ſuch
as cannot breath but ſitting vpright. The gall of Tortoiſes cleareth the eieſight, it doth ſubtili-
at the cicatrices and films that grow in the eyes: the inflammation of the tonſils it repreſſeth,
aſſuageth the ſquinancy, and helpeth all the accidents of the mouth: and more particularly, a
property it hath to heale the cankerous and corroſiue ſores there breeding: as alſo to cure the
inflammation of the genitoirs. The ſame conueied vp into the noſthrils, fetcheth thoſe again to K
themſelues who are in a fit of the falling ſickneſſe, and ſetteth them vpright vpon their feet.
And with the ſlough of a ſerpent incorporat in vineger, and dropt into the ears that run, it is an
excellent medicine to ſcoure them. Some put a Bœufes gall among, together with the broth of
the Tortoiſe fleſh ſodden, and an addition of a ſnakes ſlough in equall quantity; but firſt they
ſeeth the ſaid Tortoiſe a long while in wine. Moreouer, the gall of Tortoiſes mixed with hony,
amendeth all the imperfections incident to the eies, if they bee annointed therewith: yea, if it
were a cataract, the gall of a ſea Tortoiſe tempered with the bloud of a riuer Torroiſe and wo-
mans milk, riddeth and ſcoureth it away. The ſaid gall is very proper to giue a yellow die or co-
lour to womens haire. Againſt the poiſon of Salamanders, ſufficient it is to drinke the broth or
decoction of a Tortoiſe. L

As touching thoſe kind of Tortoiſes that liue and breed in mud and moorie waters, which I
reckoned to be the third kind: broad they be and flat in the backe as well as vpon the breſt: nei-
ther doth their ſhell ariſe arch-wiſe in manner of a vault: theſe are ilfavored to ſee to, and yet as
loueleſſe as they be, they are not without ſome medicinable vertues and remedies: for take 3 of
them and throw them into a fire made of Vine twigs, or their cuttings; when their ſhels or co-
uers begin to diuide in ſunder and part one from another, pull them haſtily out of the fire, pluck
the fleſh out of their ſhels, ſeeth them in a gallon of water, with a little quantity of ſalt put
thereto; thus let them boyle vntill a third part of the liquor be conſumed: This broth or deco-
ction if it be drunken, is thought to be ſoueraign for thoſe that be troubled either with the pal-
ſie, gout, or paine of joints. The gall of theſe Tortoiſes purgeth alſo phlegmaticke humours and M
corrupt bloud out of the body. And after that this medicine hath don his part, and ſet the belly
in a looſeneſſe, a draught of cold water knitteth it againe, and ſtaieth all.

To come now vnto the fourth kind of Tortoiſes which keepe in freſh riuers, they affoord an
excellent remedy for to rid away a quartane ague, in this manner prepared and vſed: firſt take
certaine

20030
copy 1

A certain tortoiſes, diuide one piece from another & take out the fat within, ſtamp the ſame with the herb called houſleek and Lineſeed; incorporate all into an ointment, let the patients be annointed therewith before the fit commeth, all ouer the body ſaue the head only, and when they be well lapped with cloathes about them, giue them ſome hot drink: This (I ſay) is thought to be a ſoueraigne medicine againſt the ſaid ague. But a tortoiſe to be applied for this purpoſe, ought to be taken at the full of the moone, becauſe there may be more fat found in her. Mary the ſick body muſt not be anointed (men ſay) at any time but two daies after. The bloud of tortoiſes which are of this fourth kinde, if it be dropped on the head by way of embrochation, appeaſeth the head-ach that vſeth to return and come often by fits: the ſame alſo applied vnto the kings euill cureth it. Some are of opinion, that the better to let tortoiſes bloud, and according
B to art, (as requiſit it is in ſuch caſes of phyſick) they ought to be laid along with their bellies vpward, and ſo their heads to be cut off with a braſen knife: and then they giue order to receiue the bloud in a new earthen veſſel neuer occupied before: which bloud is excellent to anoint the ſhingles, or any kind of S. *Anthonies* fire: likewiſe the running ſcalls of the head, and alſo werts. The ſame Authors doe promiſe and warrant, That with the dung of all ſorts of Tortoiſes, the biles called Pani may be diſcuſſed and reſolued. And although it be incredible and not to be ſpoken, yet ſome there be who haue written, That any ſhip maketh way more ſlowly at Sea, that carrieth within it the right foot of a Tortoiſe. And thus much ſhall ſuffice as touching Tortoiſes.

And now from henceforth as touching the fiſhes and other water creatures, I meane to diſ-
C courſe of them and their medicinable properties, according to euerie diſeaſe which they ſerue for. And yet I am not ignorant, that many a one will be deſirous to know all at once, the vertues of each liuing creature, which indeed maketh them to ſeem more admirable a great deal. Howbeit this courſe that I meane to take, I hold to be more expedient and profitable to this life; namely, to ſet downe receits and remedies digeſted by order, of each diſeaſe and malady: conſidering that one thing may be good for this Patient, and another for that; and ſome medicines are ſooner found and gotten than others.

Chap. V.

D

¶ *Sundry medicines and receits taken from thoſe liuing creatures which conuerſe in waters, and the ſame digeſted orderly into diſeaſes. And in the firſt place, ſuch as be appropriat to poyſons and venomous beaſts.*

HEretofore haue I written of venomous honey, and the countries wherein ſuch is gathered and made: now if any be poiſoned therewith, good it is to eat the fiſh called Arata, *i.* a Guilt-head. Or ſay one be glutted with pure hony, or haue taken a ſurfet thereof, being of all other moſt dangerous, wherby the appetite is clean gon, and the ſtomack oppreſſed with
E crudities: for to preuent farther danger, *Pelops* ordained for a ſpecial antidote or defenſatiue the meat of tortoiſes boiled, after the head, feet, and taile were cut away. But *Apelles* in this caſe attributeth as much to Scincus. Now what this Scincus is I haue declared heretofore. Shewed alſo I haue oftentimes in many places, how venomous the monthly fleurs of women are, but yet (as hath bin ſaid already) the fiſh called a Barble is a ſingular remedy againſt the poiſon ther-of: like as, both applied outwardly in a liniment, and taken inwardly as meat, it is a ſoueraigne thing for the prick of the Puffin or Forkfiſh, of Scorpions as well of the land as the ſea, and of the malicious ſpiders Phalangia. The aſhes of a Barble freſh taken and calcined, is a generall counterpoiſon; but more particularly it helpeth thoſe who haue eaten deadly Muſhroms. Alſo it is ſaid, That if the fiſh called a Sea-ſtar, wel beſmeared and anointed all ouer with the bloud
F of a Fox, be faſtned to the lintell, or hanged to the braſen naile or ring of a dore, it will put by all charmes, ſorceries, and witchcrafts, that none ſhall come into the houſe; or if any doe, yet they ſhall not worke any harme. As for the pricke or ſting of ſea-dragons and ſcorpions, a cataplaſme of Sea-ſtars fleſh applied thereto healeth them: ſo it doth alſo the venomous bit of ſpiders. In ſum, the broth of their decoction is thought to be a ſoueraigne remedie againſt all

manner of poiſons; whether it be that a man haue taken it by the mouth, or be ſtung and bitten G
by any venomous beaſt.

As touching fiſhes kept in ſalt, they are not without their medicinable vertues: for to eat ſalt fiſh is very good for them who are ſtrucken with ſerpents, or otherwiſe bitten or ſtung by any venomous beaſt, ſo they drink to it eftſoons pure wine of the grape, and withal be ſure to caſt vp again by vomit toward euening their foreſaid meat which they did eat that day. The ſame ſalt fiſh more peculiarly ſerueth for them who haue bin hurt and wounded with the venomous Li-
*or Chalcidica. zard * Chalcis, the horned ſerpent Ceraſtes, or the venomous horn-fretters called Sepes: being otherwiſe ſingular to heale thoſe who haue bin ſmitten with the ſerpent Elops, or bitten with the thirſty tooth of the worme Dipſas: but if a man be pricked by the Scorpion, good it is for him to feed fully of ſaltfiſh, howbeit in no wiſe to vomit the ſame vp again, but rather to indure H
the drineſſe & thirſt occaſioned thereby: and many hold, that it is a proper remedy to apply to the ſore a cataplaſm made of the foreſaid ſaltfiſh. Verily againſt the biting of Crocodils there is not thought to be a more preſent and effectual remedy, than it. But to grow vnto particulars, Sprots ſalted haue a ſpecial propertie to heal the biting of the beetle or venomous fly Preſter: alſo in caſe a man be bitten with a mad dog, it is very good to lay ſalt fiſh vnto the ſore; yea although the wound were not cauteriſed with a red hot iron, nor the patients body emptied by a clyſtre, this cataplaſm alone of ſaltfiſh is thought ſufficient to cure it: the ſame ſoked in vineger ſerues alſo to be laid vnto the place that is hurt with a ſea dragon. Of the ſame operation
*Cybium. and effect is a * ſquare piece or canton of the fiſh Tuny ſalted and condited. And ſince I haue named the ſea-Dragon, this would be noted, That himſelf outwardly applied, is a remedie for I
the venom inflicted by the prick or fin of his ridge bone, wherwith his manner is to ſtrike: yea & his very brains alſo, if you take nothing els, are as effectual. The decoction of ſea frogs ſodden in wine and vineger, is a ſouerain drink for all poiſons, but eſpecially for the venome of the hedge toad and ſalamander. As for the frogs of riuers and freſh waters, if a man either eat the fleſh or drink the broth wherin they were ſodden, he ſhal find it very good againſt the poiſon of the ſea-hare, or the ſting of the ſerpents abouenamed; but more particularly againſt the prick of ſcorpions they would be boiled in wine. Moreouer, *Democritus* ſaith, That if a man take out the tongue of a ſea frog aliue, ſo that no other part thereof ſtick therto, & after he hath let the frog go again into the water, apply the ſaid tongue vnto the left pap of a woman while ſhe ſleepes, in the very place where the heart beateth, ſhe ſhall anſwer truly and directly in her ſleepe, to any K
interrogatorie or queſtion that is put vnto her. But the magitions tell more wonders than ſo of the frog, which if they be true, certes frogs were more commodious & profitable to a Commonwealth, than all the poſitiue written lawes that we haue. For they would make vs beleeue, That if the husband take a frog and ſpit her (as it were) alength vpon a reed, ſo as it go in at the skut or mature behinde, and come forth againe at the mouth, and then pricke the ſaid Reed or broch in the menſtruall bloud of his wife, ſhe ſhall neuer haue minde afterwards to entertaine any adulterers, but deteſt and loath that naughty kinde of life. Certaine it is, That if froggs fleſh be put within a net, or that a hooke be baited therewith, Purple fiſhes aboue all others wil come flocking thither. Moreouer, it is commonly ſaid, That a Frog hath a double liuer, the which ought to be layd before Ants, and looke which of the two lobes or flaps thereof they L
make vnto, and ſeeme to gnaw, the ſame is a moſt ſingular antidote againſt all poyſons whatſoeuer.

Some frogs there be that liue only among buſhes and in hedges, which thereupon we call in
*Our Toads. Latine by the name of * Rubetæ, and the Greeks term them Phrynos: the biggeſt they are of all other, with two knubs bearing out in their front like horns, and full of poiſon they be. They that write of theſe toads, ſtriue a-vie, who ſhal write moſt wonders of them: for ſome ſay, that if one of them be brought into a place of concourſe where people are in great number aſſembled, they ſhall be all huſht and not a word among them. They affirme alſo, that there is one little bone in their right ſide, which if it be thrown into a pan of ſeething water, the veſſel will coole preſently, and boile no more vntil it be taken forth again. Now this bone (ſay they) is found by M
this means: if a man take one of theſe venomous frogs or toads, and caſt it into a neſt of Ants, for to be eaten and deuoured by them, and looke when they haue gnawed away the fleſh to the very bones, each bone one after another is to be put into a kettle ſeething vpon the fire, and ſo

it

20030
copy 1

A it will ſoon be known which is the bone, by the effect aforeſaid. There is another ſuch like bone (by their ſaying) in the left ſide; caſt it into the water that hath done ſeething, it will ſeeme to boile and waulme again preſently: this bone (forſooth) is called Apocynon: and why ſo? becauſe ywis, there is not a thing more powerfull to appeaſe and repreſſe the violence and furie of curſt dogs than it. They report moreouer, that it inciteth vnto wanton loue; and yet natheleſſe if a cup of drinke be ſpiced therewith, it will breed debate and quarrels among thoſe that drinke thereof: alſo, whoſoeuer carrieth it about him, ſhall be prouoked to fleſhly luſt: and contrariwiſe, if the bone in the right ſide bee likewiſe vſed, it will coole as much, and take downe the pride of fleſh and heat of concupiſcence. Others there be who are of opinion, that if it bee but worne about one, either hanging to the necke, or faſtened vnto any other part of the body, infol-
B ded within a little piece of a new lambs skin, it will cure a quartane ague, or any other feuer beſides. The ſame alſo repreſſeth the affection of loue. Moreouer, they beare vs in hand, that the milt of theſe toads is a counterpoiſon againſt their owne venome: but the heart (ſay they) is much more effectuall.

There is a certaine kind of ſerpent or Snake haunting the water, called in Latine Coluber; the fat and gall of which Serpent, if they haue about them who vſe to hunt after Crocodiles, it is wonderfull (ſay they) how they be armed and defenced againſt them, for they wil not attempt to turne againe vpon the hunters and giue any aſſault: and yet of greater effect and force they ſhall finde it, in caſe there be incorporat withall, the pond-weed or water-ſpeeke called Potamogiton.

C The riuer Creifiſhes, if they be taken freſh, ſtamped and giuen in water to drinke, are ſoueraigne againſt all poiſons: ſo is their aſhes alſo a counterpoiſon; but more particularly againſt the ſting or pricke of Scorpions, if it be drunke in aſſes milke; or for default thereof, in goats milke, or any other whatſoeuer: but then the patient ought to drinke wine vpon it. And verily, ſo aduerſe and contrary are they vnto Scorpions, that if they be punned with Baſill into a certaine compoſition, it will kill them, if the ſame be but laid vpon them. Of the ſame force they are againſt the ſting or biting of any other venomous beaſt beſides, and more eſpecially of the pernicious hardiſhrew Scytale, of ſnakes, ſea-hares, and hedge-toads. Many there be who vſe to ſaue the aſhes of Creyfiſhes calcined, as a ſoueraigne remedy for all ſuch as be in danger to fall into the ſymptome of feartulneſſe to drink, incident to thoſe that are bitten by mad-dogs: ſome
D adde thereto the herbe Gentian, and giue both together in wine to drink: but if the ſayd ſymptome of Hydrophobie haue ſurprized them already, then the ſaid aſhes or powder ought to bee reduced (by the meanes of wine) into troſches or pils, which they preſcribe vnto their patients for to be ſwallowed downe. The Magitians proceed farther and affirme, that if a man take ten Creifiſhes and tie them all together with a good bunch or handfull of baſill, all the Scorpions that be thereabout, will aſſemble together to that one place: and they giue order, that if a man be hurt already with a ſcorpion, there ſhould be a cataplaſme made of them, or at leaſtwayes of their aſhes mixed with Baſill, and ſo applied to the place affected. The ſea-crabs are nothing ſo good of operation in all theſe cauſes, as the Land-crabs or Creifiſhes aforeſaid, according as *Thraſillus* mine Authour doth report. Howbeit, hee ſayth neuertheleſſe, that there are no ſuch
E enemies to ſerpents, as Crabs: and he affirmeth moreouer, That if ſwine be ſtung or hurt by ſerpents, they helpe and cure themſelues by feeding vpon ſea-Crabs onely, and ſeeke for no other helpe or remedie. Hee addeth furthermore and auoucheth, that ſerpents are ill at eaſe, yea and much tormented with paine when the Sunne is in the ſigne of the crab, called commonly Cancer.

To come now to the riuer ſhell-ſnailes: moſt certaine it is, that their fleſh, whether it bee raw or boyled, is ſingular good to reſiſt the venome of ſcorpions inflicted by their pricke or ſting: and ſome there be, who for to haue them in a readineſſe to ſerue in thoſe caſes, keep them in ſalt: and they ordaine them to be applied vnto the very ſore it ſelfe, occaſioned by their foreſayd ſting.

F As for the [blacke] fiſhes named Coracini, they are peculiar and appropriate vnto the riuer Nilus: howſoeuer my determination and purpoſe is to deliuer medicines profitable and beneficiall to all parts of the earth in general. Their fleſh is good to be applied vnto the ſores cauſed by ſcorpions.

The Sea-ſwine or Porpuis, hath pricky fins vpon his back, and thoſe are counted amongſt other venomous things that the ſea yeeldeth, putting them to much paine that are wounded or hurt thereby: but what help therfore? ſurely the very muddy ſlime that gathereth about the body of the ſame fiſh, is the onely remedy. G

The Sea-calfe, otherwiſe named a Seale, hath a certaine greace, wherewith it is good to annoint the face or viſage of thoſe, who by reaſon that they are bitten with a mad dog, are afraid to drink and cannot away with water: but it will worke the better, if there be mingled therewith the marrow of an Hyæna, the oile of the Maſtich tree and wax, that all may be reduced into a liniment.

As for the biting of a Lamprey, there is not a better thing to heal it than the aſhes of a lampreys head. The Puffin likewiſe or Fork-fiſh, cureth the wound that himſelfe inflicted; namely, if the place be annointed with his own aſhes, tempered with vineger, or mixt with the aſhes of any other fiſh. If a man would make meat of this fiſh, there ought to be taken out of the backe whatſoeuer is there found like to ſaffron: likewiſe the head all and whole would be taken away: and yet to maintain and keep the taſt thereof, the ſame muſt be waſhed but a little and no more than all ſhell fiſhes, for otherwiſe all the pleaſantneſſe in the eating would be clean gone. H

The miſchieuous venome of the ſea-hare, [called otherwiſe Imbriago] is quenched clean and mortified, by taking the fleſh of the ſea-Horſe any way in drinke.

Againſt the poiſon of deadly dwale, the meat of ſea-vrchins is ſoueraigne: & whoſoeuer haue drunk the dangerous juice of * Carpaſum, find much eaſe and help eſpecially by ſupping their decoction. To conclude, the broth of ſea-crabs likewiſe taken, is thought to be effectual againſt the foreſaid dwale named Dorycnium. I

*Named afterward *Opocarpaſum.*

Chap. VI.

¶ *Of Oiſters and Purple ſhell-fiſhes: of Sea-moſſe, or Reits: and the remedies which they afford.*

MOreouer, Oiſters haue a ſpeciall vertue to reſiſt the venome of the ſea-hare. And albeit I haue written already of oiſters, yet me thinks I cannot ſpeak ſufficiently of them, ſeeing that for theſe many yeres they haue bin held for the principal diſh & daintieſt meat that can be ſerued vp to the table. This fiſh loueth to haue freſh water, & joieth to be in thoſe coaſts where moſt riuers do run into the ſea: which is the reaſon, few of them are found in the deep, called therupon Pelagia; and thoſe thriue not, but are in compariſon very ſmall. Howbeit, they breed and ingender otherwhiles among rocks, & in ſuch holes which want the recourſe of ſweet waters; as for example, about Grynia and Myrina. They wax big and full according to the encreaſe of the Moon, as I haue ſhewed already in my treatiſe of creatures liuing in waters: but principally about the ſpring prime, when they be full of a certain humour or moiſture like vnto milk; and in thoſe ſhallow places where the ſun pearceth with his beams to the very bottom of the water. And this ſeemeth to be the reaſon, that in other coaſts and parts of the ſea, they bee found far leſſe: for ſhade hindreth their growth, and for want of the cheerfull ſight of the ſunne, they haue leſſe appetite to meat & feed not: moreouer, this is to be noted, that oiſters differ one from another in colour. In Spaine they be reddiſh, whereas in Sclauonia they be brown and duskiſh: but about the cape Circeij in Italy, their ſhell and fleſh both, be blacke. In what coaſt or countrey ſoeuer they be found, the beſt and principall thoſe are held to be, which be maſſie and compact; not glib and ſlippery without, with their owne humour and moiſture: and rather bee they choſen which are thicke, than broad and flat: ſuch alſo as bee taken neither in muddy nor yet in ſandie places, but vpon the ſound and firme ground in the bottome; hauing their white meat truſſed vp ſhort and round, and not flaggie as fleſh: the ſame not jagged and fringed about in the edges with ſmal ſtrings, but lying all cloſe vnited together as it were couched within the belly. They that be more expert and practiſed in the choice of oiſters, adde one marke more to chuſe them by, namely, if there be a purple thread or ſtring that compaſſeth them about the edges: and by this ſigne they know the oiſters of the beſt kind and race, from others, and call them by a proper name Calliblephara. Oiſters delight (as I may ſo ſay) to trauell into ſtrange quarters, to be tranſported from their naturall ſeat into other vnknown waters. Thus the oiſters bred about Brindis, and remoued from thence to the lake Auernus; and beeing there fed, are ſuppoſed K L M

20030
copy 1

poſed by that means to keep ſtill their own natiue juice and humidity,and beſides to gain nouriture by the moiſture of Lucrinus. Thus much as touching the ſubſtance and body of Oiſters: it remaineth now to ſpeake of thoſe parts and tracts where the beſt oiſters are to be had; to the end that ſuch coaſts may not be defrauded of the honour due and appertaining vnto them. But of this point ſpeake I will by the tongue of another,and alledge his ſpeech who is thought to haue written hereof with beſt judgement of any man in our time. Theſe therefore bee the verie words of *Mutianus*,which I will put downe as followes: The oiſters(quoth he) of Cyzicum taken about the ſtraights of Callipolis,be the faireſt of all other,and bigger than thoſe which are fed or bred in the lake Lucrinus,ſweeter than thoſe of Brittain,more pleaſant in the mouth than the Edulian,quicker in taſt than thoſe of Leptis,fuller than the Lucenſian, drier than thoſe of
B Coryphanta,more tender than the Iſtrian,and laſt of all,whiter than the oiſter of Circeij: and yet there haue not bin found any oiſters either more ſweet or tender than theſe laſt named. The Hiſtoriographers who wrote of *Alexanders* voiages and exploits,haue left in writing, that within the Indian ſea there be oiſters found a foot long euery way. Moreouer, there is among vs a certain Nomenclator or Controller belonging to one of our prodigall and waſtful ſpendthrifts here at Rome,who haue giuen a proper name to certain oiſters,and termed them Tridacna: his deſire was by that ſignificant name, to expreſſe thus much,That they were ſo big as that they would make three good bits or mouths-full a piece.

Now proceed I will to their medicinable vertues,& before I go any further,in this very place ſet down how far forth they ſerue in phyſick.Firſt and formoſt, they be the only meat to com-
C fort and refreſh a decaied ſtomack:they recouer an appetite that was cleane gone. Bnt ſee the practiſe of our delicat wantons!to coole oiſters forſooth,they muſt needs whelm & couer them all ouer with ſnow;which is as much as to bring the tops of mountaines and bottom of the Sea together,and make a confuſed medley of all. This good moreouer do oiſters, that they gently looſe the belly,and make a body ſoluble: ſeeth the ſame with honied wine, they cure the Tineſme,which is an inordinat and bootleſſe deſire to the ſtoole without doing any thing,eſpecially if the tiwil(which is the place affected)be not exulcerat:oiſters likewiſe ſo prepared,clenſ and mundifie the vlcers of the bladder:eat them in their ſhel with their water,as they came cloſed and ſhut from the ſea,you ſhall find them wondrous good for any rheumes or diſtillations. The aſhes of an oiſter ſhell calcined,and incorporat with honey,be ſingular for the paine of the
D uvula,and aſſuage the inflammation of the tonſils:ſemblably,they repreſſe the ſwelling kernels that riſe vnder the ears,aſſuage the biles and botches called Pani,mortifie the hard tumours of womens breſts,and heal the ſores or ſcalls of the head,if they be applied accordingly with water:and in the ſame order prepared,they rid away wrinkles,and make womens skin to lie ſmooth and euen. Theſe aſhes are a ſoueraigne powder to be caſt vpon any place that is raw, by reaſon of a burne or ſcalding:and the ſame is commended for an excellent dentifrice to clenſe & whiten the teeth withall:temper the ſaid aſhes with vineger,it killeth the itch, and healeth angrie wheales;the ſmall pocks alſo and meazils. Oiſters punned raw and reduced into a cataplaſme, heale the kings euill and kibed heels,if they be applied accordingly.

Moreouer,the Shell-fiſhes called Purples,are very good againſt poiſon.

E As for the reits Kilpe,Tangle,& ſuch like ſea-weeds,*Nicander* ſaith,they are as good as treacle. Sundry ſorts there be of theſe reits,going vnder the name of Alga, as I haue already declared:ſome are long leafed,ſome large;others of a reddiſh colour;and ſome haue curled and jagleaues: the beſt ſimply of all others, be they of the Iſland Creta,which grow near the ground vpon rocks;and namely for to dye wooll & woollen cloth;for they ſet ſo ſure a colour,as neuer will ſhed or be waſhed off afterwards. *Nicander* giueth direction,to take the ſaid treacle in wine

Chap. VII.

¶ *Medicines againſt the ſhedding of haire. For to colour the haire of the head. Alſo againſt the accidents of the eares,teeth,and viſage.*

F

IF by occaſion of ſome infirmity the haire be fallen off or grow very thin,the aſhes of the fiſh called the Sea-horſ,mingled with ſal-nitre and ſwines greaſe,or applied ſimply with vineger, repleniſh the bare places with new haire,and cauſe it to come vp thick again:and for to apply ſuch medicines for this purpoſe,the pouder of a cuttle bone prepareth the skinne well before-

*Muris marini hand. Alſo the aſhes of the ſea-Tortoiſe incorporat with oile: of a ſea-vrchin likewiſe burnt and G
calcined fleſh and all together: as alſo the gall of a ſcorpion, be appropriat medicines to recouer haire that was loſt. In like maner take the aſhes of 3 frogs burnt together aliue in an earthen pot, meddle them with hony, it is a good medicine to cauſe haire to grow: but the operation will be the better, in caſe the ſame be tempered with liquid pitch or tar. If one bee diſpoſed to colour the haire of the head black, let him take horſe-leeches which haue putrified and been reſolued together in ſome groſſe red wine for the ſpace of 60 daies, he ſhall find this to be an excellent medicine. Others there be who giue order, to put as many horſe-leeches as a ſextar will hold, in two ſextars of vineger, and let them putrifie within a veſſell of lead as many daies together; and when they be reduced into the form of a liniment, to annoint the haire in the ſunſhine for the ſame purpoſe. And *Sornatius* attributeth ſo much power vnto this compoſition, that vn- H
leſſe they that haue the annointing of the haire with it hold oile in their mouths all the while, their teeth alſo (by his ſaying) who haue the doing of it, wil turn black. The aſhes of Burrets or Purples ſhels incorporat in hony, ſerue paſſing well in a liniment to heale ſcald heads: and the pouder of the foreſaid fiſh ſhels (although they be not burnt and calcined) tempered with water, is as good for the head-ach. Of the ſame operation is Caſtoreum, incorporat with Harſtrang in oile roſat. The fat or greaſe of all fiſhes whatſoeuer, as well thoſe of the ſea as riuers, beeing diſſolued in oile and tempered in honey, is ſoueraigne for to cleare the eyes: and of the like effect is Caſtoreum applied with hony. The gal of the fiſh Callionymus, healeth the cicatrices
*i. Looking vp to heauen or ſcars that ouergrow the skin about them: and the ſame eateth & conſumeth the excreſcence of ſuperfluous fleſh in the corners of the eies. And verily there is not a fiſh that hath more gall I
than it, as teſtifieth *Menander* the Poet in his comedies: the ſame fiſh is otherwiſe called * Vranoſcopus, by reaſon of the eies which he hath in the vppermoſt part of his head. Semblably the gall of the black fiſh Coracinus quickneth the eie-ſight. Alſo the gall of the reddiſh ſea-ſcorpions, mixt with old wine or the beſt hony of Athens, ſerueth to diſcuſſe the filmes of the eies like to breed a cataract: and thrice muſt the eies be annointed therewith, letting a day goe euer betweene. The ſame cure ſerueth likewiſe to take away the pearle in the eie. As for Barbels, it is commonly ſaid, that if one do feed ordinarily vpon them, hee ſhall ſenſibly feele his eies to decay and wax dim thereby. The ſea-hare it ſelfe verily is venomous; but the aſhes keep the diſorderly and hurtfull haires of the eie-lids from growing any more, if they be once pluckt vp by the roots: and for this purpoſe, the leaſt of this kind are the beſt. In like manner, the little K
Scallops kept in ſalt, and ſtampt together with the roſine or oile of cedar: the ſmall frogs likewiſe which vſually they call Diopetes and Calamitæ, haue the like effect to hinder the comming vp of hairs in the eielids, after they be once pulled vp; in caſe their bloud be tempered with the gum of the vine-tree, and therewith the edges of the ſaid eie-lids be annointed. The ſwelling and redneſſe of the eies is by nothing better delaied and diſcuſſed, than by a liniment made of a cuttle bone puluerized and mixt with womans milk. And in very truth, the ſaid cuttle bone ſimply by it ſelfe, cureth the aſperity and roughneſſe of the ſaid eie-lids. But to worke this cure, the chirurgion vſeth to turne vp the ſaid eie-lids, and to apply therto the medicine, which he ſuffereth not to ſtay there long, but taketh it away within a while: he annointeththe place alſo with
oile roſat, and ouer night laieth thereto white-bread crums [with breſt milke] for to aſſuage the L
paine. The ſelf-ſame ſhell or couer of the cuttle-fiſh beaten to pouder and brought into a liniment with vineger, cureth thoſe who can ſee neuer a whit towards night. The aſhes of the ſayd cuttle-bone draw forth the ſcales or films which grow in the eies: the ſame incorporat with hony, heale the skars of the eies; but tempered with ſalt or braſſe-ore, of each one dram, they rid away the pin and web growing in the eie: the ſame help horſes of the haw that offendeth their eies. Some ſay moreouer, that the little bones within the cuttle, if they bee ſtamped to powder heale the eie-lids of any ſore or accident befalling vnto them. The ſea-vrchins fleſh applied with vineger, taketh away the accidents of the eies called Epinyctides. The Magitians giue direction to burne the ſame with vipers skins and frogs, and to ſpice the drink with the aſhes that
come thereof, aſſuring thoſe who vſe to drink the ſame, that they ſhall haue a very cleare ſight. M
[A fiſh there is named Ichthyocolla, which hath a glewiſh skin, and the very glue that is made thereof, is likewiſe called Ichthyocolla. The ſame glue taketh away the night-foes, commonly named in Greek Epinyctides. Some affirm, That the ſaid glue Ichthyocolla is made of the belly and not of the skin of the ſaid fiſh, like as Buls glue. This fiſh glue is thought to be beſt that

20030
copy 1

A is brought out of Pontus: the ſame alſo is white without any veines, ſtrings, or ſcales, and verie quickly melteth and reſolueth. Now the ſame ought firſt to be cut or ſhred ſmall, and then to lie infuſed or in ſteep a whole day and a night in water or vineger, which done, to be punned and beaten with the pebbles found about the ſea-ſhore, that the ſame may the ſooner melt and diſſolue. This glue thus ordered, is held to be ſoueraigne for the head ach: and a good thing to enter into thoſe medicines or compoſitions which are deuiſed to ſmooth the skin & rid away the wrinkles. Take the right eie of a frog, lap it within a piece of ſelfe ruſſet cloth (ſuch as is made of black wooll as it came in the fleece from the ſheep) and hang it about the neck, it cureth the right eie, if it be inflamed or bleared. And if the left eie be ſo affected, do the like by the contrary eie of the ſaid frog, &c. Now, if it were poſſible to pluck out theſe eies as the frog is ingende-
B ring, it would heale alſo the white cicatrices or ſcars in the eie, if it were hung about the necke of the patient in like ſort within an egge-ſhel. The reſt of the frogs fleſh applied to the eie, ſucketh out and conſumeth the bloud that is congealed vnder the tunicles of the eie, and lies there black and blew. They affirme moreouer, That the eies of a crab or craifiſh being hanged about the neck, are a ſoueraigne remedy for bleared eies.

A little frog there is, delighting to liue moſt among graſſe & in * reed plots: mute the ſame is and neuer croaketh, green alſo of colour: if kine or oxen chance to ſwallow one of them down with their graſſe, it cauſeth them to ſwell in the belly, as if they were dew blown. And yet (they ſay) that if the ſlime or moiſture wherewith their bodies be charged outwardly, be ſcraped off with the edge of ſome penknife, it cleareth the ſight, if the eies be annointed therewith. As for
C the fleſh it ſelfe, they lay it vpon the eies for to mitigat their pain. Furthermore, ſome there are who take 15 frogs, pricke them with a riſh, & draw the ſame through them, that they may hang thereto; which done, they put them in a new earthen pot: and the humour or moiſture that paſſeth from them in this manner, they temper with the juice or liquor which in manner of a gum iſſueth out of the white wine Brionie, wherewith they keep the eielids from hauing any haires growing vpon them. But firſt they pluck vp thoſe diſorderly haires which grew there to offend and hurt the eies: & with a fine needle point drop the foreſaid liquor into the very places where the haires were fetched out by the roots. *Meges* the Chyrurgian deuiſed another depilatory for to hinder the growing of hairs, made of frogs which he killed in vineger, and permitted them therin to putrfiie and reſolue into moiſture: and for this purpoſe his manner was to take many
D freſh frogs, euen as they were ingendred in any rain that fel during the Autumne. The ſame depilatory effect, the aſhes of Horſe-leeches are ſuppoſed to haue, if they bee reduced into a liniment with vineger, and vſed accordingly: now muſt they be burnt and calcined in a new earthen veſſel that neuer before was occupied. And of the like operation is the liuer of the ſea-fiſh Tænia, if the ſame be dried, and thereof the weight of foure deniers Romane incorporate in oile of Cedar to the forme of a liniment, for to annoint the haires of the eie-lids by the ſpace of nine moneths together.

The freſh gall of a Ray or Skeat, yea, and the ſame preſerued and kept long in old wine, is an excellent medicine for the eares: ſo is the gal likewiſe of the fiſh * Bancus, which ſome cal Myxon: alſo of Callionymus the fiſh aforeſaid, if it be dropt into the ears with oile roſat: ſemblably
E Caſtoreum with the juice of Poppie. There be alſo in the ſea certaine creepers ingendred, called Pedunculi, *i.* ſea-lice, which being ſtamped and tempered with vineger, they giue counſell to drop into the eares. Alſo a lock of wooll died in the bloud of the purple ſhell-fiſh Conchylium, of it ſelfe alone is a very good thing to be applied to the eares: howbeit, ſome doe wet the ſame in vineger and ſalniter mixed together. But the ſoueraigne remedy in the opinion of moſt Phyſitians for any grieuance and infirmity of the ears, is this, namely, *Recipe* of the beſt ſauce or pickle called Garum Sociorum that may be gotten, one cyath, of hony one cyath and an halfe, of vineger one cyath, ſeeth them all together gently ouer a ſoft fire in a new pot, eft ſoon skimming it in the boiling with a feather; and when it hath left caſting vp a ſcum and is ſufficiently purified, take it from the fire: and of this decoction warm drop into the pained eares. If the ears
F be ſwelled withall, they ordain and preſcribe to mitigat & aſſuage the ſame firſt, with the juice of Coriander. The fat of frogs dropt into the eares, allaieth their paine preſently. The juice or decoction of craifiſhes incorporat with fine Barly meale, is a ſingular and moſt effectuall ſalue to heale the wounds of the eares. As for ſwellings and inflammations riſing behind the eares, there is not a better thing to cure them, than to apply therto the aſhes of Burrets ſhels tempered with

hony,

* *Calamettes.*

* *ganchi.* Some reade *Bacchi.*

hony, or of the Purples Conchylia, with honied wine.

If the teeth ake, the ready means to aſſuage them, is to ſcarifie the gums and let them bloud with the ſharp bones of the ſea-dragon: and withall, to make a collution with the brains of the ſea dogfiſh boiled in oile and ſaued for the purpoſe, to waſh the mouth and teeth therwith once in a yere. Likewiſe in the pain of the teeth, found it is moſt ſoueraigne to ſcarifie the gums with the pricky bone or fin of the Puffin or Forkfiſh, vntill they bleed againe. The ſame alſo beeing puluerized, brought into a liniment with white Ellebore, and applied to the teeth, cauſeth them to fall out of the head without any great paine. Moreouer, the aſhes of ſalt fiſh burnt in a new earthen veſſell, and mixt with the pouder of the marble ſtone, is reckoned among the remedies for the teeth. In like maner the quadrants or ſquare cantons of the old Tuny fiſh, *burnt to a cole in a new earthen pan, and afterward beaten to pouder, are thought to be good for the tooth-ach. Of the like operation and effect (they ſay) be the pricks and fins of all kindes of ſalt fiſh, if they be firſt burnt to a coale, then puluerized, and therewith the teeth well rubbed. Furthermore, to make a collution to waſh the teeth withall, and to hold the liquor in the mouth, ſome ſeeth frogs in vineger, with this proportion, that to euery frog they take one hemine of vineger. But becauſe many a mans ſtomack lothed & abhorred ſuch a medicin, *Salluſtius Dionyſius* found the means to hang many of them by the hinder legs ouer the veſſell or pan of ſeething vineger, that out of their mouth there might fall the humor within their bodies into the ſaid vineger. But to thoſe who had good ſtomacks & were of ſtronger complexions, he preſcribed to eat the very frogs broth & all wherein they were ſodden. And in very truth, many are of this opinion, that if the grinders and great jaw teeth do ake, this is a ſpeciall medicine for them, but in caſe they be looſe in the head, then the beſt way to confirm and ſet them faſt, is a collution with the vineger aforeſaid. And for this purpoſe ſome there be, who after they haue cut off the feet of 2 frogs, lay their bodies to infuſe and ſteep in one hemine of wine, and ſo aduiſe their patients to waſh their vnſteedy teeth with the ſaid infuſion. Others apply them whole as they be, legs and al outwardly to the chawes, and keep them faſt thereto. Whereas ſome again ſeeth ten of them in 3 ſextars af vineger, vntill a third part of the liquor be conſumed, and with this decoction thinke to faſten the teeth ſure that ſhake in their ſockets. Moreouer, others you ſhall haue who take the hearts of 36 frogs, and bake or boile them in one ſextar of old oile vnder a pan or ouen of braſſe; the grauie or liquor whereof they poured into the eare of that ſide where the cheek or jaw doth ake: whereas many others beſides ſeeth the liuer of a frog, and when they haue ſtamped and incorporat it with hony, put it into the hollow teeth, or apply it thereto. But all theſe medicines aboueſayd you muſt thinke to be more effectuall, if they be made of ſea-frogs. Now if the teeth bee worme eaten and ſtinke withall, they giue order to dry a hundred of them in an ouen all night long: afterwards to put vnto them as much ſalt in proportion as they come to in weight, and therewith to rub the ſaid faulty teeth. There is a kind of ſerpent or water-ſnake called in Latine Coluber, and of the Greeks Enhydris: diuers there be, who with foure of the vpper teeth of this ſerpent, ſcarifie the gums of the vpper chaw, in caſe the teeth therin do ake: and ſemblably with foure of the nether teeth, if the other bee in paine: and yet ſome there bee who content themſelues with the eye-tooth onely. They vſe alſo the aſhes of Sea-crabs, and no maruell: for the aſhes of Burrets is a dentifrice well knowne for to keepe the teeth cleane, and make them neat and white.

The fat of a ſea-Calfe or Seale taketh away the foule tettars called Lichenes, and the filthy leproſie: ſo do the aſhes of Lampreys, if the ſame be incorporat with hony to the weight of 3 oboli. The liuer alſo of the Puffin boiled in oile. Finally, the aſhes of a ſea Horſe and a Dolphin mixt with water, ſo that the part affected be well rubbed withall vntill it bliſter. Now, when it is thus exulcerat, it muſt be followed with that manner of cure which is appropriat thereto, and namely, vntil it be healed and skinned againe. Some take the liuer of a Dolphin, and fry or torrifie it in an earthen pan, vntil there come from it a kind of greaſe in manner of oile, & therwith annoint the patients in the caſes aboueſaid.

If women deſire to be rid of the foule freckles, ſpots, and morphew that do injury vnto their beautie; if they would looke young, and haue their skin plumpe and void of all riuels, let them take the aſhes of Burrets and purple ſhels calcined, incorporat the ſame with honey into the form of a liniment: within one weeks ſpace if they ply it with annointing, they ſhal ſee the effect thereof; namely, the skin cleare and neat, euen and ſmooth without wrinkles, & the cheekes

not

* *Exuſta*, not *Eluta*, according to *Galen*.

copy 1

not hollow, but faire and full. Mary vpon the 8 day they muſt not forget to foment and bath the place with the white of an egge wel beaten. Among the kinds of Burrets called Murices, are to be ranged thoſe ſhell-fiſhes which the Greeks ſome call Colycia, others Corythia, ſhaped in the ſhell like to the reſt in manner of a turbant, but that they be far leſſe, howbeit more effectuall: for that beſides the other properties abouenamed, this ſpeciall gift they haue, to maintaine a ſweet breath. As for the fiſh or glue called Ichthyocolla, it hath vertue to lay the skin euen without riuels, and to make it riſe and appear firm, but then it ought to boile in water the ſpace of 4 houres, afterwards to be ſtamped, * ſtrained, and wrought to the liquid conſiſtence of hony and no more. Thus prepared, it muſt be put vp into a new veſſell neuer occupied, & there kept. When time ſerues to vſe it, to euery 4 drams weight thereof proportion two of brimſtone, of Orchanet as much, of litharge of ſiluer 8 drams: put them all together, and ſtampe them, with ſome ſprinkling of water among. Herewith let the face bee annointed, and after foure houres waſh it off againe. For the ſpots and pimples in the face, called Lentils, as alſo for all other deformities, the aſhes of Cuttill bones are thought ſingular, if the skin be rubbed therewith: and the ſame conſume the excreſcence of proud and rank fleſh, like as they dry vp any moiſt and rheumaticke vlcers.

* Colata.

Chap. VIII.

¶ *Diuers receits, ſet downe diſorderly one with another, for ſundry maladies.*

C ONe Frog boiled in fiue hemines of ſea-water, is ſingular to cauſe the ſcurfe of the mange or wild ſcab to fall off: but ſodden ſo long it muſt be, vntill the decoction bee riſen to the height of hony.

There is ingendred in the ſea alſo that which is called Halcyoneum, made as ſome thinke of the neſts of the birds Halcyones and Ceyces: but as others ſuppoſe, of the filthy ſome of the ſea thickened and indurat: and according to the opinion of ſome, it proceedeth from the muddie ſlime or a certaine * hoary dry ſcum or froth of the ſea. Foure kinds there bee of it. The firſt of an aſh colour, thick and maſſie, of a quick and hot ſmell. The ſecond is ſoft and more mild, fauoring in manner like to ſea weeds. The third reſembleth the whiter kinde of checquer worke in D marquettry. The fourth is more hollow and fuller of holes in maner of a pumiſh ſtone, & in that reſpect reſembleth a rotten ſpunge, inclining much to the colour of purple: and this is ſimply the beſt, called alſo by the name of Halcyoneum Mileſium; yet in this kind the whiter that it is the worſe it is to be liked. The property of them all in generality, is to exulcerat and mundifie. Vſed they are being torrified, euen without any oile. Wonderfull is their operation, if they bee tempered with Lupines, and the weight of two oboli in ſulphur, for to take away the wilde ſcab or leproſie, the foule tettars Lichenes, and the pimples or ſpots of the skin called Lentils. Halcyoneum alſo is commonly emploied about the ſcars or thick filmes appearing in the eyes. *Andreas* the Phyſitian vſed much the aſhes of a ſea-crab incorporat with oile in curing the leproſie. *Attalus* occupied as vſually the fat of a freſh Tuny, new taken, for the healing of vlcers. The E pickle of Lampreies, together with the aſhes of their heads calcined, and brought into a liniment with hony, healeth the kings evill. And many are of opinion, that to prick the wennes named the Kings euill aforeſaid, with the ſmall bone or pricke that ſticketh in the taile of that ſea fiſh which is called * Rana marina, with this gage and rule of the hand that it wound not deep, is very good for that diſeaſe: but the ſame muſt be done euery day vntil they bee throughly cured and whole. Of the ſame operation is the ſharp prick in a Puffen: of the ſea-hare alſo applied to them, ſo as neither the one nor the other be ſuffered to lie long to the place, but bee ſoone renewed. Alſo the ſhelly skin of the ſea-Vrchin ſtamped to pouder and brought into a liniment with vineger: as alſo the aſhes of the ſea Scolopendre incorporat with honey: and the riuer craifiſh either puluerized or calcined, and the duſt or aſhes thereof likewiſe tempered with honey, F are good to be applied to the ſame diſeaſe. Wonderfull effectuall be the bones alſo of the cuttill fiſh beaten to pouder, and with old ſwines greaſe brought into the form of a liniment: and in this manner they apply this medicine to the tumors behind the ears: like as the liuers of the ſea fiſh Scarus. Moreouer, the ſheards of ſuch earthen veſſels wherin ſalt fiſh was pouderd & kept, beaten to pouder, & tempered with old ſwines greaſe: the aſhes alſo of Burrets ſhels incorporat in oile, ſerue in right good ſtead for the ſwellings behinde the eares, and the tumours or wennes called

* Halotichnes.

* The Frenchmen terme it *Diable de mer*, i. the diuell of the ſea.

called the kings euill. The ſtiffe cricke in the neck is mollified and made pliable againe, ſo as it G
may turne which way a man would haue it, with drinking of one dram weight of thoſe creepers or inſects which be called ſea-lice; and yet ſome take for the ſame Caſtoreum in honied wine, adding thereto a little pepper, and drinke this compoſition in the broth of frogs boiled in oyle and ſalt. After which manner, many Phyſitians cureth the crampe that draweth the neck backward: the generall convulſion alſo that ſtretcheth the body ſo, as if it were of one piece: and other particular ſpaſmes and cramps of any part, ſo there be ſome pepper put thereto. The aſhes of ſalt Cackerels heads burnt and reduced into a liniment with honey, diſcuſſe and reſolue the Squinancy cleane, like as the broth of frogs boiled in vineger; and the ſayd broth is ſingular alſo for the inflammation of the tonſils. The Creifiſhes of the riuer dried and beaten to pouder, then put into water (ſo as there be to euery one a hemine of water) make a good liquor to garga- H
rize withall for the ſquinancy. The ſame alſo drunke in wine or hot water, worke the like effect. The ſauce made of Maquerels called Garum, put with a ſpoon vnder the uvula, and there held a while, putteth it vp, and reduces it again to the right place. The fiſh * Silurus eaten at the table either freſh or poudered, helpeth the voice much. The barbels kept vntill they be dried, & then puluerized, prouoke vomit, if a cup of drinke be ſpiced with the pouder. If a man or woman bee ſhort winded, there is not a medicine again ſo good to helpe that difficulty of breath, as to drink whiles they be faſting, Caſtoreum, with a little quantity of Ammoniack in honied vineger. The ſame potion taken likewiſe with honied vineger hot, allaieth the convulſion of the ſtomack proceeding from exceſſiue yexing or hicquets. *Item*, it is ſaid, that Frogs boiled in ſome broth be- I
tween two platters after the manner of fiſhes, are good for a cough: and beeing hanged by the heeles, after that their ſaliuation and humidity is dropt from them into a pan or platter vnderneath, they are to be rid of their garbage, & when the ſame is flung away, they ought to be kept and preſerued for the purpoſe aforeſaid. There is a little Frog that vſeth to climb trees, & from thence crieth and croaketh: if a man ſpit into the mouth of one of them, & then let her go again, it is thought hee ſhall bee deliuered by that meanes from the cough. To conclude, many giue counſell for the cough that bringeth vp bloud withall, to drinke in hot water the fleſh of a raw perwinckle well punned.

* Some take it for the Sturgeon, but vntruly

Chap. IX.

¶ *Proper receits for the accidents of the Liuer and the ſides: for the infirmities alſo of the Stomacke and Belly. Beſides other medicines huddled together confuſedly.* K

MAny vſe to ſuffocate and kill in wine a ſea Scorpion, and to drink thereof for the paine of the liuer. For the ſame purpoſe many are wont to take in honied wine and water of each a like quantity, the fleſh of the long muskles or ſhell fiſhes: or if they haue a feuer, in honied water. In caſe of pleuriſie or paine of the ſides, the fleſh of the ſea horſ roſted, eaſes the ſame: ſo doth the fiſh Tethea, which reſembleth an Oyſter, taken as meat. The pickle of the fiſh Silurus injected by way of clyſtre allaieth the pain of the ſciatica. To the like effect there are giuen for 15 daies together, Cockles, or Muskles, to the weight of 3 oboli infuſed in two ſextars of L
wine. The broth of Silurus ſofteneth the belly: like as the crampefiſh Torpedo, eaten as meat. The * ſea-wort is like to that of the garden, hurtful to the ſtomack, but moſt eaſily it purges the belly. In regard of the acrimony that it hath, they vſe to ſeeth it with ſome fat fleſh. The broth of any fiſh whatſoeuer is laxatiue: the ſame prouokes vrine, eſpecially if it be made of wine. The beſt fiſh broth comes from the Sea Scorpions, and thoſe which they call Iulides: of ſtone fiſhes alſo that keep about rocks, and haue no rank or ſtrong taſte; and ſuch muſt be ſodden with dill, parſely, coriander, and leeks, putting therto oile and ſalt. The ſquares alſo or cantons of the Tunie, that haue bin old kept, are purgatiue, for particularly they euacuate crude and wateriſh humors, beſides flegme and choler. The ſhel-fiſhes alſo named Myaces, haue a quality purgatiue: as touching whoſe nature I purpoſe to write fully in this very place. They gather together by M
heaps after the manner of Burrets; they liue in places giuen to breed reits and ſea moſſe; moſt delicat and pleaſant meat they be in Autumne, & eſpecially in thoſe coaſts where good ſtore of freſh water is intermingled in the ſea, which is the reaſon that thoſe of Ægypt bee moſt commendable: as winter grows on, they begin to gather a kind of bitterneſſe, & a red colour beſides.

* *Olus marinũ*: haply he meaneth *Braſſica marina*, i. *oleracea*, yet it is nothing like to our Colewort

The

20030
copy 1

A The broth of theſe fiſhes hath the name to euacuat both the belly & bladder, to ſcour & mundifie the guts, to open any obſtructions whatſoeuer, to purge the reines, to take down the rankeneſſe of bloud and fat. In which regards they be ſouerain for the dropſy, for the monthly termes of women, the jaundiſe, all gouts and diſeaſes of the joints whatſoeuer, and ventoſities. Singular they are holden to be for to clenſe the humors either cholerick or phlegmatick, which anoy and ſtuffe the lights, or which ingender obſtructions about the liuer: likewiſe to cure infirmities of the ſpleen, and all rheums or deſcent of humors to any place. Only they be hurtfull to the throat, and make a man to loſe his voice, this is al the harm they do. The vlcers that corrode and be full of filthy matter, and require mundification, they heal: ſo do they all cankerous ſores. Being calcined after the order of Burrets, they cure the biting both of dog and man, if their a-
B ſhes be incorporat in hony: and ſo they cleanſe the leproſie, and rid away the pimples or ſpots in the skin called Lentils, Their aſhes * taken in drinke, haue a vertue to diſcuſſe the dimneſſe and miſtineſſe of the eie-ſight, to cure the accidents of the gums and teeth; and beſides, to drie vp the ſmall pocks and ſuch like breaking out of wheals by occaſion of flegm. Moreouer, they are as good as a counterpoiſon againſt the iuice of the deadly Dwale called Dorycnium, or of Carpaſum, which is commonly named Opocarpaſum. Beſides, this would be noted, that they grow all to be of two kinds of them; the one * Mituli [*i.* Limpins] which haue a taſt of ſalt, & cary a ſtrong ſauor; the other * Myſcæ, which differ from the other in roundneſſe: leſſe alſo they be a good deal, and hairy: and as their ſhels be thinner, ſo their fleſh is more firm and hard. The ſaid Limpins alſo, as well as Burrets, yeeld aſhes when they be calcined, which haue a cauſtick
C quality, whereby they ſerue properly to mundifie the skin from leproſie, lentils, and other pimples and ilfauored ſpots. The ſame being waſhed afrer the maner of lead, be ſingular for to ſubtiliat the thick eie lids, to ſcatter and diſcuſſe the pearls in eies, to diſſipat the cloudy & miſty dimneſſe, to clenſe filthy vlcers in any part of the body, and namely the puſhes and bliſters that ariſe in the head. As touching the fleſh that they haue, it ſerueth in a cataplaſm to be laid vnto the biting of mad dogs. The Palours alſo do ſoften and mollifie the belly: ſo doth Caſtoreum, being drunk to the weight of two drams in honied water. They that would haue this medicine more quick in operation, and to work throughly, put therto of the garden cucumber root dried one dram, & of ſalt-petre two drams. As for the fiſhes named Tetheæ, they are ſingular againſt the wringing torments [and gripings] of the belly and all ventoſities. Theſe fiſhes be found
D ordinarily about the rocks of the ſea, ſucking the leaues of Reits and ſuch like weeds, more like indeed to Muſhroms and Puffes, than to fiſhes. But the ſame haue a ſpecial propertie to cure the Tineſme and the accidents of the kidnies.

Moreouer, there growes in the ſea a kind of Wormwood, which ſome call Seriphium, and principally towards * Tapoſiris in Egypt, the which is more ſmal and ſlender than that of the land: it looſeth the belly, killeth the worms in the guts, and expelleth them. The Cuttil fiſh alſo is laxatiue: and ordinarily giuen it is to be eaten, after it hath bin ſodden with oile, ſalt, and meal. Salt Cackerels likewiſe prouoke vnto the ſtoole, in caſe they be reduced into a liniment with buls gall, and therewith the nauil anointed. Generally, the broth of fiſh ſtewed betweene two platters with Lectuce, diſpatcheth thoſe ſharp and fretting humors which are the cauſe of
E the Tineſm. Craifiſhes of the riuer ſtamped and drunk in water, ſtop a lask, and be diureticall. But yet in wine they moue appetite to the ſiege. Take away their feet and armes whereby they crawle, then pun and incorporat the reſt of their body with Myrrh, they driue out the ſtone. But this proportion muſt be obſerued, that to euery dram weight of them there be put three oboli of Myrrh.

To appeaſe the painefull paſſion called Iliaca, to allay and reſolue ventoſities alſo and inflations, there is not a better thing than to take in 4 cyaths of mead or honied wine hot, Caſtoreum, with carot and parſly ſeed, as much as may be comprehended with 3 fingers. The ſame is ſingular to allay the wrings and torments of the belly, with vineger & wine mixt togeather. The
F fiſhes named Erythini eaten as meat, ſtay the looſneſſe of the belly. For to cure the dyſenterie or bloudy flix, ſeeth frogs with the ſea onion commonly named Squilla, and thereof make certain trochisks to be giuen to the patient in that caſe. The ſame effect hath their gall or heart ſtamped and incorporate with honey, as *Niceratus* myne author doth teſtifie. Eat ſalt fiſh with Pepper, ſo as you abſtain from all fleſh beſides, if you would be cured of the jaundiſe. Lay the fiſh named a Sole to the region of the ſpleene, it doth cure the oppilation and hardneſſe there-
of:

* *Potus*, rather *illitus*, for it is brought into a liniment, & to vſed outwardly.

* *Salem.* Some read *Scilla.* *i.* ſea Onion or Squilla.

* Muskles.

* Haply Cockles.

* *Taphoſiris.*

of: ſo doth the cramp-fiſh Torpedo: and a Turbet in like manner, being applied aliue; but afterward you muſt let it looſe againe into the ſea. A ſea ſcorpion killed in wine healeth the infirmities of the bladder, is breaketh and expelleth the ſtone. The ſame effect hath the ſtone which is found in the tail of a ſea ſcorpion, if it be drunk to the weight of one obolus: the liuer alſo of the water ſnake Enhydris, and the aſhes likewiſe of thoſe kind of Mullets called Blennij, if they be taken with Rue. Moreouer, there be found alſo in the head of the fiſh Banchus, certain little ſtones as it were, which if they be drunke in water, are ſoueraigne for them which be troubled with the grauel and the ſtone. And it is commonly ſaid, That the ſea fiſh called a Nettle taken in wine, is very good therefore: like as another named in Latine Pulmo Marinus, boiled in water. The egs or ſpawn that the Cuttill fiſh doth caſt be diuretical, and prouoke vrine, whereby alſo they clenſe the kidnies from the phlegmatick humors there gathered. Riuer crabs or crai- H fiſhes ſtamped and taken in aſſes milke eſpecially, doe cure ruptures and inward convulſions. And as for ſea Vrchins, if they be ſtamped prickes and all, and ſo drunke in Wine, they expell ſtone and grauell: but to euery Vrchin there muſt be taken one hemine of Wine, and the Patient ought to drinke it continually vntill he find help: and otherwiſe their meat is good to be eaten ordinarily for this purpoſe. To feed alſo vpon Cockles and Scalops is wholſome for to ſcoure the bladder. Of theſe ſhel-fiſhes thoſe of the male ſex be called by ſome Donaces, by others Auli, wheras the female are named Onyches. The male do prouoke vrin, but the female are the ſweeter in taſt, and of one colour. The egs or ſpawn alſo of the Cuttill fiſh moue vrin, as hath bin ſaid before, and purge the reins. For that rupture wherein the guts fall downe into the cods, it is ſaid, That the ſea Hare punned and applied to the place in form of a cataplaſm with I hony, is ſingular to reduce them vp into their place. The liuer alſo of the water-ſnake or adder, called otherwiſe Hydrus or Enhydris, beaten to pouder and put in drink, helpeth thoſe that be giuen to breed the ſtone and grauel. The pickle that comes of the fiſh Silurus ſalted, infuſed or injected by a cliſtre into the guts, ſo that the belly were before emptied from the groſſe excrements, cureth the Sciatica. The aſhes of Barbles and Mullets heads calcined, heale and skin vp the galls and frets of the fundament. Now the manner of burning or calcining them is in an earthen pot: and reduced they ought to be into a liniment with hony, before the place be therewith anointed. The aſhes alſo of Cackerels burnt do cure and cloſe vp againe the chaps in the ſeat: which alſo are good for the ſwelling piles and bigs in thoſe parts: Like as the aſhes of the yong Tunies heads ſalted, called Pelamides: or the Squares named Cybia, with hony. If the ti- K will be ſlipped down and ready to hang out of the body, apply thereto the cramp fiſh Torpedo, it preſently reduceth it and ſtaieth it vp. The aſhes of craifiſhes brought into a liniment with oile and wax, healeth the chaps and fiſſures in thoſe parts: ſo doth the fine pouder of the Sea-crab dried and puluериſed. The pickle alſo of the fiſhes Coracini diſcuſſeth and reſolueth the biles called Pani. The ſame effect work the aſhes of the garbage and ſcales of the ſhadow-like Sciæna. The ſea Scorpion alſo boiled in wine, ſo that the ſaid biles or impoſtumes be fomented therewith. But the hard and ſhel-like skins of ſea-Vrchins being wel ſtamped, and with water brought into a liniment, keepe the ſaid biles downe and repercuſſe them in the beginning. The aſhes likewiſe of Murrets or Purple fiſhes ſerue both waies, whether it be needfull to diſcuſſe them in the beginning, or to ripen them, and after they be brought to maturation, for to L break them and let them forth. Some phyſitians for this intent compound a medicine or ointment in this maner: *Recipe* of wax and flax 20 drams, of litharge of ſiluer forty drams, of Burrets aſhes ten drams, of old oile one hemin, *fiat vnguentum*. The very fiſhes alone by themſelues, ſalted, ſodden, and ſo applied, ſerue in this caſe. Craifiſhes of the riuers punned into a cataplaſme and applied vnto the ſecret parts, reſolue & diſcuſſe the puſhes that there ariſe: ſo do the aſhes of Cackerels heads: their fleſh alſo boiled and laid to the place affected. In like manner, the aſhes of Perches heads ſalted and reduced into a ſalue with honey. The aſhes of yong Tunies heads, whiles they are Pelamides, or the rough skin of the fiſh called * Squatina, burnt. This is the skin which, as I ſaid before, is proper to poliſh wood and make ſmooth any workes made thereof: whereby you may ſee, that euen the ſea alſo doth afford inſtruments to fit the Ioiners M and Carpenters hand. The ſmall fiſhes named Smarides applied vnto the puſhes of the ſayd priuy parts in the forme of a liniment, do much good. As alſo the aſhes of Burrets or Purples ſhells incorporate with honey: and the ſame would be more effectuall, in caſe that the Fiſhes bee burned whole, ſhell, fiſh and all. Salt fiſh ſodden in honey, and applied, ſerueth particu-

larly

* Some take it for a Sole, others for a Skeat.

20030
copy 1

larly to extinguiſh the heat of carbuncles & botches in the ſaid ſecret parts. If one of the cods hang down flagging vnſeemely lower than his fellow, ſome would haue it annointed with the froth that commeth from ſhell-ſnails or periwinckles. The fleſh of the ſea horſe roſted, helpeth them that cannot hold their vrin, in caſe they vſe ordinarily to eat therof: likewiſe the little fiſh called Ophidion, ſo like vnto a Congre, if it be taken with a Lillie root. The ſmall fiſhes found in the bellies of the greater who haue deuoured and ſwallowed them down, taken forth & burned to aſhes, are good in this infirmity to be drunk in water. The aſhes of ſhel-ſnailes, meat and all, burnt, are preſcribed by ſome phyſitians to be giuen in Signine wine againſt incontinency of vrin; but principally of Barbary ſnails. For the gout in the feet, & the diſeaſes of other ioints, the oile wherein a frog was boiled, is ſoueraigne: ſo are the guts of the ſaid frog, and the aſhes of a toad incorporat with old oile: ſome put thereto the aſhes of all the three kinds of barly, of ech an equal weight. And they giue direction to rub alſo the goutie feet, with a Sea-hare: alſo to be ſhod with the skins of Beuers, eſpecially thoſe which are bred in Pontus: like as to weare ſhoos made of Seals skin: the fat of which fiſh, is likewiſe very good. Alſo the ſea-moſſe or reits called Bryon, like to lettuce, but that the leaues be more riueled, and grow to no ſtalke; whereof I haue written heretofore: of a ſtyptick and aſtringent nature it is; no maruell therfore, if being applied vnto the gout, it mitigat the fury and violence thereof. Moreouer, the common ſea-weeds named Alga, of which alſo I haue treated already; but this caution there would be in the application thereof, That it be not dry. The ſea-fiſh called Pulmo-Marinus, cureth the kibes in the heels: the aſhes alſo of the ſea-crab, tempered with oile: yea, and the riuer-crabs or Creifiſhes burnt and calcined to aſhes, if the ſame be incorporat with oile: like as the fat of the fiſh Silurus. Moreouer, if other joints be diſeaſed, it were very good for the eaſement of their griefe, eftſoons to lay thereto frogs, freſh and new taken: mary the beſt way, by the direction of Phyſitians, is to ſplit them through, and ſo to apply them warme. The broth of Limpins, Muſcles, cockles, and Wilkes, is very nutritiue, and maketh them fat that vſe it. Thoſe that be ſubject to the falling ſickneſſe, vſe ordinarily (as hath bin ſaid before) to drink the rennet of the Seale or Sea-calfe, either with mares milke or aſſes milk, or els with the juice of the pomgranat: and ſome are woont to take it in oxymell or honied vineger: and yet there be others that ſwallow the ſame downe by it ſelfe in forme of pils. And for the ſame purpoſe, Caſtoreum is vſually giue vnto ſuch patients faſting, to be drunke in 3 cyaths of honied vineger or oxymell aforeſaid: but thoſe that eftſoons be ſurprized with the fits, and oftentimes fall thereof, find wonderfull much good by this clyſtre following: Take of Caſtoreum two drams, of honey and oile one ſextar, and of water as much. But ſay that one be preſently in a fit, the ready meanes to raiſe him and ſet him vpright vpon his feet again, is to preſent vnto his noſthrils Caſtoreum with vineger, for to ſmel vnto. The liuer alſo of the fiſh named the Sea-cat or Weazill, is giuen in like caſe: euen as the bloud either of Sea-mice or Tortoiſes.

Chap. X.

¶ *Remedies for feuers of all ſorts: alſo for diuers other infirmities.*

THe liuer of a Dolphin eaten before the acceſſe, cureth all thoſe agues which be not continuall, but returne by fits and keep their courſe. Oile roſat wherein the fiſhes called Sea-horſes were ſuffocated and killed, is ſingular good to annoint thoſe that be ſicke of ſuch agues as come with a cold fit: and the very fiſh it ſelfe is moſt effectuall to rid away the ſame, in caſe it be hanged about the necke, or to the arme of the patient. Semblably, the little ſtones which are found in a Haddocks head at the full of the moone, if they be taken forth and hung about the patient, lapped handſomly in a little linnen bag, ſerue to driue away ſuch feuers. Moreouer, it is ſaid, that the longeſt tooth in the head of a riuer Fiſh called Pagrus, tied to one of the hairs of the patients head, ſo as he do not ſee the party who faſtened or hung it therto, in 5 daies ſpace will doe the deed: as alſo the oile wherein a frog hath beene boyled in ſome carrefour or croſſe ſtreet turning three waies, cureth thoſe who are ſicke of a quartane ague, if they be all ouer annointed therewith; prouided alwaies, that the fleſh be firſt throwne away. And yet ſome ordaine, that they ſhould be ſtrangled or ſtifled in oile, and then the bodies hung priuily about ſome part of the patient without his knowledge; and that he be afterwards well rubbed and annointed with the foreſaid oile. If one carry about him the heart of a frog either hanging by his

necke or tied to his arme, ſurely it will diminiſh and ſhorten the cold fit of an ague: like as the G
oile will do no leſſe, wherein the entrails of the ſaid frog were boiled, in caſe he be annointed
therewith. But aboue all, either frog or toad (the nailes wherof haue been clipped) hanged about
one that is ſicke of a quartan ague, riddeth away the diſeaſe for euer: alſo, whoſoeuer haue about
him hanging to any part of his body the heart of a toad, infolded within a piece of cloth of a
white ruſſet colour, he ſhall be deliuered from the quartan ague. Stampe riuer crabs or creifi-
ſhes, concorporat them with oile and water, and herewith annoint the patient all ouer before
the fit of any ague, you ſhall find it to do very much good, but ſome put pepper thereto: other
for the quartan particularly, boile the ſame in wine vntill a fourth part be ſodden away, & then
giue counſell vnto the ſicke parties to drinke of that broth preſently after they be come out of
the baine. You ſhall haue ſome aduiſe, for to ſwallow downe whole, the left eie of a creifiſh in H
this caſe. Moreouer, the Magitians ſeem to aſſure vs, that whoſoeuer be ſicke of a tertian ague,
ſhal be rid of it, in caſe the eies of the ſaid creifiſhes be tied or hanged about them one morning
before the Sun be vp; ſo as withall, they that haue the doing hereof, let them go again blinde as
they are, into the water: and they would beare vs in hand, That if the ſaid eies plucked out of
the head of a creifiſh, be wrapped together with the fleſh of a Nightingale, within a piece of a
ſtags skin, and ſo worne either about the neck, or otherwiſe tied faſt to ſome part of the bodie,
they will cauſe him or her that weareth them, to be watchfull & not inclined one whit to ſleep.
They vſe likewiſe the rennet of a Whale or els of a Seale, giuing it vnto thoſe that be growing
into a lethargie, for to ſmell vnto: and ſome of them annoint thoſe that be already in a lethar-
gie, with the bloud of tortoiſes. The fiſh likewiſe called Spondylus, is ſaid to rid away the ter- I
tian ague, in caſe the patient weare one of them without any thing elſe, about the necke: like
as the riuer ſhel-ſnails eaten freſh and new gathered, cure the quartan: howbeit, ſome there bee,
who for that purpoſe keep them condite in ſalt, and giue them after they be punned for to drink.
The wilks alſo or wrinkles called Strombi, ſuffered to lie and putrifie in vineger, do with their
very ſmell awaken and raiſe thoſe that lie in a lethargie. The ſame are good likewiſe for ſuch as
be ready to faint and fall into cold ſweats, through feebleneſſe of the heart and ſtomacke. The
fiſhes named Tetheæ, eaten with rue and hony, are ſoueraigne for to reſtore them whoſe fleſh is
fallen away in a conſumption. The fat of a dolphin melted and drunk in wine, cureth ſuch as be
in a dropſie. In caſe the head be heauie and ready euermore to * fall aſleepe, there is not a better
* Grauitati ſoporis. thing than to rub the noſthrils with ſome conuenient ointment, or to hold thereto ſome per- K
fume, or els to ſtop the ſame any way it makes no matter how. Alſo, the meat of the foreſaid
wilks or wrinkles, ſtampt & giuen in 3 hemines of honied wine, with as much water, or in mead
or honied water if the patient haue a feuer withal, is ſingular good againſt the ſaid drowſineſſe:
likewiſe the juice or decoction of creifiſhes with honey. Moreouer, water-frogges boiled in old
wine with the red wheat Far, and eaten as meat, ſo as the patient drinke alſo of the broth out of
the ſame veſſell where they were ſodden, are thought to be ſoueraigne for ſuch ſleepie diſeaſes:
or elſe take a tortoiſe, cut away his head, feet, and taile, plucke out his guts and garbage; the reſt
of the fleſh condite, ſo as it may be taken without any lothing or riſing of the ſtomack, for this
is held to be ſingular in this malady. Moreouer, freſh-water creifiſhes eaten with their broth,
haue the name to reſtore ſuch as be in a phthyſicke or conſumption of the lungs. The aſhes ei- L
ther of a ſea-crab or riuer creifiſh, be excellent either for burne or ſcald, and this manner of cure
alſo ſerueth for to reſtore haire again; but then they hold opinion, that together with the aſhes
of the riuer creifiſhes, there be wax vſed & bears greace. Alſo the aſhes of frogs gal is thought
good for a feuer. As for Shingles and S. *Anthonies* fire, the bellies of liue frogs applied to the
place, doe extinguiſh and quench the extremitie of their heat: but in any caſe order is giuen,
that they be tied by the hinder leggs with their mouths bending forward; to the end, that their
often breathing alſo vpon the place, may coole and do good. Furthermore, many there be who
vſe for that purpoſe, the aſhes of the heads of the fiſhes called Siluri: as alſo of ſaltfiſh with vi-
negre, and apply the ſame to ſuch wildfires and inflammations. The liuer of a Puffen or Forke-
fiſh ſodden in oile, being outwardly applied, killeth not onely the itch and ſcab of men, but alſo M
the ſcurfe and mange of four-footed beaſts, moſt effectually. The callofitie or thick skin where-
with Purple fiſhes couer their heads and hollow concauitie, if it bee punned and applied vnto
wounded ſinews, doth conſolidat and ſowder them againe though they were cut aſunder. The
rennet of a Seale or Sea-calfe taken in wine to the weight of one obolus, helpeth thoſe that lie
in

20030
copy 1

A in a lethargie: ſo doth fiſh-glew Ichthyocolla. Such as are giuen to the ſhaking and trembling of their lims, find much benefit by Caſtoreum, if they bee rubbed and annointed with it and oile together. I read, that Barbles are hurtfull meat for the ſinews: and many are of opinion, that as much feeding vpon fiſh * cauſeth bleeding, ſo the ſame may be ſtanched with the poulpe or pourcuttle, if it be ſtamped and applied to the place: of which fiſh, thus much moreouer is reported, That of himſelfe he yeeldeth a certain ſalt pickle, and therefore there ſhould be no ſalt put into the liquor while he is ſeething: *Item*, that it ought to be ſliced and cut with an edged reed; for with an yron knife it will take infection, and the nature of it is ſuch as to *keep and retaine it ſtill. For the ſtanching of bloud, they vſe alſo the aſhes of frogs, or els their bloud dried, to be applied accordingly. But ſome would haue the aſhes to be made of that kind of frog,

B which the Greeks name Calamites, becauſe it liueth among reeds, buſhes, and ſhrubs, & of all others is the leaſt and greeneſt: and yet many do ordain, if the flux of bloud be from the noſtrils, to take the aſhes of young frogs breeding in the water, whiles they be tadpoles, and haue little wriggling tailes, (and thoſe muſt be calcined for that purpoſe in a new earthen veſſell) & to put vp the ſaid aſhes into the noſe. On the contrary ſide, the horſleeches which we call in Latine Sanguiſugas, [*i.* Bloudſuckers] are vſed for to draw bloud. And verily it is iudged that there is the ſame reaſon of them, as of ventoſes and cupping-glaſſes vſed in phyſicke, for to eaſe and diſcharge the body of bloud, and to open the pores of the skin. But here is all the harme and diſcommoditie of theſe horſleeches, That if they be once ſet too for to draw bloud, the body will looke for the ſame phyſick again euery yere after, about the ſame time, & be ill at eaſe for want

C thereof. Many phyſicians haue thought it good to vſe them for the gout of the feet alſo. Well, ſet them to the hæmorrhoids, and where you will, they fall off lightly when they are full and ſatisfied, euen with the very weight of the bloud which pulleth them downe; or els by ſtrewing ſome ſalt about the place where they ſticke too: and otherwhiles it falleth out, that they leaue their heads behind them faſt fixed in the place where they ſettled, and by that means make the wound incurable and mortall, which hath coſt many a man his life: as it happened to *Meſſalinus* a noble man of Rome, and who in his time had bin a Conſull, whoſe forturne it was to die therupon, hauing ſet them to his knee: whereby we may ſee, that oftentimes they bring a miſchiefe for a remedy: and the red ones are they that in this reſpect ought to be feared. To preuent therfore this dangerous inconuenience, they vſe with a paire of ſizzers to clip them at the very

D mouth as they be ſucking; and then ſhall you ſee the bloud ſpring out, as it were at the cocke of a conduit, and ſo by little and little as they die, they will gather in their heads, and the ſame will fall off, and not tarrie behind to do hurt. Theſe horſleeches naturally are enemies to Punaiſes, in ſo much as their perfume killeth them. Furthermore, the aſhes of Beuers skins burnt and calcined together with tar, ſtancheth bloud guſhing out of the noſe, if the ſame be tempered & mingled wel with the juice of porret. The ſhels of cuttles applied to the body with water, draw forth arrow heads, pricks, or ſpils, that ſticke deepe within the fleſh: ſo doth any ſalt fiſh if the fleſhie ſide be laid therto; yea, and freſh-water creifiſhes haue the ſame effect: likewiſe the fleſh of the freſh water Silurus (for this fiſh breedeth in other riuers beſides Nilus) applied to the place, either freſh or ſalted it makes no matter, worke with the ſame ſucceſſe. The aſhes of the

E ſame fiſh, and the fat, be of the ſame operation, and very attractiue. As for the aſhes of their ridge-bone, and prickie finnes, they are taken to bee as good as Spodium, and are vſed in ſtead thereof. As touching thoſe vlcers which be corroſiue, as alſo the excreſcence of proud fleſh growing in ſuch ſores, there is not a better thing to repreſſe and keepe them downe, than the aſhes of Cackerels or the fiſh Silurus aforeſaid. The heads of ſalted Perches be ſingular good for cancerous vlcers: and the more effectually they will work, in caſe there be ſalt mingled with their aſhes, and together with knopped Majoram or Sauorie and oile, be incorporat into a liniment. The aſhes of the Sea-crab burnt and calcined with lead, repreſſe cancerous ſores: and for this purpoſe, ſufficient it were to take the aſhes only of the riuer creifiſh, medled with hony and lint: but ſome chuſe rather to mingle alume and hony with the ſaid aſhes. As for the ea-

F ting ſores called in Greeke Phagedænæ, they may be healed well with the fiſh Silurus, kept vntill it be dried, and ſo together with red orpiment, reduced into a pouder. Likewiſe morimals, and other conſuming cankers, and thoſe ſores which be filthy and growing to putrefaction, are commonly healed with the old ſquares of the Tunie fiſh. Now if there chance to be wormes and vermine breed in the ſaid vlcers, the only means to cleanſe them is with the gall of frogs.

* *Sanguinem cieri.*

* *Retinente.*

But the hollow ſores commonly knowne by the name of Fiſtuloes, are enlarged, kept open, yea and brought to drines, with tents made of ſaltfiſh conueied into them within fine linnen rags: and within a day or two at moſt, they will rid away all the calloſitie, together with the dead and putrified fleſh within the ſores, yea and repreſſe the eating and corroſiue humor in them, if they be wrought into the forme of a ſalue or emplaſter, and ſo applied. To mundifie vlcers, there is not a fitter thing than ſtockfiſh made into a tent with fine lint of rags, and ſo put into the ſore. Of the ſame effect are the aſhes of the ſea-vrchins skin. The pieces of the fiſh Coracinus ſalted, diſcuſſe and reſolue the hot apoſtems named carbuncles, if they be applied: ſo doe the aſhes of the Barble ſalted and calcined. Some vſe the aſhes of the head of the ſaid fiſh onely with hony, or els the very fleſh of Coracinus. The aſhes of murrets tempered with oile, delay & take down any ſwelling. The gall likewiſe of the Sea-ſcorpion, taketh off the roufe of ſores, and bringeth skars that ouergrow the fleſh vnto the leuell of the other skin. The liuer of the fiſh Glanus, cauſeth werts to fall off, if they be rubbed withall. Alſo, the aſhes of Cackerell heads do the like, if they be tempered with garlick: but for the thyme werts particularly, they vſe them raw: the gall likewiſe of the reddiſh ſea ſcorpion, and the ſmall ſea fiſh Smarides, punned and brought into a liniment do the like. The groſſe pickle ſauce called Alex, if it be made through hot, cures the raggedneſſe of nails: the aſhes alſo which come of Cackerell heads, do extenuat and make them fine. The fiſh Glauciſcus eaten in the own broth, cauſeth women to haue ſtore of milke: ſo doe the ſmall fiſhes called Smarides, taken with ptiſan or barley gruell; or els boiled with fennell: and in caſe they haue ſore breſts the aſhes of Burrets or Purple ſhells incorporat with honey, doe heale effectually. A liniment made of Sea crabs or freſh-water Creifiſhes, takes away the offenſiue haires that grow about womens nipples or breaſt heads: the fleſhie ſubſtance alſo of the Burrets applied to them, work the ſame effect. A liniment made of the fiſh called a Skate, will not ſuffer womens paps to grow big. A candle-weike or match made of lint, and greaſed al ouer with the oile or fat of a dolphin, and ſo ſet a burning, yeeldeth a ſmoake which will raiſe women againe, lying as it were in a trance and dead vpon a fit of the mother: the ſame do Macquerels putrified in vinegre. The aſhes either of Pearch or Cackerel heads tempered and incorporat with ſalt, ſauerie and oile, ſerue for all the accidents of the matrice, and more particularly in a perfume, bring down the after-birth. Semblably, the fat of a Seale or Sea-calfe, conueighed by meanes of fire in a perfume vp into the noſthrils of a woman lying halfe dead vpon the riſing and ſuffocation of the matrice, bringeth her to her ſelfe againe: ſo doth it alſo, if with the rennet of the ſame Seale, it be put vp in wooll after the manner of a peſſarie, into the priuie parts. The aſhes of the Sea-fiſh called Pulmo, applied conueniently to the region of the matrice, and kept faſt thereto, purgeth women paſſing well of their monethly fleurs: of the ſame operation are Sea-vrchins ſtamped aliue, and drunk in ſome ſweet wine: but the riuer Creifiſhes likewiſe punned and taken in wine, do contrariwiſe ſtay the immoderat flux thereof. Likewiſe it is ſaid, that a ſuffumigation of the fiſh Silurus, eſpecially that which breedeth in Africa, cauſeth women to haue more ſpeedie and eaſie deliuerance in childbirth: as alſo, that Crabfiſhes drinke in water, doe ſtop the exceſſiue ouerflowing of their monethly terms; whereas with *hyſſop they ſet them a going and purge them away. Say that the infant ſticke in the birth, and by reaſon of painfull labour be in danger of ſuffocation, let the mother drinke the ſame in like manner, there will preſent help enſue. Women with child vſe alſo either to eat them freſh, or drink them dried, that they may go out their full time, and not ſlip an abortiue fruit. *Hippocrates* vſeth the ſame, and preſcribeth vnto women for the bringing down of their ſickneſſe, and likewiſe to thruſt out the infant dead in their wombs, to drinke them in honied wine with fiue dock roots, ſtamped together with rue and ſoot: and in very truth, ſodden with ſorrel or docks and parſley, they force womens monthes to come downe ſpeedily, if the broth be drunke; and withall, bring plentie of milke into nurces breaſts. If women haue an ague, and the ſame accompanied with head-ach & much twinkling or inordinat palpitation of the eies, it is thought they ſhall find much good by drinking them in ſome hard and auſtere wine. Caſtoreum taken inwardly in honyed wine, is ſingular to helpe forward womens monethly purgation: the ſame being held to their noſthrils with vinegre and pitch to ſmell vnto; or put vp beneath in manner of a ſuppoſitorie, after it is reduced into the forme of trochiſques, helpeth them when by riſing of the mother they are in danger of ſtrangulation. For to bring away the after-birth, it auaileth much alſo for women to drinke the ſaid Caſtoreum with Panaces in foure cyaths of wine: as alſo it is certaine, that whoſoeuer

*Hyſſope, otherwiſe Oeſype, is the tried greace of vnwaſhed wooll.

20030
copy 1

A ſoeuer take the weight of three Oboli thereof, ſhall auoid the danger that may come to them by extremitie of cold. Moreouer, if a woman great with child chance to goe ouer a place where lieth Caſtoreum, or to ſtep ouer the Beuer it ſelfe (which is the beaſt that beareth it) ſhe ſhal be deliuered before her time; yea ſhe ſhall be in great danger vpon her deliuerance, if the ſame be but born ouer her where ſhe lieth. A wonderfull thing it is that I read of the crampfiſh Torpedo, namely, That if it be taken while the moone is in the ſigne Libra, and be kept for three daies together abroad in the open aire; ſo often afterwards as it is brought into the roume where a woman is in trauell of childbirth, ſhe ſhall haue eaſie and ſpeedie deliuerance. In this buſines alſo it is thought expedient, that the prick which a Puffin or Forkfiſh hath in the taile, be applied and tied faſt to the nauell of a woman; prouided alwaies, that if it be taken forth of
B the fiſh aliue, and then the ſame fiſh be let goe againe and throwne into the ſea. I read in ſome writers of that which they call Oſtracium, to be the ſame that others name Onyx; but call it what you will, a ſuffumigation made thereof, is of wonderfull effect to eaſe the pain and griefe of the matrice. I find, that it hath the ſmell of Caſtoreum, and if it be burnt together therwith in a perfume, the more good will enſue: as alſo that the aſhes thereof calcined, beale all inueterat vlcers, and ſuch as are morimals and ſcorne any ordinary cure. And verily, the ſame authors doe report, that for carbuncles, cancers, and ſuch vntoward ſores, as ariſe ſometimes about the priuities of women, the moſt preſent & aſſured remedy that is to heale them, is the female Sea-crab, ſtamped after the full of the moone with the fineſt powder of ſalt, called the floure thereof, and water together, and ſo reduced into the forme of a ſalue or liniment. The bloud, gall, and liuer
C of the fiſh Tunie, ether taken freſh or old kept, be all of them depilatories, for they fetch away hair and hinder it from growing: the liuer therof punned, and together with the roſin or oile of cedar incorporat and kept in a leaden box, hath the ſame effect. This was the deuiſe that the famous midwife *Salpe* had for boies, to make them beardleſſe and appeare alwaies young, and to ſet them out the better for ſale. Of the ſame operation is the fiſh called Pulmo Marinus, the Sea-hare likewiſe, I meane the bloud and gall of them both: and as for the ſaid Sea-hare, being but ſtifled & killed in oile, it is as effectuall. The aſhes of the Sea-crab and Scolopendre both; the Sea-nettle [a fiſh ſo called] incorporat with vinegre ſquillitick; the brains of the crampfiſh Torpedo tempered with alume, be all depilatories, if the place be anointed therewith the morrow after the moon is at the full. The bloudy moiſture that coms from the little frog, which I
D deſcribed heretofore in the cure belonging to eies, is the ſtrongeſt depilatorie that is, and worketh moſt effectually, in caſe the part be dreſſed therwith while it is freſh and new: and the frog it ſelfe dried and ſtamped, and anon after boiled in three hemins of vinegre till one of them be conſumed; or in oile after the ſame manner in ſome braſen pan, is a ſure medicine to take away haire, and hinder the comming vp of it againe. In the ſame meaſure of liquor, ſome put fifteene frogs, and make thereof an excellent depilatorie; like as I haue ſaid already among the remedies appropriat to the eies. Moreouer, horſleeches torrified in ſome earthen pan, and brought into a liniment with oile, worke the ſame effect in the hairs: the very perfume or ſmoke which they caſt as they be burnt or torrified, killeth Punaiſes, if they either flie or be brought into the aire thereof. Furthermore, diuers haue beene knowne to vſe Caſtoreum and hony in a liniment for
E many daies together, as a notable depilatorie. But in vſing any depilatorie what ſoeuer, this one point is generally to be obſerued, That the haires be firſt pulled vp by the roots, in any place, where they would not haue them to grow.

To come now vnto the gumbs of children, and their breeding of teeth: the aſhes of dolphins teeth mixed with hony, is a ſoueraign medicine: yea, or if you do but touch their gumbs with a dolphins tooth all whole as it is, the effect thereof is admirable: the ſame hanged about their necks, or tied to any part of the body, riddeth them of ſodain frights, wherunto infants are much giuen. Of the ſame effect is the tooth alſo of a dogfiſh. As for the vlcers or ſores incident to their eares, or any other part of their body, the broth of riuer creifiſhes thickned with barly meale, heales them. For other diſeaſes alſo of breaking out, a liniment made of them and oyle
F incorporat together in a mortar, is ſingular good, if they be anointed all ouer therwith. Touching the hot diſtemperatures and inflammations of the head, wherto little babes be much ſubject, a ſpunge actually cold applied to the place, and oftentimes wet, is a good meanes to cure the ſame: but a frog turned inſide outward hath no fellow, if it be bound faſt vnto the head: for they ſay, that it may be found all drie vpon the head with drawing the heat ſo forcibly to it.

A Barble drowned in wine,or the fiſh called a Rochet,or alſo two Eeles; likewiſe the fiſh named the Sea-grape putrified in wine, do infuſe this vertue into the foreſaid wine, That whoſoeuer drinke thereof, ſhall haue no mind afterwards to any wine beſides, but fall into a diſlike and loathing thereof. G

The ſtay-ſhip Echeneis, the skin of a Sea-horſe forehead, eſpecially toward the left ſide, wrapped within a little linnen cloth, and ſo hanged about one; or the gall of a liue Crampe-fiſh, applied vnto the genitall members in manner of a liniment, be all means to coole the wanton luſt of the fleſh: contrariwiſe, the fleſh of riuer Creifiſhes powdred and kept in ſalt, giuen in wine to drinke, do ſtir and prouoke the appetite vnto venerie. Moreouer, to feed vpon the fiſhes called Erythrines ordinarily at the table: to hang about the necke the liuer of the frog called Diopetes or Calamita, within a little piece of a cranes skin; or the jaw tooth of a Crocodile faſtened to any arme; either els the Sea-horſe, or the ſinewes of a Toad, bound to the right arme, incite greatly to wantonneſſe and lecherie. Put a toad within a piece of a ſheeps skin newly flaied, and let one weare it tied faſt about him, he ſhall forget all loue and amitie for euer. H

The broth of froggs boiled in water, do extenuat the ſcuruie thicke rouſe in the farcins or mangè of horſes, and make way that they may be bathed and anointed: and verily it is credibly affirmed, that if they be cured after this manner, the ſcab will neuer returne againe. The expert midwife *Salpe* affirmeth for certain, That doggs will not barke, if there be giuen vnto them in a morcell of bread or gobbet of fleſh, a liue frog.

In this diſcourſe of Water, and the things concerning it, ſomwhat ought to be ſaid as touching Calamochnus, which otherwiſe in Latine is named Adarca: it groweth about ſmall canes or reeds, and is engendred of the froth of ſea water and freſh water together, where they both meet and are intermingled: a cauſticke qualitie it hath; in regard whereof, it entreth into the compoſitions called Acopa, which ſerue for laſſitude, and thoſe that are benummed with cold. It is emploied alſo in taking away the pimples or ſpots in womens faces like to lentils. I

As for Reeds and Canes, this is their very proper place alſo, wherein they ſhould be treated of. And to begin with that reed or cane called Phragmitis, which is ſo good for mounds & hedges; the root thereof greene gathered and punned, is ſingular for diſlocations, and the paine of the backebone, if the place affected be annointed with it, incorporat in vinegre. But the rind of the Cyprian cane, which alſo is named Donax, burnt into aſhes, is ſingular for to recouer haire againe where it was ſhed by occaſion of ſickneſſe, and to heale old vlcers. The leaues alſo ſerue very well to draw forth any ſpills, pricks, or arrow heads that ſticke within the fleſh, yea and to extinguiſh S. *Anthonies* fire. As for the floure or downe of their catkins, if it chance to enter into the eares, it cauſeth deafeneſſe. The blacke liquor reſembling inke, which is found in the cuttle-fiſh, is of that force, that if it be put to the oile of a lamp burning (*Anaxilaus* ſaith) it will drown and put out the former cleare light, and make all thoſe in the room to looke like blackamores or Æthiopians. The hedge frog, otherwiſe called a toad, boiled in water and giuen to ſwine among other draffe to drinke, cureth all their diſeaſes: and of the ſame effect are the aſhes of any other frogs beſides. Rub a piece of wood with the fiſh called Pulmo Marinus, it will ſeem as though it were on a light fire; in ſo much as a ſtaffe ſo rubbed or beſmeared with it, may ſerue in ſtead of a torch to giue light before one. K L

Chap. XI.

¶ *That there be of fiſhes and other creatures liuing in the Sea, one hundred ſeuentie and ſix ſeuerall and diſtinct kinds.*

HAuing thus treated before ſufficiently of the natures and properties of Fiſhes, and ſuch creatures as the water doth yeeld; it remaineth now for a finall concluſion, to preſent vnder one view, all thoſe fiſhes name by name, which are engendred and nouriſhed not only in thoſe mediterranean and inland arms of the ſea, which for many a mile take vp a great part of the continent and firme land, but alſo in that vaſt and wide ocean without the main, bounded as it were limited onely by the compaſſe and circumference of the heauen: and thoſe, namely as many as be knowne, may be reduced all into 176 kinds: a thing which cannot be done either in the beaſts of the land or foules of the aire. For how is it poſſible to decipher & particularize the wild beaſts and foules of India & Æthyopia, of the deſarts, and of Scythia, which we are not M

come

20030
copy 1

A come to the knowledge of, ſeeing we haue found ſo many different ſorts in men, of whom wee haue ſome notice and intelligence? to ſay nothing of Taprobane, and other Iſlands lying within the Ocean, whereof ſo many fabulous reports are deliuered: certes, there is no man but hee muſt needs confeſſe and agree to this, that it was not poſſible in this hiſtorie of Nature to compriſe all ſorts of creatures which the earth & aire do yeeld. Howbeit, thoſe that are bred in the Ocean, as huge and vaſt as it is, may be comprehended vnder a certaine number: a wonderfull matter that we ſhould be better acquainted with thoſe, conſidering how Nature hath plunged and hidden them in the deepe gulfes of the maine ſea!

To begin then with the greateſt monſters and beaſts that this vnruly Element of the water doth breed: we find therin the ſea-Trees, Whirlepooles, greater Whales, Prieſts, Tritons [*i.* ſea
B Trumpetters] Nereides [*i.* Meremaids] Elephants, ſea Men and Women, Wheeles, ſea Tuns or Pipes, [1]Rams, and ſmaller Whales accompanying the bigger. Beſides, other [2]Rams that reſemble the ordinary ſhape of fiſhes; Dolphins, and the ſea Calues or Seales, whereof the Poët *Homer* writeth ſo much. Furthermore, the ſea Tortoiſes, which ſerue for [3]roiot, wantonneſſe, and exceſſe: the Beuers, which are ſo much in requeſt among [4]Phyſicians. As for the Otters, albeit a kind of Beuers they are, yet becauſe I neuer heard that they came into the ſalt water, I make no great reckoning of them; for my purpoſe is to rehearſe thoſe only which inhabit or haunt the ſea: moreouer, the ſea Dogs: the Curriors, Poſts, or Lacquies of the ſea: the horned fiſhes: the Swordfiſh or Emperour of the ſea, and the Sawfiſh. Ouer and beſides, thoſe which liue indifferently in the ſea, the land, & the riuer, to wit, the water Horſes and the Crocodiles: others again
C that ordinarily keepe in the ſea, and yet come vp into the riuers, but neuer land, to wit, the Tunies, as well the growne Thunnies, as the yonger ſort, [5]Thunnides or Pelamides. The Siluri, the blacke Coracini, and Perches. As touching thoſe that neuer came forth of the ſea, the [6]Sturgeon, the Guilthead, the cod, the Acarne, Aphya, Alopecias, the Yeels, and [7]Araneus. The billowing fiſh Box, Batis, Banchus, [8]Barrachus, and Belone, with all the kind of thoſe which wee call Needle fiſhes, and alſo Balanus. The ſea Rauen Corvus, and [9]Cytharus: all the ſorts of the Chrombi: the Carpe, Chalcis, and [10]Cobio: Callarius of the Cods kind, but that it is leſſe: Colias, whether it be Parianus [of Parium the Colony] or Sexitanus, ſo called of a city in Granado or Bætica, a fiſh *reſembling Lizards: of which and of the young Tunie Pelamis (both bred in
D Mœotis) being chopped and cut into pieces & ſo ſalted are made thoſe Quadrants or Squarerands, called Cybia. For this you muſt vnderſtand, that the Tunie is called Pelamis, *when after 40 daies he returneth out of Pontus or the Euxine ſea into Mœotis: wheras the ſaid ſmal Pelamis taketh the name of Cordyla, when it goes firſt forth of the ſaid great lough or lake Mœotis, and enters into the ſea beforenamed. Moreouer, in the ſaid meer Mœotis be theſe fiſhes beſides, to wit, Cantharus, Callionymus, otherwiſe named Vranoſcopus, and Cinædi, which bee the only fiſhes that be all ouer yellow; Cnide, which we in Latin Cal Vrtica, *i.* the Nettle, al the
E ſorts of Crabs, the gaping ſmal Cockles and Muskles, whether they be the rough Chamæ-trachæ, the ſmooth Chamæ-leoi, or the Chamæ-pelorides: which be of diuers kinds diſtinct one from another, both in forme of roundneſſe, and variety of colours: as alſo the Cockles named Chamæ-glycimerides, which be bigger than the former Pelorides, together with thoſe that the Greekes call Colycia or Corophya. Moreouer, ſundry ſorts of other ſhell fiſh, and among them thoſe that engender and beare pearles, and therof be called Mother-pearls. The wilkes alſo and winckles which reſemble ſhel-ſnailes: of which kind are the Pentadactyles, Melicembales, and the prickly Echinophoræ, whoſe ſhels ſerue to ſound or wind withal. Ouer & beſides theſe ſhel fiſhes, are thoſe winkles of a round forme, the ſhels whereof are much vſed to lade vp oyle. Furthermore, the ſea Cucumber and Cynopus, the ſea Craifiſh Cammarus, Cynoſdexia, and the
F ſea Dragon. As for that which is named Dracunculus, ſome are of opinion, That it differeth from the foreſaid Draco, and like it is to the Chough-fiſh Gracculus, ſharpe prickes it hath in the gils, and thoſe pointing toward the taile: like as the ſea Scorpion, which thereby woundeth and hurteth thoſe that would ſeem to take it vp in their hands. There is beſides the Erythinus, the ſtay-ſhip Echeneis, & the ſea Vrchin. The black Elephants alſo, which be the black kind of the Lizards, hauing foure feet, and thoſe clouen & two-forked; beſides two arms with two joints apiece, and each of them armed with a little forked cley, and cloſing in manner of teeth. Then haue you the fiſh called Faber or Zeus, that is, the Goldfiſh or Doree. All the ſorts of Glaucif-
cus, the Glanis, the Gonger, or Conger, the Hearing or Pilchard Gerries, Galeos, and * Garus.

Alſo

[1] So called of the forme of warlick engins of batterie, called in Latin *Arietes.*

[2] And yet haue ſome proportiõ of the land beaſt ſo called.

[3] *Luxuriæ*, haply becauſe the form of a Lute was deuiſed firſt by the ſhel thereof: or ſumptuous buildings either framed archwiſe according to thẽ, or els adorned & ſeeled with their ſhels by Marquetage.

[4] By reaſon of their ſtones, which yeeld Caſtoreum.

[5] Some take *Thunni* for the Milters and *Thunnides* for Spawners.

[6] *Acipenſar.*

[7] A kind of Crab, which ſome call S. Barnards Hermite.

[8] *Diable de mer.*

[9] A kind of Turbot.

[10] A Gougeon.

* *Lacertorum æmulus*, as *Dalechampius* readeth.

*Dalechampius readeth it contrariwiſe, and correcteth the place out of *Ariſtotle.*

* Which ſome take for the Pikerell.

Alſo the coaſt Crabfiſh called Hippeus, or Sea-horſeman Hippuros; the ſea Swallow fiſh, Ha- G
lipleumon, or Pulmo Marinus; the ſea-lights, heart-fiſh, the liuer of the ſea, and Helacathenes.
All the ſorts of the ſea-Lizards: the flying Calamarie: the Locuſts and Lanternes of the ſea, Ly-
paris, Lamyrus, the ſea Hare and ſea Lions, which haue cleies or armes in maner of Crabfiſhes,
but in other reſpects reſembling Locuſts. The Barble, the Merling or Whiting (among ſtone-
fiſhes well eſteemed) and the Mullet: the black taile Perch [which ſome take for a Ruffe, others
for a ſea Breame:] the Cackerell, the Meryx, the Lamprey, the little Muskle, the Limpin, the
* Which are a kind of oyſters Myſcus, and the Burret. The ſeuen-eye Oculata, the Ele-pout Ophidion, the Oiſtre, the * eares
of the ſea called Otia, & Orcynus. This fiſh of the Tunie kind named Pelamides is the biggeſt,
and neuer returneth again into Mœotis, like vnto a Triton; & the meat therof is the better for
age. The Lompe, Paddle, or ſea Owle, and the grunting Molebout: moreouer, the fiſh Phager, the H
Mole or Lepo counted among ſtonefiſhes, and the Pelamis, the greateſt of which kind is called
Apolectus, and harder it is than the Triton, alſo the ſea-god Phorcus, and Phtitharus: the Plaice
or Hallibut, & the Puffin: all the kinds of Pulpes or Pourcuttils. The greateſt Scallops alſo, and
thoſe which during Summer be blackeſt, whereof the beſt ſort be thoſe which are taken about
Mytelenæ, Tyndaris, Salonæ, Altinum, Antium, and the Iſland Pharos neere to Alexandria in
Ægypt. Alſo the little Scallops, the Purples, & the ſea Perches, named Percides: the Nacres and
their hunters, called Pinnotheræ. Ouer and beſides, the fiſh called Skate, which ſome will haue
to be Rhina in Greek, & named by vs in Latine, Squatus, and the birt or Turbot: the Guilthead
Scarus, which at this day is thought to be a principal fiſh: the Sole, the Sargus, the Shrimp, and
the Sarda, for ſo they call the long Pelamis when he coms out of the Ocean. The Maquerel or I
Scomber, the Stockfiſh, the Sparus, Scorpæna, Scorpios, Sciadeus, Sciæna, the Scolopendra,
the ſerpent fiſh Smyrus, the Scepines; the ſhel-fiſh pointed like a Turbant, Strombus: & Solen,
otherwiſe called Aulus, Donax, Onyx, or Dactylus, all ſhell-fiſhes made like kniues: the aſſe-
houſe oyſter Spondilus, and the ſhel-fiſh Smarides, the Star, and the Spunge. Then follow the
noble ſtonefiſh Turdus, and the Thomus Thurianus, ſold in pieces or rands cut forth, which fiſh
ſome call Xiphia, or the Sword-fiſh. The Theſſa, Torpedo or Crampfiſh, and Tethea. Triton al-
ſo, which is reckoned among the greater kind of the Pelamides, whereof are made thoſe ſquare
taile-pieces of the Tunie, called Vræa Cybia. Laſt of all, the Vrenæ, the ſea Grape or the Empe-
rour with a ſword, called Xiphias. And here I thinke it not amiſſe to annex the names of diuerſe
fiſhes ſet downe by the Poët *Ouid*, which are not to be found in any other Authour: But haply K
thoſe breed in the great ſea of Pontus, in which realme he began that booke *De Ponto*, in his la-
* Some read *Bos-piger.* ter daies. In the firſt place he nameth * Bopgyrus, which liueth among the rockes: the red Or-
phus, and the blacke Rhacinus, the painted and ſtreaked Mormyræ, and the golden coloured
Chryſos. Moreouer, the little Teragus, and Labrus with the faire & pleaſant taile. Likewiſe the
Epodes, which are of the broad or flat kind, named Lati. All theſe be notable fiſhes: but ouer
and beſides, he reports the ſpeciall properties and nature of ſome: as namely that the Chaune
doth conceiue of it ſelfe without a mile: that the Glaucus neuer is to be ſeene in Summer: that
Pompilus alwaies accompanieth the ſhips vnder ſaile: and Chronius buildeth a neaſt in the
very water. He ſaith moreouer, That Helops is a ſtranger to vs in this part of the world, and
not known in our ſeas: whereby it is euident that they be deceiued who take it for the Sturgeon L
Acipenſer; and yet many reckon this Elops to haue the daintieſt taſt, and to be the moſt delicat
meat of all fiſhes. There are ouer and beſides other fiſhes, named as yet by no writer, to wit,
that which in Latine wee call Sudis, the Greekes Sphyræna, which (as it ſhould ſeeme by the
name) hath a ſnout or muffle reſembling a ſharpe ſtake or ſpit, and may for quantitie be coun-
ted among the biggeſt: a rare fiſh, but of no baſe and baſtard kind. There be alſo of the Nacres
thoſe which are called Pernæ, taken and gathered in exceeding great plenty about the Iſlands
of Pontus: their manner is to ſtand or ſticke faſt planted vpon the ſea ſand, and made they are
in faſhion of the long ſhanke of a ſwine; they gape alwaies toward the coaſt which is cleare;
and neuer doe they hunt for their food, but they yawne at leaſt a foot wide. Teeth there bee
growing round about the edges of a ſhell, and thoſe ſtand thicke together, and when they M
ſhut or cloſe their ſhels, the foreſaid teeth run one betweene another in manner of a combe. In
ſtead of a calloſitie within, they haue a great lumpe of fleſh. As for the fiſh Hyæna, I my ſelfe
haue ſeen one of them taken in the Iſland Ænaria, which vſed to put forth and draw in his head
at his pleaſure.

Thus

20030
copy 1

A Thus much of Fiſhes worth the naming. For beſides theſe, I am not ignorant that there be other baſe excrements that the ſea voideth and purgeth, which I hold to be very vnfit and not worthy to be ranged among Fiſhes and liuing creatures, but rather to be reckoned as Kilpes, Reike, and other ſea weeds.

B

THE XXXIII. BOOKE OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIVS SECVNDVS.

C

Of Mettals and Minerals, and their natures.

The Proem.

D K *NOw is it time to enter into the diſcourſe of the Mettals and Minerals, the very riches and precious treaſure of the World, which men ſo curiouſly and carefully ſeeke after, as that they ſticke not to ſearch into the very bowels of the earth by all the meanes they can deuiſe: for ſome you ſhall haue (to enrich themſelues) for to dig into the ground for mines of gold and ſiluer, baſe mettall Electrum, Copper and Braſſe: others againe vpon a deſire of daintie delights and brauerie, to lay for gems and precious ſtones, for ſuch Minerals (I ſay) which may ſerue partly to adorne their fingers, and partly to ſet out the walls of ſumptuous buildings with coſtly colours, rich marble, and porphyries. Laſtly, there bee many, who maintaine raſh quarrels and audacious attempts, ſpare for no labour to get yron and ſteele, and eſteeming it better than gold, for cruell warres and bloudie murthers. In ſumme there is not a vaine in the whole earth but wee prie and ſearch into it: we follow it alſo ſo farre as it goeth. Thus hauing vndermined the poore ground, wee liue and goe aloft vpon it, as ouer hollow vaults and arches vnder our feet: and yet we would ſeeme to wonder, that otherwhiles ſhe cleaueth aſunder into wide and gaping chinkes, or elſe trembleth and quaketh againe: and wee* E L *will not ſee how theſe be apparant ſignes of the wrath of this our bleſſed mother, which we bring and force from her, to expreſſe the indignation that ſhe taketh for this wrong and miſuſage. We deſcend into her entrailes: we goe downe as far as to the ſeat and habitation of the infernall ſpirits, and all to meet with rich treaſure: as if the earth were not fruitfull ynough and beneficiall vnto vs in the vpper part thereof, where ſhe permitteth vs to walke and tread vpon her. Howbeit, in all this paines that wee take to ranſacke the mines therof, the leaſt matter of all other is to ſeeke for any thing that concerneth Phyſick and the regiment of our health: For among ſo many maſters as there be of mines, where is there one that would be at ſuch expence of digging, in regard of any medicines. And yet I muſt needs ſay, that as the earth otherwiſe is no niggard, but bounteous and liberall, readie alſo and eaſily entreated to bring forth all things good and profitable for vs: ſo in this behalfe ſhe hath furniſhed vs ſufficiently with wholeſome drougs and medici-* F M *nable ſimples growing aboue and fit for our hand, without need of digging deepe for the matter. But the things that ſhee hath hidden and plunged (as it were) into the bottome, thoſe be they that preſſe vs downe, thoſe driue and ſend vs to the diuell in hell: euen thoſe dead creatures (I ſay) which haue no life nor doe grow at all. In ſuch ſort, as to conſider the thing aright, and not to captivat our ſpirits to ſuch baſe matters, How farre think we, will couetous minded men pierce and enter into earth? or when will they make*

an end of these mines, hollowing the ground as they doe in all ages from time to time, and making it void G
and emptie? Oh how innocent a life, how happy and blessed, nay, how pleasant a life might we lead, if we
coueted nothing else but that which is aboue the ground: and in one word, if we stood contented with that
which is ready at hand and euen about vs. But now, not sufficed with the gold which we fetch out of the
* Chrysocolla, i. Gold-soder. *mines, we must seeke for the greene earth Borras also, which lieth hard by, yea, and giue it a name respective*
vnto gold, whereby it might be thought more deare and pretious. For why? we thought not the inuention
and finding out of gold alone to be enough for to infect and corrupt our hearts, vnlesse we made great ac-
count also of that vile and base minerall, which is the very ordure of gold and no better. Men vpon a co-
uetous mind would needs seeke for siluer, and not satisfied therwith, thought good withall to find out Mine-
rall vermilion, deuising meanes how to vse that kind of red earth. Oh the monstrous inuentions of mans
wit! What a number of waies haue we found to enhaunce the price and value of euery thing! for painters H
of the one side with their artificiall painting and enameling: the grauers on the other side with their cu-
rious cutting and chasing, haue made both gold and siluer the dearer by their workemanship: such is the
audacitie of man, that hee hath learned to counterfeit Nature, yea, and is so bold as to challenge her in her
workes. And wherein is the art and cunning of these artificers so much seene, as in the workemanship
of such pourtraitures vpon their gold and siluer plate, which might incite and prouoke men to all kind of vi-
ces: for in processe of time we tooke pleasure to haue our drinking boles and goblets engrauen all ouer with
those workes which represent lust and wantonnesse: and our delight was to drinke out of such beastly cups
which might put vs in mind of sinfull and filthy lecherie: but afterwards these cups also were cast aside
and laid away, men began to make but base account of them; gold and siluer was so plentifull and common,
that we had too much thereof. What did we then: Forsooth we digged into the same earth for Cassidonie I
and Crystall, and we loued to haue our cups and other vessels of such brittle minerals; and the more preci-
ous we held them, as they were more subiect to breaking: so as now adaies hee is thought to haue his house
most richly furnished, who hath his cupbourds best stored with this tickliſh ware: and the most glorious
shew that we can make of excesse and superfluitie, is this, To haue that which the least knocke may breake,
and being once broken, the pieces thereof might be worth nothing. Neither is this all, for stay we cannot
here, we are not yet at cost enough, vnlesse we may drinke out of a deale of precious stones. Our cups other-
wise chased, engraued, and embossed in gold, must be set out with hemeraulds besides: to maintaine drun-
kennesse, to make a quarrell to caronse and quaffe, we must hold in our hand and set to our mouth the riches
of India. So as, to conclude, our golden plate comes behind pretious stones and pearles, and we count it but
an accessarie and dependant, which may be spared. K

Chap. I.

¶ When mines of gold grew first into request. The beginning of gold rings. The quantitie of gold in treasure among our ancestors in old time. Of the Cavallerie and Gentrie of the Romanes. The priuiledge of wearing golden Rings.

OH that the vse of gold were cleane gone: Would God it could possibly be quite abolished among men, setting them as it doth into such a cursed and excessiue thirst after it, if I may vse the words of most renowmed writers: a thing that the best men haue alwaies reproched and railed at, and the onely meanes found out for the ruine and ouerthrow of mankinde. What a blessed world was that, and much more happier than this wherein wee liue, at what time as in all the dealings betweene men, there was no coine handled, but their whole trafficke stood vpon bartering and exchanging ware for ware, and one commoditie for another; according as the practise was in the time of the Trojane war, as *Homer* (a writer of good credit) doth testifie. And in that manner (as I take it) began first the commerce of negotiation among men for the maintenance of their society and liuing together: for so he reporteth, That some bought that which they stood in need of, for Bœufes hides, others, for yron or such commodities as they had gotten in bootie from their enemies. And yet I must needs say, that euen *Homer* himself esteemed gold of great price, as may appeare by the æstimat that he made thereof in comparison of brasse, when he saith, That *Glaucus* exchanged his golden armour, worth 100 * oxen, for the [brasen] harneis of *Diomedes*, which

L

M

* It is thought that hereby are meant certaine pieces of siluer coine, stamped with the portraiture of a bull or ox, called *Didrachma* & were worth two drams or diniers Romã.

χρύσεα χαλκείων, ἑκατόμβοια ἐννεαβοίων.

20030
copy 1

A which was valued but at nine Bœufs: according to which manner practiſed in thoſe daies, euen at Rome alſo (as may appeare by the old records) there were no other penalties and fines impoſed vpon thoſe that tranſgreſſed the lawes, but ſuch as conſiſted in Bœufes and Muttons, and vnder that name paſſed all the amercements that were leuied. Well, a bad example and preſident gaue he vnto the world, who firſt deuiſed to weare rings vpon the fingers: but who he was that did this harm vnto mankind, it appeareth not for certaine vpon any record. For as touching the reports that go of *Prometheus*, I hold them all but fabulous tales: and yet in all the antient pictures and portraitures of him, he is to be ſeen by a generall conſent of antiquity, with a ring of yron: howbeit, I ſuppoſe that they repreſented thereby his bonds and his impriſonment, rather than any cuſtome that he had to weare a ring as an ornament vpon his finger. And verily

B concerning the ring of K. * *Midas*, which if the collet were turned about toward the palm of the hand, cauſed them to go inuiſible that ſo wore it: is there any man (thinke you) that judgeth it not more fabulous than the other of *Prometheus*? But to come more particularly vnto gold, the greateſt credit and authority that it got, was by wearing it in rings vpon the fingers, and thoſe only and altogether vpon the left hand. And yet this was no faſhion at firſt among the Romans, whoſe manner was to vſe no other but of yron, to ſhew that they were good ſouldiers, skilfull and expert in feats of arms. Whether the antient kings of Rome were wont to haue gold rings vpon their fingers, I am not able to ſay for certaine. Sure it is, that the ſtatue of king *Romulus* in the Capitoll hath none. Neither is there any to be ſeen in the other ſtatues of the Roman kings, ſaue only of *Numa*, and *Servius Tullius*; no nor in that of *Lucius Brutus*: Whereat I maruel much,

C and eſpecially at the two *Tarquines* kings of Rome, conſidering that they were deſcended of the Greeks, from whence came vp the firſt vſage of theſe gold rings, how ſoeuer yet at this day in Lacedæmon there be none worne but of yron. Howbeit, this is recorded and known for a truth, That *Tarquinius Priſcus*, the firſt of all the *Tarquins*, honoured a ſonne of his with a brooch or tablet of gold pendant at his neck, for that whiles he was vnder 16 yeares of age, and as yet in his Prætexta, hee had killed an enemy in plain fight. And thereupon was taken vp the manner firſt, (which alſo continued afterward) to hang that *ornament about the necks of thoſe gentlemens

D ſonnes who were men at armes and ſerued in the wars on horſe-backe, in token of knighthood and cheualrie: whereas other mens ſonnes ware a riband onely. And therefore great maruell I haue at the ſtatue of the ſaid prince king *Tarquine*, ſurnamed *Priſcus*, that it ſhould be without a ring on his finger. And yet beſides all this, I reade, that there hath been ſome variance and difference in old time about the naming of rings: The Greekes impoſed a name deriued from the finger, and called it Dactylios. The Latines here with vs in old time named it Vngulus: but afterwards, as well we as the Greeks termed it Symbolum. Certes, long it was firſt (as appeareth evidently by the Chronicles) ere the very Senators of Rome had rings of gold. For plaine it is, that the State allowed and gaue rings only to certain eſpecial lieutenants when they were to go in embaſſage to forrein nations: and in mine opinion, it was for their credit and countenance, for that the moſt honorable perſonages in ſtrange countries were diſtinguiſht from others by that ornament. And verily, no perſon (of what degree ſoeuer) was wont to weare rings, but ſuch as had receiued them firſt from the common-wealth vpon that occaſion: & ſo it ſerued them or-

E dinarily in triumph, as a token and teſtimoniall of their vertue and valour. For otherwiſe, he that triumphed in Rome, although there was a Tuſcan coronet al decked with ſpangles of gold, born vp behind and held ouer his head, had no better than a ring of yron vpon his finger, no more than the ſlaue at his back, who haply carried the ſaid Tuſcan chaplet. For certainly in that maner triumphed *C. Marius* ouer K. *Iugurtha*: aud as the Cronicles do ſhew, receiued not a golden ring, nor tooke vpon him to weare it before his third Conſulſhip. And euen thoſe alſo who from the State had golden rings giuen them, in regard of embaſſage aforeſaid, I neuer vſed them but when they came abroad into open place, for within dores they might ware none but of yron: which is the reaſon, that euen at this day the wedding ring which the bridegroom ſendeth as a token *of eſpouſals to his bride, is of yron ſimply without * any ſtone ſet in it. Neither, ſo farre as I can

F finde by reading, were there any golden rings in vſe and requeſt about the time of the Trojane war: for ſure I am, that the Poet *Homer* maketh no mention of them at all, who otherwiſe ſpeaketh of the brauery and rich attire of thoſe times. And when he talketh of writing tablets, ſent ordinarily in ſtead of letters miſſiue; when he writeth of cloths and apparels beſtowed in chiſts and coffers; when he telleth vs of veſſels, as well gold as ſiluer plate; he ſaith they were all bound and

*Gyges rather, as appeareth by *Plato*, and *Cicero*.

*Called *Bulla*, which was in forme of the heart: & after they were growne to bee men, *i.* at 17 yeares of age they offered it vp to the Lares: like as yong maidens mariageable preſented *Venus* with yong babies of clouts ſuch as they were wont to make and play withall, as being now deſirous to haue babes indeed of their owne bodies. *Alex. ab Alex. lib. 2 cap. 25. & lib. 6 cap. 18.*

*It was called *Pronubus Annulus*.

and truſſed faſt with ſome ſure knot,and not ſealed vp with any mark of a ring as the order is in G
theſe daies. Moreouer,when he reporteth of any challenge made by the enemy to ſingle fight,
and ſheweth how the captains fel to caſt their ſeuerall lots for the choiſe of them which ſhould
performe the combat,this was neuer done by the ſignet of rings, but by ſome other eſpeciall
marks that euery one made. Alſo,when he taketh occaſion to ſpeak of the workmanſhip of the
*As of *Vulcan* gods,he rehearſeth buckles,claſps,and buttons of gold,other jewels and ornaments alſo belon-
ging to the attire of women,as eare-rings and ſuch like of their making,which at the beginning
were commonly made,but he ſpeaketh not one word of golden rings. And verily in my conceit
whoſoeuer began firſt to weare theſe rings,did it couertly by little and little,putting them vpon
the fingers of the left hand,the better to hide them,as if they were aſhamed to haue them open-
ly ſeene: whereas if they might haue auowed the honouring of their fingers by that ornament, H
they ſhould haue ſhewed them at the firſt vpon the right hand. Now if any man obiect and ſay,
that the wearing them on the right hand might be ſome impeachment to a ſoldier for vſing his
offenſiue weapon which he beareth in that hand; I alledge again,that the hinderance was more
in the left hand,which ſerueth to hold and manage the targuet or buckler defenſiue. I reade in
the ſame Poet *Homer* aforeſaid,that men vſed to plait & bind vp the treſſes of their haire with
gold:and therefore I wot not well whether men or women firſt began the manner of ſuch brai-
ding the locks of the haire.

As touching gold laid vp for treaſure,little was there of it at Rome for a long time;for ſure-
ly,when the city was taken & ſacked by the Gauls,and that the Romans were to buy & redeem
their peace for a ſum of mony,there could not be made in all Rome aboue one thouſand pound I
weight of gold. Neither am I ignorant,that in the third Conſulſhip of *Cn. Pompeius* there was
embezeled and ſtolne 2000 pound weight of gold out of the throne or ſhrine of *Iupiter* within
*By *M.Craſſus* the Capitoll,which had bin there beſtowed and laid vp by **Camillus* : whereupon many men
haue thought,that there was 2000 pound weight of gold gathered for the ranſome of the city.
But ſurely looke what ouerplus and ſurcreaſe there was aboue the foreſaid weight of one thou-
ſand pound,it was of the very booty and pillage of the French,and taken out of the temples and
chappels in that part of the city whereof they were maſters. Moreouer, that the Gaules them-
ſelues were wont to goe to the wars brauely ſet out and inriched with gold,it appeareth by this
one example of *Torquatus*,who ſlew a Gaule in combat , and tooke from him a maſſie collar of
gold. Apparant it is therefore,that all the gold,as well that of the Gaules, as that which came K
from the temples aboueſaid,amounted to the ſaid ſum,and no higher : to the light and know-
ledge whereof we come by meanes of reuelation from Augurie, which gaue vs to vnderſtand,
that *Iupiter Capitolinus* had rendered againe the foreſaid ſum in duple proportions. And here by
the way there commeth to my remembrance another thing,not impertinent to this place: con-
ſidering I am to treat againe of rings: when the ſexton or keeper of this cell was apprehended,
and the queſtion demanded,What was become of the treaſure aforeſaid of 2000 pound which
Iupiter had in cuſtody, and which now was out of the way and gone? Hee tooke the ſtone that
was in the collar of his ring which he ware,crackt it between his teeth,and preſently dyed ther-
upon: wherby the truth was not bewraied and reuealed,as touching the theefe that robbed the
ſaid treaſure. Wel,reckon the moſt that can be,ſurely there was not aboue 2000 pound weight L
of gold to be had in Rome,when the city was loſt;which was in the 364 yere after the firſt foun-
dation therof,at what time(as appeareth by the rols of the Subſidie booke)there were in Rome
to the number of 152580 free citizens. And what was 2000 pound in proportion to ſuch a mul-
titude of people. Three hundred and ſeuen yeres after,when the temple of the Capitoll was on
fire,all the gold to be found therein,as alſo in al the other chappels and ſhrines aroſe to thirteen
thouſand pound weight,which *C.Marius* the yonger ſeized vpon and conueied away to the city
Prænеſte. And all the ſame was recouered againe and brought backe againe by *Sylla* his enemy,
who vnder that title carried it in triumph,beſides ſeuen thouſand pound weight of ſiluer,which
he raiſed out of the ſpoile of *Marius*. And yet neuertheleſſe, the day before hee had cauſed to
be carried in a pompe of triumph fifteene thouſand pound weight of gold,and one hundred and M
fifteene thouſand pound of ſiluer, which came of the reſt of the pillage gotten by that victorie
of his.

But to returne againe vnto our diſcourſe of gold rings:I doe not read that they were ordina-
rily vſed,before the daies of *Cn.Flavius* the ſonne of *Annius*: This *Flavius* beeing otherwiſe a
man

20030
copy 1

A man of mean and baſe parentage, as whoſe grandſire by the fathers ſide had bin no better than a
ſlaue infranchiſed: howbeit hauing a pregnant wit of his own, & brought vp daily vnder a good
ſchoolmaſter *Appius Claudius* ſirnamed the Blind (whom he ſerued as his Scribe, Clerke, or Se-
cretarie) he grew into inward credit and fauor with his maſter, that for his better aduancement
he opened vnto him the whole courſe of dayes pleadable and not pleadable, exhorting and per-
ſuading him withal, to publiſh that ſecret and myſterie to the view & knowledge of the whole
city: which the ſaid *Flauius* (after much conference and conſultation had with *Appius*) did, and
effected accordingly; wherupon he became ſo gratious with the whole body of the people (who
were alwaies before wont to hang euery day vpon the lips of ſome few of the chief & principal
Senators, for to haue the information and knowledge of the ſaid daies) that in the end a bil pro-
B mulged by him, paſſed by generall aſſent of them all, for to be created Ædile Curule together
Q. Annicius of Prænеſte (who not many years before had bin a profeſſed enemy, and born armes
againſt the Romanes) without any regard had in this election, either of *C. Petilius*, or *Domitius*,
who were nobly born, & had two Conſſ. to their fathers, who notwithſtanding ſtood for the ſaid
dignitie and honorable place. Nay more, This *Flauius* had a ſpeciall grace beſides granted, To
be at the ſame time one of the Tribunes alſo or Prouoſts of the Comminaltie. At which indig-
nitie the Senat took ſuch diſdaine, and chafed ſo for deſpight and anger, that as we reade in the
antient Annals and Chronicles of our city, there was not one Senator of them all but laid away
his golden rings and gaue vp his place. Many are of opinion (although they be farre deceiued)
that the knights and men of arms alſo did the ſemblable, and left off their rings the ſame time.
C And this likewiſe goeth currant and is generally receiued, That they caſt aſide the capariſons
and trappings of their bard horſes; for theſe be the two badges or markes which cauſe them to
be called Equites, as one would ſay, knights, men of arms, or horſmen. True it is beſides, that in
ſome annals we find it recorded, that it was the nobility only of Rome that gaue ouer their gold
rings, and not generally the whole body of the Senat. Wel, howſoeuer it was, this hapned when
P. Sempronius Longus and *L. Sulpitius* were Conſuls. But *Flauius* aboueſaid, ſeeing what trouble
and diſcontentment was riſen hereupon throughout the city, vowed to erect and build a temple
in the honor of *Concord*, if he could reconcile the eſtate of the Senat, and the order of the gentle-
men again to the common people. And ſeeing that he could not be furniſhed with mony out of
the common treaſure of the city, for defraying of charges requiſit to this piece of work, he made
D means to haue certaine extreme vſurers condemned to pay good round ſums of mony: & with
theſe fines a little chappell he cauſed to be made all of braſſe, and reared it in the place appoin-
ted for Embaſſadors out of ſtrange countries to wait and giue attendance in, called Græco-
ſtaſis, the which was at the head of the publique grand place or hal of aſſemblies called Comi-
tium: where in a table of braſſe he tooke order there ſhould be cut and engrauen the veritie of
the dedication of the ſaid temple, which was 104 yeres after the temple in the Capitol was de-
dicated, and in the 448 yere from the foundation of the city. This is the firſt and moſt antient
euidence that may be collected out of all the antiquities of Rome now extant, as touching the
vſage and wearing of Rings. Another teſtimonie we haue thereof in the ſecond Punicke War:
which implieth, that rings in thoſe daies were vſed more ordinarily, as wel by commons, as gen-
E tlemen and Nobles: for otherwiſe, if they had not bin ſo vſually worn as wel by one as another,
Annibal could neuer haue ſent to Carthage thoſe three Modij of rings, which were pluckt from
the fingers of thoſe Romans who were ſlain in the battell of Cannæ. Moreouer, the Chronicles
beare witneſſe, that the great quarrell betweene *Cæpio* and *Druſus* (from which aroſe the ſociall
war of the Marſians, and the ruin of the ſtate) grew by occaſion of a ring ſold in port ſale, which
both of them would haue had, the one as well as the other. Neither at that time verily did all
Senators weare gold rings; for known it hath bin within the remembrance of our grandfathers,
that many of them (and ſuch as beare the Pretorſhip) in their old age, and to their very dying
day, neuer wore any other rings but of iron. The ſame doth *Feneſtella* report of *Calphurnius*; and
of *Manilius* alſo, who was Lieutenant vnder *Caius Marius* in the war againſt King *Iugurtha*. And
F many other hiſtorians affirme the like of *L. Fuſidius*, him I meane vnto whome *Scaurus* dedica-
ted that Booke which he compiled of his Life. There is a whole houſe or family at Rome of
Quintij, wherein (by antient cuſtome and order) there was neuer any known, ſo much as the very
women, to weare any gold about them. And euen at this day, the greater part of thoſe nations
and people who liue vnder the empire of Rome, know not what theſe rings meah. All the coun-

tries of the Eaſt throughout, and Egypt generally, at this time content themſelues with ſimple writings and bare ſcripts, without any ſeale or ſigne manuel ſet vnto them. But ſo far off are we in theſe daies from keeping vs to the plain hoop rings of our anceſtors, that as in all things els, ſo in them alſo we loue to change and alter euery day, ſo giuen we are to exceſſe and ſuperfluitie: for now, many muſt haue curiouſly ſet in their rings, pretions ſtones of excellent beautie and moſt exquiſit brightneſſe; and vnleſſe their fingers be charged and loden again with the riches and reuenues of a good lordſhip, they are not adorned and decked to their mind. But I purpoſe more fully to ſpeake hereof in my treatiſe of gems and pretious ſtones. Others again wil haue in their rings and ſtones ſundry figures and portraitures as they liſt themſelues engrauen, that as there be ſome rings coſtly for the matter, ſo others again ſhould be as pretious for the workmanſhip. Yee ſhall haue many of theſe wantons and delicate perſons make conſcience (forſooth) to cut and engraue ſome of their pretious ſtones, for hurting them; and (to ſhew that their rings ſerue for ſomewhat elſe than to ſeale and ſigne withall) doe ſet the ſaid ſtones whole and entire as they be. And diuers there are who will not encloſe the ſtone with gold on the inſide of the colet which is hidden with the finger, to the end (forſooth) that it may touch the naked skin and be ſeene through. And ſuch an opinion they haue of theſe ſtones, that gold is worth nothing in compariſon of many thouſands of them now in vſe and requeſt. Contrariwiſe, many there are who will haue no ſtone at all in their rings, but make them all of maſſiue gold, and therewith do ſeale: a deuiſe that came vp in the time of *Claudius Cæſar* the Emperor. Furthermore, in theſe our daies ſome ſlaues ſet iron within a collet of gold, in ſtead of a ſtone; and others again hauing their rings of iron, yet they adorn and ſet them out with the moſt pure and fine gold that may be had. This licence (no doubt) and libertie of wearing rings in this order, began firſt in Samothrace, as may appeare by the name of ſuch rings, which therefore are called Samothracia. Now to come again to our golden rings: The manner was in old time to weare rings but vpon one finger onely, and namely that which is the fourth or next to the little finger, as we may ſee in the ſtatues of *Numa* and *Servius Tullius*, Kings of Rome: but afterward they began to honour the fore-finger which is next vnto the thumbe, with a ring, according to the manner which we ſee in the images of the gods: and in proceſſe of time they took pleaſure to weare them vpon the leaſt finger of all: and it is ſaid, that in France and Brittaine they vſed them vpon the middle finger. But this finger now adayes is excepted onely and ſpared, whereas all the reſt be ſped and charged with them; yea and euery joint by themſelues muſt haue ſome leſſer rings and gemmals to fit them. Some will haue the little finger loden with 3 rings; others content themſelues with one and no more vpon it, wherewith they vſe to ſeale vp the ſignet that is to ſigne ordinarily; for this ſigne manuel (I may tell you) the manner was to lay vp ſafe among other rare and pretious things: this might not come abroad euerie day, as beeing a jewell that deſerued not to be miſuſed by handling commonly, but to be taken forth out of the cabinet or ſecret cloſet neuer but when need required: ſo that whoſoeuer weareth one ring and no more vpon the leaſt finger, hee giueth the world to vnderſtand, that he hath a ſecret cabinet at home ſtored with ſome ſpeciall things more coſtly and pretious than ordinarie. Now, as ſome there bee that take a pride and pleaſure to haue heauy rings vpon their fingers, and to make a ſhew how maſſiue and weighty they are; ſo others againe are ſo fine and delicat, as they thinke it a paine to weare more than one. Some hold it good, for ſauing of the ſtone or collet (if the Ring ſhould chance to fall) to haue the round hoope or compaſſe thereof wrought hollow or enchaſed within, yea and the ſame filled vp with ſome lighter matter than is gold, that it may fall the ſofter. You ſhall haue many that vſe to carry poyſon hidden within the collet vnder the ſtone, like as *Demoſthenes* did, that renowned Prince of Greeke Orators; ſo as their rings ſerue for no other vſe or purpoſe but to carry their owne death about them. Finally, the greateſt miſchiefes that are practiſed by our mighty men in theſe dayes, are for the moſt part performed by the meanes of rings and ſignets. O the innocence of the old world! what a heauenly life led men in thoſe dayes, when as there was no vſe at all of ſeale and ſignet? But now we are faine to ſeale vp our ambries and hogſheads with our ſignets, for feare we be robbed and beguiled of our meat and drinke. This is the good that commeth of our legions and troupes of ſlaues, which we muſt haue waiting and following at our heeles: this commoditie we haue by our traine and retinue of ſtrangers that wee keepe in our houſes: inſomuch as wee are driuen to haue our Controllers and *Remembrancers to tell vs the names of our Seruants and people

*Nomẽclatores.

20030
copy 1

people about vs, they are ſo many. It was otherwiſe ywis by our anceſtors and fore-fathers daies, who had no more but one yeoman or groome apiece, and thoſe of the linage and name of their Lords and Maſters: as may appeare by the ordinary names of * *Marci-pores*, and *Luci-pores*: and theſe had all their victuals and diet ordinarily at their maſters bourd. And therefore there was no great need to keep ſafely any thing vnder lock and key from ſuch houſhold ſeruitors: whereas now adayes the cater goeth to the market to prouide cates and viands for to be ſtollen and carried away as ſoon as they come home, and no remedy there is againſt it: for no ſeale will ſerue to make ſure either ſuch lurchers themſelues for filching, or keep the very locks and keies ſafe and whole that lead to the prouiſion. And why? an eaſie matter it is to plucke the rings from their lord and maiſters fingers that are oppreſſed with dead ſleep, or when they lie a dying. And verily we hold in theſe daies a ſeale to be the beſt aſſurance in contracts that may be: but I wot not how long it is ſince that cuſtom firſt came vp. And yet if we conſider the faſhions and manners of ſtrange Nations, we may peraduenture find how theſe ſignets came into ſuch credit and authoritie: and namely by the Hiſtory of *Polycrates* the Tyrant or King of the Iſle Samos: who hauing caſt into the ſea a ring which he loued and eſteemed aboue all other jewels, met with the ſame againe by meanes of a fiſh which was taken, in the belly whereof the ſaid ring was found. Now this king was put to death, about the two hundred and thirtieth yeare after the foundation of our citie. Howbeit, the ordinarie vſe of theſe ſignets (as I ſuppoſe by all reaſon and likelihood) began together with vſurie: for proofe whereof, marke how ſtill at this day, vpon any ſtipulation and bargaine paroll made, off goes the ring preſently to confirme and ſeale the ſame. The which cuſtome no doubt came from old time, when there was no earneſt nor gods-pennie more ready at hand than a ſignet. So as we may conclude aſſuredly and affirme, That amongſt vs here at Rome, when the vſe of money and coyne was taken vp, ſoone after came the wearing of rings in place. But as touching the deuiſe and inuention of mony, I will write anone more at large.

* i, the pages or groomes of *Marcus* or *Lucius*.

And now to return againe to my diſcourſe of rings: after they began once to bee in any requeſt, there were none at Rome vnder the degree of a knight or gentleman that carried rings on their fingers; inſomuch, as a man might know a gentleman from a commoner by his ring, like as a Senator was diſtinguiſht from the Gentlemen, wearing rings, by his coat embroidered with broad gards and ſtuds of purple. Howbeit, long it was before this diſtinction was obſerued: for I find that the publicke criers wore ordinarily ſuch coats likewiſe embroidered, as Senators do: as appeareth by the father of *L. Ælius Stilo*, ſyrnamed vpon that occaſion *Præconimus*, becauſe his father had bin a publicke Crier. Certes, theſe rings certified the middle degree, inſerted between the Commons and the Nobles: and that name which in times paſt horſes of ſeruice gaue to men of armes and * gentlemen of Rome; the ſame now adaies ſheweth men of worth, and thoſe who are of ſuch and ſuch reuenues. But long it is not ſince this diſorder and confuſion begun. For when as *Auguſtus Cæſar* late Emperour of happy memory, ordained decuries of Iudges in criminal matters, the greater part of them conſiſted of thoſe who wore no other rings but of yron: and thoſe were ſimply called Iudges, and not Knights or Men of armes: for this name continued ſtill appropriat to the troups of thoſe gentlemen, who ſerued vpon horſes allowed by the Senat. Moreouer, at the firſt there were no more but foure decuries of Iudges, and hardly might there be found in each of thoſe decuries, a bare thouſand: for as yet thoſe of our prouinces might not be admitted to this eſtate to ſit and judge vpon criminall cauſes: and euen at this day preciſely obſerued it hath bin, That none but antient citizens might be Iudges: for neuer any that came newly to their free burgeoiſie, were taken into this order and degree.

* Who therupon were called *Equites*.

Chap. II.

¶ *Of the Decuries or Chamber of Iudges vpon record at Rome. How often the name and title of the Romane Cavallerie changed. The gifts and rewards repreſented vnto valiant ſouldiers for their braue ſeruice. And at what time Coronets of gold were ſeene.*

THe chamber of the foreſaid judges conſiſted of diuers eſtates and degrees, diſtinguiſhed all by ſeuerall names: for firſt and foremoſt, there were of them called Tribuni æris, as it were

Generall receiuers or Treaſurers: ſecondly, Selecti, choſen from among the Senators: and laſt of all, thoſe who ſimply were named Iudices or Iudges, taken from among the knights or men of armes. Ouer and beſides theſe, they had others called Nongenti, choice men ſelected from out of all the eſtates, who had the keeping of thoſe chiſts or caskets wherin were put the voices of the people in their ſolemn elections. And by reaſon of a proud humor in men, chuſing themſelues names to their owne liking, great diuiſions and factions aroſe in this houſe and chamber of the foreſaid Iudges; whiles one would needs be called Nongentus; another Selectus, and a third gloried in the title of Tribune or Receiuer. But at length, in the ninth yere of the reigne of the Emperor *Tiberius Cæſar*, the whole eſtate of the gentrie or cauallerie of Rome, was reduced to an vniformitie; and an order was ſet downe whereby it was knowne who might weare rings, and who might not? which fell out to be in that yeare when *C. Aſinius Pollio*, and *C. Antiſtius Vetus* were Conſuls together, and in the 775 yere after the foundation of Rome city. And verily this vniforme regularity was occaſioned by a trifling cauſe to ſpeak of, and whereat wee may well maruell: and thus ſtood the caſe: *C. Sulpitius Galba* deſirous in his youth to win ſome credit with the foreſaid Emperour *Tiberius*; and namely, by deuiſing meanes how to bring Tauerns, Cooks ſhops, and victualing houſes in danger of the law, and to forfeit penalties; pleaded againſt them, and complained before the Senat, That thoſe who were the vndertakers and Tenants as it were of the foreſaid Tauerns, &c. and made their gaine thereby, had no other meanes to beare themſelues out, nor plea to defend their faults and diſorders, but their rings. The Senat taking knowledge hereof, ordained an act, That none from that time forward might bee allowed to weare the ſaid rings, vnleſſe he were free borne, and that both himſelfe, his father, and grandfire by the fathers ſide were aſſeſſed in the Cenſors booke 400000 ſeſterces; and by vertue of the law Iulia as touching the publicke Theatre, had right to ſit and behold the plaies in the firſt and foremoſt 14 ranks or ſeats for knights appointed. Howbeit afterwards, euery man labored and made means one with another, to be allowed to weare this ornament of a ring. Now in regard of theſe diſorders and variances aboue rehearſed, prince *Caius Caligula* the Emperour, adjoyned to the former foure, a fifth Decurie. And ſhortly after, men grew to that height and pride in this behalfe of wearing rings, and the company ſo ſurcreaſed, that whereas in *Auguſtus Cæſars* dayes there could not be found knights and Gentlemen ſufficient throughout all Rome to furniſh thoſe Decuries, by this time they could not be contained all within the Chamber of Iudges or Decuries aboueſaid: inſomuch as now adaies, no ſooner are there any ſlaues manumiſed and affranchiſed, but preſently (by their good will) they muſt be at their rings. A thing that neuer before was knowne in Rome: for aforetime when a man ſpake of the iron ring, he was vnderſtood preſently to point at the Gentlemen and Iudges before named: but the ſaid ornament or badge became ſo commonly to be taken vp by one as well as another, that a gentleman of Rome (*Flauius Proculus* by name) indited 400 at once before *Claudius Cæſar* Cenſor for the time being, and declared againſt them for this abuſe and offence. See what inconuenience inſued vpon the act of rings! for whiles thereby a diſtinction was made between that degree & other free-born citizens, ſtreight-waies baſe ſlaues leapt in, and were ſo bold as to take that ornament vpon them. And here by the way, it is to be noted, that the two *Gracchi*, *Tiberius*, and *Caius*, brethren, vpon a certain deſire and inbred affection that they had to maintaine and nuzzle the people in ſedition, and to beare a ſide alwaies againſt the Senat, for to currie fauour with the Commons and to do them a pleaſure, deuiſed firſt to haue al them called Iudges, who by vertue of the foreſaid ſtatute or edict, might weare rings: and this he did to croſſe and beard the* Senat. But after the fire of this ſedition was quenched, and the popular authors thereof who ſtirred & blew the coles were murdered, the denomination of theſe criminall Iudges (after diuers troubles and ſeditions with variable and alternatiue fortune) fell in the end to the Publicans and Farmers of the reuenues of the State; and being thus deuolued vpon them, there continued: inſomuch as for a good while the ſaid Publicans made vp the third degree betweene the Senatours and the Commons. Howbeit, *M. Cicero* when he was Conſull re-eſtabliſhed the Knighthood & Cauallerie of Rome in their former eſtate and place; and ſo far preuailed, that hee reconciled them againe vnto the Senat: giuing out openly, that he himſelfe was come of that degree, and by that means by a certain popularity, ſought to draw them all to ſide with him. From this time forward, the men of arms were inſtalled as it were in the third eſtate of Rome; inſomuch as al edicts and publick acts paſſed in the name of the Senat, People, and Cauallerie of the citie. And for

* Who onely indeed were to judge cauſes.

that

20030
copy 1

that theſe knights or gentlemen were laſt incorporated into the body of the Common-weale,
A this is the only reaſon that euen now alſo they are written in all publicke Inſtruments, after the People.

As touching the name or title, attributed to this third eſtate or degree of Horſemen or men of Arms, it hath bin changed and altered oftentimes: for in the daies of *Romulus* and other KK. of Rome, they were called Celeres, afterwards Flexumines, and in proceſſe of time Troſſuli, by occaſion that theſe horſmen without any aid at all of the Infanterie, had woon a towne in Tuſcane nine miles on this ſide Volſinij, called Troſſuli: which name continued in the Cauallerie of Rome, vntill the time of *C. Gracchus* and afterward. And verily *Iunius* (who vpon the great amitie betweene *Gracchus* and him, was ſyrnamed *Gracchanus*) hath left theſe words in writing as touching this matter: concerning the degree of knights (quoth hee) thoſe who now are called Equites, [*i.* Horſemen] beforetime had to name Troſſuli: the change of which name aroſe vpon this; that many of theſe Gentlemen, ignorant in the originall and firſt occaſion of the foreſayd name Troſſuli, and what the meaning thereof was, were aſhamed ſo to be called. He alledgeth moreouer the cauſe of the ſaid name: and yet notwithſtanding (quoth hee) they cannot away with the name at this day, but are ſo called againſt their wils.

To come again vnto our former diſcourſe of gold. There be yet ſome other points beſides to be conſidered therein, which cauſe diſtinction in diuers conditions of men: for our anceſtours, willing at all times to honour thoſe ſouldiers who had borne themſelues valiantly in wars, were
C wont to beſtow chains of gold vpon ſtrangers and auxiliaries, ſuch I meane as came to ayd and ſuccour the Romans: but vnto their owne naturall citizens they gaue none other but of ſiluer: and true it is, that Roman citizens had bracelets giuen them ouer and aboue, which forreiners had not. They were wont alſo (a thing to be maruelled at) to giue vnto citizens, coronets of gold: but who he was whom they honored firſt with this reward, I could neuer find in any Chronicle; and yet *L. Piſo* hath ſet downe in his Annals, the firſt giuer thereof: for *A. Poſthumius* L. Dictator (quoth he) vpon the winning of the fortified campe of the Latines neare the Lake Regillus, was the firſt that beſtowed vpon that ſouldier, by whoſe valorous ſeruice principally the ſaid hold was forced, a coronet of gold; which he cauſed to be made of the pillage taken from the enemie. *L. Lentulus* in like manner, being Conſull, gaue a crowne of gold vnto *Sergius Cornelius*
D *Merenda*, at the winning of a certaine towne within the Samnites countrey. Semblably *Piſo* ſyrnamed *Frugi*, beſtowed vpon his owne ſonne a Coronet of gold weighing fiue pound, which hee cauſed to bee made of his owne priuate money: and yet amongſt other Legacies in his laſt Will and Teſtament, the ſaid Coronet hee bequeathed to the State and Common-wealth of Rome.

Chap. III.

¶ Other vſes beſides of gold, as well in men as women. Of Gold, in money. When Braſſe, Siluer, and Gold, were firſt ſtamped and coined. Before Braſſe was conuerted into ſtamped money, how they vſed it in old time. At what rate and proportion of money were aſſeſſed the beſt houſes of Rome, at the firſt leuying of Subſidies. And at what time gold came into credit and requeſt.

E

ALl the gold imploied in ſacrifices to the honor of gods, was in guilding the horns of ſuch beaſts as were to be killed, and thoſe onely of the greater ſort. But in warfare among ſouldiers, the vſe of gold grew ſo exceſſiue, that the field and campe ſhone againe withall, inſomuch as at the voiage of Macedony, where the Marſhals of the field and colonels bare Armour ſet out with rich buckles and claſps of gold, *M. Brutus* was offended and ſtormed mightily at it, as appeareth by his letters found in the plaines about Philippi. Well done of thee, O
F *M. Brutus*, to find fault with ſuch waſtfull ſuperfluitie: but why ſaidſt thou nothing of the gold that the Roman dames in thy time wore in their ſhoos? And verily this enormity and abuſe, I muſt needs impute vnto him (whoſoeuer he was) that firſt deuiſed rings, and by that means cauſed gold to be eſteemed a mettall of much worth: which euill precedent brought in another miſchiefe as bad as it, which hath continued a long time; namely, that men alſo ſhould weare about their arms, bracelets of gold next to their bare skin: which deuiſe and ornament of the arm

is called Dardanium, becauſe the inuention came from the Dardanians: like as the fine golden carkanets Viriæ, we tearme Celticæ; and the necke-laces of gold Viriolæ. Celtibericæ. Oh the monſtrous diſordes that are crept into the world! But ſay that women may be allowed to weare as much gold as they will, in bracelets, in rings on euery finger and joynt, in carkanets about their necks, in earings pendant at their ears, in ſtaies, wreaths, & chinbands; let them haue their chains of gold as large as they liſt vnder their arms or croſſe ouer their ſides, ſcarfe-wiſe; be gentlewomen and miſtreſſes at their collars of gold, beſet thicke and garniſhed with maſſie pearls pendant from their necke, beneath their waſt; that in their beds alſo when they ſhould ſleepe they may remember what a weight of gold they carried about them: muſt they therfore weare gold vpon their feet, as it were to eſtabliſh a third eſtate of women anſwerable to the order of knights, betweene the matrons or dames of honour in their ſide robes, and the wiues of meane commoners? Yet me thinkes, we men haue more reaſon and regard of decencie, thus to adorne with brooches and tablets of gold, our youths and yong boies, and a fairer ſight it is to ſee great men attended vpon to the baines by beautifull pages thus richly decked and ſet out, that all mens eies may turne to behold them. But what meane I thus bitterly to inueigh againſt poore women; are not men alſo growne to ſuch outragious exceſſe in this kind, that they begin to weare vpon their fingers either *Harpocrates, or other images of the Ægyptian gods engrauen vpon ſome fine ſtone? But in the daies of the Emperor *Claudius* there was another difference and reſpect had, That none might carrie the pourtraiture of that prince engrauen in his ſignet of gold, without expreſſe licence giuen them by thoſe gratious enfranchiſed ſlaues who were in place to admit vnto their lord the Emperor, whom it pleaſed them: which was the occaſion and means of bringing many a man into danger, by criminall imputations. But all theſe enormities were happily cut off as ſoon as the Emperour *Veſpaſian* (to the comfort and joy of vs all) came once to the crowne: for by an expreſſe edict, he ordained, That it might be lawfull for any perſon whatſoeuer to haue the image of the Emperour in ring, brooch, or otherwiſe without reſpect. Thus much may ſuffice concerning rings of gold, and their vſage.

* Called alſo *Sigalion.*

To come now to the next miſchiefe that is crept into the world; I hold that it proceedeth from him who firſt cauſed a *denier of gold to be ſtamped: although, to ſay a truth, I know not certainly who he was that deuiſed this coine. As for the people of Rome, ſure I am that before king *Pyrrhus* of Epirus was by them vanquiſhed, they had not ſo much as ſiluer mony ſtamped and current. Well I wot alſo, that in old time the manner was to weigh our braſſe by the Aſſe, which was a pound weight, and thereupon called As Libralis; and yet at this day, Libella: like as the weight in braſſe of two pound, they named Dipondius [As.] And hereupon came the cuſtome of adjudging any fine or penaltie vnder the tearme of [Æris grauis] that is to ſay, of braſſe Bullion or in Maſſe. From hence it is alſo, that ſtill in reckonings and accounts whatſoeuer hath bin laid out or deliuered, goeth vnder the name of Expenſa [*id eſt*, Expences] as a man would ſay, weighed forth, becauſe in times paſt all paiments paſſed by weight. The Latines likewiſe vſe the nowne Impendia, for coſt beſtowed, or the charges of intereſt in vſurie aboue the principall; euen as the verbe Dependere, betokeneth (to pay) becauſe paiments ordinarily were performed by poiſe. Moreouer, the vnder treaſurers of war, or paimaſters in the camp, were in ancient time named Libripendes, for weighing out vnto the ſouldiers their wages; and their very pay thereupon was called Stipendiam, from whence commeth Stipend, a word commonly receiued. According to which manner and cuſtome, all buyings and ſellings at this day which paſſe with warrantiſe, are vſually performed by interpoſition of the ballance, which ſerueth to teſtifie the realitie of the contract and bargaine on both parts.

* He ſpeaketh κατα χαρακτῆρα, as I take it; for *Denarius* was a ſiluer piece: but he meaneth any piece of coine.

Touching braſſe mony, *Servius Tullius* a king of Rome, cauſed it firſt to be coined with a ſtampe, for before his daies, they vſed it at Rome rude in the maſſe or lumpe, as *Remeus* mine author doth teſtifie. And what was the marke imprinted thereupon? euen a ſheepe, which in Latine they call Pecus: and from thence proceedeth the word Pecunia, that ſignifieth mony. And note here by the way, that during the reigne of that king, the beſt man in all Rome was valewed to be worth in goods not aboue 120000 Aſſes in braſſe: and at this rate were aſſeſſed the principall houſes of the city in the kings bookes: and this was counted the firſt Claſſis.

Afterwards, in the 485 yere from the foundation of the city, when *Q. Ogulnius* and *C. Fabius* were Conſuls, fiue yeares before the firſt Punicke warre, they began to ſtampe ſiluer mony at Rome, and three ſeuerall pieces were coined. At what time ordained it was, That the Denarius

or

20030
copy 1

A or Denier ſhould goe for tenne Aſſes or pounds of braſſe mony; the halfe Denier, Quinarius, ſhould be currant for fiue; and the Seſterce reckoned worth two and a halfe. Now, for as much as during the firſt Punick war againſt the Carthaginians, the city was growne much behind hand and farre indebted, ſo as they were not able to goe through the charges which they were to defray, agreed it was and ordained to raiſe the worth of the braſen mony by diminiſhing the poiſe: wheras therfore the Aſſe weighed a pound of twelue ounces, they made the Aſſe of two ounces: By which deuiſe, the Commonwealth gained fiue parts in ſix; and the Fiſque or city chamber by that means was ſoone acquit of all debts. But if you would know what was the marke of this new braſen Aſſe: of the one ſide it was ſtamped with a two faced *Ianus*, on the other ſide with the beake-head of a ſhip, armed with braſen pikes. Other ſmaller pieces there were, according
B to that proportion, to wit, Trientes, the third part of an Aſſe; and Quadrantes the fourth; which had the print of *punts or ſmall boats vpon them. As for the piece Quadrans, it was before time called Triuncis, becauſe it weighed three ounces. Howbeit in proceſſe of time, when *Annibal* preſſed hard vpon the city, and put them to an exigent for mony to maintaine the wars againſt him, driuen they were to their ſhifts and forced (when *Q. Fabius* was Dictator) to bring downe the foreſaid Aſſe of two ounces vnto one. Yea, and enacted it was, That the ſiluer denier, which went beforetime for ten Aſſes, ſhould be worth * ſixteene; the halfe Denier or Quinare, eight; and the Seſterce foure: and by this means the State gained the one halfe full. And yet I muſt except the mony paied to ſouldiers for their wages: for a Denier vnto them was neuer reckoned aboue ten Aſſes. As for the ſiluer Deniers, ſtamped they were with the pourtraiture of coches
C drawne with two horſes or foure horſes, whereupon they were called Bigati and Quadrigati. Within a while after there paſſed an act promulged by *Papyrius*, by vertue whereof the Aſſes weighed not aboue halfe an ounce. Then came *Liuius Druſus* in place, who being one of the Prouoſts or Tribunes of the commons, brought in baſe money, and delaied the ſiluer with one eight part of braſſe. Touching that piece of coine, which now is called Victoriatus, ſtamped it was by an Act propoſed by *Clodius*; for before his time, thoſe pieces of mony were brought out of Sclauonia, and reckoned as merchandiſe: and ſtamped it is with the image of Victorie, of which it tooke that name.

* And therfore they were called *Ratiti* of *Rates*.

* Ordinarily the Romane ſiluer Denier had the letter *X.* ſtamped vpon it, but theſe Deniers had *XVI. Vrſino.*

Concerning gold coined into mony, it came vp threeſcore and two yeres after the ſtamping of ſiluer pieces: and a ſcriptule of gold was taxed and valued at twenty ſeſterces, which ariſeth
D in euery pound according to the worth of ſeſterces as they were rated in thoſe daies, to nine hundred Seſterces. But afterwards it was thought good to caſt and ſtampe pieces of gold, after the proportion of fiftie to a pound: And thoſe, the Emperors by little and little diminiſhed ſtil in poiſe, till at length *Nero* brought them downe to the loweſt, and cauſed them to be coined after the rate of fiue and fiftie pieces to the pound. In ſumme, the very ſource and originall of all auarice proceedeth from this mony and coine, deuiſed firſt by lone and vſurie, and continued ſtill by ſuch idle perſons that put forth their mony to worke for them, whiles they ſit ſtill, and find the ſweetnes of the gaine comming in ſo eaſily. But this greedy deſire of hauing more ſtill, is growne after an outragious manner to be exceſſiue, and no more to be named couetouſneſſe, but rather inſatiable hunger after gold: inſomuch as *Septimuleius*, an inward and familiar friend
E of *C. Gracchus*, forgat all bonds of amitie, and hauing cut off his friends head, vpon promiſe to haue the weight of it in gold, brought the ſame vnto *Opimius*: howbeit, he poured molten lead into the mouth thereof to make it more heauie, and ſo together with this parricide and vnnaturall murtherer, couſened alſo & beguiled the Commonweale. But to ſpeak no more of any particular citizen of Rome, the whole name of the Romanes hath beene infamous among forraine nations for auarice and corruption in this kind: as may appeare by the conceit that king *Mithridates* had of them, who cauſed *Aquilius* (a Generall of theirs, whoſe hap was to fall into his hands) for to drinke molten gold. See what couetouſneſſe brings home with it in the end.

Now when I behold and conſider no more but theſe ſtrange names of our veſſell in plate, which are newly deuiſed in Greek from time to time, according as the ſiluer is either double or
F parcell gilt, or the gold encloſed and bound within worke, I am aſhamed of it; and the rather, for that in regard of theſe deuiſed names and daintie toies, ſuch plate as well of beaten gold, as guilded only, ſhould be ſo vendible and ſell ſo deare: eſpecially knowing as we do full well, the good order that *Spartacus* held in his campe, expreſſely commanding that no man ſhould haue any plate of gold or ſiluer. A great reproch to vs Romans, that our fugitiues & baniſhed perſons

ſhould

ſhould ſhew a more nobler ſpirit than we our ſelues. *Meſſala* the great Oratour hath left in wri- G
ting, That *M. Antonius* vſed to diſcharge all the ordure and filthy excrements of the body into veſſels of gold; yea, and allowed *Cleopatra* likewiſe to do the ſame by her monthly ſuperfluities, moſt ſhamefully. Noted it was among forrein Nations for exceſſiue licentiouſneſſe, and that in the higheſt degree, that K. *Philip* of Macedony was neuer wont to go to bed and ſleepe without a ſtanding cup of gold vnder his pillow: alſo, That *Agnon Teius* (a great captain vnder *Alexander* the Great) was giuen to ſuch waſtfull prodigality, as to faſten his ſhooes and pantophles with buckles of gold. But *Antony* aboue named, to the contumelie and contempt of * Nature, abuſed gold, and imploied it to the baſeſt ſeruice that is: an act (as much as any other) deſeruing proſcription and outlawing indeed.

*Which had giuen vs gold for veſſels of honour.

But among diuers things beſides, I wonder much at this, That the people of Rome, vpon the H
conqueſt of ſo many Nations, impoſed vpon them a tribute to be paied alwaies in ſiluer, & neuer made mention of gold: as for example, when Carthage was ſubdued, & *Annibal* vanquiſhed, the Carthaginians were injoined for 50 yeres together to make paiment yerely of * [12000] pound of ſiluer only, and no gold at all. Neither can it be thought that there was little gold at that time to be had abroad in the world; for *Midas* and *Cræſus* both, were poſſeſt of infinit ſums and huge maſſes of gold: and *Cyrus* vpon his conqueſt of Aſia, met with 34000 pound weight of gold, beſides the golden plate and veſſell, and other gold which he found ready wrought: and among the reſt, certain *leaues, a Plane and a vine-tree, both of beaten gold. In the pillage alſo of this victory, he gaue away 500000 talents of ſiluer, and one ſtanding cup that he tooke from *Semiramis*, that weighed 15 talents. And *Varro* mine Author ſaith, That the poiſe of the Ægyp- I
tian talent ariſeth to * 80 pound. Beſides, there had raigned before time ouer the Colchians, *Salauces*, and one *Eſubopes*: who hauing newly broken vp a piece of ground in the Samnians country, is reported to haue gotten out thereof great ſtore of ſiluer and gold: notwithſtanding that the whole kingdome is renowned for the golden fleeces there. And verily this prince had the arched and embowed roufes of his pallace made of ſiluer and gold: the beames and pillars alſo ſuſtaining the ſaid building, yea, the jambes, poſts, principals, and ſtandards, all of the ſame mettall; namely, after he had vanquiſhed *Seſoſtres* K. of Ægypt, ſo proud a prince, that (as Chronicles make mention) he was wont euery yere to haue one or other (as the lot fell out) of thoſe kings who were his tributaries and did homage to him, for to draw in his charriot like horſes, when he was diſpoſed to ride in triumph. Theſe and ſuch like things haue bin thought K
fabulous tales: but haue not our Romans done ſemblable acts, which the age and poſterity hereafter wil think incredible? *Cæſar* afterwards Dictatour, was the firſt that in his Ædileſhip, when hee exhibited a ſolemne memoriall in the honour of his father departed, did furniſh the whole Cirque and ſhew-place, with all things meet for ſuch a ſolemnity, of cleane ſiluer; inſomuch as the chaſing ſtaues and bore-ſpeares were of ſiluer, wherewith the wild beaſts were aſſaulted: a ſpectacle neuer ſeene before. And not long after, *C. Antonius* ſet forth his plaies (when he was Ædile) vpon a ſtage or ſcaffold of ſiluer: after whoſe example, diuers free cities and townes of the empire haue don the like. Semblably, *L. Muræna* and *C. Caligula* the Emperor, erected a frame or pageant to go and riſe vp of it ſelfe with vices, ſupporting images and jewels in the place of publick paſtimes, which was thought to haue in it 124000 pound of ſiluer. *Claudius Cæſar* who L
ſucceeded Emperor after him, when he rode in triumph for the conqueſt of Brittaine, among other crownes of beaten gold, ſhewed two that were principall, the one of 7 pound weight, which high Spaine had giuen to him; the other weighing 9 pounds, ſent vnto him as a Preſent from that part of Gaule which is called Comata: as appeared by the inſcriptions and titles which they bare. *Nero* his ſucceſſour, to ſhew vnto *Tyridates* king of Armenia what abundance of treaſure he had, kept the great Theatre of *Pompeius* for one whole day couered all ouer with gold. But what was that furniture in compariſon of his golden houſe, which tooke vp a great part of the city, and ſeemed (as it were) to compaſſe it about. In that yeare when *Sex. Iulius*, and *Lucius Aurelius* were Conſuls (which fell out to be 7 yeares before the third Punicke warre) there was found in the treaſury or chamber of Rome, * 700026 pound weight of gold, in Maſſe or Ingots; M
of ſiluer likewiſe in Bullion, 92000 pound weight; beſides the coine and ready money, which amounted to 375000 Seſterces. The yeare wherein *Sex. Iulius* and *L. Marcius* were Conſuls, to wit, in the beginning of the ſociall warre againſt the Marcians and other Romane allies, the treaſure of Rome aroſe to 846 pounds of gold in Bullion. *C. Cæſar* at his firſt entrance into

*For in al they were to pay 10000 talents: reckon a talent at 60 pound, which is the leſſe Attick.

* *Folia*, I think rather *ſolia*, i. bathing veſſels.

*Some ſay 75.

*According to *Budæus*.

the

20030
copy 1

A the city of Rome, when the ciuill war between him and *Pompey* was begun, took out of the citie chamber 15000 wedges or ingots of gold, 35000 lumps or masses of siluer, and in ready money 40000 Sesterces. And to say a truth, neuer was the city of Rome wealthier than at this time. Moreouer, *Æmylius Paulus*, after he had defeated and vanquished *Perseus* the Macedonian King, brought into the Treasurie of the Citie a bootie of 3000 pound of gold in weight. After which time the common people of Rome had neuer any tributes or taxes leuied of them by the State.

* According to *Budæus*.

Moreouer, this is to be obserued, That after the ouerthrow and destruction of Carthage, the beames began first to be guilded within the temple of the Capitoll, whiles *Lu. Mummius* was Censor. And now adaies you shall not see any good house of a priuat man, but it is laid thicke
B and couered ouer with gold. Nay, the brauery of men hath not staid so, but they haue proceeded to the arched and embowed routs, to the walls likewise of their houses, which we may see euery where as wel and throughly guilded as the siluer plate vpon their cupbourds. And yet *Catulus* was diuersly thought of in the age wherein he liued, because he was the first that gilded the brasen tiles of the Capitoll.

Touching the first inuentors, as well of gold, as also of all other mettals to speake of, I haue already written in my seuenth booke. As for the estimation of this mettall, that it should bee chiefe as it is, I suppose it proceedeth not from the colour, for siluer hath a brighter lustre, more like to the day, and in this respect more agreeable to the ensignes of war than that of gold, because it glittereth and shineth farther off: and hereby is their errour manifestly conuinced, who
C commend the colour of gold, in this regard, that it resembleth the starres: for well it is knowne that their colour is not reputed richest, either in precious stones or in many things besides. Neither is gold preferred before other mettals, because the matter is more weighty or pliable than the rest; for lead surmounteth it, both in the one and the other. But I hold, that the reputation which it hath, commeth from hence, That it alone of all things in the world, loseth nothing in the fire: for say that a house be burnt wherein gold is, yet it wasteth not: and looke what gold is committed to the funerall flames, it consumeth not with the dead body, but is found all againe among the ashes. Nay, the ofteuer it hath bin in the fire, the better it is, and the more refined: in such sort, that the best gold which they call Obryzum, is knowne by this, if it be of the same deep red colour that the fire is wherein it is tried. And a principal argument this is of fine gold,
D if it hardly be kindled & set on fire red hot. Moreouer, this is wonderful in the nature of * gold: that in a fire made of light straw or chaffe, it wil most quickly become red hot and melt; put the same among the hottest burning coles that can be of wood, vnneath or hardly wil it yeeld to the heat thereof and resolue: as also for the purifying thereof, it ought to be melted with lead. A greater reason there is besides that maketh gold so precious: for that with vse or handling there is little of it lost and wasted; whereas siluer, brasse, and lead, if you draw any lines therewith, colour as they go and leaue somewhat behind: they soile their hands also who occupie the same with the substance and matter that sheddeth from them. Ouer and besides, there is not a mettall will be driuen out broader with the hammer, or diuide easily into more parcels than gold, insomuch as euery ounce of it may be reduced into 750 leaues, or more, and each one of them foure
E fingers large euery way. The thickest gold foile beareth the name at this day of Prænestium, for that the Image of Fortune at Prænestè is aboue all other most richly guilded. The next thereto in goodnesse is the foile or leafe of gold named Quæstoria. In Spaine they vse to call by the name of Strigiles, the small pieces of that fine gold which is found naturally alone aboue al the rest either compact in some masse, or in manner of sand or grauell; whereas all other parcels of gold taken out of the Mines, need to be fined and brought to their perfection by the meanes of fire. But this gold that I speake of, is gold presently at the first, and no sooner is found, but the matter thereof by and by is consummat and accomplished. Loe how gold is found in the owne nature pure and perfect! As for the other manner of finding and fining gold, whereof I meane to speake anone, it is forced (as it were) and vpon constraint. But aboue all other properties to
F commend the goodnesse of gold, this especially is to bee obserued, That there is no rust nor canker, no nor any filth besides breeding of it selfe therein, which is able either to corrupt the goodnesse, or diminish the weight and substance thereof. What should I say how firme it continueth and dureable against salt and vineger, scorning all their iniuries: and yet otherwise their moysture is able to eat into any other mettals, yea, and to consume and tame all things

* This haply may be true in ore, for otherwise in fined gold it is not so: & the finer that it is, the stronger fire it asketh to bee melted by.

else

els whatſoeuer. But this paſſeth all, that ſpun it may be as wooll and ſilke, wouen alſo in manner G
of yearn, chuſe whether you wil work it twiſted with [ſilke] thred, or ſingle in wire by it ſelfe.
Verrius the Hiſtoriographer reporteth, that K. *Tarquinius*, ſurnamed *Priſcus*, rode in triumph in a
robe of wrought gold. I my ſelfe haue ſeene the Empreſſe *Agrippina*, wife to *Claudius Cæſar*, ſit-
ting by her husband the Emperor to behold the braue ſhew of a nauall skirmiſh vpon the wa-
ter which he exhibited, all gorgeouſly arraied in a roiall mantle, wouen without any other mat-
ter ſaue onely pure gold. Cloth of gold and tiſſue I know there is beſides, called Veſtis Attali-
ca, wherein gold is wrought with other ſtuffe: and long ſince it is, that this inuention hath been
deuiſed by the rich and ſumptuous kings of Aſia. Furthermore, to guilde marble or any other
thing that wil not abide to be guilded by the fire, gold foile muſt be laid on with the white of
an egge. As for wood and timber, they vſe to guild it by the means of a certaine compound glue H
*or Chryſoperõ. or ſize, which is commonly called * Leucophoron: but what a glue this is, and how it is made,
I will declare in place conuenient. As touching the manner how to guild braſſe, it was perfor-
med ordinarily heretofore by quick ſiluer naturall, or els artificiall named Hydrargyron: & here-
in there hath bin deuiſed much fraud and deceit; according as I wil hereafter ſhew in their pro-
per chapters, when I purpoſe to ſet down their nature and properties. But now after that braſſe
hath bin much knocked and beaten, they vſe to put it into the fire: and ſo ſoon as it is perceiued
red hot, they quench it again in ſalt, vineger, and allum. Now afterward, when it is well ſcoured
and clenſed with ſand, and knowne by the brightneſſe and luſtre thereof that it hath bin ſuffici-
ently frobiſhed and purified, again it muſt into the fire to take a new heat by the ardent exha-
lation thereof; that beeing thus (as it were) mortified and beſmeared with a ſize of the pumiſh I
ſtone, allum and quick ſiluer mixt together, it may take vp gold foile laid vpon it the better, and
keep it more ſurely. To conclude, allum hath the very ſame vertue to trie and clenſe gold, as I
ſaid before Lead had.

Chap. IIII.

¶ *The manner of finding gold naturally in the Mine. When were knowne the firſt ſtatues of gold. The medicinable vertues and properties of gold.*

IN theſe parts of the world wherein we liue, gold mines are found: ſo that we need not to ſtand K
ſo much vpon the gold of India, nor that which the ants caſt vp out of the ground, or the grif-
fons gather in Scythia. And verily the gold here with vs commeth naturally in three ſorts;
to wit, among the ſands of ſome great riuers, like as Tagus in Spaine, the Po in Italy, Hebrus in
Thrace, Pactolus in Aſia, and the Indian Ganges do yeeld it: neither is there any gold more fine
and perfect, as being throughly poliſhed by that rubbing and attrition which it meets withall,
in the courſe and ſtream of the water. Another manner there is to come by gold; namely, by dig-
ging it out of pits which are ſunk of purpoſe for it, or els to light vpon it within the caues and
breaches happening by the fals of mountains vndermined or cut through. And my meaning is
to diſcourſe of the one way as well as the other, of ſearching for gold.

To begin then with thoſe who ſeek for this mettall: firſt aboue all they hit vpon a vaine of L
earth called Segullum, and this is it that giueth them the firſt light and ſhew that gold is there
to be had. This they take vp: the bed and couch wherein it lieth: the grauell likewiſe & the ſand
about it they waſh, obſeruing diligently that which ſetleth in the bottome, for by it they haue
a good gueſſe and aim that directeth them to gold, whether it lie deep or ſhallow. And by this
conjecture, otherwhiles their hap is ſo good, as to find that which they deſire, aloft, euen ebbe
vnder the vpmoſt coat of the earth: but I muſt needs ſay, a rare felicity is this: & yet of late daies
during the Empire of *Nero*, there was found in Dalmatia a vaine of gold ore within one ſpades
griffe in the firſt turfe of the ground, which yeelded euery day the weight of fifty pound. This
manner of earth, if it be found alſo vnder a vaine of gold, they call Alutatio. Moreouer, this is to
be noted, That ordinarily the dry and barren mountains in Spaine which beare and bring forth M
nothing elſe, are forced (as it were) by Nature to furniſh the world with this treaſure, and doe
yeeld mines of gold. As for that gold ore which is digged forth of pits, ſome call it in Latine
Canalitium, others Canalienſe. And verily this is found ſticking to the grit and vtmoſt cruſt of
hard rocks of marble; not after the manner of drops or ſparkes glittering in orient Saphire, or

the

20030
copy 1

A The Thebaick marble, and in many other pretious ſtones, which are marked here and there with ſpecks of gold: but this ore or mettall doth claſp and embrace whole pieces of marble & ſuch like, found in rocks. And commonly theſe canales (as I may ſo ſay of gold ore) follow the veins of ſuch marble and ſtone in the quarry, diuiding and ſpreading as they do here and there: wherupon the gold tooke the foreſaid name of Canalitium: they wander alſo along the ſides of the pits as they are digged, ſo that the earth had need to be borne vp and ſupported with poſts and pillars for the getting of it, leſt by hollow vndermining it fall vpon the pioners. This mine or vein of gold ore when it is once digged vp and landed aboue ground, the manner is to bray and ſtamp, to waſh, burn, and melt, yea and otherwhiles to grind into pouder. As for that which (as they pun thus and beat in mortars) is knocked from it, they call * Apilaſcus: but the mettall
B which ſweateth out and commeth forth by the violent heate of the furnace where the foreſayd ore is melted, they name Argentum, i. Siluer. The groſſe ſubſtance caſt vp from the pot or veſſel, and ſwimming aloft (whether it be the droſſe comming of gold thus tried, or any other mettal) is named Scoria. Howbeit, this droſſe that gold doth yeeld from it in the trying, is ſet ouer the fire again to take a new melting, & is ſtamped in maner aforeſaid. As for the pans or veſſels wherin gold is thus tried and refined, they be made of a certain earth named Taſconium: and the ſame is white like vnto a kinde of potters clay. For ſurely there is no other earth or matter whatſoeuer will abide either the heate of the fire vnderneath, plied continually with the bellows, or the matter within it when it is melted. And thus much of the two firſt waies of finding out gold.

* Quaſi ad pilas cuſam.

C The third manner of ſearching for this mettal is ſo painfull and toileſome, that it ſurpaſſeth the wonderfull works of the * Geants in old time. For neceſſary it is in this enterpriſe & buſines, to vndermine a great way by candlelight, & to make hollow vaults vnder the mountains. In which labor the pioners work by turns ſucceſſiuely, after the maner of the reliefe in a ſet watch, keeping euery man his houres in iuſt meaſure: and in many a moneths ſpace they neuer ſee the Sun or day light. This kind of work and mines thus made they call Arrugiæ, wherin it falleth out many times that the earth aboue head chinketh, and all at once without giuing any warning ſetleth and falleth, ſo as the poore pioners are ouerwhelmed & buried quick: inſomuch as conſidering theſe perils, it ſeemes that thoſe who diue vnder the water into the bottom of the Lenant ſeas for to get pearls, haſard themſelues nothing ſo much as theſe pioners: a ſtrange thing,
D that by our raſhneſſe and folly wee ſhould make the earth ſo much more hurtfull to vs than the water. Wel then, to preuent as much as poſſibly may be theſe miſchiefes and dangerous accidents, they vnderprop the hils, and leaue pillars and arches as they go, ſet thick one by another to ſupport the ſame. And yet ſay they worke ſafe enough, and be not in jeopardy of their liues by the fall of the earth, yet there be other difficulties that impeach their work: for otherwhiles they meet with rocks of flint and rags, as wel in vndermining forward, as in ſinking pits downeright; which they are driuen to pierce and cleaue through with fire and vineger. But for that the vapor and ſmoke that ariſeth from thence, by the means, may ſtifle and choke them within thoſe narrow pits and mines, they are forced to giue ouer ſuch fire-work, and betake themſelues to great mattocks and pickaxes, yea and to other engines of iron, weighing 150 pounds apiece,
E wherewith they hew ſuch rocks in pieces, and ſo ſinke deeper, or make way before them. The earth and ſtones which with ſo much ado they haue thus looſed, they are fain to cary from vnder their feet in ſcuttles and baskets vpon their ſhoulders, which paſſe from hand to hand euermore to the next fellow. Thus they moile in the dark both day and night in theſe infernal dungeons, and none of them ſee the light of the day; but thoſe that are laſt and next vnto the pits mouth or entry of the caue. If the flint or rock that they work into ſeem to run in a long grain, it will cleaue in length, and come away by the ſides in broad flakes, and therefore the pioners with eaſe make way, trenching and cutting round about it. Howbeit, be the rock as ragged as it will, they count not that their hardeſt work: for there is a certaine earth reſembling a kinde of tough clay which they call white Lome, and the ſame intermingled with gritty ſand ſo hard
F baked together, that there is no dealing with it; it ſo ſcorneth and checketh all their ordinary tooles and labour about it, that it ſeemeth impenetrable, What doe the poore labourers then? They ſet vpon it luſtily with iron wedges, they lay on lode vnceſſantly with mighty beetles; and verily they thinke that there is nothing in the world harder than this labour, vnleſſe it bee this vnſatiable hunger after gold, which ſurpaſſeth all the hardneſſe and difficulty that is. Wel,

* Who were ſaid to reare one mountain vpon the head of another.

when

when the work is brought to an end within the ground, & that they haue vndermined & hollo- G
wed the ground as far as they think good, down they go with their arch-work abouesaid, which they builded as they went: they begin first at those props which are fartheſt off, cutting the heads of the ſtancheons ſtill as they return backward to the entrance of the work. Which don, the ſentinel only, which of purpoſe keeps good watch without vpon the top of the ſame mountain that is thus vndermined, perceiues the earth when it begins to chink and cleaue, menacing by that token a ruin thereof anon. Whereupon preſently he giues a ſigne either by a loud cry, or ſome great knock, that the pioners vnderneath may haue warning thereby to get them ſpeedily out of the mines, and runneth himſelfe apace down from the hil as faſt as his legs will giue him leaue. Then all at once on a ſudden the mountain cleaueth in ſunder, and making a long chink, fals downe with ſuch a noiſe and crack, as is beyond the conceit of mans vnderſtanding, H
with ſo mighty a puf and blaſt of wind beſides, as it is incredible. Wherat theſe miners & pioners are nothing troubled, but as if they had done ſome doughty deed, and atchieued a noble victorie, they ſtand with ioy to behold the ruin of Natures workes which they haue thus forced. And when they haue all don yet are they not ſure of gold, neither knew they all the whiles that they labored and vndermined, that there was any at all within the hill: the hope only that they conceiued of the thing which they ſo greatly deſired, was a ſufficient motiue to induce them to enterpriſe and endure ſo great dangers, yea & to go through withall and ſee an end. And yet I cannot wel ſay that here is all; for there is another labor behind, as painfull euery way as the other, and withall of greater coſt and charges than the reſt, namely, to waſh the breach of this mountaine (that is thus clouen, rent, and laid open) with a currant: for which purpoſe they are I
driuen many times to ſeek for water a hundred miles off, from the creſts of ſome other hils, and to bring the ſame in a continued channel and ſtream all the way along vnto it. Theſe Riuers or
*or rather *Corrivi.* furrows, thus deuiſed and conueyed, the Latines expreſſe by the name of * Corrugi, a word as I take it deriued *à Corrivando, i.* of drawing many ſprings and rils together into one head & chanel. And herein conſiſteth a new piece of worke as laborious as any that belongs to mines. For the leuel of the ground muſt be ſo taken aforehand, that the water may haue the due deſcent & currant when it is to run: and therefore it ought to be drawn from the ſources ſpringing out of the higheſt mountains; in which conueiance regard would be had as well of the vallies as the riſing of the ground between, which requireth otherwhiles, that the waters be commanded by canels and pipes to aſcend, that the carriage thereof be not interrupted, but one piece of the K
work anſwer to another. Otherwhiles it falleth out, that they meet with hard rockes and crags by the way, which do impeach the courſe of the water; and thoſe are hewed through, and forced by ſtrength of mans hand to make room for the hollow troughs of wood to lie in, that carrie the foreſaid water. But a ſtrange ſight it is to ſee the fellow that hath the cutting of theſe rockes, how he hangeth by cables and ropes between heauen and earth; a man that beheld him afar off would ſay it were ſome flying ſpirit or winged diuell of the aire. Theſe that thus hang for the moſt part take the leuel forward, and ſet out by lines the way by which they would haue the water to paſſe; for no treading out is there of the ground, nor ſo much as a place for a mans foot to reſt vpon. Thus you ſee what ado there is. And theſe good fellowes whiles they bee
* *Manus trahuntur ad omen* aloft, * ſearch with the hands and pluck forth the earth before them, to ſee whether it be firme L
*or rather *Aræum, Græci dicunt.* and faſt, able to beare the trunks or troughs for the water; or otherwiſe looſe and brittle, which defect of the earth they call * Vrium: for the auoiding whereof the fountainers feare neither rocks nor ſtones to make paſſage for their pipes or trunks aforeſaid. Now when they haue thus brought the water to the edge & brow of the hils where theſe mines of gold ſhould be, & from whence as from an head there is to be a fall thereof to ſerue their purpoſe, they dig certaine ſquare pooles to receiue the water, 200 foot euery way, and the ſame ten foot deep: in which they leaue fiue ſeuerall ſluces or paſſages for the deliuerie of water into the mines, and thoſe commonly three foot ſquare. When the ſaid pools ſtand full, as high as their banks, they draw vp the floud-gates: and no ſooner are the ſtopples driuen and ſhaken out, but the water guſheth forth amaine with ſuch a force, and carrieth ſo violent a ſtreame therewith, that it rolleth M
downe with it any ſtones, be they neuer ſo big, lying in the way. And yet are we not come to an end of the toile, for there remaineth a new piece of work to do in the plaine beneath. Certain hollow ditches are to bee digged for to receiue the fall of the water both from the pooles that are aboue, and the mines alſo. Theſe trenches the Greekes tearme Agogæ, as a man would ſay,

Conduits,

20030
copy 1

A Conduits,and thoſe are to be paued by degrees one vnder another. Beſides, there is a kinde of ſhrub or buſh,named Vlex, like to Roſemarie, but that it is more rough and prickely,and the ſame is there planted becauſe it is apt to catch and hold whatſoeuer pieces of gold do paſſe beſide. The ſides moreouer of theſe canals or trenches,are kept in with planks and bourds,and the ſame borne vpon arches pendant through ſteep places,that by this means the canale may haue paſſage and void away at length out of the land into the ſea.

Lo what a worke it is to ſearch out and meet with gold! and verily by this means Spaine is grown mightily in wealth,and ful of treaſure. In the former work alſo of ſinking pits for gold, an infinit deale of labour there is to lade out the water that riſeth vpon the workemen, for feare it choke vp the pits; for to preuent which inconuenience,they deriue it by other drains. As touB ching the gold gotten by cleauing and opening mountains (which kind of work I called Arrugia) it needeth no trying by the bloome-ſmithie, for fine it is naturally & pure of it ſelfe: and found there be whole lumps and maſſes of this kind,and in this manner. In pits likewiſe ye ſhal haue ſuch pieces,weying otherwhiles ten pounds and more. Theſe groſſe and maſſie pieces of gold,the Spaniards call Palacræ or Palacranæ: but if they be but ſmall,they haue a prety name for them,and that is Baluces. But to come again to the ſhrub or plant Vlex,whereof I ſpake before; after it is once dried,they burn it,and the aſhes that come thereof, they waſh ouer turfs of greene graſſe,that the ſubſtance of gold may reſt and ſettle therupon. Some writers haue reported,that the countries of Aſturia, Gallæcia,and Luſitania,were wont to yeeld euery yere 20000 pound weight of good gold gotten after this ſort: yet ſo, as they all doe attribute the greateſt C proportion thereof to Aſturia:and there is not any part of the world comparable to it either for ſo great fertility of mines,or ſo long continuance,holding out as they do ſo many ages. As for Italy,our antient Senat in old time thought good to haue it ſpared, and they made an Act, forbidding expreſſely to break any ground for mines: otherwiſe there is not,I dare be bold to ſay, a land more plentifull in gold and other mettals. And here there commeth to my remembrance an Act of the Cenſors extant vpon record,as touching the gold mine of Ictimulum, a towne in the territory or countrey of Vercelles; which Act contained an inhibition, that the publicanes who fermed that mine of the city, ſhould not keepe aboue fiue thouſand pioners together at worke there.

Moreouer,there is one deuiſe to make artificiall gold,to wit,of Orpiment,a minerall digged D out of the ground in Syria,where it lyeth very ebbe,and the painters vſe it much:in colour it reſembleth gold,but brittle it is in ſubſtance like as glaſſe ſtones. And verily *Caligula* the Emperour (a couetous prince and greedy of gold) was in great hope to extract gold out of this minerall,and thereupon cauſed a huge maſſe thereof to bee boiled, melted,and calcined:and in truth he made therof moſt excellent gold,but in ſo ſmal a quantity,that it would not quit for the coſt & pains about it; inſomuch,as he loſt by the bargain:yet his auarice was ſuch,as he would needs make the experiment,notwithſtanding that orpiment it ſelfe was worth fourteene deniers the pound:but he ſped ſo bad,that no man afterwards would go about to try the like concluſion.

Gold vntried is of a diuers touch; & generally there is not any but it hath ſiluer in it more or leſſe:for in ſome places,the gold ore hath a tenth part in weight of ſiluer,in others a ninth, and E there is again that hath a mixture of the eight part. In one gold mine within France,called Albicrarenſe,there is found in gold the 36 part of ſiluer,and no more:ſuch mettall is not elſwhere found to my knowledge,and therefore it paſſeth all other whatſoeuer.

There is a baſe kind of pale and whitiſh gold,which hath in it a fifth part of ſiluer:and wherſoeuer this is found,they call it Electrum. Such mettall lieth commonly in trenches and pits minerall, and namely with that gold which I called before Canalienſe. Moreouer,there is an artificiall Electrum made,namely,by intermingling gold with ſiluer according to the naturall mixture; but if it exceed that proportion of one part to fiue,it wil not abide the hammer and the anuill. This white gold alſo hath bin of great account,time out of mind,as may appeare by the teſtimony of the Poet *Homer*, who writeth, that the pallace of prince *Menelaus* glittered with F gold,electrum,ſiluer,and yvorie. At Lindos (a city within the Iſland of the Rhodians) there is the temple of *Minerua*,wherein Lady *Helena* did dedicate vnto that goddeſſe a cup made of Electrum:and as the ſtory ſaith moreouer,it was framed and wrought juſt to the proportion & bigneſſe of one of her own paps. This property hath Electrum naturally, To ſhine by candle-light more cleare and bright than ſiluer. This ſingularitie and proper vertue it hath beſides (if it

be naturall) to diſcouer and ſhew any poiſon: for be there poiſon in a cup of this mettall, a man ſhal ſee therein certain ſemicircles reſembling rainbows, & perceiue beſides the liquor to keep a hiſſing and ſparkling noiſe as the fire doth; which 2 ſigns do certainly giue warning of poiſon. G

As touching ſtatues of gold: it is ſaid, that the firſt image that euer was knowne to be ſolid and maſſie, was that of the goddeſſe *Diana* ſyrnamed *Anaitis*, which ſtood within a temple dedicated to her, which in my Coſmography I haue ſignified vnder that name, and this was before any braſen ſtatue of that making. This temple in thoſe parts was accounted in regard of the diuine power of this goddeſſe, moſt holy and ſacred; and ſuch a kind of Image they cal Holoſphyraton. Howbeit, as religious as the church was, *Antonie* in his voiage into Parthia, ſpoiled it, and carried away the ſaid Image. And here I cannot forget to put downe a pretty ſpeech, which (by report) an old gentleman and ſouldier of Bononie deliuered to *Auguſtus Cæſar*, at what time as he was entertained as a gueſt and ſupped with the ſaid Emperour at his owne table: for beeing asked by *Auguſtus*, whether it was true, that the man who firſt violated this goddeſſe, died blind, lame, and bereaued of all his lims? he anſwered, Yea ſir, that it is; and that me thinks you ſhould know beſt, for euen now a leg of his you haue at ſupper, and * all your wealth beſides is come to you by that ſaccage. H

* For *Auguſtus Cæſar* defeited *Antony*, & was mightily enriched by the ſpoile of him.

The firſt man that * cauſed his owne ſtatue to be made of gold, and the ſame ſolid & maſſie, was *Gorgias Leontinus* the great Orator and Rhetoritian, which (to immortalize his owne name) he ſet vp in the temple at Delphos; and this was about the 70 Olympias: whereby we may ſee what wealth and gain was gotten in thoſe daies by teaching Oratory and the Art of Rhetorick.

* And yet other writers ſay, that al Greece erected that image to honor him withall.

But to come at length vnto the medicinable vertues of gold: certes, diuers waies effectuall it is in the cure of many diſeaſes: for firſt of all, ſoueraign it is for green wounds, if it be outwardly applied: and if yong children weare it about them, leſſe harme ſhal they haue by any ſorcery, witchcraft, or inchantments, that be brought into the houſe, or practiſed where they are: howbeit, gold it ſelfe if it be carried ouer one, is thought to be miſchieuous and hurtfull: for in that ſort it doth harme alſo to hens that couve and ſit, or ews that are great with lambe and ready to yeane. But what is the remedy to preuent this miſchiefe? marry take the ſame gold that is thus brought in place to do a ſhrewd turn, waſh it well, and with that water beſprinkle them that you would cure. Moreouer, gold may be torrified once with cornes of ſalt taken to the triple weight thereof; and a ſecond time with two parts of ſalt, and one of the ſtone which they call Schiſtis: by this manner of preparing, all the venomous and hurtfull quality that is therein, it doth tranſfuſe into the other things that be calcined or burnt therewith (which muſt be done vpon an earthen veſſell) and it ſelfe continueth pure and incorrupt ſtill. Now the reſt of the aſhes ſeparated from the gold, ſaued in an earthen pot, and incorporat with water into the forme of a liniment, healeth the foule tettar that appeareth in the face: it cureth the ſame diſeaſe alſo, if the face be rubbed with the ſaid aſhes and beane floure together, but then it muſt be afterwards waſhed off. Theſe aſhes thus prepared, cure the hollow vlcers called fiſtuloes, and alſo the hæmorrhoids: but in caſe you put thereto the * floure of ſalnitre, it healeth corrupt and putrified vlcers, & ſuch as ſtink again: the ſame being boiled in hony with Nigella Romana, doth gently looſe the belly, if the naual be anointed therwith. To conclude, *M. Varro* ſaith, that gold wil cauſe werts to fal off. I K L

* *Nitriſpuma*, or *Aphronitrũ*, i. Sal-petre.

Chap. V.

¶ *Of Borras, and the ſix medicinable properties that it hath: the wonderfull Nature thereof in ſodring one mettall with another, and in bringing all mettals to their perfection.*

Chryſocolla, called otherwiſe Borax, or green earth, is found in thoſe pits and mines that are digged for gold: and a humor it is at the firſt, running along the veine of gold, which as it thickneth and groweth muddy, congealeth at length by the extreame cold of winter to the hardneſſe of a pumiſh ſtone. Howbeit, the beſt kind of Borax we haue known by experience to be ingendred in mines of braſſe; and the next to it for goodnes, in thoſe of ſiluer: otherwhiles alſo men meet withal in leaden mines, but the ſame is not ſo good as that which the gold mines doe yeeld. Moreouer, there may be an artificiall Borras made in all the ſaid mettall mines, but far inferior to that which is naturall; namely, by letting water gently to run among their veines all winter long vntill the month of Iune: the which water, in Iune & Iuly wil grow to be dry and M

prooue

20030
copy 1

A prooue Borras; whereby a man may perceiue plainely, that Borras is nothing els but a putrified vein of mettall. But this Minerall, if it be of the own kind, differeth from this other which is made by art of man, eſpecially in hardneſſe, for much harder it is, and called the yellow Borax, or in Latine Lutea: and yet it may be brought to that colour by artificiall means, namely by dying with an herb called likewiſe *Lutea: for of this nature it is, that it will take color & drink it in, as well as linnen or woollen. But for to dreſſe and prepare it for the purpoſe; firſt, they pun it, in a morter, then they let it paſſe through a fine ſerce; afterwards it is ground or beaten againe, & ſo it is ſerced a ſecond time through a finer ſerce; whatſoeuer paſſeth not through, but remaineth behind, muſt be punned once more in a mortar, & ſo ground into a ſmall pouder: and euer as they haue reduced any into pouder, they put it into ſundry pots or cruſes: then they let the B ſame to lie enfuſed and ſoked in vinegre, till the hardnes therin be wholly reſolued: which done, to the mortar it goeth againe, where it muſt be throughly ſtamped for altogether, and ſo when it is well waſhed out of one trey or boll into another, they let it dry: after it is thus prepared they giue it a colour with the herb Lutea (beforeſaid) and alume de plume: and thus you ſee it muſt be painted and died firſt, before it ſelfe ſerue to paint or die withall. And herein it skilleth much how pliable & apt it is to receiue the ſaid color; for vnleſſe it haue willingly taken a deep tincture, they vſe to put therto Schytanum and Turbyſtum, for ſo they call two drugs which ſerue to make it take a color the better. This Borax thus died, our painters vſe to call Orobitis: and two kinds they make therof; to wit, Lutea, *i.* the yellow, which they keep for the pouder or colour *Lomuntum; the other liquid, namely when the ſaid grains or pellets be reſolued into a C kind of moiſture, like drops of ſweat. This Borax of both ſorts, is made in the Iſle Cypros. The principall and beſt of all other comes from Armenia: in a ſecond degree, from Macedonia: but the greateſt quantity therof is in Spain. The excellent Borax is known by this mark eſpecially, If it reſemble perfectly in colour the deep and full green that is in the blade of corn wel liking. In our time, & namely in the daies of the Emperor *Nero*, the floore of the grand cirque or ſhew-place at Rome, was ſeen paued all ouer with greene Boras, at what time as he exhibited goodly fights and paſtimes to the people; and namely, when he meant himſelfe to run a race with charriots, and took pleaſure to driue his horſes vpon a ground ſutable to the colour of the cloth or liuerie that he *wore himſelf at that time: and in truth, a world of workemen he brought thither to lay the ſaid pauing. Al the ſorts of Boras may be reduced into three diſtinct kinds: to wit, the D rough, valued at ſeuen denarij a pound; the meane, which is worth fiue; and the poudred Boras, called alſo the graſſe-green Borax, which coſteth not aboue three deniers the pound. As for the ſandie or poudred Boras, the painters before they vſe it, lay the firſt ground vnderneath it, of vitrioll and *Parætonium, and then the Borax aloft: for theſe things take it paſſing well, & beſides giue a pleaſant luſtre to the color. This Parætonium (for that it is moſt fattie & vnctious by nature, & for the ſmoothnes beſides moſt apt to ſticke too and take hold) ought to be laid firſt; vpon which muſt follow a courſe of the vitrioll ouer it, for feare leaſt the whitenes of the foreſaid Parætonium do pall the greeneſſe of the Borax, which is to make the third coat. As for the Borax called Lutea, ſome thinke it tooke that name of the herbe Lutea; which alſo, if it be mixed and tempered with azure or blew, maketh a greene, which many do lay and paint withall in ſtead E of Borax; which as it is the cheapeſt greene of all other, ſo is it a moſt deceitfull colour.

Borax doth not onely ſerue painters, but is much vſed alſo by Phyſicians; and namely, to mundifie wounds and vlcers, if it be made into a ſalue with wax and oile: and dry as it is of it ſelfe in pouder, it hath a deſiccatiue qualitie, and doth conglutinat and ſodder very well: being mixed with hony into an electuarie, they giue it inwardly vnto thoſe that haue the ſquinancie, and cannot draw their wind but ſitting vpright, and ſo it prouoketh vomit. Moreouer, it entreth into many collyries or eie-ſalues, eſpecially to conſume and diſcuſſe the cicatrices and filmes growing within the eie: it goeth alſo to the making of green plaſters, ſuch as be applied either to mitigat paine, or to heale the skin. And verily this Borax not artificially died, thus emploied in Phyſick, the Phyſicians call Aceſin; and is not that which men name Orobitis, and which F receiueth a tincture from mans hand.

Furthermore, there is a Borax or Chryſocolla, that goldſmiths occupie eſpecially about ſodring their gold: & of this kind al the reſt take the name alſo of Chryſocolla. This is altogether artificiall, and is made of Cyprian Verdegris or ruſt of braſſe, the vrin of a yong lad, and ſalnitre, tempered all togeather & incorporat in a braſen morter, ſtamped with a peſtill of the ſame mettall.

* Some take it to be weld or yellows.

* *Lomuntum*, See the beginning of the next booke.

* For ſome were called *Praſſina* that ran for the priſe, *i.* Greenkins.

* A kind of chalkie earth, or clay, growing neare the ſea ſhore.

* Wherevpon it tooke the name *Chryſocolla*, *i.* gold, glew, or ſodet.

tall. Our countrymen in Latin call this Borax Santerna: with it they vſe to ſodder that gold e- G
ſpecially which ſtandeth much vpon ſiluer, and is therefore called Argentoſum. This kind of gold may be known thus; namely, if it will look bright and cleare vpon the putting of Santerna to it: whereas contrariwiſe if it hold much vpon braſſe (and ſuch gold is named Æroſum) it will haue no luſtre at all, but looke dim and duskiſh vpon the laying of Borax vpon it, and beſides will hardly be ſodred. But to ſoder ſuch gold, there is a proper glue or ſoder made, with an addition of gold and the ſeuenth part of ſiluer to the reſt abouenamed, and all the ſame ſtamped and vnited together. And ſince I am entred into the feat of ſodring, it were very meet and conuenient to annex vnto this preſent diſcourſe, all things els concerning it, that we may vnder one view behold the admirable works of Nature in this kind. The ſoder of gold then is Borax, which I haue ſhewed already. Iron is ſodred with the ſtiffe potters cley Argilla. Braſſe ore or Chalamine called Cadmia, ſerues to vnite and knit pieces of braſſe together in maſſe. Alume is good H
to hold plates of braſſe one to another. Roſin doth ſoder lead, and beſides is the proper cement of marble: but black lead will joine well, by the means of the *white: and one piece of tin with another, with the helpe of oile. In like manner, tin will hold ſure with a ſoder of braſſe file-duſt; and ſiluer, with tin. Both braſſe or copper, & alſo yron ore, melt beſt with an yron made of Pine-wood; as alſo with the Papyr reed in Ægypt: but contrariwiſe gold ſooneſt melts with a fire of chaffe and huls. Quickelime will catch an heat and burne, if water be caſt vpon it, and ſo doth the * Thracian ſtone: but the ſame oile doth quench. Fire is moſt of all extinguiſhed and put out with vinegre, with birdlime, and the white of an egg. No kind of right earth will burn light or flame. Finally, charcole which hath beene once one fire, then quenched and afterwards ſet a burning againe, is of more force and giueth a greater heat, than that which commeth new from I
the earth.

* Some take this for Tinglaſſe.

* Which ſome take for pitcole, or ſeacole rather, ſuch as commeth frō Newcaſtle by ſea: or rather a kind of jeat.

Chap. VI.

¶ *Of Siluer, Quick-ſiluer naturall, Stibium, or Alabaſtrum. The droſſe or refuſe of ſiluer, and litharge of ſiluer.*

IT followeth by good order to write in the next place, of ſiluer mines, from whence proceedeth the ſecond rage that hath ſet men a madding: where firſt and formoſt this is to be noted, that there is but one means to find ſiluer, and that is in pits ſunke of purpoſe for it: neither is there any ſhew at all of ſiluer to giue light thereof, and to put vs in hope of finding: no ſparkes ſhining, like as there be in gold mines which direct vs to it. The earth that engendreth the veine K
of ſiluer, is in one place reddiſh, in another of a dead aſh color. But this is a generall rule, that it is not poſſible to melt and trie our ſiluer ore, but either with lead, or the veine and ore of lead. This minerall or mettall they call * Galena, found for the moſt part neer to the veins and mines of ſiluer. Now by the means of fire, when theſe are melted together, part of the ſiluer ore ſetleth downeward and turneth to be lead, the pure ſiluer floteth aloft, like as oile vpon water. In al our prouinces, yea and parts of the world to ſpeake of, there be mines of ſiluer to be found: howbeit the faireſt be in Spaine, and yeeld the fineſt and moſt beautifull ſiluer: and the ſame alſo like as gold, is engendred in a barraine ſoile otherwiſe and fruitleſſe, and euen within mountains: look alſo where one vein is diſcouered, there is another alwaies found not farre off: which is a rule obſerued not in mines of ſiluer only, but alſo in all others of what mettals ſoeuer; and hereupon L
it ſeemeth that the Greekes doe call them * Metalla. And verily, ſtrange it is and wonderfull, that the mines of ſiluer in Spaine which were ſo long agoe begun by *Anniball*, ſhould continue ſtill as they do, and retaine the names of thoſe Carthaginians who firſt found, diſcouered and brought them to light: of which, one named then Bebelo, & ſo called at this day, yeelded vnto *Anniball* daily 300 pound weight; which mine euen at that time had gone vnder the ground and hollowed the mountain a good mile and a halfe: and all that way the Aquitans at this day ſtanding iu water, lade the ſame vp, labouring night and day by the candle or lampe-light, euery man in his turne, and during the burning of a certaine meaſure of oile, in ſuch wiſe as they diuert the water from thence, and make a good big riuer thereof, to paſſe and run another way. M
A veine of ſiluer which lieth but ebb within the ground, and is there diſcouered, the miners call Crudaria, as it were a raw vein. In old time thoſe that digged for ſiluer, if they met once with allum, were wont to giue ouer their worke and ſeeke no farther: but of late daies it happened, that vnder alume there was found a veine of white braſſe or laton, which fed mens hopes ſtill,

* or, *Molybdæna*.

A and cauſe them now to ſink lower,and neuer reſt ſo far as they can dig. And yet there is a damp or vapor breathing out of ſiluer mines, hurtfull to all liuing creatures, and to dogs eſpecially. Moreouer,this point is well to be marked,that gold and ſiluer both, the ſofter that they be and tender,the better they are eſteemed: and ſiluer being white as it is, moſt men maruell how it commeth to paſſe,that if one rule paper or any thing therewith,it will draw black lines & ſully as it doth.

Furthermore,within theſe veines and mines aboueſaid, there is a certaine ſtone found which yeelds from it an humor continually,& the ſame continues alwaies liquid:men cal it * Quick-ſiluer (howbeit being the bane and poiſon of all things whatſoeuer, it might be called Death-ſiluer well enough) ſo penetrant is this liquor, that there is no veſſel in the world but it wil eat B and breake through it,piercing and paſſing on ſtil,conſuming and waſting as it goes:it ſupports any thing that is caſt into it,and wil not ſuffer it to ſettle downward, but ſwim aloft, vnleſſe it be gold only;that is the only thing which it loueth to draw vnto it and embrace: very proper it is therefore to affine gold; for if gold and it be put together into earthen pots, and after often ſhaking be poured out of one into another,it mightily purifies the gold& caſts forth al the filthy excrements thereof; and when it hath rid away all the impurities and groſſe refuſe, it ſelfe ought then to be ſeparated from the gold: for which purpoſe poured forth the one & the other ought to be,vpon certaine skinnes of leather well tewed and dreſſed vntill they be ſoft,through which the quick-ſiluer may paſſe: and then ſhall you ſee it ſtand in drops vpon the other ſide like ſweat ſent out by the pores of our skin,leauing the gold pure and fine behind it: and verily C the affinitie betwixt gold & quick-ſiluer is ſo great,that if any veſſels or pieces of braſſe are to be gilded,rub the ſame ouer firſt with quick-ſiluer before the gold foile be laid on, it will hold the ſame moſt ſurely:mary this one diſcommodity there is in it,that if the leaues of gold be either ſingle or very thin,the whiteneſſe of the quicke-ſiluer will appeare through, and make the gilding more pale and wan: wherefore our cunning goldſmiths who would make their Chapmen to pay for their plate as double gilt,when it is indeed but thin laid and ſingle,and ſo picke their purſes,ſet a rich and deep colour vpon their work for the time,by laying vnder the gold in ſtead of quick-ſiluer natural,the white of an egg,and then vpon it artificial quick-ſiluer named Hydragyrum, whereof I purpoſe to write in place conuenient. And to ſay a truth, the right quick-ſiluer which is of the own kind,is not commonly found in great plenty.

* or Life ſiluer

D Ouer and beſides,within the ſame mines and among the veines of ſiluer,there is found a minerall,which to ſpeak properly is a ſtone concrete of a certain ſcum or fome,white and ſhining, howbeit not tranſparent,which is called by ſome Stimmi,by others * Stibium, Alabaſtrum,or Larbaſon:and hereof there be two kinds,the male and the female;but the female Antimony or Stibium is the better eſteemed: for the male is more rude,rough,and rugged,& yet for all that not ſo weighty,bright and radiant; beſides that, it is more charged with ſand: whereas the female contrariwiſe ſhineth and glittereth plentifully,being alſo brittle & tender, apt to cleaue eaſily into plates or flakes,and not to breake into lumps and gobbets.

* We call it *Antimonium.*

Touching the vertues of Stibium pertinent vnto phyſick,aſtringent it is and refrigerant,but a principal and peculiar medicine to be imployed about the eies; for therupon it was that moſt E men called it Platyophthalmon,for that being put into thoſe ointments that are to * beautifie the eies of women,(named thereupon Calliblephara) it ſeemes to extend the compaſſe of the eies,and make them appeare open,faire,and * large withall. Antimonie pulueriſed and incorporat with the pouder of frankincenſe,by the means of gum withall, ſtaieth the flux of humors into the eyes, and healeth the fretting and exulcerations incident thereto: being otherwiſe a proper medicine to ſtaunch the bloud that guſheth or iſſueth from the braine. But for to ſtop the bleeding of any freſh wound, the pouder of Antimony alone is thought to be more effectuall if the place be ſtrewed withal: which alſo is a ſingular thing to heal the old bitings of dogs. It cureth moreouer any burn occaſioned by fire, in caſe it be tempered in ſome conuenient ſuet and wax, with Litharge of ſiluer, and Ceruſe or White lead, and ſo reduced into a ſalue. But F for to prepare Antimonie aright, it ought to be well luted all ouer with a certain kinde of paſte made of Cow-dung,and then dunged and calcined in an ouen; which beeing done,to bee quenched with Womans milke, and then ſtamped and brayed very well in a mortar, putting thereunto raine water alſo among, and euer and anon the troubled water ought to bee transfuſed into a veſſell of braſſe,and clarified therein together with Sal-nitre. As for that which ſetled in

* And therfore *Ion* called it μίλανας ὀμμα ἰμμαινχέφω, when he reckons vp the deuices that *Qu. Ompbale* had to paint and trim her ſelfe.

* Which was eſteemed a grace in old time,as may appeare by *Homer*, who giueth vnto *Qu. Iuno* the Epithet of βοῶπις, (id eſt) broad eyed, as is a Cow or Heifer.

the bottome of the mortar, is held to be the droſſe and dregs thereof, ſtanding moſt vpon lead, G
and is throwne away as good for nothing: but the pot or veſſell whereinto the troubled water aforeſaid was poured, after it is well couered and ſtopped with a linnen cloth, muſt be ſuffred to ſtand all night to take a ſetling; and the next morrow that which floteth aloft is to be poured out by little and little, and the reſt of the liquor to be ſoked forth with ſpunges, and ſeparated from the Antimonie. Now, that which reſteth in the bottom is taken to be the floure of Antimonie, and ſo called; which they lay forth in the Snn a drying, couered with a fine linnen cloth that it ſhould not be ouermuch dried: which done, they beat this fine floure againe in a mortar, and ſo reduce it into trochiskes. But in this operation of preparing antimonie, aboue all things regard would be had in the burning thereof, that it be not ouermuch calcined, and ſo turne into lead. Some in the burning of antimonie vſe not dung, as is beforeſaid, but rather lap the ſame about with ſome greaſe or tallow: others, after it is well beat and punned, ſtreine it with water H
through a threefold linnen cloth, & caſt away the dregs remaining behind: but the liquor that paſſed through, they poure out of one veſſel into another, and the reſidence alwaies they gather and ſaue, which they mix in the compoſition of plaiſters and eie-ſalues, or collyries.

As touching the droſſe or refuſe in ſiluer, the Greeks call it Helcyſma: the nature thereof is reſtringent & refrigeratiue: it entreth into plaiſtres like as lead ore doth (which is named Molybdæna, and whereof I intend to write in my treatiſe of lead) eſpecially thoſe that are made to heale, cicatrice, and skin. Alſo being injected by way of cliſtre with oile of myrtles, it cureth tineſms and dyſenteries. It is vſed much alſo in thoſe lenitiue and vncteous plaiſtres named Lipatæ, and ſerueth likewiſe for the excreſcence of proud fleſh in vlcers, & for thoſe exulcerations which come of rubbing and fretting, or the running ſores and ſcalls in the head. I

Within the mettal mines aforeſaid there is ingendred another minerall, known by the name of Spuma argenti [*i.* the ſome of ſiluer] commonly called litharge, & three ſorts there be found of it. The beſt litharge, of gold, which they call Chryſitis: the ſecond, of ſiluer, named Argyritis: and a third of lead, which is Molybditis: and many times all theſe kinds ſo diſtinct in color, are found in one and the ſame lump or puffed loaf of litharge. The beſt litharge is brought out of the region Attica: the next in goodneſſe comes from Spain. Litharge of gold, named Chryſitis, is made of the very mine and vein of ſiluer; Argyritis, of ſiluer it ſelfe; and Molybditis, of the lead which is melted with the ſiluer: as wee may ſee at Puteoli, where great ſtore of it is made, and of that place took the name Puteolana. All the ſorts of them are made, after that the mettal or matter appropriat vnto them, is throughly melted and tried; for it runneth downe from K
the vpper pan into that vnderneath, out of which it is taken vp with iron broches; and to the end that it might be of a ſmall weight, ſome wind it about the broch in the very flame of the furnace; and as it may appeare by the very * name, it is no other thing but the ſcum of the ore or mettal boiling and melting ouer the furnace: from droſſe it differeth as much as ſcum or froth aboue, may from dregges or lees beneath: and as the one is an excrement caſt vp from a matter whiles it is purging it ſelfe, ſo the other is the refuſe or grounds thereof after it is purged and ſetled. Howbeit many there bee who make but two kindes of this ſome or litharge; the one
* Spuma argenti. * Stereſitis, as it were ſolid and maſſiue; the other * Peumene, as one would ſay, puffed vp and
* or rather, Stereoma. full of wind. As for the third named Molybdæna, they reckon as a thing by it ſelfe, to be treated of in the diſcourſe or chapter of lead. Now the litharge aboueſaid ought for the vſe that it L
is emploied about, for to be prepared in this manner: firſt the lumps aforeſaid are to be broken into ſmall pieces as big as Haſel nuts, and ſet ouer the fire againe: thus when it is once red hot by the blaſt of bellows, to the end that the coles and cinders might be ſeparated one from another, there is wine or vineger caſt vpon it, both to waſh, & alſo withall to quench the ſame. Now if it be Argyritis, to the end it may look the whiter, they vſe to break it to the bignes of beans, and giue order to ſeeth it in water within an earthen pot, putting thereto wheat and barly lapped within pieces of new linnen cloth, and ſuffer them to boil therwith till they * burſt: which
* Rumpuntur. done, for ſix dayes together they put it in mortars, waſhing it thrice euery day in cold water, and in the end with hot, and ſo at length put to euery pound of the ſaid Litharge, the weight of one M
Obolus of Sal-gem. The laſt day of all they put it vp into a pot or veſſel of lead. Some there be who ſeeth it with blanched beans and husked barly, and after that dry it in the ſun: others think it better to ſeeth it with beans and white wool, vntill ſuch time as it colour the wooll no more black: then they put thereto Sal-gem, changing eftſoones the water, and dry it for the ſpace of

forty

20030
copy 1

A forty daies together in the hotteſt ſeaſon of the Summer. There be again who think it beſt to ſeeth it in water within a ſwines belly, and when they haue taken it forth, rub it wel with ſal-nitre, and pun it in mortars, as before, with ſalt. Ye ſhall haue them that neuer beſtow ſeething of it, but only beat it with ſalt, and then put water thereto and waſh it. Well, thus prepared as is beforeſaid, it ſerueth for collyries and eie-ſalues; in a liniment alſo, to take away the foule cicatrices or ſcars, the pimples and ſpecks likewiſe that mar the beauty of women, yea & our dames waſh the haire of their head withall, to make it clean and pure. And in very truth, Litharge is of power to dry, mollifie, coole, and attemper; to clenſe alſo, to incarnat vlcers, and to aſſwage or mitigate any tumors. Being reduced into the vnguents or plaiſters aforeſaid, and namely with an addition of rue, myrtles, and vineger, it is ſingular for S. *Anthonies* fire. Semblably, being in-
B corporat with oile of myrtles and wax into a cerot, it healeth kibed heeles.

Chap. VII.

¶ *Of Vermilion; and of what eſtimation it was among the old Romans: the firſt inuention thereof. Of Cinnabaris, the vſe thereof in Pictures and in Phyſicke. The ſundry ſorts of Minium or Vermilion: and how it is to be ordered to ſerue painters.*

C THere is found alſo in ſiluer mines a mineral called Minium, *i.* Vermilion, which is a colour at this day of great price and eſtimation, like as it was in old time: for the antient Romans made exceeding great acount of it, not only for pictures, but alſo for diuers ſacred & holy vſes. And verily *Verrius* alledgeth and rehearſeth many authors, whoſe credit ought not to be diſproued, who affirm, That the maner was in times paſt to paint the very face of *Iupiters* image on high and feſtiual daies with Vermilion: as alſo, that the valiant captains who rode in triumphant maner into Rome, had in former times their bodies * coloured all ouer therewith: after which manner (they ſay) noble *Camillus* entred the city in triumph. And euen to this day, according to that antient and religious cuſtom, ordinary it is, to colour all the vnguents that are vſed in a feſtiuall ſupper at a ſolemne triumph, with Vermilion. And no one thing doe the Cenſors
D giue charge and order for to be done, at their entrance into office, before the painting of *Iupiters* viſage with Minium. The cauſe and motiue that ſhould induce our anceſtors to this ceremony I maruel much at, and canot imagin what it ſhould be. True it is and well known, that in theſe daies the Æthiopians in generall ſet much ſtore by this colour, and haue it in great requeſt, inſomuch as not onely the Princes and great Lords of thoſe countries haue their bodies ſtained throughout therewith, but alſo the images of their gods are painted with no other colour: in which regard I am moued to diſcourſe more curiouſly and at large of all particulars that may concerne it.

Theophraſtus ſaith, that 90 years before *Praxibulus* was eſtabliſhed chiefe ruler of the Athenians (which falls out iuſt vpon the 249 yere after the foundation of our city of Rome) *Callias* the
E Athenian was the firſt that deuiſed the vſe of Vermilion, and brought the liuely colour thereof into name: for, finding a kinde of red earth or ſandy grit in the mines of ſiluer, and hoping that by circulation there might be gold extracted out of it, he tried what he could do by fire, and ſo by that means brought it vnto that freſh and pleaſant hue that it hath: which was the firſt original of Vermilion. Hee ſaith moreouer, That euen in thoſe daies there was found Minium in Spain, but the ſame was hard and full of gritty ſand. Likewiſe among the Colchi, in a certaine rock inacceſſible; by reaſon whereof the people of the country were conſtrained by ſhooting at it, to ſhake and driue it down: howbeit the ſame was but a baſtard Minium. But the beſt ſimply (ſaith he) was gotten in the territorie of the Cilbians, ſomewhat higher in the country than Epheſus: in ſum, That the ſaid Minium or Vermilion is a certaine ſandy earth of a deepe ſcarlet
F colour, which was prepared in this order: firſt they pun and beat it into pouder, and then waſhed it being thus pulueriſed. Afterwards, that which ſetled in the bottom they waſhed a ſecond time. In which artificiall handling of Minium this difference there is, that ſome make perfect Vermilion of it with the firſt waſhing: others think the Vermilion of that making to be too pale and weake in colour, and therefore hold that of the ſecond waſhing to be beſt. And verily

* To ſhew the bloudy battels they had fought, and what carnage of their Enemies they had made: for without much effuſion and drawing of their bloud they might not triumph.

I won-

I wonder not that this colour was ſo highly eſteemed: for euen beforetime during the ſtate of Troy, the red earth called Rubrica was in great requeſt, as appeareth by the teſtimony of *Homer*; who being otherwiſe ſpary enough in ſpeaking of pictures & colours, yet commends the ſhips * painted therwith. The Greeks call our Minium by the name of Miltos, and yet ſome terme it Cinnabari: and hereof aroſe the error occaſioned by the Indian name Cinnabari. For ſo the Indians call the bloudy ſubſtance of a dragon, cruſhed and ſqueeſed with the weight of the Elephants lying vpon them ready to die, to wit, when the ſaid dragons are full with ſucking out the Elephants bloud before: and now their owne and it are mingled together, according as I haue ſhewed before in the ſtory of thoſe beaſts. And verily there is not a color beſides, which expreſſeth the liuely colour of bloud in pictures ſo properly as Minium. As for that other Cinnabaris of India, it is moſt wholſom to be put into antidots, preſeruatiues, and countrepoiſons, yea and other ſouerain medicines to be taken inwardly. But our phyſitians (beleeue me) for that by an error Minium or vermilion is called Cinnabaris, vſe in ſtead of Sanguis draconis, the ſaid Minium, which in very truth is no better than a meere poiſon, as I will ſhew anon. Wel, in old time they vſed to draw thoſe pictures and pourtraits which conſiſt of one ſingle colour, and bee called Monochromata, with this colour Cinnabaris. They painted alſo with the Minium of Epheſus, but they gaue it ouer in proceſſe of time, becauſe ſuch colors were ſo coſtly, & required ſuch pains ere they were prepared and made perfect. Beſides, both the one and the other were thought to be ouer-quick and ſtinging in hand; and therfore they betook themſelues to the red earth Rubrica and Sinopis, of which colours I will ſpeak more in their proper places. But to returne again to Cinnabaris or Sangdragon, it is ſophiſticated and corrupted either with Goats bloud, or elſe with the fruit of Seruoiſes punned. But the true Cinnabaris or Sangdragon is worth fifty Seſterces by the pound. As for Minium or Vermilion aforeſaid, K. *Iuba* ſaith, that it groweth plentifully alſo in Carmania. And *Hermogenes* affirmeth, that Æthiopia likewiſe is not without good ſtore of it. But from neither of thoſe two countries is it brought vnto vs, nor (to ſay a truth) out of any other place but Spain. The beſt and moſt excellent is that which comes out of the territory of Siſapone in the Realm of Granada or Bœtica a part of Spain, euen from a Mine of Vermilion there, which payeth a great cuſtome, and yeelds much reuenue to the people of Rome: and there is nothing looked to more ſtreightly for feare of fraud and impoſture; for lawfull it is not there to dreſſe and refine it, but vncocted and crude is it brought to Rome in the maſſe as it lay within the vein, ſealed by the ſworn maſters of the mine, which yeelds one yeare with another 10000 pound weight or much thereabout. At Rome it is waſhed, and a price there is ſet vpon it by an expreſſe Act, namely, That it ſhould not be ſold aboue ſeuentie deniers the pound. But many wayes is it ſophiſticated, whereby the ſocietie and fellowſhip of the Publicanes, who had the ordering of it at Rome, robbed the Commonweale, and gained themſelues. For a ſecond kind there is of Minium, found almoſt in euerie mine of ſiluer & lead, the which is made of a certain ſtone intermingled in the veins of thoſe mettals after the ſame is burnt; and not of that red ſtone which yeeldeth forth the humor that I named before Quickeſiluer: for this ſtone may it ſelfe by boiling be brought to ſiluer, but of other red pieces of earth found together with the ſaid true Vermilion, which are knowne to be barraine and void of the right Vermilion, onely by the leaden hue which they haue: for vnleſſe it be in the furnace they neuer wax red, and then being fully burnt and calcined, they are beaten to pouder. This is that Minium of a ſecond ſort, and much inferiour vnto thoſe naturall pouders and ſands of the true Minium, notwithſtanding very few there bee that know it. Well, this is that Minium wherewith the true Vermilion is ſophiſticated in the Worke-houſes and ſhops of thoſe Publicanes, whoſe Companie and Fellowſhip had the ordering of it; like as it is corrupted alſo with Scyricum. But how this colour Scyricum is made I will in due place write hereafter. Certes our painters, to giue the better luſtre vnto Minium, yea and to ſaue charges, haue deuiſed to lay the firſt ground vnder it of this Scyricum. Beſides this, they haue another caſt to gain (or ſteale rather) by Minium; for by reaſon that it ſticketh to their penſils euer and anon, they waſh it off when they be full: this ſetleth down to the bottom of the water, where it remaines, and the painters take it for their auailes; but they were as good pick their maſters purſe who ſetteth them aworke. But if a man would know the true and ſincere Vermilion indeed, it ought to haue the rich and freſh colour of skarlet. As for the brightneſſe that is in the ſecond ſort, if a wall bee painted therewith, the naturall moiſture and dankeneſſe that commeth from thence will abate the

* Such are called by *Homer*, μιλτοβρεῖς.

20030
copy 1

A the luſtre ſoon. And yet this Minium is taken to be but a kind of ruſt in mettals, either ſiluer or lead, as they lie in the mines. Moreouer, the minerall Vermilion found naturally in the foreſaid Minium mines of Siſapona, haue no ſiluer mixed therwith, boyle and trie it in the fire as much as you will. Alſo the way to find true Minium from falſe, is by the means of gold: for touch the ſophiſticat Minium with a piece of gold red hot, it will wax blacke, whereas the true Minium keepeth colour ſtill. [Where by the way note, That I read it may be falſified with Quicklime:] And after the ſame maner, if there be no gold at hand to trie it by, you ſhal ſoon ſee the proofe and find the falſehood by a plate of yron red hot, and vſed accordingly. Furthermore this hath beene obſerued, That the ſhining beams either of Sun or Moone, do much hurt to the luſtre of Vermillion, or any thing painted therewith. But what meanes to preuent this inconuenience?

B Euen to verniſh the wall after the colour is dried vpon it in this manner: Take white Punicke wax, melt it with oyle, and while it is hot, waſh the ſaid painting all ouer with penſils or fine bruſhes of briſtles, wet in the ſaid verniſh. But when this vermiſh is laid on, it muſt be well chafed & heat again with red hot coales made of Gall-nuts held cloſe to it, that the wall may ſweat and frie again: which done, it ought afterwards to be rubbed ouer well with cerecloths, and laſt of all, with cleane linnen cloths, that it may ſhine again and be ſlicke as ſtatues of marble be.

Moreouer, the workemen that are emploied in their ſhops about the making of Vermillion, doe bind vnto their faces in manner of Maskes, large bladders, that they may take and deliuer their wind at libertie, and yet not be in danger of drawing in with their breath that pernicious and deadly pouder, which is no better than poyſon: yet ſo, as they may ſee out of the ſaid

C masks neuertheleſſe.

To conclude, Vermillion is vſed much in limming the titles and inſcriptions of roles and books, it ſetteth forth the letters alſo, and maketh them more faire and beautifull which are written in tables ouer ſepulchres, be they enriched otherwiſe either with gold or marble ſtone.

Chap. VIII.

¶ *Of quickſilver artificiall, called Hydragyrum. Of guilding ſiluer. Of Touch-ſtones for to trie the diuerſe kinds of ſiluer.*

D So inuentiue is the wit of man, that there hath beene deuiſed in the world a means to make an artificiall Quickſiluer in ſtead of the true and natural, and that out of the ſecond kind of Minium which before I called Secundarium. I ſhould erewhile haue ſpoken therof in the chapter of the right Quickſiluer, but deferred it I haue no further than to this preſent place. Firſt therfore this is to be vnderſtood, that made it is two maner of waies, ſomtimes of the Minium aforeſaid punned with vinegre in morters, and with peſtles all of braſſe; otherwhiles it is drawn by fire: for they put ſecondarie Vermilion in an earthen pot wel luted all ouer with cley, vpon which is there ſet a pan of yron, & the ſame couered ouer the head with another pot, well cemented, vnder which earthen pot abouenamed, there ought to be a good fire made, & the ſame kept continually with blowing: and thus by circulation there wil appeare a dew or ſweat in the vppermoſt veſſel proceeding from the vapors reſolued, which being wiped off, will in ſubſtance

E ſhew liquid as water and in color reſemble ſiluer: The ſame liquor is eaſie to diuide into drops, and as apt again by the lubricitie thereof, to run into an humor. This quickſiluer being by the judgement of all men a rank poyſon, I ſuppoſe, that al things reported of Minium as medicinable, be dangerous remedies, vnleſſe haply that by inunction of the head or belly, it ſtaies all flux of bloud; with this caution and charge notwithſtanding, that it neither perce and enter into the inward noble parts, nor touch the wound: for otherwiſe my conceit is, that it ought not to be vſed. I ſee that now adaies ſiluer only, and in maner nothing els, is guilded by the means of this artificiall Quickſiluer: wheras gold foile ſhould be laid alſo after the ſame maner vpon veſſels, or any workmanſhip of braſſe: but (as I haue beforeſaid) the deceit & fraud that is euery where in the world, which makes men ſo wittie as they be, hath deuiſed other means of guilding, and

F thoſe of leſſe diſpence & charge than with any Quickſiluer, according as I haue before declared

I canot thus write as I do ſo much of gold and ſiluer, but me thinks I muſt of neceſſity ſpeak of the ſtone which they cal in Latin *Coticula, which in times paſt was not vſually found in any place but in the riuer Tmolus, as ſaith *Theophraſtus*: but in theſe daies we find it euery where: ſome call it Heraclius, others Lydius. Now theſe ſtones all the ſort of them are but ſmall, not

* i. The touch-ſtone.

excee-

exceeding foure inches in length,and two in bredth. That part or ſide which lies aboue toward G
the Sunne when it is found,is thought better for touch,than the other which lieth to the earth.
By meanes of theſe touchſtones,our cunning and expert mine-maſters,if they touch any ore of
theſe mettals,which with a pickax or ſoile they haue gotten forth of the veine in the mine,will
tell you by and by how much gold there is in it, how much ſiluer or braſſe, and they will not
miſſe a ſcruple : a wonderfull experiment and the ſame infallible.

As touching ſiluer,two degrees there be of it, different in goodneſſe, which may be knowne
and diſcerned in this maner : For lay a piece of ſiluer ore vpon a ſcliſe, plate,or fire pan of yron
red hot,if it continue white ſtill,it is very good,if the ſame become reddiſh,go it may for good
too in a lower degree;but in caſe it looke blacke,there is no goodnes at all in it. Howbeit,there
is ſome deceit alſo in this triall and experiment : which may croſſe a man in his iudgement:for H
let the ſaid ſcliſe or plate lie a time in a mans vrine,be the ore neuer ſo baſe that is laid thereup-
on when it is burning red hot,it will ſeeme to take a white colour for the time,and deceiue him
that ſhall ſee it. To conclude, there is another pretty proofe of ſiluer fine, if it be brought and
burniſhed,and that is by breathing vpon it : for if the breath be ſeene thereupon preſently as a
ſweat,and the ſame paſſe away incontinently as a cloud,it is a ſigne of perfect ſiluer.

Chap. IX.

¶ *Of mirroirs or looking glaſſes. And of the Ægyptian ſilver.*

AN opinion it was ſomtime generally receiued and beleeued, That no plates might be dri- I
uen by the hammer,nor mirroirs made,but of the beſt and pureſt ſiluer: And euen this ex-
periment is falſified and corrupted by deceit. But ſurely a wonderful thing in Nature this
is of theſe mirroirs of ſiluer,that they ſhould repreſent ſo perfectly the image of any thing that
is before them,as they do:which muſt needs be(as all men confeſſe)by the reuerberation of the
aire from the ſolid body of the mirroir, which being beaten backe againe from it, bringeth
therwith the ſaid image expreſſed therin. The ſame reuerberation is the cauſe that ſuch looking
glaſſes as by much vſage are poliſhed and made ſubtile, doe in that ſort gently driue backe the
image repreſented within them,that it ſeemes infinitely big in proportion of the body it ſelfe:
ſuch difference there is in them,& ſo materiall it is,whether they repercuſſe and reject the aire, K
or receiue and entertaine it. Moreouer, there be drinking cups ſo framed and faſhioned with a
number of mirroirs within,that if there do but one look within them, he ſhall imagine that he
ſaw a multitude of people,euen as many images as there be mirroirs. There are deuiſed looking
glaſſes alſo,which will repreſent monſtrous ſhapes;and ſuch be thoſe mirroirs that are dedica-
ted in the temple at Smyrna:but this comes by reaſon that the matter wherof they be made,is
in that ſort faſhioned. For it skilleth much whether mirroirs be hollow, either in manner of a
drinking pot, or of a Threcidian buckler : whether the middle part lie low and inward, or riſe
and beare out with a bellie : whether they be ſet croſſe and ouerthwart,or ſtand bias, whether
they hang with their heads bending backward, or bolt vpright : For according as the matter
which receiueth the image, is diſpoſed to this or that faſhion, or ſet one way or other, ſo it tur-
neth the ſhadowes back againe:for verily the ſaid image repreſented in a mirroir,is nothing els L
but the brightneſſe and cleareneſſe of the matter which receiueth the ſame,returned and beaten
backe againe. But to go through in this place with all things concerning ſuch looking glaſſes,
the beſt known in old time vnto our anceſtors,came from Brindis,and thoſe conſiſted of tin and
braſſe tempered together. But when ſiluer mirroirs came in place, thoſe went downe, and theſe
were preferred before them. The firſt that made them of ſiluer, was *Praxiteles* in the daies of
Pompey the great. Of late,men had this opinion of ſiluer mirroirs, That they would repreſent an
image more liuely and truly,in caſe their backe part were laid ouer with gold.

But to return again to ſiluer,the Ægiptians vſe a deuiſe to paint it,to the end that they would
drinke more deuoutly,ſeeing their god *Anubis* painted within their pots. And in truth they reſt
contented with painting their plate,and neuer graue or chaſe any pieces. This deuiſe is growne M
into ſuch credit by the precedent receiued from thence, that the ſtatues of ſiluer caried in a
ſhew at triumphs,be nought ſet by,vnleſſe they be alſo enamelled & painted black:& wonder-
full it is how much more pretious they are thought to be when the natiue brightnes thereof, it
hid and the light quite put out or blindfolded. The manner of making this black ſiluer, is thus:

They

20030
copy 1

A They take of siluer and sulphur vif as much of the one as the other, of Cyprian brasse or latton plates (which brasse they call Coronarium) as thin as may be, a third part: these they mix together and melt them in an earthen pot wel luted all ouer with cley: and boile they must so long, vntill the lid of the pot doth rise vp and flie open of it self. Moreouer, siluer wil look black with the yolke of an egge rosted hard and well beaten with vineger and Tripoli.

To come now vnto those that counterfeit mony. *Antonius* whiles hee was one of the three vsurping Triumvirs, mixed yron with the Roman siluer denier. He tempered it also with the brasen coine, and so sent abroad false and counterfeit mony. Others there be that make money too light (namely, vnder the lawful proportion) which is, to coin and stamp for euery pound weight of siluer 84 deniers. This enormity grew to this passe, that *M. Gratidianus* published a law, by
B vertue whereof there was an act instituted and ordained for the proofe and allowance of siluer deniers, what touch and what poise they should haue: by which act of his hee so pleased the Commons of Rome, that there was not a street throughout all the city, but they erected a siluer statue, pourtraied all whole in a gowne in the fauor and honour of *M. Gratidianus*. But strange it is, and a man would not think it, that this art and cunning deuised for the detecting of falshood and forgerie, is the only means to teach deceit and wickednesse, for many a man wil giue too too much for false mony: yea, and many siluer deniers for one counterfeit, well and cleanly made: to take forsooth a pattern thereby, and learne to deceiue others.

CHAP. V.

C ¶ *Of excessiue summes of money in mens hands. Who they were in old time that were thought richest. And when there began largesses at Rome, and mony to be scattered and cast abroad to the people.*

IN old time men knew no number aboue 100000: and therefore at this day also in stead of a million we multiply the said number by ten, and say thus in Latine, *Decies centina millia, i.* A hundred thousand ten times told, and so forward, * repeating alwaies a hundred thousand to the numerall aduerbe, as the sums doth amount. Vsuries, interests, and coined money haue been the cause of these multiplications: and by that occasion also came debts to be called euen vnto
D this age, by the name of *Æs alienum*. And thereof arose the proud name of *Diuites, i.* Rich, for great monied men were so called. Yet take this withall, That the first man that euer was knowne by that syrname * *Diues*, brought a shilling to nine pence in the end, proued Banquerout, & defeated his creditours. As for *M. Crassus*, one of that same house, and who gaue the same armes, would commonly say, That no man was to be counted rich, and worthie of that title *Diues*, vnlesse he were able to dispend by the yeare as much in reuenues as would maintaine a legion of souldiers. And verily his owne lands were esteemed worth *Bis millies sestertium*, that is to say, Two hundred millions of sesterces, Roman: & setting aside *Sylla*, he was the richest Roman that euer was knowne. And yet such was his auarice, that hee could not content himselfe with that wealthy estate, but vpon a hungry desire to haue all the gold of the Parthians, would needes vn-
E dertake a * voiage against them. And albeit by his inestimable wealth he vsurped the title & addition of *Optimus i.* The best, in his time, yet (for me thinks it doth me good to prosecute stil, and inueigh against this insatiable desire of hauing more) we haue known many after him, & those otherwise of base condition, and no better than slaues newly infranchised, to haue growne vnto greater wealth; and namely three at one time, to wit, during the Empire of *Claudius Cæsar*; and those were *Pallas*, *Callistus*, and *Narcissus*, late bond slaues all to the said Emperor. But to let these men passe, as if they were lords still of worldly wealth: in that yeare wherein *C. Asinius Gallus* & *C. Marcius Censorinus* were Consuls of Rome, died *C. Cæcilius Claudius*, who signified by his last will and testament, bearing date the 6 day before the Calends of February, the yere aboue written, That albeit he had sustained exceeding great losses during the troubles of the ciuil war, yet
F he should leaue behind him at the houre of his death, of slaues belonging to his retinue foure thousand one hundred and sixteen; in oxen, three thousand and six hundred yoke; of other cattell 257000 head, and in ready coine, H.S. DC, *i.* threescore millions of sesterces Romane. And besides, he set out for defraying of his funerall charges, * eleuen thousand sesterces, and gaue order expressely, to be enterred so sumptuously. But what of all this? Set case these and such like men

* To wittwentie times, or a hundred times, a hundred thousand, &c.

* *i. Crassus.*

* In which expeditiō he was taken prisoner by *Surinas*, lieutenant general for the king of Parthia: who strake off his head, and poured gold melted into his mouth to satisfie his hūger after it.

* H S. XI. which if you read by the numerall aduerbe (*vndecies*) amounteth to the said sum a hundred times told.

men gathered together innumerable ſums of mony,and an infinit maſſe of goods,yet they ſhall G
come nothing neare to the wealth of K.*Ptolomæus*,who according to the teſtimony of *M.Varro*,
(at what time as *Pompey* the great warred about Iury)maintained 8000 horſmen in pay continu-
ally with his own priuat purſe: kept an ordinary table within his court of a thouſand perſons,
and thoſe had euery man his own cup of gold to drink out of,and at each courſe and change of
meats that came in,new plate was ſerued vp ſtil to the boord.Theſe gueſts of his fared ſo high-
ly,that a man would haue ſaid they had bin franke-fed. But how far ſhort was this mighty and
ſumptuous prince think ye(for I wil ſay no more now of kings) in compariſon of one *Pythius* a
Bithynian,who ſent to *Darius* the king a Preſent of a Plane-tree, all entire of beaten gold, and
withall, that famous gold Vine, ſo much renowned by all writers: feaſted the whole army of
Vide Budæum that mighty monarch,and thoſe were * 788000 men: promiſing ouer and aboue fiue moneths H
pay for them all,and corne for ſo long to ſerue the whole campe,if of fiue ſons that he had of his
owne,the king would ſpare him but one to beare him company in his old age,and not preſt him
for to ſerue in the wars.Certes,a man that heareth thus much of this *Pythius*, might compare
him with that rich *Cræſus* king of Lydia. But what folly and madneſſe in the diuels name is
this,to hunger and thirſt ſo much in this life after that,which either is common to baſe ſlaues,
and may fall vnto them,or els wherof kings themſelues can find no end? And thus much of ga-
thering good and heaping riches together.

To come now to the ſcattering thereof,I finde in the Chronicles,That in the yeare wherein
Sp. Poſthumius, and *Qu. Martius* were Conſuls, they began at Rome to make largeſſes, and to
fling money abroad to the common people. And at that time ſuch plenty of coine there was I
ſtirring at Rome, that the City beſtowed by a generall contribution vpon *Lu.Scipio*,as much as
bare out his charges in exhibiting the ſolemne games and plaies vnto the people. As for that
purſe which was made for the funerals of *Agrippa Menenius*,wherin euery man put his ſextant,
*i.*the ſixt part of an As, I take it to haue been no Largeſſe, but a beneuolence to teſtifie how the
people honoured *Agrippa*, and a ſupply of meere neceſſitie, conſidering how poore the man
died.

Chap. XI.

¶ *Of the ſuperfluitie and frugality both, of men in times paſt, touching plate and ſiluer veſ-*
ſels.Of beds and tables of ſiluer. Alſo when there were deuiſed chargers and K
platters of Siluer to be made of huge capacity beyond
all meaſure.

THe world is giuen to ſo much inconſtancy as touching ſiluer plate, that a wonder it is to
ſee the nature of men how variable they be in the faſhion and making of ſuch veſſel:for no
workmanſhip wil pleaſe them long.One while we muſt haue our plate out of *Furnius* his
ſhop;another while we will be furniſhed from *Clodius*: and againe in a new fit,none wil content
vs but of *Gratius* his making(for our cupboords of plate & tables,forſooth,muſt beare the name
of ſuch and ſuch Goldſmiths ſhops.)Moreouer,when the toy takes vs in the head,al our delight
is in chaſed and emboſſed plate;or els ſo carued,engrauen,and deep cut in,as it is rough againe L
in the hand,wrought in imagery or floure-work,as if the painter had drawne them.And now a-
daies we are growne to this paſſe,that our diſhes are ſet vpon the table borne vp with feet and
ſupporters to ſuſtaine the viands and meat therein,but in any wiſe their ſides muſt be pared ve-
ry neere; for herein I may tell you lieth a great matter, and the more that the ſides and edges
hath loſt by the file,the richer is the plate eſteemed to be.

As touching the veſſell ſeruing in the kitchen: did *Calvus* the noble Oratour complaine in
his time that it was of ſiluer? Why,wee in theſe dayes doe more than ſo, for wee haue deuiſed
that our coaches ſhould bee all ſiluer, and theſe curiouſly wrought and engrauen. And within
the remembrance of man, euen in this age, *Poppæa* the Empreſſe, wife to *Nero* the Emperour,
was knowne to cauſe her Ferrers ordinarily to ſhooe her coach-horſes and other palfreis for her M
ſaddle(ſuch eſpecially as ſhee ſet ſtore by,and counted more daintie than the reſt) with cleane
gold.To what exceſſe and prodigalitie is the world now grown to? *Scipio Africanus* the ſecond
of that name when hee dyed, left no more vnto his Heire in Siluer Plate and Coine than two
and thirtie pound weight: and yet this worthie Knight,when hee rode in triumph for the con-

queſt

20030
copy 1

A queſt of the Carthaginians ſhewed in that ſolemne pompe, and brought into the chamber of Rome as much treaſure as amounted to * foure thouſand foure hundred and ſeuenty pounds weight of ſiluer, a thouſand times old. This was all the treaſure in ſiluer that the whole ſtate of Carthage was able to make in thoſe daies; Carthage (I ſay) that great and proud city which pretended a title to the Empire of the world, and maintained the ſame againſt Rome: and yet ſee! in this age there is as much laid out in our cupboords of plate, and furniture of our tables. The ſame *Africanus* afterwards, vpon the winning and finall ruine of Numantia, gaue among his ſouldiers in a triumph, 17000 pound weight of ſiluer: O braue ſouldiers, and worthy ſo noble a captain, who ſtood contented with ſuch a reward. A brother of this *Scipio*, ſyrnamed *Allobrogius*, was the firſt knowne to haue in plate, one thouſand pound weight: but *Liuius Druſus*, whiles he B was but Tribune or Prouoſt of the comminalty, had in ſiluer veſſell as much as weighed eleuen thouſand pounds. Now if I ſhould tell you that the Romane Cenſors vpon a time diſgraced, yea and degraded an antient captain and one who in his time had rode in triumph, only for that he had in plate fiue pound weight, it would be taken in theſe daies for a meere tale and vaine fable: as alſo that *Catus Aelius* in his Conſulſhip, was found ſitting at dinner ſerued with earthen veſſell of potters worke, when the Embaſſadors of the Ætolians came vnto him: that he refuſed alſo ſiluer plate preſented to him for the furniture of his boord, and to his dying day had neuer in ſiluer more than two drinking cups, which *Luſius Paulus* his wiues father beſtowed vpon him after the defeiture of K. *Perſeus*, in regard of his valiant ſeruice; wehold it now for no leſſe than an vntruth and incredible. And here I call to minde a merry conceited ſpeech that I haue C read in the chronicles, of certain Carthaginian Embaſſadors, who ſaid, that no men in the world had more good fellowſhip in their houſes, and liued more friendly together, than the Romanes, for why? when they feaſted one another (ſay they) the ſame * ſiluer plate went round about amongſt them all from one to another without change. But howſoeuer this frugality whereof I ſpeak may ſeeme ſtrange and fabulous to the world wherein we liue, certes wee all know this to be true and no fable, that *Pompeius Paulinus* (the ſon of a Roman knight or man of armes borne at Arles) was not only baniſhed out of the country and nation where his father was borne, but confined alſo to the marches of moſt ſauage and barbarous people, and expoſed to their cruelty, only for this, That he had in his campe (to the euil example of the army) as much ſiluer plate as weighed 12 pounds. But long ago it is ſince the faſhion came vp at Rome, that our dames had D their beds couered all ouer with ſiluer, yea, and ſome dining rooms with tables laid with the ſame: which inuention came firſt (as it is reported) from *Caruilius Pollio*, a gentleman or knight of Rome, who deuiſed to garniſh his bourds with ſiluer, not couering them full and whole throughout with plates thereof, nor after the manner of Deliacke workemanſhip, but onely by parcels, and according to the Punicke or Carthaginian faſhion. The ſame *Pollio* made beds and tables of gold: but not long after, thoſe ſiluer beds and boords came to the order of thoſe in the Iſle Delos. But all this ſumptuoſitie was puniſhed ſufficiently and expiat by the ciuill warre of *Sylla*: for a little before thoſe troubles, this exceſſe and theſe ſuperfluities came vp: as alſo about the ſame time, men fel to make great chargers & platters of ſiluer, weighing one hundred pound a piece; of which there were at Rome (as it is well knowne) when the ſaid warre beganne, to the E number of fiue hundred and aboue: which was the cauſe that many a man fell into the danger of proſcription and confiſcation, for that their rich plate ſet their enemies teeth on water; who for the loue and deſire thereof, practiſed by all cunning meanes their vtter vndoing. Certes our Hiſtorians heretofore, who attributed this curſed and vnhappie ciuill warre betweene *Sylla* and *Marius*, vnto ſuch ſuperfluities and vices of thoſe times which reigned ſo rife, might be aſhamed and bluſh to ſay ſo; for our age hath been more hardy, and hath proceeded farther without any ſuch feare of puniſhment from aboue. No longer ſince than in the daies of *Claudius* the Emperour, *Druſillanus* a ſlaue of his ſyrnamed *Rotundus* (the Seneſchol or Treaſurer vnder him in high Spaine) had a ſiluer charger of fiue hundred pound weight (for the working whereof, there was a forge framed beforehand of ſet purpoſe:) and the ſame was accompanied and attended with F eight more of a ſmaller ſize, weighing 50 pound a piece. Now would I gladly know (if it might pleaſe you) how many of his fellowes (ſuch ſlaues I meane as himſelfe) there muſt be to carry the ſaid veſſell and ſerue it vp to the table: or what gueſts they mought bee who were to be ſerued with ſuch huge plate? *Cornelius Nepos* writeth, that before the victorie of the ſayd *Sylla* who defeated *Marius*, two dining tables and no more there were throughout Rome, all of ſiluer.

* *Quater millies, quadringenta ſeptuagena mil lia pondo*: which is foure millions of millions foure hundred & 70 thouſand poũd weight. An incredible ſum, conſidering that which preſently followeth: and therefore I ſuppoſe this place in *Pliny* is corrupted.

* This was ſpoken by way of jeſt, & ἐφυμικῶς: for that al their veſſell being plate of potters clay & no better, ſeemed alwaies the ſame: whereas in ſiluer plate, men were delighted with diuerſitie of workmanſhip, and varietie of faſhion.

Feneſtella ſaith, that in his time (and he died the laſt yere of the reigne of *Tyberius Cæſar* the Emperor) men began at Rome to beſtow ſiluer vpon their cupboords and ſide liuery tables: & euen then alſo (by his ſaying) Tortoiſe worke came in requeſt and was much vſed. Howbeit, ſomwhat before his daies, he writeth, that thoſe cupboords were of wood, round and ſolid of one entire piece, and not much bigger than the tables whereupon men eat their meat: but when hee was a young boy, they were foure ſquare, and of many peeces joyned together; and then they began to be couered ouer with thin boords or painels, either of maple or citron wood. Soone after, they fel to lay ſiluer plates vpon them at the corners only, and along the joints where the planks were ſet together: but by the time that he was come to be a well grown yong man, they were at their drinking mazers or round-bottome diſhes like balances, whereupon they were called Stateræ: alſo at thoſe platters, which in old time were named Magides. Howbeit, men reſted not contented to haue furniſhed themſelues with plenty of ſiluer in their plaine plate and about their houſes, vnleſſe the curious workmanſhip alſo thereof were more coſtly than the mettall and matter it ſelfe. But leſt this ſuperfluity ſhould be imputed vnto vs in theſe daies, be it knowne, that ſuch curioſity was crept into the world long ago: for *C. Gracchus* had in the furniture of his houſe, certain veſſels of ſiluer called Dolphins, which coſt him at the gold-ſmiths hand 5000 ſeſterces a pound: an exceeding price for the faſhion and workmanſhip, conſidering *L. Craſſus* the Orator had two pots artificially engrauen by the hand of *Mentor* that cuuning workman, the faſhion and making whereof coſt * 100 ſeſterces a pound: and yet he confeſſed and proteſted, that hee was abaſhed to vſe them, and durſt not for ſhame bring them abroad. Moreouer, knowne it is, that he had in his cabinet pieces of plate, which to be bought and ſold were worth euery pound 6000 ſeſterces. Briefly, the conqueſt and reducing of Aſia vnder our Empire, was the firſt occaſion that brought into Italy ſuch waſtfull exceſſe: for *L. Scipio* ſhewed in triumph of ſiluer plate, intailed and ingrauen, 400 thouſand and 50 pounds weight, beſides veſſells of gold amounting to the weight of 100 thouſand pound: and this was in the yere from the foundation of Rome, 565. But the free * donation and beſtowing of the ſaid Aſia vpon the city of Rome (which fell vnto the Romans by the death of K. *Attalus*, who in his laſt will and teſtament ordained them his full heires) did moſt hurt vnto our ſtate: and this ſucceſſion which our Antients injoyed by vertue of that gift, did greater dammage to the integrity of manners, and brought more corruption into our city, than the former victory atchieued by force of armes: for from that time forward men grew to be ſhameleſſe, and without regard of modeſty euery mans fingers itched to be tempering with the treaſure of K. *Attalus*, and to buy the ſame at any price, ſold in open port-ſale to them that would giue moſt: which hapned in the 626 yere after the foundation of the city: for in 56 yeres (which was the meane ſpace between the foreſaid ſubduing of Aſia and this feoffement of K. *Attalus*) our city was well nuzzled and trained not onely in the admiration of ſuch puiſſant forrein kings and princes, but alſo in ſome affectionat loue to their wealth and riches. About which middle time between, & namely in the 608 yere, reckoning from the firſt founding of Rome, when Achaia was likewiſe brought vnder our obedience and ſubjection, this victory alſo was a mighty means to bring vs alſo out of al good order, and to ſet vs forward to imbrace ſuperfluities and to ouerthrow al honeſty and vertue: for now were brought in the ſtately ſtatues and proud painted tables, that we ſhould want no inticing delights, but that all the pride and pleaſure of the world might be found at Rome. Finally, the ruin of Carthage, was the riſing of ſuperfluitie with vs, as if the Deſtinies had ſo appointed, that at one & the ſame time we ſhould haue both wil to imbrace vice, & alſo power & liberty withal to perform ſin: ſo that in regard of our times and the enormities thereof, we may juſtifie, yea and honor any of our anceſtors who ſeemed before to offend in this behalfe: for, as it is ſaid, *C. Marius* after he had deſeited the Cimbrians, contented himſelfe to drink in a woodden godet and tankerd, after the example of father *Bacchus*: *C. Marius* I ſay, who of a good husbandman in the country about Arpinum, & of a common and ordinary ſouldier, came to be a braue captaine and commander in the field.

* *Centum ſeſtertiis*: a ſmall matter to the former. and about 15 or 16. *ſh* of our mony. If you read *Seſtertium centum*, or *centum ſeſtertia*, in the neuter gender, it is a thouſad times as much and that were as monſtrous.

* *Donata*, not *Domita*, according to *Budæus*.

Chap. XII.

¶ *Of Statues and Images of Siluer: of the workemanſhip in grauing Siluer, and of other things pertinent thereto.*

MEn commonly haue thought, that the firſt ſtatues of ſiluer ſeene in Rome, were made in the honour of the Emperour *Auguſtus*, by way of courting and flatterie to winne his grace and

20030
copy 1

A and fauour, as thoſe times did require: but it is altogether vntrue; for before his daies, we finde that *Pompey* the Great when he rode in triumph, cauſed the ſiluer ſtatue of K *Pharnaces* (the firſt) [of that name] that euer raigned in the realme of Pontus) to be carried in a ſolemn ſhew: like as the image alſo of *Mithridates* his father; beſides chariots as well of gold as of ſiluer.

Moreouer, it falleth out ſometimes, that ſiluer is vſed in ſtead of gold alſo vpon ſome vrgent cauſe and juſt occaſion: as we may ſee by our proud & ſumptuous dames, that are but commoners and artizans wiues, who are forced to make themſelues carquans and ſuch ornaments for their ſhooes, of ſiluer, becauſe the rigour of the ſtatute prouided in that caſe, will not permit them to weare the ſame of gold. And I my ſelfe, as I remember, haue ſeen *Aurelius Fuſcus* (a gentleman of Rome, who being put beſide his place, and hauing loſt the dignity of a man of arms,
B by reaſon of a notable calumniation framed againſt him, when as young gentlemens ſons vſed to accompany him becauſe he had the name of a braue ſouldier) weare his rings of ſiluer. But to what purpoſe do I collect theſe examples, ſeeing our ſoldiers make no reckoning of yvorie, but the hilts of theſe ſwords and the hafts of their daggers, bee garniſhed with ſiluer, damasked and ingrauen; their ſcabberds and ſheaths bee ſet out with ſiluer chapes, and their ſword-girdles, hangers, and bawdricks, gingle again with thin plates of ſiluer. And do we not ſee how our yong boies are * kept in and reſtrained with ſiluer, during the time that they be vnder mans age? how our fine dames vſe to waſh and bath in ſiluer, diſdaining and ſetting light before any other bathing veſſels in the bains; inſomuch as the ſame mettall and matter which we are ſerued with at the table, is imployed alſo in ſhamefull and vncleanly vſes. Oh that *Fabricius* were aliue now a-
C gain to behold theſe things! if hee ſaw our women bathing together with men in one and the ſame bains, and thoſe paued (as it were) vnder foot with ſiluer ſo ſmooth and ſlipperie that they cannot hold their feet: *Fabricius* I ſay, who forbad expreſſely, that any warriours and Generall captains ſhould haue in plate more than one drinking boll or goblet, and a ſaltſellar: if hee ſaw ſiluer (which was wont to be giuen in preſents and rewards to braue men and valiant captains) thus to be melted and broken to ſerue for theſe purpoſes, what would he ſay? but What a world is this! we paſſe not for *Fabricius*, nay, we are aſhamed of him and his frugality.

* I could ſet this downe more plainly: but in ſome reſpect of chaſt minds & eares I am willing enough to leaue it as obſcure in Engliſh, as I found it in Latine.

But to leaue theſe abuſes and complaints: one thing I wonder much at, that among ſo many excellent artizans as haue been, there is not one who took any pleaſure to graue in gold, nor became renowned thereby; whereas many are famous for their workemanſhip in ſiluer: howbeit,
D *Mentor* (of whom I ſpake erewhile) excelled them all in this kinde: and yet I doe not find, that euer he made in all, aboue eight peeces that were curiouſly and exquiſitly wrought, and thoſe (as it is ſaid) be all loſt. And no maruell, for why? the temple of *Diana* at Epheſus lieth along: the Capitoll of Rome likewiſe, and all within it, hath periſhed by fire. Howbeit, *Varro* hath left in writing, That among his antiquities, one braſen image he had of *Mentors* hand-worke. Next to him, the world had *Acragas*, *Boethus*, and *Mys*, in great admiration for their excellent skill: and at this day there be extant, peeces of all their workemanſhip, to be ſeen in the Iſle of the Rhodians: for in the temple of *Minerva* which is at Lindus a city in that Iſland, there is one ſtatue of the ſaid goddeſſe, of *Boethus* his making: within the temple of god *Bacchus* in the very city it ſelfe of Rhodes, there are certain cups wrought by *Acragas*, wherein bee ingrauen the religious
E Prieſtreſſes called Bacchæ, and the Centaurs. Within the ſame Church, are the pourtraicts of *Silenus*, and the pretty *Cupids*, expreſſed liuely in imagerie, by *Mys*. Moreouer, *Acragas* pourtraied the reſemblance of chaces or hunting, in certain pots, moſt artificially; for which he became very famous. After theſe, there are to be ranged in another degree, *Calamis* and *Antipater*; together with *Stratonicus*, who wrought within a broad-mouthed cup, one of the Satyres ſound aſleepe; but with ſuch dexterity and ſo liuely, that he is judged and ſaid to haue couched and fitted him to the cup, rather than barely ingrauen him. Then followes *Tauriſcus* of Cyzicum: ſemblably *Ariſtus* and *Eunicus*, both Mityleneans, are highly commended: as alſo *Hecataus* and *Praxiteles*, who flouriſhed about the time of *Pompey* the Great. *Poſidonius* alſo of Epheſus, and *Ledus* the Stratiat, who was in great name for ingrauing of battels and armed men at the point
F to joyne skirmiſh. Likewiſe *Zopirus*, who made two ſingular cups; in the one, hee repreſented the honourable Court of the Areopagites; in the other, the triall and judgement of *Oreſtes*: which were eſteemed worth twelue talents. In another age liued *Pytheas*, a ſingular Artificer, whoſe workemanſhip was ſo rare and exquiſite, that euery two ounces of his ſiluer plate, was ſold commonly for twentie thouſand Seſterces: and verily a broad goblet or ſtan-

ding piece there was of his making, with a deuiſe appendant to it, for to be ſet too and taken off by a vice, and the ſame reſembled *Vlixes* and *Diomedes*, ſtealing the Palladium out of the temple of *Minerua* in Troy. The ſame workeman deuiſed to ſet into little cups, prettie images or mannikins reſembling cookes, which he termed Magiriſcia, but ſo finely & delicatly wrought they were, that the patterns of them could not be taken out in any mould, without hurting and ſpoiling; ſo ſubiect were they to any outward injuries in the handling. Furthermore, *Teucer* was famous in his time, for his dexterity and light hand in ſhallow imboſſing. Well, in as great requeſt as theſe artificers were in times paſt, yet this cunning decaied all on a ſudden, and grew ſo far out of vſe, that nothing now commendeth ſuch pieces of work, but only antiquity: in which regard, how neare ſoeuer they be worne with continuall handling, inſomuch as the ſhapes and proportions of the imagerie ingrauen cannot be diſcerned, yet great ſtore is ſet by any ſuch antique plate whereſoeuer it is to be had.

Ouer and beſides, it is to be noted, that ſiluer will ruſt in medicinable waters, ſuch as ſtand vpon ſome eſpeciall mine; yea, the ſalt aire breathing from them, is able to infect it: as wee may ſee in the Mediterranean parts of Spaine far remote from the ſea.

Alſo, in mines of gold & ſiluer, there are ingendred certain mineral colours ſeruing for painters; to wit, * Sil and Azur. As for Sil, to ſpeake properly, it is a kind of muddy ſlime: the beſt of this kind is called Atticum: and euery pound of it is worth 32 deniers. The next in goodneſſe is hard as ſtone or marble, and carieth hardly halfe the price of the other named Atticum: there is a third ſort, of a faſt & compact ſubſtance, which becauſe it is brought out of the Iſland Scyros, ſome call Scyricum: and yet of late verily, we haue it out of Achaia alſo, and this is the Sil that painters vſe for their ſhadows: this is ſold after two ſeſterces the pound. As for the Sil which commeth out of France, called the Bright Sil, it is ſold in euery pound two aſſes leſſe than that of Achaia. This Sil, and the firſt called Atticum, painters vſe to giue a luſtre and light withall: but the ſecond kinde, which ſtandeth vpon marble, is not imploied but in tablements and chapters of pillers, for that the marble grit within it, doth withſtand the bitterneſſe of the lime. This Sil is digged likewiſe out of certain hils not paſt 20 miles from the city of Rome: afterwards, they burne it, and by that means do ſophiſticate and ſell it for the faſt or flat kinde named Preſſum: but that it is not true and natural, but calcined, appeareth euidently by the bitterneſſe that it hath, and for that it is reſolued into pouder.

*i. Ochre.

Chap. XIII.

¶ *Of * Sil, * Cæruleum, Neſtorianum, and Cælum. Alſo that all theſe kindes keep not the ſame price euerie yeare.*

*i. Ochre.
* Azur.

Polygnotus and *Mycon* were the firſt Painters who wrought with Sil or Ochre, but they vſed onely that of Athens in their pictures. The age inſuing, imploied it much in giuing light vnto their colours, but that of Scyros and Lydia for ſhadowes. As for the Lydian ochre, it was commonly bought at Sardis, the capitall city of Lydia, but now it is growne out of all remembrance.

As touching Cæruleum or Azur, it is a certaine ſandy grit or pouder: of which, in old time there were knowne 3 kinds: to wit, the Ægyptian, moſt commended aboue the reſt: the Scythian which is eaſie to be diſſolued and tempered, and in the grinding turneth into foure colours: namely, the Azur, which is of a pallet colour, called therefore the whiter; the blacker Azur of a deeper blew; there is the Azur alſo of a groſſer ſubſtance; and the fourth of a finer. The Cyprian Azur is preferred before that of Scythia. Ouer and aboue thoſe Azures before-named, wee haue ſome from Puteoli and Spaine, where they be artificiall, and they haue taken to making it, of a kind of ſand. All the ſorts of theſe Azurs, receiue firſt a dye, and are boiled with a certain hearbe appropriat to it, called Oad, the colour and iuice whereof Azur is apt to drinke in and receiue. As for all the preparation and making of it otherwiſe, it is the ſame that belongeth to Chryſocolla or Borax. Of Azur there is made that powder which wee call in Latine Lomentum, for which purpoſe it muſt be firſt punned, puluerized, and waſhed; and this is whiter indeed than the Azur it ſelfe: ſold it is after three and twentie deniers the pound, whereas Azur may bee bought for eighteene. Herewith they vſe to paint walls that be ouercaſt with plaſtres, for lime it will not abide. Of late daies there is a kinde of Azur growne into requeſt, called Neſtoria-

num,

20030
copy 1

num, taking that name of him who firſt deuiſed it: made it is of the lighteſt part of the Ægyptian Azur, and it coſteth 40 deniers the pound. Of the ſame vſe alſo is the Azur of Puteoli, ſaue only in windows; and this ſome call Cœlon. It is not long, ſince another kind of Azur or blew named Indico, began to be brought ouer vnto vs out of India, which is prized at 17 deniers the pound. It ſerueth painters wel for the lines called Inciſuræ, that is to ſay, for to diuide ſhadows from lights in their workes. To conclude, there is another kinde of Lomentum or blew powder of the baſeſt account of all other; ſome call it Tritum, and it is not eſteemed worth aboue fiue aſſes the pound.

But to try the right and perfect Azur indeed, the beſt experiment is to ſee whether it will flame vpon a burning cole. As for the falſe and ſophiſticat Azur, it is thus made: they take the floures of violets dried, and boile them in water: the juice they preſſe forth through a linnen cloth, and mix the ſame with the chaulky earth called Eretria, vntill ſuch time as it be well incorporat with it.

To proceed vnto the medicinable vertues of Azur: It is holden to be a great clenſer, & therfore it mundifieth vlcers: in which regard, it entreth into plaſters: as alſo into potentiall cauteries. As touching Ochre or Sil, it is exceeding hard to be reduced into pouder: and this alſo ſerueth in Phyſicke; for it hath a mild kind of mordacity: aſtringent it is beſides & incarnatiue; in which reſpect, ſoueraigne to heale vlcers: but before that it will doe any good, it ought to be burnt and calcined vpon an earthen pan.

To conclude with the prices of all thoſe things named heretofore: howſoeuer hitherto I haue ſet them downe, yet I am not ignorant, how they vary according to the place; yea, and alter in manner euery yeare: and well I wot, that as ſhipping and nauigation ſpeeds well or ill, as the Merchant buyeth cheap or deare, the price may riſe and fall. Againe, it falleth out, that ſometime one rich munger or other, buying vp a commodity, and bringing it wholly into his owne hands for to haue the Monopoly of it, raiſeth the market, and inhaunceth the price: for I remember well, how in the daies of *Nero* late Emperor, all the ſpicers, druggers, and Apothecaries, preferred a Bill of complaint vnto the Conſuls, againſt one *Demetrius* a regrater. Yet notwithſtanding, I thought it neceſſarie to put downe the prices of things as they are ordinarie valued at Rome one yeare with another, to ſhew in ſome ſort (by a generall æſtimat) the worth of ſuch wares and commodities whereof I haue written.

THE XXXIV. BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

The Proem.

CHAP. I.

¶ *The Mines of Brasse.*

IT is now time to go in hand with Mines of Brasse, a mettall esteemed most of all other next to Gold and Siluer, in regard of the vses about which it is imployed: nay, if I should say truly, preferred it is (especially that which is called the laton of Corinth) in diuers respects before siluer, yea, and gold it selfe: for brasse (I may tell you) is of great authority in the campe, and carrieth no small stroke among souldiers in regard of their pay, which (as I haue said before) was weighed them out in brasse: and hereupon their wages-money is vsually called by the name of Æra militum. From this mettall likewise, the generall Receiuers and Treasurers take their title of credit and place: for at Rome they be called Tribuni ærarij, as a man would say, The Tribunes or Officers to the chamber of brasse coine, that is indeed, of the Treasury: hereof also is the Chamber of the city or Treasurie it selfe, called Ærarium: finally, those that be deeply indebted to any man, are in Latine named Obærati, as it were charged and pressed with the heauy burden of brasse, *i.* debt. Moreouer, I haue shewed already (for the greater credit and authority of this mettall) for how many yeres together the people of Rome vsed no other mony but brasen coine. And otherwise, as may appeare by antient records and histories, the credit of brasse took root at the beginning, and hath bin in authority euer since Rome was Rome: an euident proofe whereof we haue from K. *Numa*, who founded and erected a third society or confraternity of brasse-founders. As touching the ore or veine of brasse, digged it is out of the mine in manner aforesaid, but it is tryed, & brought to perfection by fire. Made also it is of the Chalamine stone, named otherwise Cadmia. The best mines of brasse that yeeld the excellent mettall, are now in Asia; howsoeuer in old time Campaine in Italy carried the name. And euen at this day, the brasse digged out of the mines within the territory of the Bergomats in the farthest part of Italy, is in great request: and as it is said, there are good mines thereof discouered lately in Germany, a Prouince vnder the Roman Empire.

CHAP. II.

¶ *Diuers kinds of Brasse: and namely, the Brasse of Corinth, of the Isles of Delos and Ægina.*

IN the Island of Cyprus, where first were found mines of brasse, the same is made of another stone also besides Cadmia, which they name Chalcitis: but this * Cyprian brasse fel soon to beare a low price, by reason of a better kind which other countries did yeeld; and principally the laton called Orichalcum, which for a long time was counted the best and held in greatest admiration. Howbeit, this kind of brasse hath not bin gotten for these many yeres, as if the earth

* i. Copper.

were

20030
copy 1

A were not in heart,and had giuen ouer bearing of it. Next to this Aurichalcum,the moſt reckoning was made of the braſſe Salluſtianum,within the tract or quarter of the Centrones among the Alps: neither held theſe mines out any long time;but after it,ſucceeded the Livian braſſe, diſcouered in France. Theſe two kinds laſt mentioned, take name both of the lords and maſters of the mines wherein they were digged: the former of one *Salluſtius*,a great friend and fauorite of *Auguſtus Cæſar* the Emperor: the other of the Empreſſe *Livia* his wife: and this mine alſo quickly failed. And verily of this Liuian braſſe very little or none there is to be had. But now adaies all the name goes of the Marian braſſe,which alſo is called Cordubenſe:and to ſay a truth ſetting aſide the aboue-named Liuian braſſe,there is not any wil take the yellow tincture of the Cadmia or Calamine ſtone better,or commeth ſo neer in goodneſſe to the latton Orichalcum;
B as if a man would ſay that a piece of coin ſtamped of it,were a ſeſterces,or at leaſtwiſe a double As,to the Cyprian piece,which is but a ſingle As. And thus much concerning the degrees in goodneſſe and credit,of thoſe kinds of braſſe which be naturall.

*As if he wold ſay,this mettal is ſo much better thã the Cypriambraſſe & copper, as the Seſterce and Dupondius,is of more value than As: i. duple,or duple and halfe.

There be other ſorts of braſſe mettall,which ſtand vpon an artificiall mixture and temperature,whereof I purpoſe to write in more ample manner in place conuenient,after I haue ſhewed aboue all other things the excellencie of this mettall in generalitie,thus tempered. In old time there was a mixt mettall made of braſſe,gold and ſiluer,melt and confuſed all together,whereof were made ſingular pieces of worke:and albeit the mettall was rich and precious, yet euermore the workmanſhip was the dearer and went beyond it. But now, it is hard to ſay, whether is
C worſe of the two,the matter or the art that is ſeen in it? But certes, I cannot but maruell much how it commeth to paſſe, That theſe braſen workes, hauing alwaies bin from time to time ſo dear,and growing ſo infinitly as they do ſtil in price to be bought & ſold,yet the magnificence and credit of this art is ſo much decaied & vtterly gone?But I take this verily to be the cauſe, that in times paſt artificers wrought for to win glory and fame;& now,as all things els,for gain and lucre only. Certes,in old time the feat of caſting mettall was counted ſo magnificent, that the Poets aſcribed it to ſome of the principal gods,as a myſtery beſeeming their diuine workemanſhip;inſomuch,as the great lords and noble princes of the world ſought to win an immortall name by this meanſ:and yet I ſay for all that,the manner of tempering and caſting this precious Maſcellin,this compound mettall I mean of gold,ſiluer,and braſſe, is ſo far grown out of
D practiſe and knowledge,that for theſe many yeres paſt Fortune her ſelfe hath had no power either to retain or to reſtore the antient art belonging therto. But ſetting aſide the glorious Maſcellin of old time, the Corinthian braſſe mettall was moſt highly commended: and the ſame mixture happened euen by meere chance and fortune,when the city Corinth was woon, ſacked and burnt to the ground:and wonderfull it is how the minds of many great men was affected to this compound mettall,and how they ſtood vpon the hauing thereof, inſomuch as (by report) there was no other cauſe in the world why *Verres*, whom *Cicero* had cauſed to bee condemned, was together with him proſcribed,outlawed,and baniſhed by *Antonie*,but only this, For that he vaunted that he had as goodly veſſels and pieces of Corinth mettall as himſelfe,and would not part with any of them to *Antonie*:howbeit,in my conceit, moſt part of thoſe men who delight thus in this Corinth Maſcellin,in a certain ſingularity by themſelues,becauſe they would ſeem
E to know more than their fellows,make ſemblance rather of a ſpecial inſight and skill that they haue therein,than know indeed any thing by it of ſuch exquiſit ſtuffe. And this will I ſhew and declare to you in few words: the city of Corinth was won and deſtroied in the 156 Olympias, and the third yere thereof,which fell out to be in the 608 yeare by our computation at Rome: now long before this time,thoſe great maſters and imageurs,ſo famous for mettal-founding and caſting of Images were dead and gon;and yet all the pieces of their making,theſe men forſooth at this day will needs haue to be of Corinthian medley,and ſo they call them. And therefore to diſproue this erronious opinion of theirs,I purpoſe as I proceed in this my diſcourſe, to range all the notable artificers that antiquity hath knowne in this kind,according to the ſeueral ages wherin they liued & flouriſhed in the world. For eaſie it wil be to calculat and collect the yeres
F from the foundation of our city,by the former compariſon of them with the Olympiades. All the veſſels then which our delicats haue,thoſe I mean that would ſeem to be more fine in their houſes than their neighbors,are only of the Corinth mettal and no better,which they caſt,partly into pots and pans and ſuch like kitchin veſſell for to ſeeth meat in;partly into candleſticks, chafers,chamber pots,and ſuch like homely and baſe veſſels, without any regard of cleaneneſſe

and

and neat ſeruice. But this Corrinthian mettall may be reduced well into three principall kinds, G
to wit, the white, which commeth neareſt in brightneſſe to ſiluer, as ſtanding moſt indeed vpon
the mixture of ſiluer: the ſecond yellowiſh, according to the nature and colour of gold, which
beareth the chiefe ſtroke in it: and a third of an equall medley and temperature, wherein a man
ſhall not perceiue any one mettall predominant. Ouer and beſides, theſe 3 ſorts of Corinthian
braſſe, there is another kind of Maſcellin; as touching the mixture whereof preciſely, we are not
able to yeeld any reaſon: for although there be found Images and ſtatues thereof made, wherein
we may ſee the handy worke of man, yet it ſhould ſeem that Fortune in ſome ſort hath giuen
the temperature thereto: and that dainty and precious colour that it hath, is a deep red, much
reſembling that of the liuer, and therefore they call it commonly Hepatizon. Short it commeth
far of the Corinthian mettall, but out-goeth a great way the braſſe either of Ægina or Delos, H
which two mettals for a long time were thought to be the chiefe. And in very truth, for antient
glory and name the Deliake braſſe may challenge the firſt place: for thither, as to a mart or fair,
there was great reſort of chapmen from all parts of the world; & ſpecially of thoſe artificers who
were curious in making of table feet, treſtles, and bed-ſteads: and indeed the fineſt workmanſhip
at firſt was ſeen herein, and thereby artificers came to be innobled. But in proceſſe of time they
went farther, euen to caſt the images of gods, the perſonages alſo of men for ſtatues, yea, & the
ſolid forms and pourtraits of beaſts and other ſuch liuing creatures. After this braſſe of Delos,
the moſt account was made of that which came from Ægina: an Iſland this is without any mine
at al of braſſe in it, howbeit, much renowned for the excellent mettal-founders therein, in regard
of the ſingular temperature that they gaue vnto their braſſe. The braſen Oxe which ſtandeth in I
the beaſt market at Rome was brought from thence. And this may ſerue for a paterne of the Æ-
ginetick braſſe: but the image of *Iupiter*, erected within the chappel of *Iupiter*, ſyrnamed Thun-
dring, in the Capitoll, is the true paterne, teſtifying what kind of braſſe that of Delos was. And,
as *Myron* was wont to caſt the mettall of Ægina in all his works, ſo *Polycletus* vſed ordinarily that
of Delos for this purpoſe; and theſe two were rare Imageurs, liuing at one time, and prentiſes at
the Art together: but they indeauoured to ſurpaſſe one the other in diuers mettalls which they
occupied.

Chap. III.

¶ *Of Candle-ſtickes and Ornaments belonging to Temples, made of Braſſe.* K

IN old time the Iſland Ægina was in eſpecial name for the workmanſhip only of the branches,
ſockets, & heads of candle-ſticks; like as Tarentum, for the ſhanke, ſhaft, & body ſupporting
the ſame: and therefore that candle-ſticke was counted rich indeed, when both theſe places
ſeemed to concur to the making and workmanſhip therof: for ſuch a candle-ſtick ſome haue not
bin aſhamed to giue as much mony as the ſalarie and yearely penſion of a Tribune militarie or
Which was a talēt, or 50000 ſeſterces. Colonell, commeth to: and yet you ſee, an implement or moueable it is, that hath but a vile
& baſe name, for called it is in Latine Candelabrum, of ſticking a candle in it. But wil you know
who was ſo fooliſh as to beſtow ſo much vpon a candle-ſtick, and what a tale belongeth therun-
to, for to mend the hard bargain? thus ſtood the caſe: it was a jolly dame in Rome, named *Gegania* L
who made this wiſe match. And when ſhe had ſo done, ſhe muſt needs forſooth make a feaſt to
ſhew this candle-ſtick to her gueſts, which coſt her 50000 ſeſterces. Now *Cleſippus*, the founder
or Braſier that ſold it her, was miſhapen and bunch-backt. And order was taken by the comman-
Cleſippus fuſor gibber, &c. not Fullo. Who as it ſhould ſeeme, was one of her gueſts, & knew how to play his part well enough. dement of * *Theon* a publick crier of Rome, that he ſhould in the middeſt of ſupper be brought
into the place ſtark naked as euer he was borne (and as foule and ill-fauoured a fellow he was o-
therwiſe as a man ſhould lightly ſee) vnder a colour to make ſport and to ſet the company in a
laughing; but indeed to mocke *Gegania* the Miſtreſſe of the houſe. But what followed therupon?
The woman caſt a fanſie to him by and by, and in that heat of loue, or luſt rather, admitted him
anon to her bed, and after ſet him into her will, and made him her heire. This crooke-backed
ſquire ſeeing himſelfe exceedingly inricht by this double bargaine, adored the ſaid candleſtick M
no leſſe than a god, as the only cauſe of his riſing, and all the wealth he had: and thus by his oc-
caſion, one tale more goeth currant abroad in the world, of Corinthian veſſels. And yet after-
wards (as it were to puniſh his Miſtreſſe for that light behauiour of hers) he cauſed a ſtately and
magnificent ſepulchre to be made for her, whereby the infamy and ſhame of *Gegania*, might be

eter-

20030
copy 1

A eternized and continue freſh in remembrance with all poſterity. But to return again to Corinthian Braſſe and the veſſels made thereof, although it be well knowne, that there are no Candleſticks indeed made of that Maſcelin, yet there goeth a great name of them, as if they aboue all other things were certainly caſt of that mettall: and the reaſon is, becauſe that *Mummius*, as in the heat of his victorie he ſacked and deſtroied Corinth, ſo withall hee diſperſed the braſſe by parcels and piece-meale, and ſent it away into many other townes and cities of Greece.

Moreouer, this is to be noted, That in old time it was an ordinary thing to make of braſſe, the ſides, lintels, ſils, and leaues of great dores belonging to temples. I reade alſo in Chronicles, that *Cn. Octauius*, who defeated K. *Perſeus* in fight at ſea, and rode in triumph for that naual victorie, cauſed the double gallerie, which ſtandeth neere vnto the Cirque of *Flaminius*, to be erected;
B which was called the Corinthian gallerie, for that the chapters of the pillers were of braſſe. Furthermore, the Annals do teſtifie, that it was thought good, That the rouſe of the chappel of *Veſta*, ſhould be alwaies couered ouer with Braſſe, after the manner of Saracoſſian work. Likewiſe *M. Agrippa* made all the chapters of the pillars, ſtanding in the temple *Pantheon*, of Syracuſian braſſe, which remaine at this day to be ſeene. And not onely publick places and buildings were thus beautified and adorned, but great mens priuat houſes alſo were inriched by this mettall: for it appeareth vpon record, That *Sp. Carvilius*, one of the Treaſurers of Rome, amongſt other criminal imputations that he obiected to *Camillus*, challenged him for this, That the dores of his dwelling houſe were plated and garniſhed with braſſe & copper. Moreouer, as *L. Piſo* reporteth in his Chronicle, *Cneus Manlius* after his conqueſt of Aſia, was the firſt that in the triumph
C wherein he rode in the yeare after the foundation of Rome 568, he made a ſhew of three-ſided tables, cup-bourds, and bourds, ſupported by one foot all of braſſe: And *Valerius Antias* verily doth write, That *L. Craſſus*, heire to that great Orator *L. Craſſus*, made ſale of many ſuch braſen tables, which fell vnto him by right of inheritance. Semblably, I find in the hiſtories, That in old time they were wont to make many large baſons, ſupported with a frame of 3 feet, known by the name of Delphick baſons, for that they were commonly dedicated to *Apollo*, the patron or god of Delphos, for to receiue the gifts and oblations offered to him. In thoſe daies alſo the lamp-branches hanging aloft in churches, ſpreading out their arms abroad and carrying lights like trees bearing fruit were vſually made of braſſe: and ſuch a one is to be ſeen in the temple of *Apollo* within the Palatine hill at Rome: which being found by *Alexander* the great in the ſac-
D cage of Thebes, the ſaid prince dedicated to the god *Apollo* at Cyme, a towne in Æolia. To conclude, this art of founding and caſting braſſe proceeded farther and paſſed on, vntil it was commonly practiſed in making the idols and images of the gods.

Chap. IIII.

¶ *At what time the firſt braſen Image was caſt at Rome. The firſt originall and beginning of ſtatues, and the honour that belonged to ſtatues. Alſo the diuers kinds and faſhions of them.*

E THe firſt Image of braſſe that euer was made at Rome, I finde to be conſecrated to *Ceres*, & raiſed it was out of the goods of *Sp. Caſſius*, who aſpiring to be a king, was therefore ſlaine by his owne father. But this honor continued not long proper to the gods, but paſſed from them vnto the ſtatues of men alſo and their portraitures, and that after ſundry ſorts. In antient time the manner was to verniſh their images and ſtatues of braſſe, with * Bitumen: more mar- * or as ſome
uel it is therefore, that afterwards men ſhould take ſuch pleaſure to guild them as they did: this ſay, with a kind
inuention, whether it came from Rome or no, I know not: but if it did, ſurely it was no antient of Amber.
deuiſe, nor of any long continuance there. Certes, the manner was not in old time to expreſſe the liuely ſimilitude of men in braſſe, vnleſſe they were ſuch worthy perſons as by ſome notable and famous acts deſerued to be immortalized, as namely, for winning the prizes at any of the
F foure ſacred and ſolemn games holden in Greece, and principally at thoſe of Olympia, where it was an ordinary thing to ſee the ſtatues of thoſe erected and dedicated, who had atchieued any victory there. But in caſe any one were ſo happy as to obtain victory at thoſe ſolemnities 3 ſeueral times, his ſtatue in braſſe was ſo liuely & perfectly caſt, that it reſembled his perſon full & whole, according to the proportion of euery member, joint and muskle of the body, yea, euen to

the

the haire of the head and beard. And ſuch kind of complete images, the Greeks vſe to call Iconicæ, *i.* perſonages. The manner of the Athenians was to honour men of ſingular vertue and valour, by repreſenting their perſonages in braſſe: but I am not ſure whether thoſe Athenians were the firſt that brought vp that manner or no: true it is, that long ago they cauſed ſtatues of *Harmodius* and *Ariſtogiton*, to be made of braſſe at the charges of the ſtate, and to be erected in publick place, for that they had the courage and heart to kill *Piſiſtratus*, who tyrannized ouer them: and this fell out juſt in that very yeare wherein the kings were alſo depoſed at Rome, and expelled the city for euer. And in proceſſe of time this manner was taken vp in all parts of the world: ſo plauſible to the nature of man, is the ambitious deſire to perpetuate their memorie by ſuch monuments, inſomuch as there is not a good towne within our prouinces, but they haue begun already to beautifie their market places with many ſuch ornaments of braſen ſtatues & images; together with titles, honours, and dignities ingrauen at the baſes or pied-ſtal therof, for the better continuance of mens memoriall, that the poſterity might be informed by ſuch inſcriptions, as well as by their tombs and ſepulchers. And at length the ambition of men proceeded ſo far, that as well their priuat houſes within, as the baſe courts and porches without, were ſo beſet with images, that a man would take them for ſome publicke places within a city: and all this aroſe from the deuote courteſie of vaſſalls, in token of homage and honour done to thoſe their patrons and lords, whom they acknowledged to be the protectors and maintainers of their life and liberty.

Chap. V.

¶ *Of braſen ſtatues in long robes, and diuers other ſorts of Images. Whoſe ſtatues were firſt erected vpon pillars. When they were ſet vp firſt in publicke, and at the common charges. Finally, which were the firſt in Rome.*

In antient time all the images and ſtatues erected to the honour of any men, were in their gowns and robes. Men delighted alſo to haue them otherwhiles all naked, reſting vpon their ſpears which they held in their hands: this pattern came from the Greeks, reſembling the maner of their yong men, which in that ſort did exerciſe naked in their publick wreſtling places, thereupon called Gymaſia: and ſuch images are named Achilleæ. And verily, the Greekiſh faſhion it is, To hide no part of the body, but to ſhew all: wheras the Romanes contrariwiſe (like ſouldiers and military men) vſed to make their ſtatues armed with a cuirace or breſt plate only, leauing the reſt of the body diſcouered and bare. And *Iulius Cæſar* verily the Dictator, was well content that his image ſhould be ſet vp in the Forum or common place at Rome, armed with an habargeon or coat of male. As for ſuch ſtatues which repreſented in habit the prieſts of *Pan*, called *Luperci* (*i.* all diſcouered but their priuities) it is an inuention new come vp, and as lately deuiſed as thoſe which be pourtraied in clokes or mantles. *Mancius* appointed that his image ſhould be erected in that habit and manner, that is to ſay, bound and vnarmed, as he was deliuered priſoner to the Numantines his enemies. As touching the ſtatue of *L. Actius*, a famous Poet, I will report vnto you what writers haue recorded, namely, That being himſelfe a very little man and low of ſtature, he cauſed his image to be made exceeding big and tall, and ſo to be ſet vp within the temple of the Muſes at Rome. As for the ſtatues repreſented on horſe-backe; in great name and requeſt they were among the Romans: but no doubt they had their precedent from the Greeks. At firſt they honoured ſuch horſmen only in this ſort, who had won the price in the race at thoſe ſolemn & ſacred games which were held in Greece, and thoſe horſe-runners they called Celeres: howbeit, afterwards the like honor obtained they, who had born themſelues beſt at the running of chariots, whether they were drawn with 2 horſes or four. And from hence came the manner with vs of our valiant captains and victorious generalls, to haue their ſtatues made riding triumphant in their chariots. Howbeit, long it was firſt ere this faſhion came to be taken vp: and before the daies of *Auguſtus Cæſar*, late Emperour of famous memory, there had not been knowne any ſuch images at Rome riding in chariots either drawne with ſix ſteeds, or Elephants, as now there be. The manner alſo of riding in coches with 2 horſes about the cirque or ſhew place (which vſually they did who had bin lords Pretors of Rome) repreſented in their pourtraitures, is not antient.

Con-

20030
copy 1

A Concerning ſtatues erected vpon columns or pillars, they be of greater antiquity, as may appeare by that of *C. Menius*, who vanquiſhed the antient Latines that inuaded the territory of Rome: vnto which nation, the people of Rome was woont by vertue of the league, to allow the third part of the bootie and pillage gotten in the wars: during the Conſulſhip of which *C. Menius*, vpon the victory atchieued of the Antiats, the city of Rome ordained, that the beak-heads with their braſen tines, which were taken from them in a conflict at ſea, ſhould be faſtened vnto the pulpit of publicke pleas and Orations, which thereupon was euer after called Roſtra: and this fortuned in the 416 yeare after the foundation of Rome. The like ſtatue vpon a column was ſet vp for the honour of *C. Duillius*, who firſt defeated the Carthaginians by ſea, and for that naual victorie entered Rome in triumph: the ſame remaineth at this day to be ſeen in the Forum
B or grand place of the city. Semblably, *P. Minutius* obtained the ſame honour, who being Purueior generall of corne for the city in time of a dearth, behaued himſelfe ſo well in that office, that his ſtatue of braſſe was erected vpon a piller without the gate of Rome called Trigemina: and that by an vniuerſall contribution of the people, who gaue voluntarily toward the charges thereof, euery man to the value of an * ounce of braſſe coine. And I wot not whether I may boldly ſay that he was the firſt man who receiued that honour at the peoples hands: for before-time I am well aſſured that the Senat only granted ſuch rewards for mens good ſeruice. Certes, theſe were braue and honourable memorials, had they not begun vpon occaſion of ſome trifling matters to ſpeake of. For ſuch a ſtatue was that of *Actius Nauius* the Augur or Soothſayer, which ſtood before the entrie of the Curia or Councell-chamber of Rome: the baſe or foot of which
C pillar was burnt, at what time as the ſaid Curia or Senat-houſe caught a light fire, at the funerals of *P. Clodius*. The like image was ſet vp (by authoritie from the State) in the publicke place of elections at Rome, called Comitium, to the honor of *Hermodorus* the Epheſian; who tranſlated out of Greeke into Latine the lawes of the 12 tables, which the ten Decemvirs had gathered and ſet down for the publicke benefit of the city. As for the ſtatue of *Horatius Cocles*, which remaineth to this day, there was another reaſon of it, and the ſame of greater credit and importance: for that he alone ſuſtaining the charge and brunt of K. *Porſenaes* army, made good the woodden bridge ouer Tybre at Rome, and cauſed the enemies perforce to abandon the place. As touching the Statues of the Propheteſſes *Sibyllæ*, three of them there be neare vnto the Roſtra, before ſaid, but of a leſſe making, whereat I nothing maruell: the one was repaired by *Sex. Pacuvius Taurus*, one of the Ædiles of the Commons; the other two by *M. Meſſala*. And I aſſure you
D I would haue taken theſe Images and that of *Actius Nauius* to haue beene the moſt antique of all others, as being ſet vp in the daies of K. *Tarquinius Priſcus*, but that I ſee the ſtatues of the former kings within the Capitoll.

*i. The twelfth part of their As.

Chap. VI.

¶ *Statues without gowne or robe at all. Of other Statues. Which was the firſt ſtatue on horſe-backe. When and whereupon all the Images, as well publicke as priuat were demoliſhed and put downe. What women they were at Rome who were honoured with braſen ſtatues: and which*
E *were the firſt ſtatues erected publiquely at Rome by ſtrangers.*

AMong the ſaid Statues of Roman kings, that of *Romulus* is without any coat or caſſocke at all; like as that alſo of *Camillus*, which ſtandeth at the pulpit Roſtra. As for the Image of *Q. Martius Tremellius*, which was erected before the temple of *Caſtor* and *Pollux*, the ſame was in a gowne, and ſitting vpon horſe-backe: this noble knight had vanquiſhed the Samnites twice: and by the winning of Anagnia, a city not far from Rome, procured thereby an eaſment vnto the people, from paying tribute vnto the ſtate for the maintenance of the wars. In the ranke of the moſt antique monuments of Rome, I may range the ſtatues of *Tullius Clœlius*, *L. Roſcius*,
F *Sp. Nautius*, and *C. Fulcinius*, which ſtand about the Pulpit Roſtra: and theſe were the foure Roman Embaſſadors, who againſt all law of Nations, were during their embaſſage murdered by the Fidenatians. For this was an ordinary cuſtome with the Romanes, to honour thoſe in this manner, who in the ſeruice of the Commonwealth were vniuſtly killed: as may appear likewiſe by *P. Iunius*, and *T. Coruncanus*, who by *Teuca* the queene of the Illyrians were put to death, notwithſtanding

withstanding they came in embassade to her. And here I cannot ouerpasse one point noted in the Annals, that the measure of the statues erected in the common place at Rome, was set down precisely to be three foot in height: whereby it may appeare, that this proportion and scantling in those daies was thought to be honorable. Neither wil I conceale from you & omit the memorable example of *C. Octauius*, who for one word speaking lost his life: this man beeing sent as Embassadour vnto king *Antiochus*, and hauing deliuered his message vnto him according to his charge and Commission, when hee saw that the king made no haste to giue him his dispatch presently, but said hee would make him an answer another day; made no more adoe, but with a wand or rod that he had in his hand, drew a circle about the king, and compelled him by force to giue him his answer before he stirred his foot without that compasse. But this cost him his life: and for that he was killed thus in his Embassage, the Senat of Rome ordained, That his statue should be erected in the most conspicuous place of the city, and that was in the publick pulpit for Pleas and Orations, the Rostra before named. I read in the Chronicles, that the Senat made a decree, that *Taracia Caia*, or, as some say, *Suffetia*, a Votary or Vestall Nun, should haue her image made of brasse, and this speciall prerogatiue besides, that she might set it vp in what place she would her self: which addition or branch of the decree implieth no lesse honor than the grant it selfe of a Statue to a woman. What her desert might be, in consideration whereof she was thus honoured, I will set downe word for word, as I finde it written in the Chronicles, namely, *For that she had conferred frankely vpon the people of Rome, a piece of medow ground lying vnder the Riuer Tybre, which was her owne Free-land.* I finde moreouer vpon record, That the Statues of *Pythagoras* and *Alcibiades* were set vp in the cornered nouke of the Comitium at Rome, & that by direction from the Oracle of *Apollo Pythius*; vnto which the Senate sent of purpose to know the issue of the Samnites warre, which was then in hand: from whence they had this answere, that if they looked to speed well in their affaires, they should take order to erect two statues of brasse in the most frequented place of the city of Rome, the one in the honour of the most valiant man, and the other in the honour of the wisest person of all the Greekish Nation: which Images remained there vntill such time as *Sylla* the Dictatour built his stately hall or pallace in the same place: But I maruell very much, that those sage fathers (the Senatours of Rome at that time being) preferred either for wisedome *Pythagoras* before *Socrates* (considering that the said *Socrates* by the very same Oracle of *Apollo*, was judged the wisest man, not of Greeks onely but of all others in the world;) or in regard of valour, *Alcibiades*, before so many hardie Captaines in Greece: but most of all I muse, that in both respects, as well of wisedome as vertue, they set any one before *Themistocles*. Now if a man be desirous to know the reason of these Columnes and Pillars, which supported those Statues aforesaid, it was to signifie, That such persons were now aduanced and lifted vp aboue all other mortall men: which also is meant by the triumphant Arches, a new inuention, and deuised but of late daies: yet both it, and all other such honourable testimonies, began first with the Greekes. But amongst many and sundry statues which they granted and allowed vnto such as they affected and liked of, I suppose, there was neuer man had more than *Phalerius Demetrius* at Athens: for the Athenians honoured him with three hundred and threescore: and yet soone after they * brake them all to peeces, euen before one ful yeare went ouer their heads, that is to say, a few daies more than there were Images. Moreouer, all the tribes or wards of Rome set vp a statue in euery street of the city (as I haue said before) in the honor of *Marius Gratidianus*, and those they ouerthrew euery one, against the comming in of *Scylla*.

As touching statues and Images on foot, I doubt not but they haue beene for a long time greatly esteemed at Rome. Howbeit those on horse-backe were very antient: and that which more is, this honour they did communicat also vnto women as well as men; as may appeare yet at this day by the statue of *Clœlia* sitting on horse-backe, as if shee could not haue beene honored sufficiently by making her statue in the habit of a Damosell or Ladie of Rome in a side gowne. And yet neither the Chaste dame *Lucretia*, nor the valiant *Brutus* (who chased the kings and all their race out of Rome, and for whose sake and in whose quarrell the said *Clœlia* was deliuered as an Hostage among others) neuer attayned vnto that honour. And I doe verily beleeue, that this Statue of hers, and that of *Horatius Cocles*, were the first that publique authoritie ordayned: for before time King *Tarquinius Priscus* caused both his owne Statue and also *Sibyllats* to be made, like as the other kings before him and after, as may be presumed by all likelihood

* Others say *Pompilius*.

* *Strabo* saith that they defaced & melted them, yea, and flung them into draughts and priuies.

20030
copy 1

A lihood and probabilitie. And yet *Piſo* ſaith, that the other damoſels and young gentlewomen her fellow hoſtages, after they were ſet free and ſent home ſafe againe by king *Porſena* (for the honour that he meant vnto *Clælia* in conſideration onely of her rare and ſingular vertue) cauſed the ſaid ſtatue or image of hers to be caſt in braſſe, and erected. But *Annius Fœcialis* (another antiquarie or heralt at armes of Rome) reporteth this ſtorie otherwiſe; for he writeth, That the ſtatue of a woman ſitting on horſebacke (which ſtandeth ouer-againſt the temple of *Iupiter Stator*, and hard at the gate or entry of king *Tarquinius* the Proud his Pallace) was of ladie *Valeria*, daughter vnto *Valerius* the Conſull, ſurnamed *Publicola*: who ſaith moreouer, that ſhee it was alone who eſcaped from her fellowes, and ſwam ouer the riuer Tiberis; whereas the reſt of the virgins which had been ſent as pledges vnto king *Porſena*, were murdred all, by the ſecret traines
B and indirect meanes of *Tarquin* the Proud.

L. Piſo moreouer hath left in writing, that in the yeare when *M. Æmilius* and *C. Popilius* the ſecond time were Conſuls, the Cenſors for the time being (*P. Cornelius Scipio* and *M. Popilius*) cauſed all the images and ſtatues of thoſe who had been head magiſtrates, that ſtood about the Forum of Rome, to be taken downe; permitting thoſe onely to ſtand which had beene erected and ſet vp either by grant from the people, or warrant and decree of the Senat. As for that ſtatue which *Sp. Caſſius* (him I meane who ambitiouſly ſought to be a king) cauſed to be erected for his owne ſelfe before the church of the goddeſſe *Tellus*, the Cenſors not only pulled it down, but alſo took order that it ſhould be melted. And this (no doubt) did thoſe wiſe and prouident fathers, to cut off all means euen in ſuch things as theſe, that might feed the ambitious ſpirit of
C men. There be yet extant certaine declamations of *Cato*, who being Cenſor, cried out againſt the vain-glorie and pride of certaine Romane Ladies who ſuffered their own images to be ſet vp in the prouinces abroad: yet with all his exclamations, he could not repreſſe their ambition, but that their ſtatues muſt be erected euen in Rome alſo: as for example, *Cornelia*, the daughter of the former *Scipio Africanus*, and mother to the two *Gracchi*, whoſe ſtatue was made ſitting: and this ſingularitie it had beſides from all others, That her ſhooes were pourtraied open and looſe without any ſtrings or latchets at all. This image of hers was ſet vp in the great gallery or publick walking-place of *Metellus*, but now it is to be ſeen among the ſtately workes and buildings of *Octavia*.

Moreouer, (by allowance and permiſſion of the ſtate) there haue been ſtatues ſet vp in Rome
D in publicke place, by ſtrangers: as namely, for *C. Ælius* a Tribune or Prouoſt of the commons, for that he publiſhed and enacted a law, That *Stennius Statillius* a Lucan, who twice had invaded and ouer-run in hoſtile manner, the Territory of Thurium, ſhould be reputed as an enemy vnto the Romanes: In regard of which demerit, the Thurines honoured the ſaid *Ælius* with a ſtatue of braſſe, and repreſented to him a coronet of gold. The ſame Thurines alſo cauſed another ſtatue to be made in the honour of *Fabricius*, for raiſing the ſiege that inueſted and beleaguered their citie. By occaſion of which ſuccour and reliefe giuen vnto ſtrangers and aliens, it came to paſſe in proceſſe of time, that forrein ſtates and cities ſhrouded themſelues ordinarily vnder the protection of ſome great men at Rome; and in deuotion to them, honoured ſuch as their lords and maſters, by ſtatues and all other means, euen as their bounden vaſſels. At length, there grew
E ſuch diſorder and confuſion of theſe ſtatues, that we had them pell mell at Rome without any choiſe or regard at all: inſomuch as it this day, they are no fewer than three ſtatues of *Annibal* to be ſeene at Rome, in three ſeuerall places of that citie, within the walls whereof he was the onely enemy euer knowne to haue launced his jauelin.

Chap. VII.

¶ *Of the Braſſe-founders in old time. The ineſtimable prices of molten Images. Of the moſt renowned Coloſſes and gyant-like Images in Rome.*

F THat the art of Founderie or caſting mettals for Images hath been very antique, practiſed alſo and profeſſen in Italie as well as in other countries time out of mind, may be euidently proued by the ſtatue of *Hercules*, which K. *Evander* conſecrated to the honour of him, in that very place (by folks ſaying) which now is the beaſt market in Rome. This image is called at this day, *Hercules triumphalis*, and at euery triumph is richly clad in triumphant habit. The image likewiſe of *Ianus* with two faces, dedicated by K. *Numa*, teſtified no leſſe; and honoured

he is no lesse than a god, as by whom the times of warre and peace be distinctly knowne. Moreouer, the fingers of his hand are in that sort fashioned and formed, as they represent the number of 365, which are the daies of the whole yere; by which notification of the yere, he sheweth sufficiently, that he is the god and patron of time and ages. The images also which are knowne commonly by the name of Thuscanica, which are so dispearsed abroad in all parts of the world, who will euer doubt but that they were commonly made in Tuscan? I would haue thought verily, that these Thuscanica had beene the images of the gods, and no other, but that *Metrodorus Scepsius* who for the immortall hatred that he bare against the Romans had his * surname giuen him, reproches the Romanes among other imputations, That they had forced and sacked the towne Volsinij, for the loue of two thousand pretty images in brasse which were therein. Considering then, that the inuention of making such molten images hath been so antique in Italie, I cannot chuse but much maruaile, that the idols and images of the gods in times past dedicated in churches and chappels, were either of wood or potters earth, rather than of brasse, vntill the conquest of Asia; from whence to say a truth, first arose and proceeded all our excesse and superfluitie. As touching the first deuise and originall of casting by moulds and forming the liuely similitudes of any thing expressely to the patterne, I shall haue fitter and better occasion to write thereof in my treatise of the art of Pottery, which the Greeks call Plastice; for of more antiquity I take it to be than this feat of Founderie: & yet this craft and cunning so flourished in times past, and brought for art such excellent pieces of worke, and for number so infinit, that if I should put down the greater part of them, it would require many volumes; for, to comprehend them all, what man is able? During the time that *M. Scaurus* was Ædile, there were three thousand molten images shewed vpon the stage when he exhibited his plaies, notwithstanding this theatre of his was made not to continue any time, but to serue for the present. *Mummius*, after the conquest of Achaia, brought in with him so many of these images, that hee filled the citie therewith, and no corner was free: and yet when he departed this life & died, he left not behind him a competent portion for to bestow his daughter in marriage. And this I write not to accuse and condemne so braue a man, but rather to excuse and commend him: for how can I otherwise doe? The two *Luculli* stored Rome with a number of these images. *Mutianus* (a man who of late daies had been twice Consull) reporteth, That there be yet within Rhodes three thousand such images: and verily it is thought, that in Athens, Olympia, and Delphi, there remaine no fewer to be seen. What man liuing is able to particularize them all? and say a man should come to the perfect knowledge of them, what good can he reape therby, or what vse may he make therof? Howbeit, one would take some delight and pleasure lightly to touch the principall pieces of workemanship in this kind, and namely those that be of marke and note for some special singularitie aboue the rest; as also to name therewith the renowmed artificers in times past, who wrought euery one of them a number of pieces, the exquisit and curious workmanship wherof, no man is able to vnfold and vtter as they deserue, since that *Lysippus* (by report) made in his time six hundred and ten, so full of art, so excellent and perfect all, as there is not one of them but sufficient it were to immortalize his name. And how was it knowne that hee made such a number just? It appeared plaine after his decease by a coffer that he had, wherein he treasured vp his gold, and which was then broken open by his heire: for the manner of *Lysippus* was, whensoeuer he tooke mony for the workemanship of any piece that went out of his hands, to lay by in the said coffer one *denier of gold; and so by the number of those deniers it was knowne, how many pieces of worke he made. Incredible it is to what height of perfection this art grew vnto, first by the succesſe of the art, which was so vendible and high prised; afterwards, by the audaciousnesse of the artificer, who ventured to make so huge and monstrous works.

What good speed this art had, may appeare by an example which I will set downe, of an image, deuised to expresse the likenesse neither of god nor man: and a dogg it was in brasse, which many a man hath seene in our time in a chappell of *Iuno* within the Capitoll temple, before it was burnt now last by the **Vitellians*: This dog was made licking his owne wound; but how artificially it was wrought, and how liuely it expressed the proportion & feature of a dog indeed, to the wonder of all those that beholding it could not discerne the same from a liuing creature, is apparant not only by this, That it was thought worthy to stand in that place and to be dedicated to that goddesse, but also by the strange manner of charge laid vpon them that had the keeping and custodie thereof: for no reall caution of mony was thought sufficient to be

* It doth not appeare what it was, but by all likelihood μυσοβιομηχανος.

* It should seeme that the Greekes had a piece in gold answerable in weight vnto the Romane *Denarius* in siluer, which was a dram Attick: and this commeth neer vnto our French crowne.

* i. Those that sided with *Vitellius*.

20030
copy 1

A be pledged and pawned for the warrantiſe, or to counteruaile the worth thereof: Order therefore was giuen by the ſtate, and the ſame obſerued from time to time, that the ſextons or wardens of the ſaid chappell ſhould performe the ſafety and forth-comming of it vnder paine of death.

As touching the bold and venturous pieces of worke that haue been performed and finiſhed by this art, we haue an infinite number of ſuch examples: for we ſee what huge and gyant-like images they haue deuiſed to make in braſſe, reſembling high towers more like that perſonages, and ſuch they called Coloſſi. Of this kind is the image of *Apollo* within the Capitoll, tranſported by *M. Lucullus* out of Apollonia, a city within the kingdome of Pontus, which in height was thirtie cubits, and coſt a hundred and fifty talents the making. Such another is that of *Iupiter* within *Mars* field, dedicated by *Claudius Cæſar* the Emperour, which becauſe it ſtandeth ſo
B neere vnto *Pompeys* theatre, men commonly call *Iupiter Pompeianus*, and full as big he is as *Apollo* abouenamed. Like vnto theſe, is the coloſſe or ſtately image [of *Hercules*] at Tarentum, the handiwork of the ſaid *Lyſippus*, but he is forty cubits high: and miraculous is the deuiſe of this coloſſe, if it be true which is commonly reported thereof, namely, that a man may mooue and ſtirre it eaſily with his hand, ſo truly ballanced it ſtands and equally counterpoiſed by Geometry; and yet no wind, no ſtorme or tempeſt, is able to ſhake it. Certes, it is ſaid, that the workeman himſelfe *Lyſippus*, prouided well for this danger, in that a pretty way off he reared a columne or pillar or ſtone full oppoſit to the winds mouth, for to breake the force and rage thereof, from that ſide where it was like to blow and beat moſt vpon the coloſſe: and verily ſo huge it
C was to weld, and ſo hard to bee remoued, that *Fabius* ſurnamed *Verrucoſus*, durſt not meddle withall, but was forced to let it alone & leaue it behind him; notwithſtanding be brought with him from thence another *Hercules*, which now ſtandeth within the Capitoll. But the Coloſſe of the Sun which ſtood at Rhodes, and was wrought by *Chares* of Lyndus, apprentice to the abouenamed *Lyſippus*, was aboue all others moſt admirable; for it carried ſeuenty cubits in height: well, as mighty an image as it was, it ſtood not on end aboue threeſcore yeares and ſix; for in an earthquake that then happened, it was ouerthrowne: but lying as it doth along, a wonderfull and prodigious thing it is to view and behold: for firſt and foremoſt, the thumbs of the hand and great toes of the foot are ſo big, as few men are able to fadome one of them about: the fingers and toes are bigger than the moſt part of other whole ſtatues and images: and looke where any of the members or limbs were broken with the fall, a man that ſaw them would ſay they were
D broad holes and huge caues in the ground: for within theſe fractures and breaches, you ſhall ſee monſtrous big ſtones, which the workemen at the firſt rearing and ſetting of it had couched artificially within, for to ſtrengthen the coloſſe, that ſtanding firme and vpright ſo ballaiſed, it might checke the violence of wind and weather. Twelue yeares (they ſay) *Chares* was in making of it before he could fully finiſh it, & the bare workemanſhip coſt three hundred talents: This mony was raiſed out of K. *Demetrius* his prouiſion which he had ſet by for that purpoſe, & paid from time to time by his officers, for that he would not himſelfe endure to ſtay ſo long for the workemanſhip thereof. Other images there are beſides of the nature of coloſſes in the ſame citie of Rhodes to the number of one hundred, leſſer indeed than the foreſaid coloſſe of the Sun, yet there is not one of them, but for the bigneſſe were ſufficient to giue a name to the place and
E ennoble it, whereſoeuer it ſhould ſtand. Ouer and aboue, there be in the ſaid citie fiue other gyant-like images or coloſſes repreſenting ſome gods, and thoſe of an huge bigneſſe, which were of *Bryaxes* his making. Thus much of workemen ſtrangers.

And to come ſomewhat nearer home: we Italians alſo haue practiſed to make ſuch coloſſes, for ſurely we may ſee (and go no further than to the librarie belonging to the temple of *Auguſtus Cæſar* here in Rome) a Tuſcan coloſſe made for *Apollo*, and the ſame is fiftie foot high from the great toe vpward: but the bigneſſe thereof is not ſo much as the matter and workemanſhip: for hard it is to ſay, whether is more admirable, the beautifull feature of the body, or the exquiſit temperature of the mettall. Moreouer, *Sp. Carvilius* long agoe made the great image of *Iupiter* which ſtandeth in the Capitoll hill, after the Samnites were vanquiſhed in that dangerous war, wherein they bound themſelues by a ſacred lay and oth to fight it out to the laſt man, vnder paine of death to as many as ſeemed to turne backe or once recule; to the making whereof, he tooke the braſen cuiraces, grieues, and morions of the enemies that lay dead and ſlaine vpon the ground: which is ſo exceeding bigg and large, that hee may very plainely and euidently bee diſcouered and ſeene from the other *Iupiter* in Latium, called therefore *Latiarius*.

* *Feſtus* ſaith 105 foot: wherby it appeareth that a cubit was one foot & a halfe. *Chares* the workeman engraued vnder it this Hypogram in Iambicke verſe:

Τὸν ἠέλιον πλοσσον ἐπέβαλε δῆμος,
Χίρας ἐποιες σπ-
ρῶν ὁ Λινδιος.

The pouder & duſt which the filme made in the workmanſhip & poliſhing of this coloſſe, *Carvilius* himſelfe caſt again, and thereof made his own image and pourtraiture, and the ſame ſtandeth (as you may ſee) at the foot of the other. Within the ſaid Capitoll, there be two braſen heads worthy of admiration, which *P. Lentulus* when he was Conſull thought good to dedicat to that place. The one was made by *Chares* the foreſaid founder; the other wrought by *Decius*: but this of *Decius* his making compared with the other, commeth ſo farre ſhort, that one would not take it to be the doing of an artificer that was his crafts-maſter, but rather of ſome bungler, prentice, or learner. But to ſpeake indeed of a great image, and that which ſurpaſſeth in bignes all the reſt of that kinde, looke but vpon the huge and prodigious coloſſe of *Mercurie*, which *Zenodorus* in our age and within our remembrance, made in France at Auvergne: ten yeares he was about it, and the workmanſhip came to foure hundred thouſand ſeſterces. Now when hee had made ſufficient proofe of his Art there, *Nero* the Emperour ſent for him to come to Rome, where he caſt indeed and finiſhed a coloſſe a hundred and ten foot long, to the ſimilitude and likeneſſe of the ſaid Emperor, according as it was firſt appointed, and as he began it: but the ſaid prince being dead and his head laid, dedicated is was to the honour and worſhip of the Sun, in deteſtation of that moſt wicked monſter, whoſe vngratious acts the city condemned and abhorred. Certes, I my ſelfe haue been in that workhouſe of *Zenodorus*, where I beheld and conſidered not onely that great maſter-patterne in cley of the ſaid coloſſe, but alſo another conſiſting of very ſmall pieces, as branches, which ſerued as it were for moulds, and the firſt induction to the worke, as the aſſay and proofe thereof. Surely the workemanſhip of this one ſtatue or coloſſe, ſhewed plainly, that the true ſcience & skil of founderie or caſting braſſe into forms, was clean decaied and gone; conſidering that *Nero* was ready and willing to giue ſiluer and gold enough for the doing thereof artificially and with expedition. *Zenodorus* alſo himſelfe was not thought inferiour to any workeman in old time, either for counterfeiting a ſimilitude, or grauing the ſame: for during the time that he made the ſtatue beforeſaid in Auvergne, he counterfeited two drinking cups grauen and chaſed by the hand of *Calamis*, but belonging to *Vibius Avitus* (the preſident and gouernor at the ſame time, of that prouince) which he had receiued of *Caſſius Syllinus* his vncle by the mothers ſide, tutor and ſchoolemaſter ſomtime to *Cæſar Germanicus*; which prince notwithſtanding that he loued them wel, yet hee beſtowed them freely vpon his ſaid inſtructer *Caſſius*, whom he loued better: and *Zenodorus* did it ſo well, that hardly there could be diſcerned any difference in the workemanſhip. But to conclude, the more conſummat and accompliſhed that *Zenodorus* was for his skill and cunning, the more euidently it appeareth, that the true Art of founderie was in his time cleane loſt, and out of knowledge and practiſe.

Chap. VIII.

¶ *Of 366 excellent pieces of worke in Braſſe, and as many cunning artificers in that kind.*

THe images aad wrought pieces of Braſſe, commonly called Corinthian works, many men take ſuch pleaſure & delight in, that they loue to carry the ſame with them whitherſoeuer they goe; as *Hortenſius* the famous orator, who would neuer be without the counterfeit of *Sphinx*, which hee had from *Verres* his client, at what time as he was in trouble and called into queſtion, for his extortions and oppreſſions in Sicilie: in which triall of *Verres*, wherein *Cicero* was his aduerſarie and accuſer, vpon occaſion that *Hortenſius* who pleaded at the barre againſt him in the behalfe of *Verrus*, among other croſſe words that paſſed betweene, happened to ſay, That he vnderſtood no parables and riddles, and therefore willed him to ſpeake more plainly; *Cicero* made anſwer readily againe, that by good reaſon he ſhould be well acquainted with riddles, ſeeing he had a *Sphinx* at home in his houſe. Likewiſe, *Nero* the Emperour had a great fancie to a piece or counterfeit of an Amazon, (wherof I meane to write more hereafter) which by his good will he would neuer be without. And *C. Ceſtius*, ſomewhat before *Nero*, a man that in his time had bin Conſul, was ſo addicted to a little image that he had, that it went with him into the campe, yea and he would haue it about him in the very conflict and battell with his enemies. Moreouer, K. *Alexander* the Great had four ſtatues or images (by report) which ordinarily were wont and none but they, to ſupport his tent when he lay abroad and kept the field: wherof, twain ſtand now before the temple of *Mars* called the Reuenger, & other 2 before the Palatium.

As

A As touching images, ſtatues, and counterfeits of a leſſer ſize, there are an infinite number of artificers who are ennobled & renowned by them: yet to begin with the image of *Iupiter* made at Olympia, *Phidias* the Athenian (aboue all other) was of great name therefore, and wrought it was of yvorie & gold together: howbeit many other pieces of braſſe there were of his making, which greatly commended the workman; he flouriſhed in the 83 Olympias, and about the yere (after our computation at Rome) 300. And at the ſame time there liued thoſe concurrents of his who endeauoured to match him, to wit, *Alcamenes*, *Critias*, *Neſtocles*, and *Hegias*. After theſe, and namely in the 87 Olympias, there ſucceeded and had their time, *Agelades*, *Callon*, *Polycletus*, *Phragmon*, *Gorgias*, *Lacon*, *Myron*, *Pythagoras*, *Scopas*, and *Perelius*: of which, *Polycletus* brought vp diuers braue and worthy apprentices, and by name, *Argius*, *Aſapodorus*, *Alexis*, *Ariſtides*, *Phrynon*, *Py-*
B *non*, *Athenodorus*, *Dameas* of Clitore, & *Myron* the Lycian. In the 95 Olympias there flouriſhed *Naucides*, *Dinomedes*, *Canochus*, and *Patrocles*. In the 102 Olympias there came in place, *Polycles*, *Cephiſſodorus*, *Leochares*, and *Hypatodorus*. In the 104 liued *Lyſippus*, at what time alſo K. *Alexander* the Great flouriſhed: likewiſe *Lyſiſtratus* and his brother *Sthenis*, *Euphronides*, *Soſtratus*, *Ion*, and *Silanion*: of which *Silanion* this is wonderfull, that hauing no maſter at all to teach and inſtruct him in the art, yet he became himſelfe ſo excellent, that he brought vp vnder him, *Zeuxis* and *Iades*. In the 120 Olympias, *Eutychides*, *Euthycrates*, *Lahippus*, *Sephiſſodorus*, *Tymarchus*, and *Pyroma-*
chus were famous artificers for the time. Then lay the art aſleep and as it were dead for a while, vntill ſuch time as about the 155 Olympias it ſeemed to reuiue and awaken again; & then there aroſe *Antheus*, *Calliſtratus*, *Polycles*, *Athenæus*, *Callixenus*, *Pythocles*, *Pythias*, and *Timocles*, indifferent
C good workemen, but nothing comparable to the other before named. Thus hauing ranged the moſt famous Artificers diſtinctly according to their ſeuerall Ages, I will runne ouer them againe, as many I meane as excell the reſt: and yet howſoeuer I make haſte, I will not ouerpaſſe the multitude of others, but interlard (as it were) and diſperſe them among, as occaſion ſhal be offered.

In the firſt place this is to be vnderſtood, that the principal and ſingular of al theſe founders came in queſtion (notwithſtanding they liued in ſundry ages) which of them ſhould be eſteemed chiefe, by reaſon of diuers Amaſons wrought by their hands: for when theſe images ſhould be dedicated in the temple of *Diana* in Epheſus, it was thought good to make choiſe of one that ſhould be deemed & approued beſt, by the iudgment of thoſe workmen who then liued & were
D preſent: for plaine it was, that the image whom they all iudged to be next and ſecond to their own, the ſame was ſimply beſt, and ſo to be reputed. This principal Amaſon hapned to be of *Polycletus* his making: in a ſecond degree was the Amaſon made by *Phidias*: that of *Cteſilas* was counted the third; of *Cydon* the fourth, & in a fift place was reckned the workmanſhip of *Phragmon*. As for *Phidias*, beſides the *Iupiter Olympius* of his making, (wherin no man ſeeketh to come neere vnto him) he made likewiſe *Minerva* of ivorie at Athens, which ſtandeth there in the temple Parthenon. But ouer and aboue the foreſaid Amaſon, there was of his workmanſhip *Minerva* in braſſe, ſo faire and beautifull, that of her beauty ſhe tooke the ſirname [*Kallimorphos*.] Of his doing was the image called * *Cliduchos*, and another of *Minerva*, which *Æmilius Paulus* dedi-
E cated at Rome in the temple of *Fortuna hujuſce diei*, *i*. Of the daies of Fortune. Alſo two other ſtatues or images portraied in clokes or mantles, were his handiwork, which *Catulus* ſet vp in the ſame temple: likewiſe another after the maner of a coloſſus or gyant all naked. In ſum, he was deemed and that iuſtly, to haue bin the firſt that deuiſed and taught the skil of chaſing & embоſſing. As for *Polycletus* the Sicyonian, who learned his cunning vnder *Agelades*, hee it was that made in braſſe *Diadumenus* an effœminat yong man looking wantonly, with a diadem or wreath about his head; a piece of work of great account, & much ſpoke of, for that it coſt 100 talents: and of his making was *Doryphorus*, a yong boy with a manly countenance, hauing a ſpeare in his hand. Moreouer, he made that which workmen call Canon, that is to ſay, one abſolute piece of worke, from whence artificers do fetch their draughts, ſimetries, and proportions, as from a perfect patterne or rule which guideth and directeth them in their worke: ſo as wee may well and
F truly iudge, That *Polycletus* alone reduced the skill of Founderie and imagerie into an Art and method, as may appeare both by that Canon, and by other workes which paſſed through his hands. Of his workmanſhip was the braſen image, repreſenting one ſcraping and rubbing himſelfe in the bath or hot-houſe: as alſo another all naked, and * challenging to the dice. *Item*, two boyes both naked playing at dice, which thereupon be called Aſtragalizontes. And theſe remaine

* Κλειδοῦχος, *i*. Claviger, the key-bearer.

* *Talo inceſſente* ſome read, *talo incedente*.

main to be ſeen in the court or portall belonging to the houſe of *Titus* the Emperor, which is ſo G
exquiſit a piece of worke, that many doe iudge there cannot be ſet another to it more abſolute
and perfect: alſo he it was which wrought the image of *Mercury* which is at Lyſimachia of *Her-*
cules at Rome, and namely how hee heaued and held vp *Anteus* from the ground between heauen
and earth: and the counterfeit of *Artemon*, that effeminate and wanton perſon, who becauſe hee
was ordinarily carried in a Litter, men called *Poryphoretos*. This *Polycletus* was iudged to haue
brought this art of Imagery to a conſummat perfection; the feat alſo of ingraiuing & imboſſing
he was thought to practiſe and promote, like as *Phidias* before him opened the way to it & gaue
inſtructions. This proper and ſpecial gift he had beſides aboue all other, to deuiſe how Images
might ſtand vpon one leg: and yet *Varro* ſaith, that all the images of his making be four ſquare,
and all in manner after one pattern. H

To come vnto *Myro*, born he was at Eleutheræ, and an apprentice likewiſe to *Agelades*: the
piece of worke that brought him into name and made him famous, was an heifer of braſſe; by
reaſon that diuers Poets haue in their verſes highly praiſed it, and ſpread the ſingularity of it a-
broad: for ſo it falls out otherwhiles, that many men are commended by the wit of others, more
than by their own. Other pieces of work there were of his beſides, to wit, a dog, a coit-caſter (or
one hurling a ſtone or weight of lead) *Perſeus* [killing *Meduſa*] ſawyers called Priſtæ, a Satyre
wondring at a pipe or flute, and the goddeſſe *Minerva*: moreouer, the Delphick Pentathli, & the
Pancratiaſtæ: furthermore, that image of *Hercules* which ſtandeth in the temple that *Pompey* e-
rected neere the greateſt cirque or ſhew-place, is the handiwork of *Myro*. Beſides (as it appeares
by the poëſie of *Erinna* the Poëtreſſe) hee it was that made the tombe or monument in braſſe of I
a poore graſhopper and a locuſt; the image likewiſe of *Apollo*, which (after that *Antonius* the
Triumvir had wrongfully taken from the Epheſians) *Auguſtus Cæſar* reſtored againe vnto them,
being warned ſo to do by a viſion appearing vnto him in his ſleep, was of *Myro* his making. This
workman ſeems to haue bin the firſt that wrought not his images after one ſort, but altered his
work after many faſhions, as being fuller of inuention, and giuen more to deuiſe in his art, more
curious alſo and preciſe in his ſymentries and proportions, than *Polycletus*: and yet as exquiſite
as he was, he went no farther than to the outward linements of the body and members thereof;
as for the inward affections of the mind he did not expreſſe in any of his work: the haire alſo as
well of head, beard, as ſhare, he left after a groſſe maner, & wrought them no finer than the rude
and vnexpert workmen in old time had either done or taught. No maruel therefore if *Pythagoras* K
the Imageur of Rhegium in Italy went beyond him in this feat, and namely in that piece of
worke of his which reſembled a wreſtler or Pancratiaſtes, which was dedicated in the temple of
Apollo at Delphos. He came ſhort alſo of *Leontius*, who expreſſed liuely in braſſe, *Aſtylos* the fa-
mous runner in a race; which image is ſhewed for a rare piece of work in Olympia: alſo the boy
Libys, which is to be ſeen in the ſame place, holding in his hand a little table, and withall carry-
ing apples, ſtark naked. He made alſo the pourtraiture of one that ſeemed lame and to halt, vpon
an vlcer; but the ſame is ſo liuely and naturally done, that as many as behold the ſame ſeeme to
haue a compaſſion and fellow-feeling with him of ſome pain and grieuance of his ſore; and this
piece of work a man may ſee at Syracuſa. Furthermore, the ſaid *Leontius* caſt in braſſe one *Apollo*
playing vpon his harpe: as alſo another *Apollo*, and the ſerpent killed with his arrowes; which I.
image he ſirnamed *Dicæus*, *i.* Iuſt: for that when the city of Thebes was won by *Alexander* the
Great, the gold which he hid in the boſome thereof when hee fled, was found there ſafe and not
diminiſhed, when the enemy was gon and he returned. Hee was the firſt that in his images ex-
preſſed the ſinues and veines lying vnder the skinne: hee it was alſo that couched and layd the
haire of the forehead more handſomely, yea and wrought the ſame farre more finely than any
before him.

* or rather *Pa-*
rius, of *Paros*.

Now beſides *Pythagoras* before mentioned, there was another a * Samian both, who by occu-
pation was at the beginning a painter: of his handiwork are thoſe 7 images halfe naked, which
* *Huiuſce dici.* are to be ſeen in the Temple of * This daies *Fortune* at Rome; and one reſembling an old man:
all highly commended for ſingular art. This *Pythagoras* was ſo like vnto the other aboue named, M
eſpecially in face and countenance, that hardly (by report) one of them could be knowne from
the other. As touching *Soſtratus*, it is ſaid he was apprentice to *Pythagoras* of Rhegium, and his
ſiſters ſon beſides. As for *Lyſippus* of Sicyone, *Durus* ſaith, That he learned the art by himſelfe,
and neuer was taught by other. But *Tullius* affirmeth, That hee was an Apprentice vnto it, and
hauing

20030
copy 1

A hauing bin at firſt by occupation a poore tinker or a plain braſier and copperſmith at the moſt, he began to take heart vnto him and to proceed further, by a ſpeech or anſwer that *Eupompus* the painter gaue him: for when he ſeemed to ask this painters counſel, what pattern and whom he were beſt to follow of all thoſe workmen that were gon before him? hee ſhewed vnto him a multitude of people, and ſaid withall, That he ſhould do beſt to imitate Nature her ſelf, and no one artificer: and that was it (quoth he) which I meant by the former demonſtration of ſo many men. And verily, ſo excellent a workman he proued in the end, that he left behind him the moſt pieces of any man (as I haue ſaid before) and thoſe of all ſorts, and fulleſt of art and good workmanſhip: and among the reſt, the image of a man, currying, rubbing, and ſcraping the ſweat and filth off his own body, which *M. Agrippa* cauſed to be ſet before his own bains: and the Emperor *Tiberius Cæſar* took ſo great pleaſure in it, that notwithſtanding at his firſt comming to the crown he knew well enough how to command and temper his own affections, yet he could not now rule himſelfe, but would needs haue the ſaid image to be remoued from thence, into his own bed-chamber, and another to be ſet in the place of it: wherat the common people (ſee their contumacie and frowardneſſe!) were ſo much offended and diſpleaſed, that they reſted not with open mouth to exclaim vpon him in all their theatres, when they met there together, and cried to haue their Apoxyomenos ſet again in the own place: inſomuch as the Emperor was content ſo to do, notwithſtanding he loued it ſo well. This *Lyſippus* alſo won great credit and commendation by another image that he made, repreſenting a woman piping or playing vpon the flute, and drunken withall: alſo by a kennell of hounds, together with the huntſman and all belonging to the game. But aboue all, he got the greateſt name for making in braſſe a chariot drawne with foure ſteeds, together with the image of the Sun, ſo much honored among the Rhodians. The perſonage of King *Alexander* the Great hee likewiſe expreſſed in braſſe, and many images he made of him, beginning at the very childhood of the ſaid Prince: and verily the Emperour *Nero* was ſo greatly enamoured vpon one image of *Alexander*, that hee commanded it to be gilded all ouer; but afterwards, ſeeing that the more coſt was beſtowed vpon it by laying on gold, the leſſe was the art ſeen of the firſt workman, ſo that it loſt all the beauty and grace that it had by that means, he cauſed the gold to be taken off againe: and verily the ſaid image thus vngilded as it was, ſeemed far more pretious than it was whileſt it ſtood ſo enriched with gold, notwithſtanding all the hacks, cuts, gaſhes, and raſes all ouer the body wherein the gold did ſticke, remained ſtill, which in ſome ſort might disfigure it. Of this mans making was the ſtatue of *Hephæſtion*, a great fauorit and minion of *Alexander* the Great; and yet ſome aſcribed this piece of worke vnto *Polycletus*; whereas in truth he liued almoſt an hundred yeres before the ſaid *Hephæſtion*. He counterfeited alſo *Alexander* the Great how hee rode a hunting, with his hounds and all things belonging to the chace; and this Worke of his reſembling hunting was thought worthy to be conſecrated in the temple of *Apollo* at Delphi. At Athens he made a troupe of Satyrs. As for *Alexander* himſelfe, with all his principall courtiers and friends about him, he reſembled in braſſe moſt liuely. All theſe pieces of his workmanſhip before rehearſed were tranſported to Rome by *Metellus*, after the ſubduing and conqueſt of Macedonie. Finally, Coaches drawne with foure horſes, he made of many ſorts and faſhions, all in braſſe. And in a word, the art of founderie and imagerie was brought to far greater perfection by this Artificer, as it was thought; for hee expreſſed the very haires of the head as fine and ſmall as Nature made them. The heads to the images of his making were nothing ſo big in proportion to the reſt of the body as they were in old time: his images ſhewed not ſo great and corpulent, but more lank, ſlender, and lean; as wel to expreſſe the knitting of joints, the ribs, veins, and ſinues the better, as to cauſe them alſo to ſeem the taller. The Symmetrie, which aboue all things hee obſerued moſt preciſely in all his workes, is a terme that cannot properly bee expreſſed by a Latine word. A new deuice he had that neuer before him any practiſed, and that was, to make his images of a quarry and ſquare ſtature, as the Antients before his time did: for an ordinary ſpeech it was of his, That in times paſt men were made plain, ſuch as they were; but he made them as they would ſeem to be. Finally, it ſeemeth, that this ſingular gift he had aboue all others in all his workes, to ſhew fineneſſe and ſubtiltie, which hee obſerued moſt curiouſly in the ſmalleſt things that paſſed vnder his hand. When he died, he left behind him three ſonnes, which alſo were his apprentiſes: of whom, *Lahippus* and *Bedas* were paſſing good Workemen, and very well regarded; but *Euthycrates* his third ſonne ouerwent his brethren. Although I muſt needs ſay, That hee

loued

loued rather to follow his father in ſuch Workes as carried ſome conſtancie and maieſty with them, than any dainty geſture or curious elegancie, wherein his father excelled: and hee choſe rather to employ his wit in expreſſing ſad, auſtere, and graue perſonages, than to beat his braine about pleaſant and beautiful works to pleaſe and content the eie. And therefore the portrait of *Hercules* which is to be ſeen at Delphos within the temple of *Apollo*, he expreſſed moſt excellently. The ſtatue alſo of K. *Alexander* the great was of his making, and is thought to be a rare piece of work: the hunter *Theſpis* was of his making, a work highly eſteemed: like as the nine Muſes alſo, known by the name of *Theſpiades*. Hee repreſented alſo in braſſe a skirmiſh on horſebacke, repreſenting that Turnois which was performed at the Oracle of *Iupiter Throphonius*: likewiſe the coches of Queen *Medea* drawne with foure horſes, of which kinde he made many: as alſo an horſe with panniers: and hunters hounds as if there were a cry of them. G H

He brought vp vnder him one *Tiſicrates*, who alſo was a Sicyonian, but hee rather ſeemed to imitate *Lyſippus*, than his maſter *Euthycrates*, inſomuch as many pieces of his making could bee hardly diſcerned from thoſe in the ſame kind, which came out of *Lyſippus* his hand: as for example, the image of an old man reſembling in habit a Theban, the portrait of K. *Demetrius*, and of one *Peuceſtes* who ſaued the life of *Alexander* the Great; in which regard he deſerued well to be immortaliſed by ſo good a hand.

Moreouer, diuers artificers there be who haue written great volumes of ſingular workmen in Imagery, and they commend wonderfully one *Telephanes* a Phocean, whoſe name otherwiſe had bin vnknown, for that in Theſſaly where he dwelt his works lay hidden & neuer came to light: for in regard of his skill and ſufficiency, by all their voices equal he was to *Polycletus*, *Myron*, and *Pythagoras*. And to come vnto particulars, they write much in praiſe of his *Lariſſa*, his *Apollo*, and one *Spinarius* a notable wreſtler, and who had won ſeuerall prizes in all the fiue kinds of maſteries and feats of actiuitie. And yet I am not ignorant, that ſome alledge another cauſe of his obſcureneſſe, and why he was no more talked of, becauſe hee was a feed workman to *Xerxes* and *Darius*, and deuoted himſelfe wholly to their ſeruice, and had the work of thoſe two Kings onely. I

As for *Praxiteles*, his workmanſhip was more ſeene in cutting of marble, and making Images thereof, wherein he had a ſingular grace and rare felicitie, and in which regard his name was the greater. Yet he ſhewed good proofe of his skil in foundery alſo, for there be moſt beautiful caſt images of braſſe which he made, to wit, the rauiſhing of *Proſerpina* by *Pluto*, a Spinſter ſpinning, which he called *Catagnſa*: the image of Drunkenneſſe, god *Bacchus* attended with one of the Satyrs; a noble piece of worke, and which for the great voice and bruit that went of it, the Greekes ſirnamed *Periboetos*. The braſen images likewiſe, which ſtood ſometimes in the forefront of the temple at Rome dedicated vnto *Felicity*, were of his making: as alſo the goddeſſe *Venus*, which when the chappel wherein ſhe ſtood erected was burnt, during the raign of *Claud. Cæſar* the emperor, was melted; an exquiſit piece of work, and comparable to that *Venus* of his cutting in marble, which all the world ſpeakes ſo much of. He portraied alſo in braſſe a woman making coronets and Chaplets of floures, which goes vnder the name of *Stephuſa*: a foule old trot & a naſty, bearing the title of *Spilumene*: a carier alſo of flaggons or wine-pots, knowne by the addition of *Oenophorus*. He expreſſed moreouer in braſſe, and that moſt liuely, *Harmodius* and *Ariſtogiton*, maſſacring the tyrant *Piſiſtratus*: which images being with other pillage taken and caried away by *Xerxes* K. of Perſia, and recouered by King *Alexander* the Great when he had conquered the kingdom of Perſis, the ſaid prince and conquerer ſent them home to the Athenians again. Furthermore, he caſt in braſſe a * youth lying in wait with an arrow to kill a Lizard, which was readie to creepe cloſe vnto him and to ſting; which piece of work hee termed Sauroctonus. Two images there are beſides of his making, which people take much pleaſure to behold, and thoſe in countenance ſhew diuers affections; to wit, a ſober Matron weeping, and a light Courteſan ſmirking: It is thought that this Courteſan was his owne Sweet-heart *Phryne*; for men doe note both (in the curious workemanſhip of the Artificer) the loue of him which fancied her, and alſo (in the pleaſant countenance of the harlot) the contentment that ſhe took by receiuing her hire. There is an image alſo of his making, which doth expreſſe his own benignity & bountifull mind; for to a coach of *Calamis* his doing, drawn with foure horſes, he ſet a choachman of his owne handiworke: and why? becauſe the poſteritie another day ſhould not thinke, That *Calamis* hauing done ſo well in pourtraying the horſes, failed of the like cunning in expreſſing the K L M

* Some thinke he meaneth this of *Apollo*.

20030
copy 1

A the man: and to ſay a truth, *Calamis* was not altogether ſo perfect & ready in perſonages of men and women, as in the pourtraiture of horſes. This *Calamis* was he who made many other coaches and chariots, as well with two ſteeds as foure, and verily, for abſolute workmanſhip about horſes, wherein he neuer miſſed, he had not his fellow againe in the world: and yet becauſe hee would not be thought vnlike himſelfe, but be taken for as good an imageur in expreſſing men and women, as in repreſenting horſes, one ſtatue hee made in reſemblance of Ladie *Alcmena*, which is ſo exquiſitly wrought as no man could euer ſet a better piece of worke by it.

To come now to *Alcamenes*, trained vp vnder *Phidias*. A ſingular workman he was, & wrought many pieces in marble, as alſo in braſſe, and namely a braſen *Pentathlus*, knowne alſo by the name of *Encrinomenos*.

B But *Ariſtides*, who learned his skill vnder *Polycletus*, is famous for the chariots that he made as well with foure as two horſes. *Iphicrates* likewiſe caſt in braſſe a Lioneſſe, which is much praiſed, and goes vnder the name of *Læna*, and that vpon this occaſion: There was a certaine ſtrumpet named *Læna*, who being familiarly acquainted with *Harmodius* and *Ariſtogiton* abouenamed, (for that ſhe could play vpon the harpe, and withal ſing ſo ſweetly to it) and priuie to their plots and projects as touching the murder of the tyrant *Piſiſtratus*, would neuer, to die for it, diſcouer and reueale this intention and purpoſe of theirs vnto the tyrant and his fauourits, notwithſtanding ſhe was put to moſt exquiſit & dolorous torments about it. The Athenians therfore deſirous to honour this woman for her reſolute conſtancie accordingly, and yet loth to be thought for to make ſo much of ſuch an harlot as ſhe was, deuiſed to repreſent the memoriall C of her and her act by a beaſt of her name, and that was a Lioneſſe, yet for to expreſſe the particular motiue and reaſon of this honour done vnto the ſaid Lioneſſe, they gaue order vnto *Iphicrates* the workeman, to leaue out the * tongue in the head of this Lioneſſe.

Touching *Bryaxis*, there be two excellent pieces of his making, to wit, *Æſculapius* and *Seleucus*. As for *Bedas*, he reſembled in braſſe old *Battus* adoring *Apollo* and *Iuno*: And all three by him curiouſly wrought, are now ſtanding in Rome within the temple of *Concord*. *Cteſilas* expreſſed in braſſe a man grieuouſly wounded, fainting and ready to die thereupon; which he did ſo liuely, that one might perceiue therin how little life & breath was left within his body. He made likewiſe the image of *Pericles* * *Olympius*, who for his diuine eloquence and holineſſe was worthy of that heauenly name. And here by the way, a wonderfull gift this art hath, that it alwaies hath D made noble and worthy perſons more noble and famous.

As for *Cephiſſodorus*, the admirable image of *Minerva* which is to be ſee in the hauen or harbor of the Athenians, was his workmanſhip: The altar alſo before the temple of *Iupiter*, ſurnamed *Saviour*, neer the ſaid hauen, was of his doing, and few pieces of worke there be comparable vnto it.

Canachus made one excellent image of *Apollo* all naked, which by the title and ſyrname of *Phileſius*, ſtands in the temple called *Didymæum*. And this *Apollo* was caſt of the braſſe of Æginetticke temperature. There is with the ſaid *Apollo* another moſt exquiſit and curious piece of worke by him deuiſed and wrought, to wit, a ſtag ſtanding ſo lightly vpon his feet, that a man may draw a thred vnder them; and the ſame takes hold of the floore vnderneath, ſo daintily that he ſeemeth to touch it with one foot by the clea, with another by the heele, and the ſame after E ſuch a winding manner twining and turning, as well with the one as the other, that a man would thinke one while he were about to bounce and ſpring forward, and another while to ſtart and caſt himſelf backward by turns. The ſame workman inuented a deuiſe of yong lads & youths vaulting and mounting on horſeback. *Cheræas* expreſſed in braſſe the liuely pourtraitures of K. *Alexander* the Great, and king *Philip* his father. *Cteſalaus* repreſented in the ſame mettal, one of theſe Doryphori, which were of K. *Darius* his guard, bearing a ſpeare or pertuiſane: alſo one of thoſe warlick women, Amaſons, wounded. And *Demetrius* woon great credit by making *Lyſimache* in braſſe, who had beene the Prieſtreſſe of *Minerva*, and exerciſed that miniſterie threeſcore and foure yeares. And this artiſane made alſo the image of *Minerua*, ſurnamed *Muſica*, vpon this deuiſe, For that the dragons or ſerpents which ſerue in ſtead of haires vpon her *Gorgon* or *Me*F *duaſes* head, wrought in her targuet, would ring and reſound againe, if one ſtrucke the ſtrings of an Harpe or Citron neer to them. And the ſame imageur made the liuely pourtraiture of *Sarmenes* riding on horſeback; for that he was the firſt that wrote of horſemanſhip. *Dædalus* moreouer, who is ranged among the excellent founders & imageurs of old time, deuiſed in braſſe two boies, rubbing, ſcraping, and currying the ſweat from their bodies in the baine. And *Dinomenes*

was

* For this harlot *Læna* fearing leaſt ſhe might for pain and torment let paſſe ſome word, and bewray the thing, ſhee bit out her owne tongue, & ſpit it in the face of the tyrant and the tormetors.

* For he neuer made ſpeech to the people, but with ioint hands litted vp to heauen, he praied firſt.

was the workman, who caſt in braſſe the full proportion and ſimilitude of *Proteſilaus*, and of *Pythodemus* the famous wreſtler. *Alexander*, otherwiſe called *Paris*, was of *Euphranor* his making: The excellent art and workmanſhip wherof was ſeen in this, that it repreſented vnto the eie all at once, a iudge between the goddeſſes, the louer of *Helena*, and yet the murtherer of *Achilles*. The image of that *Minerua* at Rome, which is called *Catuliana*, came out of this mans ſhop: and it it the ſame which was dedicated and ſet vp beneath the Capitoll by *Quintus Luctatius Catulus*, whereupon it tooke that name. Moreouer, the image that ſignifieth good lucke or happie ſucceſſe, carying in the right hand a boule or drinking cup, in the left an eare of corne and a Poppy head, was his handie worke. Like as the princeſſe or ladie *Latona*, newly deliuered of *Apollo* and *Diana*, holding theſe her two babes in her armes: and this is that *Latona* which you ſee in the church of *Concordia* in Rome. He made beſides many chariots, drawne as well with foure as two horſes: as alſo a key-bearer or *Cliduchus*, of incomparable beautie. Semblably two other ſtatues, reſembling Vertue and Vice, both which were of an extraordinary ſtature and bignes, gyant-like, in manner of Coloſſes. He made beſides a woman miniſtring, and yet worſhiping withall. *Item* King *Alexander* the Great, and King *Philip* his father, riding both in chariots drawne with foure horſes. *Eutychides* a renowned imageur, repreſented the riuer Eurotas in braſſe: and many men that ſaw this worke, were wont to ſay, That the water ran not ſo cleare in that riuer, as art and cunning did appeare in this workemanſhip. *Hegyas* the imageur made *Minerva* and King *Pyrrhus*, which be much praiſed for the art of the maker: likewiſe boies practiſing to ride on horſebacke: the images alſo of *Caſtor* and *Pollux*, which ſtand before the temple of thundring *Iupiter* in Rome. In the colonie or city Parium, there is an excellent ſtatue of *Hercules*, the handy worke of *Iſidorus*. *Buthyreus* the Lycian was taught his cunning by *Myron*, who among many other pieces, beſeeming the apprentiſe of ſuch a maſter, deuiſed in braſſe to repreſent a boy blowing at a fire halfe out: and he it was that caſt in the ſame mettall the famous Argonautes, in that voyage to Colchos.

Leocras made the Ægle that rauiſhed *Ganymede*, and flew away with him; but ſo artificially, as if ſhe knowing what a fine & dainty boy ſhe had in charge, and to whom ſhe caried him, claſped the child ſo tenderly, that ſhee forbare with her tallons to pierce through the very cloths. The boy *Autolicos* alſo, winning the prize in all games and feats of actiuitie, was of his making; for whoſe ſake *Xenophon* wrote his booke entituled *Sympoſion*: likewiſe that noble image of *Iupiter* in the Capitoll of Rome, ſurnamed Thundering, which is commended aboue all others: as alſo *Apollo*, with a crowne or diademe.

Lyciſcus counterfeited *Lago* a boy, who in maner of a page or lacquey, ſeemed to be double diligent, & after a flattering and deceitfull ſort performed nothing but eie-ſeruice. *Lycus* alſo made another boy blowing the coales for to maintain fire. *Menechmus* deuiſed to caſt in braſſe a calfe, turning vp the neck & head at the man that ſettteth his knee vpon his ſides, and keepes his body down. This *Menechmus* was a ſingular imageur, and himſelf wrote a book as concerning his own art. *Naucides* was iudged to be an excellent workman, by the making of *Mercury*, & of a diſcobole or coiter: as alſo for counterfeiting in braſſe one that was a ſacrificing or killing a ram. *Naucerus* woon credit by making of a wreſtler, puffing & blowing for wind. *Nicerates* had the name for the curious workmanſhip of *Æſculapius* and **Hygia*, which are to be ſeen at Rome within the temple of *Concord*. *Porymachus* got great reputation by a coach drawn with four ſteeds, & ruled by *Alcibiades* the coachman, all of his making. *Policles* was the maker of that noble piece of work that goeth vnder the name of *Hermaphroditus*. *Pyrrhus* counterfeited in braſſe another *Hygia* & *Minerua*. And *Phœnix* who learned his art of *Lyſippus*, liuely counterfeited the famous wreſtler *Epitherſes*. *Stipax* the Cyprian got himſelfe a name by an image reſembling one *Splanchnoptes*: This was a prety boy or page belonging to *Pericles*, ſurnamed *Olympius*, whom *Stipax* made frying & roſting the inwards of a beaſt at the fire, puffing and blowing therat with his mouth full of breath and wind for to make it burne. *Silanion* did caſt the ſimilitude of *Apollodorus* in braſſe, who likewiſe was himſelfe a founder and imageur, but of all other moſt curious and preciſe in his art, he neuer thought a thing of his owne making well done, and no man cenſured his worke ſo hardly as himſelfe: many a time when he had finiſhed an excellent piece of work, he would in a miſlike vnto it, paſh it in pieces, and neuer ſtood contented and ſatisfied with any thing when it was all done, how ful of art ſoeuer it was, and therfore he was ſurnamed Mad: Which furious paſſion of his, when *Silanion* aforeſaid would expreſſe, he made not the man himſelfe alone of braſſe, but the

* i. Good health.

20030
copy 1

A the very image of Anger and Wrath alſo with him, in habit of a woman. Ouer and beſides, the noble *Achilles* was of his making, a piece of worke well accepted and much talked of. Of his doing is *Epiſtates*, teaching men how to wreſtle and exerciſe other feats of actiuitie. As for *Strongylion*, he made one of the Amazons, which for an excellent fine and proper leg that ſhe had, they call *Eucnemos*; and in that regard *Nero* the Emperour ſet ſo great ſtore by this image, that it was carried ordinarily whereſoeuer he went. This artificer made likewiſe another braſen image reſembling a faire and ſweet boy, which for the ſingular beautie *Brutus* of Philippo ſo loued, that it was commonly called by his ſurname *Philippenſis*.

Theodorus who made the Maze or Labyrinth at Samos, cauſed his own image to bee caſt in braſſe, which beſides the wonderfull neere reſemblance and likeneſſe to himſelfe, was contriued
B ſo artificially beſides, and ſo ſet out with other fine deuiſes, that he was much renowned for the workmanſhip, and in the ſight of all men it was admirable: he carrieth yet in his right hand a file, and in his left hand he bare ſomtime (with three fingers) a little pretty coach, and the ſame with four horſes at it; which was afterwards taken from the reſt, and had away to Prænеſte: but both the coach, the teeme of horſes, and the coachman were couched in ſo ſmall a roome, that a little flie (which alſo he deuiſed to be made to the reſt) couered all with her pretie wings.

Xenocrates was apprentice to *Tiſicrates*, or as ſome ſay, to *Euthycrates*; but whether of the twaine ſoeuer was his maſter, he outwent them both in the number of ſtatues and images that he wrought, and beſides compiled bookes of his owne art and workemanſhip.

Many artificers there were, that by imagerie delighted to counterfeit in braſſe the battailes
C that king *Attalus* and *Eumenes* both, fought againſt the Galatians or Gallogreekes; and namely, *Iſigonus*, *Pyromachus*, *Stratonicus*, and *Antigonus*, and this artiſane laſt named, compoſed bookes alſo of his own art. *Boethius*, although he was a better workeman in ſiluer, yet one piece of worke he made in braſſe, which had an excellent grace, and that was a child throtling a Gooſe by the necke.

Of all theſe pieces of antique worke which I haue reckoned vp, the moſt choiſe and ſingular aboue the reſt, *Nero* before time had by his violent edicts and commandements cauſed to bee brought from all parts to Rome, and he diſpoſed them in diuerſe roomes of his golden houſe for to adorne and beautifie the ſame; but now they be conſecrated by *Veſpaſian* the Emperour, in the temple of Peace, and in other ſtately buildings and edifices of his.

D Many other excellent artificers there are beſides theſe aboue rehearſed: but they may be all raunged in one ranke, and counted for their skill and cunning equall, for a man ſhall not find one piece of worke of their making, that carieth any ſingularity aboue the reſt, and namely *Ariſton*, who alſo was wont to graue and chaſe in ſiluer, *Callias*, *Cleſias*, *Cantharus* of Sicyone, *Dionyſodorus* who was an apprentiſe trained vp vnder *Critias*, *Deliades*, *Euphorion*, *Eunicus*, and *Hecataeus*. As touching famous engrauers in ſiluer, I read of *Lesbocles*, *Prodorus*, *Pithodicus*, and *Polygnotus*, who alſo were moſt excellent and renowned painters. Likewiſe, of ſiluerſmiths or grauers in ſiluer, we haue *Stratonicus*, and *Scymnus*, who had for his maſter *Critias*.

Now will I reckon vp thoſe worthy and famous Imageurs, who emploied themſelues in one and the ſame kind of workes. In the firſt place, *Apollodorus*, *Androbulus*, *Aſclepiodorus*, and *Aleuas*
E tooke pleaſure to expreſſe the ſimilitudes of learned men & Philoſophers. As for *Apelles*, he delighted beſides to repreſent women at their deuotions, adoring the gods, and offering ſacrifices *Antigonus* had a grace likewiſe to repreſent one *currying and ſcraping his skin al ouer the body in a ſtoue, as alſo the murderers of the Tyrants abouenamed. *Antimachus* and *Athenodorus* lo- ued to haue in their ſhops the ſtatues of great ladies and noble women. *Ariſtodemus* tooke much pleaſure to buſie himſelfe about the portraying of wreſtlers, coaches with two horſes ſet therto, and a coachman, Philoſophers and great clearkes, old matrons, and king *Seleucus*: There is alſo of his making a *Doryphorus*, reſembling one of *Darius* his guard, which is a proper piece of work & a louely. As touching the *Cephiſſodori* (for two of them there were) the elder had a great dexterity in making *Mercurie* foſtering prince *Bacchus* in his infancie: He made alſo one, preaching
F to the people, and caſting forth his armes; but what perſon of quality he ſhould be, it is not certainely knowne: the younger was wont to repreſent the Philoſophers. *Colothas*, who joined with *Phidias* in the making of *Iupiter Olympius*: He delighted alſo to be doing with the images of Philoſophers. So did *Cleon* and *Cenchramis*, *Callicles*, and *Cephis*. As for *Calcoſthenes*, he buſied and amuſed himſelfe in the counterfeits of Comædians, players of enterludes, and champions. *Dahippus*

Periſcomenon the ſame that Apoxiomenon.

hippus had a very good hand, in making one ſcraping and rubbing his body in an hot-houſe. G
Daiphron, *Democritus*, and *Dæmon*, were as cunning and perfect in the perſonages of Philoſophers and Sages. *Epigonus* would haue his hand in all thoſe works in manner which I haue rehearſed, and laboured to imitate thoſe artificers: but he ſurpaſſed them all in a Trumpetter of his owne deviſing; and a little infant, who ſeeing the mother ſlaine, made toward the dead corps, and hung about it as if it would play and be plaied withall, ful pittiouſly to behold. *Eubolides* made one, as if he were counting vpon his fingers. *Mycon* his cunning was moſt ſeen in the counterfeiting of wreſtlers and ſuch as practiſe feats of actiuitie: and *Menogenes*, in making chariots with foure horſes. *Niceratus* likewiſe enterpriſed all maner of works wherein others were beſt ſeen: and beſides repreſented the perſonage of *Alcibiades*, together with his mother *Demarete*, as ſhee ſacriced with lampe light burning by her. *Piſicrates* ſhewed much skill with a chariot of two horſes, H
wherein he beſtowed * *Pitho* ſitting in the habit of a woman: The images *Mars* and *Mercurie* alſo, which ſtand at Rome in the temple of *Concordia*, be of this mans making. As for *Perillus*, there is no man commendeth him for his workmanſhip, but holdeth him more cruell than *Phalaris* the Tyrant, who ſet him a work, for that he deuiſed a braſen Bull, to roſt & frie condemned perſons in; aſſuring the Tyrant, that after the fire was made vnder it, they would when they cried ſeeme to bellow like a Bull, & ſo rather make ſport than moue compaſſion: but this *Perillus* was the firſt himſelfe that gaue the hanſell to the engine of his own inuention, & although this was cruelty in the Tyrant, yet ſurely ſuch a workman deſerued no better a reward, & juſtly he felt the ſmart of it: For why? The art and cunning foundery, which of all others is moſt ciuile & agreeable to our nature, and which had beene emploied ordinarily in repreſenting the perſonages of I
men and gods, this monſter of men abuſed, and debaſed to this vile and vnnaturall miniſtery of tormenting man. Would one haue euer thought, that after ſo many witty & worthy men who had trauelled in this ſcience to bring it to ſome perfection, all their labours ſhould turne in the end to this proofe, for to make inſtruments thereby of torture? And certes, there being many pieces of his workmanſhip, they be kept and ſaued for this cauſe onely, that as many as ſee the ſame, may deteſt and abhor the wicked hand that made them. But to proceed forward to other workmen in this kinde. Of *Sthenis* making are the images of *Ceres*, *Iupiter* and *Minerva*, which at Rome are within the temple of *Concord*. The ſame man took pleaſure in counterfeiting ancient dames and matrons, weeping, praying, aad offering ſacrifice. *Simon* [of Ægina] was very good at the making of a dog and an archer. *Stratonicus* that famous cutter and engrauer, was neuer well K
but when he pourtraied ſome Philoſopher or other: no more than *Scopas*, both the one and the other. As for wreſtlers and champions, armed men, hunters, and ſacrificers, they were the onely workes that theſe artificers following delighted moſt in, to wit, *Batten*, *Eucher*, *Glaucides*, *Heliodorus*, *Hicanus*, *Leophon*, *Lyſon*, *Leon*, *Menodorus*, *Myagrius*, *Polycrates*, *Polydorus*, *Pythocritus*, and *Protogenes* (who alſo was a moſt excellent & renowned painter, as I will hereafter ſhew more at large) alſo *Patrocles*, *Polis*, *Poſidonius* born at Epheſus, who likewiſe chaſed and engraued in ſiluer moſt finely, *Periclimenus*, *Philon*, *Simenus*, *Timotheus*, *Theomneſtus*, *Timarchides*, *Timon*, *Tiſias*, and *Thraſon*. But aboue all other, *Callimachus* is the workeman of greateſt note, in regard of a by-name giuen vnto him, and that was *Cacizotechnos*: and well he might be ſo called, for hee would alwaies be finding fault with his own workmanſhip, & neuer could ſee when to make an end, thinking ſtill L
that he had not beſtowed art ynough vpon that he had vnder his hand. And ſo he brought forth little or nothing perfect in the end: A notable and memorable example to teach all men not to be ouer curious and exquiſit in any thing, but to hold a meaſure in all. And there is a daunce of Lacedemonian women of his making: a piece of work which he went about alſo to amend, and when he thought to make it better, he marred it clean, ſo that it loſt all the grace it had before. Some ſay, that this *Callimachus* had bin in former time a painter. And ſince I haue entred ſo far into this Treatiſe of ſtatues & images, I may not paſſe ouer in ſilence, but note (as it were) by the way one thing of *Cato*, although haply it may be thought but a meere vanity: In that expedition or voiage wherein Cyprus was conquered and reduced vnder the dominion of Rome, hee made port-ſaile of al the pillage taken there, ſaue only one ſtatue of *Zeno*, not for the excellencie of the M
matter, for it was but braſſe, nor yet for the art and curious workmanſhip thereof, but for that it was the image of a Philoſopher. In this diſcourſe of ſtatues and images, I muſt not paſſe by one, although it is not certainely known who was the maker of it; and this is *Hercules* in his ſhirt and other habit that he wore vpon the mount Oete: ſtanding now at Rome neere vnto the publicke pulpit

* *Suada*, i. Perſuaſiō, or *Diana* as ſome think. Some read *Pitho*, i. the goddeſſe of Credulitie.

20030
copy 1

A pulpit called Roſtra: Made he is (whoſoeuer did it) with a grim, ſterne, and ſower countenance, and ſuch indeed as doth bewray and feel thoſe intollerable torments which the body ſuſtained by that poiſoned ſhirt [ſent to him from *Deianira*.] Vpon this ſtatue there ſtand 3 titles or inſcriptions: the firſt is this; *L. Luculli Imperatoris de Manubius, i. L. Lucullus* Lord Generall, erected this ſtatue out of the ſpoile of the enemies: the ſecond, *Pupillus Luculli filius ex S. C. dedicauit, i.* The ſon of *L. Lucullus*, being orphan or ward, dedicated this, by an order or act from the Senat: the third, *T. Septimius Sabinus Ædilis Curulis, ex priuato in publicum reſtituit, i. T. Septimius Sabinus*, Ædile Curule for the time being, hath from a priuat houſe cauſed it to ſtand againe in publick place. This is the image of that worthy *Hercules* that fought ſo many battels, indured ſuch hard conflicts and labors, and was ſo highly honored.

B Now is it time to return to the different kinds and ſundry temperatures of braſſe, from which I haue digreſſed: firſt and foremoſt therefore this is to be noted, That in Cyprian braſſe or copper there is to be conſidered one ſort which is named Coronarium, and the other that they call Regulare; and both the one and the other will abide the hammer & be brought into thin plates As for the Coronarium or Laton, when it is reduced into thin leaues or plates, and then coloured or rubbed ouer with the gal of an oxe, it looketh like gold, and maketh a faire ſhew in thoſe coronets that plaiers weare; whereupon it tooke the name Coronarium: the ſame, after that to euery ounce of it there be put ſix ſcruples of gold, and be reduced into a very thin foile, reſembleth the color of fire, like a rubie or carbuncle ſtone. As touching this braſſe, it is found alſo in other mines of mettal, like as the pot braſſe Caldarium: this only is the difference, that this Cal-
C darium wil melt only, for vnder the hammer it will break; whereas the other ſort of copper named Regulare, yeeldeth to the hammer and will be drawne out, whereupon ſome there be who call it Ductile, *i.* battable; and ſuch is all the kind of copper or Cyprian braſſe. That alſo which is found in the mines of other mettalls, by art refined, differeth from the foreſaid pot-mettal, for out of what mine ſoeuer it commeth, after that the droſſe & imperfections therof be throughly purged by the fire, being thus (I ſay) clenſed, it becommeth Regulare and wil abide the hammer. As for all other ſorts beſides the Cyprian braſſe aboue named, the Campane braſſe is counted beſt: like to which, there is much in other parts alſo of Italy, and in the prouinces: but to euery [hundred pound of braſſe] they put 8 pound of lead: then they boile it as it were and melt it againe with a ſoft fire, for want and ſcarſitie of wood and fuell. And what difference there may
D be in that regard, it is moſt of all ſeen in the heart of France, where it is commonly melted (for lack of other fuel) among ſtones made red hot: for by reaſon that this is a ſwift & ſcorching fire, it becommeth black and brittle withall: beſides, they melt it but once: but ſurely to doe ſo oftner, maketh very much for the goodneſſe thereof.

Chap. IX.

¶ *The difference in Braſſe: the diuers mixtures thereof: and how Braſſe ſhould be kept.*

E Moreouer, it were not amiſſe to note thus much alſo, that all kind of braſſe melteth beſt in coldeſt weather. Now there is another temperature of braſſe which ſerueth for founders, imageurs, and braſen tables, called thereupon in Latine, Statuaria and Tabularis, which is made in this manner following: firſt, the maſſe, ore, or ſtone as it commeth out of the mine, is melted in the bloome-ſmithie; and ſo ſoone as it is melted, they put thereto a third part of the braſſe Collectaneum, that is to ſay, broken pieces of old veſſels that haue bin vſed, and bought vp here and there. In the choice whereof, this care would be had, that for to giue vnto this temperature the kind ſeaſoning as it were, which peculiarly it requireth, there would be gotten ſuch pottain or old mettall which is ouerworne, and by ordinary occupying and vſing to the hand, bright-ſhining, and as one would ſay tamed, made gentle, and pliable. It would not be forgotten alſo, to euery 100 pound weight of the ſaid melted ore, to mix 12 pound and a halfe of Tin.
F But to haue a kinde of Braſſe mettall that is moſt tender and ſoft, there muſt bee giuen vnto it that mixture or temperature which is called Formall, namely, by putting thereto of ordinarie lead a tenth part, and of Tin a twentieth part; and by that means eſpecially it taketh that colour which they call Grecanicke. The laſt temperature is that, which in Latine they call Ollaria, as one would ſay, the pot-braſſe, for it taketh the name of that veſſell whereto it is moſt emploied;

and this is by tempering with euery hundred pound weight of braſſe, 3 or four pound weight of G
argentine lead or tin. To Cyprian braſſe or copper, if you put lead, you ſhall haue that deep red
or purple colour which giueth the tincture to the robes that ſtatues are pourtraied with. More-
ouer, this is to be noted, that the more you do ſcoure any veſſels of braſſe, the more are they ſub-
ject to ruſt, and ſooner will they gather it, than if they were neglected and not medled withall;
vnleſſe they be well annointed with oile. It is ſaid, that a vernith made of tarre, is ſingular for to
preſerue and ſaue any braſſe from ruſt. To conclude, braſſe hath ſerued many a yeare ago, for the
perpetuity of memorials and regiſters, as we may ſee by thoſe braſen tables here in Rome, wher-
in be cut and ingrauen all our publick laws and conſtitutions.

Chap. X. H

¶ *Of Cadmia or Braſſe ore, and the medicines wherein it is vſually employed.*

THe mines and veins of braſſe ore do many waies furniſh vs with medicines: a good proofe whereof this may be, that any vlcers be ſooneſt healed there: but the moſt medicinable of all minerals that belong to braſſe mettall, is Cadmia [artificial.] And verily there is a kind of Cadmia made in the furnaces where ſiluer is fined, of a whiter colour and leſſe ponderous, but nothing comparable to that which commeth from the braſſe furnaces. And ſundry ſorts there be of Cadmia: for the very ſtone of which they make braſſe, is called Cadmia, and as it is neceſſary for founders, ſo it is of no vſe at all in Phyſick. Now is there a Cadmia beſides which I is made in the furnaces, and ſo called, but the reaſon thereof is far different: and this kinde of of Cadmia commeth of the fineſt and thinneſt part of the ore or matter in the furnace, caſt vp aloft by the flame & blaſt, ſticking to the roofe or ſides of the furnace, higher or lower according to the proportion of the lightneſſe that it carrieth, more or leſſe. The fineſt and the floure as it were of Cadmia, is found in the very mouth of the furnace, whereas the flames * do ſtriue to get forth; the Greeks call it Capnitis, for that it is ſmokie and burnt, and for the exceeding leuity thereof reſemble flying cinders. That which is more inward and hangeth downe from the coping and vauted roofe of the furnace, is the beſt: and in that reſpect, becauſe it hangeth ſo as it were by cluſters, they giue it the name Botryitis: heauier this is than the former, but lighter than thoſe that follow after. As for the colour thereof, it is in two ſorts: that which you ſee of a dead K
hew like aſhes is the worſe, whereas the red is the better; the ſame alſo is brittle and will ſoone crumble ſmall: for eie-ſalues and collyries reputed ſoueraign. A third kind of Cadmia ſticketh by the way, to the ſides and wals of the furnace; for by reaſon of the heauineſſe and ponderoſity, it was not able to mount vp to the bending roofe of the furnace: this the Greeks call Placitis: and well it may be ſo named; for a cruſt rather it is than a ſcaly ſubſtance: break it, you ſhal find many colours in it: and this Cadmia for to heale ſcabs and ſcurfe; as alſo to cicatrice or skin a ſore, is better than the former. Out of this kinde, there proceed other twaine; to wit, Onychitis, which in the outſide is after a ſort blewiſh, but within, it reſembleth the flecks or ſpots of the onyx ſtone; and Oſtracitis, blacke throughout, of all the reſt moſt foule and groſſe, howbeit, fitteſt for wounds. L

* *Eluctantur*, or rather, *Eruptantur*, i. are breathed and ſent forth.

Generally, that Cadmia, of what kinde ſoeuer, is beſt, which is found within the furnaces of Cypros: this the Phyſitians doe burne a ſecond time with pure coles; and when it is calcined and turned to aſhes, they quench it with Amminean wine, if they meane to prepare it for plaſters; but with vineger, for ſcabs and ſcurfe. Some there be, who after it is ſtamped groſſe, burne or calcine it in an earthen pot, then waſh it well in a mortar, and afterwards dry it. *Nymphodorus* taketh the very ſtone or the ore as it lieth in the mine, the heauieſt and moſt compact that may be found, which he burneth among coles; and after it is ſufficiently burnt, quencheth it in wine of Chios: he beateth and punneth it then again, anon he driueth or boulteth it through a linnen cloth, and grindeth it finer in a mortar: this done, ſoon after he ſteepeth and ſoketh it wel in rain water, and that which ſetleth in the bottom he ſtampeth: and this he doth, vntill ſuch time as it M
be like ceruſe or white lead, and wil not craſh between the teeth. The ſame maner of preparing vſeth *Iöllas*, but he chuſeth the pureſt and brighteſt ſtone that he can get.

The medicinable operations of Cadmia, bee, to drie, to heale throughly, to ſtay fluxes, to cleanſe the filthineſſe in the eyes, and to ſcoure the pin and web, to extenuate any roughneſſe;

and

20030
copy 1

A and in one word, to worke all those effects which I shall attribute hereafter to Lead.

Furthermore, brasse it selfe may be burnt; and being so prepared, it serueth for all those purposes beforenamed: ouer and aboue, it cureth the pearls, films, and skars in the eies: if it be incorporat with milk, it healeth the vlcers in the eies: the same likewise they vse to grinde vpon hard stones, after the manner of the Ægyptian collyrie; taken as a lohoch inwardly with hony, it causeth vomit. Now as touching copper, the manner is to burn it in vnbaked earthen pans, with the like weight of brimstone; but all the breathing holes of the furnace ought to be well closed and luted vp where they must stand, vntill such time as the said pans be throughly baked hard: some put salt thereto: others in stead of brimstone take alumne; and there be againe, who vse neither the one nor the other, but sprinckle it well with vineger onely: when it is thus calcined, they pun
B it in a morter of Thebaick marble, and then wash it in rain water. Howbeit, this first lotion of it maketh it but weak and of small effect: and therefore it had need of a second washing, in a greater quantity of water, and to be braied againe therein, and left so standing vntill it be setled: this would be reiterated often, vntill such time as it be brought to looke like vnto Minium: after that, it ought to be dried in the Sun, and saued in a brasen box.

Chap. XI.

¶ *Of the drosse or refuse of Brasse: of the skales of Brasse: of Verdegreace or Spanish greene: of Stomoma: of Verdegreace which is the rust of Brasse, and of Hieracium.*

C

THe drosse of Brasse is washed after the same manner, but of lesse effect it is than Brasse it selfe: howbeit the floure of Brasse or verdegreace, is much vsed in Physick: and engendred it is, when Brasse is melted by much blowing, and then transferred out of the furnace into other receptacles; and there, are shaken out certain skales of millet, and this they call Flos æris *i.* Verdegreace. Now these skales vse to fall off, when as the masses of brasse be cooled with water and be red. Likewise of the same masses, there is made that which they call Lepis; and thus the verdegreace may be sophisticated, so as the said Lepis or skales be sold for it. Now these skales come, by being driuen & smitten off from those nails which they vse to forge of the said masses and lumps of brasse, and all these most commonly are found in the Cyprian forges: herin
D only is the difference; that the foresaid skales are driuen forcibly & smitten from the said pains or masses of brasse, whereas the floure of verdegreace fals off by it selfe. And yet there is a second kind of these skales more fine and subtile than the other, to wit, driuen and smitten from the very outside and vppermost part of the brasse, and this they call * Stomoma.

Howbeit, Physitians in these daies (with reuerence to their profession and with their good leaue be it spoken) are ignorant wholly of all these things; yea, and the greater part of them bee not so much as acquainted with the terms and bare names (so far be they from the true composition of medicines:) and yet in times past, it belonged properly vnto Physitians, for to be acquainted with the terms of all simples, and to be perfect in the knowledg of them. But our phytians in this age, when they are to make any composition of simples, they haue recourse straight-
E waies to their books to be directed by them, that is to say, they try experiments by the hazard of their poore patients; and there finding the names of this and that, they set downe a receit, & for the making thereof trust the Apothecaries, as also for the ingredients; which commonly they do sophisticat and corrupt by all deceitfull meanes that possibly they can deuise; selling their emplasters and collyries that are old made, and such drugs as are past all goodnesse, seruing the bils of the Physitians with the very refuse of their shop. And thus the deceitfull wares that they haue, they rid their hands of, to the discredit of the Physitian, and danger of the sicke.

But to come againe vnto our skales, and floure of brasse or verdegreace; the manner is, first to calcine both the one and the other, either vpon earthen vessels or brasse pans; then, to wash the same, as is before said, and for the same vses. But ouer and aboue, these being prepared thus
F accordingly, are singular for the carnosities and excrescences within the nosthrils, or the fundament: for hardnesse also of hearing, if they be blowne into those parts by meanes of a pipe: and the sores or cankers of the mouth they doe heale, by application of their powder: this powder also taketh away the inflammations and accidents of the tonsils or almonds about the throat, if it be tempered and incorporat with honey, and vsed in a collution or gargarisme. There is be-

* *Stomoma is* nothing [illegible] but steel [illegible] therfore [illegible] here doth [illegible] like as in m[illegible] of this chap.

ſide, a ſcale that commeth of laton or white braſſe, farre better than that which the red braſſe or copper doth yeeld. G

Moreouer, there is a deuiſe that ſome vſe, namely, to let firſt the nails and panes of braſſe to lie wet in the vrine of a boy: others, ſo ſoone as the ſcales be driuen off, bray them, and afterwards waſh them in rain water; which they vſe to giue for the dropſie, to the weight of two drams in one hemine of honied wine; and beſides they make a liniment with it and floure, for to vſe outwardly to the belly.

*Which ſome take to be verdegreace. *Ærugo raſilis

As touching the ruſt * of braſſe, great vſe there is of it in Phyſick: but it commeth after many ſorts; for firſt and foremoſt, it is found ſticking (in manner of the floure aforeſaid) vnto the ſtone or ore out of which braſſe is tried, in ſuch ſort, as it muſt be * ſcraped from it before a man can haue it. Alſo it is made after an artificiall manner, by hanging certain plates of laton driuen H full of holes, and hung in a pipe or barrell ouer vineger; but the ſame ought to be cloſe couered and ſtopped with a lid of braſſe, ſo as the ſaid plates do not touch the vineger: and verily, verdegreace thus made, is far better than of skales in the ſame wiſe vſed. Some there be that take veſſels of white braſſe or laton, and put them in earthen pans, where they ſuffer them to lie in vineger for ten daies together, and then ſcrape off the verdegreace or ruſt that is gathered vpon the ſaid laton. Others there are who couer the ſaid veſſels of laton in the refuſe of grapes after they be preſſed (skins I meane and ſtones;) and after ten daies, as is aforeſaid, ſcrape off the Verdegreace which they find vpon the braſſe. There be againe, who take the fine duſt which the file fetcheth from braſſe, and ſtrew the ſame in a veſſell of vineger, ſtirring it with ſpattules or ladles oftentimes in a day, vntill it be reſolued into the vineger and conſumed: and yet many think it I better to work and ſtamp the ſaid file-duſt with ſtrong vineger in a braſen mortar, for to gather verdegreace. But the ſpeedieſt way of ingendring the ſaid ruſt of braſſe or verdegreace, is to take the cuttings, parings, or ſmall pieces of laton plates, ſuch as be emploied about coronets, and to put them in vineger: and you ſhall haue diuers, who will not ſticke to ſophiſticat verdegris (ſuch eſpecially as is brought out of Rhodes) by mixing it and the pouder of marble together; others with the pumiſh ſtone puluerized, or els with gum. But the cunningeſt deuice that they haue to falſifie it and deceiue chapmen by, is to mingle vitrioll amongſt: for all the other deceitfull tricks be ſoone found out by the teeth, becauſe a man ſhall feele the verdegreace to craſh and grate between them like grit, which hee ſhall not perceiue if it be ſophiſticate with vitrioll: howbeit, this ſophiſtication alſo and fraudulent caſt, may be ſoon detected and found out by an K experiment made with a ſlice or fire-pan of yron made red hot in the fire: for caſt vpon it the right and true verdegreace indeed, it will hold and keep the owne colour ſtill; but if it be corrupted with vitrioll, you ſhall ſee it turne red. You may diſcouer likewiſe the fraud aboueſaid with * paper, tempered beforehand and ſoked in gall-nuts; for beſmeare therewith the verdegreace that is falſified, it wil quickly become black. The eie alſo wil ſoon bewray the falſhood that is vſed therein, for if it be naught, a man ſhall perceiue it to looke with a weak green color, nothing full nor freſh. But be the verdegreace true or falſe, the beſt way is, before it be emploied in Phyſick, after it be dried, to calcine it vpon a new earthen pan that neuer was occupied, and in the burning to turne it often with a ſlice or ſpatule, vntil ſuch time as it be reduced into light cinders, and then after it is finely puluerized, to lay it vp for vſe. Others prepare it after another L ſort; they put it in an earthen pot vnbaked, and ſet the ſame into an ouen, where they let it ſtand to be calcined ſo long vntill the ſaid pot of clay be well and throughly baked. Finally, there be, that before they vſe Verdegreace, put thereto the male Frankincenſe, the beſt that can poſſibly be had.

*Of the reed *Papyrus.*

*Olibanum.

The manner alſo is to waſh verdegreace before it be occupied, after the ſame order as Cadmia is vſed. Being thus made & prepared as is aboueſaid, it is excellent to be put into eie-ſalues or collyries, for by a * mordicatiue quality it helpeth weeping and watering eies: in which regard, neceſſarie it is that it be waſhed firſt with pencils well bathed in hot water, ſo long vntill it haue loſt that corroſiue quality.

* *Græce* Ἀνδρα-χνιτης, which *Pliny* tranſlateth *delachrymationibus mor dẽdo proficiens:* which alſo may be turned thus, It helpeth watering eies proceeding of ſome fretting humors.

As touching Hieracium, a compoſition it is or collyrie ſo called, and made in this manner: M Take foure ounces of Sal Ammoniacke, of Cyprian Verdegreace two ounces, of ſhooemakers blacke, or that copperesſe which the Greekes name Chalcanthum as much, that is to ſay, two ounces; of Myſy or yellow vitrioll one ounce, and of ſafron ſix: let all theſe bee ſtamped together and tempered in the vineger of Thaſos vntill they be concorporat, and then reduce them into

20030
copy 1

A into trochiques. A ſingular collyrie or eyeſalue this is to withſtand the beginning of pearls, cataracts, and ſuch accidents of the eies; to diſcuſſe alſo the webs that come ouer their ſight, to leuigat the roughneſſe of the tunicles, to diſpatch the white skars, and in one word to cure all the infirmities of the eielids. As for verdegreace, that is not calcined at all, it is excellent good to be put into vulnerarie or healing plaſters: the ſame alſo is of a wonderfull operation to cure the exulcerations of the mouth or the gumbs; the lips alſo exulcerat it heales, being reduced into a liniment with oyle: but if you put wax thereto, it doth mundifie, and withall skin and heale perfitly. Verdegreace is proper to eat away and conſume the calloſitie growing in a fiſtula, and in thoſe infirmities which are incident to the ſeat or fundament, whether it be brought into a liniment with gum Hammoniacke and ſo applied; or elſe in forme of a collyrie, that is to ſay, a
B tent thruſt into the hollow fiſtula. The ſame verdegreace incorporat with a third part of the true roſin called Terpentine, is ſoueraigne for foule leproſies and wild-fires.

Chap. XII.

¶ *Of* [1] *Scolecia, and* [2] *Chalcitis, of* [3] *Myſy,* [4] *Sory, and* [5] *Chacanthum.*

1 A kind of verdegris or ruſt of braſſe in manner of a worme, as *Pliny* taketh it.
2 The floure of copperesſe, whereof is made vitrioll, as ſome think.
3 *Braſauolus* holdeth it to be vitrioll Romane: others take it for yellow coppreſſe.
4 Duskiſh or aſh-colour coppreſſe.
5 Vitrioll.
* It ſeemeth that *Pliny* doth here err, by reading in *Dioſc.* σκωλήκας, for κόνικας; & for ἰὸ σκωλήκιον: σκωλήκιον: for the ſaid mixture is to be reduced into certaine trochiſques or thin cakes called κονίκια, and not into the form of worms σκωλήκια. *

ANother ſort there is of Braſſe-ruſt or Verdegreace, which commonly is called Scolecia: this is made of alume, ſalt or ſalnitre, of each a like weight, ſtamped well together with the ſtrongeſt white wine vinegre that can be gotten, in a morter of Cyprian braſſe or copper: and this muſt not be done but in the hoteſt daies of the yere, to wit, about the riſing of the Dog-
C ſtarre. Now muſt all the ingredients aforeſaid be pnnned and incorporat together, vntill ſuch time as the maſſe become green, and that it gather and draw together in manner of *crawling wormes, whereupon it taketh the name Scolecia. But if ſo be, that this manner of working and making it, chance to faile and doe not well, for to amend the ſame, the two parts of vinegre which entred into the mixture, ought to be tempered with as much vrine of a boy vnder fourteene yeares of age. Now if you would know the medicinable effects and vertues of this kind of verdegreace, both it and the artificiall Borax beforeſaid (which I named Santerna) be of the very ſame operation that the ordinary ruſt of braſſe or verdegreace, called in Latin Ærugo. There is a kind of Scolecia naturall or minerall of it ſelfe, without addition of any thing els whatſoeuer; whereof I purpoſe to ſpeake in this place, and the ſame is ſcraped from the ſtone or ore of
D which commeth braſſe. There is a ſtone lying in the mine which they name Chalcitis, out of which alſo (with burning) they excoct braſſe: differ it doth from Cadmia; for Chalcitis is hewed out of the mines that lye aboue, very ebb and expoſed to the aire, wheras the other is digged from vnder the ground in thoſe mines that lie hidden. *Item*, Chalcitis (as being of a tender and ſoft nature) preſently will crumble into pieces, ſo as it ſeemeth to be a certaine fine moſſe concreat and gathered together. Alſo, there is another difference betweene theſe two Marcaſſins, for that, Chalcitis containeth in it three ſeuerall kinds of matter, to wit, Braſſe, Myſy, and Sory, of which I purpoſe to ſpeak ſeuerally by themſelues in their due place. Now this Chalcitis lies within the braſſe mine in long veins: that which is of a yellowiſh colour like hony, full of ſmall veines running here and there, brittle and apt to crumble, and not of a ſtony hardneſſe, is coun-
E ted the beſt: the freſher alſo and more newly gathered that it is, the more effectuall and wholeſome men take it to be; for that being long kept, it will grow into the nature of Sory. Being thus in the right nature, it hath a facultie (if it be puluerized) to conſume the excreſcence of proud or dead fleſh in vlcers, to ſtaunch bloud, to repreſſe alſo the accidents befalling to the gumbs, uvula, and tonſils: the ſame put vp into the naturall parts of a woman within a locke of wooll in manner of peſſarie, helpeth the infirmities of thoſe places: but if it be tempered and incorporat with the juice of porret, it ſerueth to put into thoſe plaſters which are appropriat to the vlcers and ſores of the priuities or members of generation. Now if you ſteepe it in vinegre, and let it lie ſo infuſed within an earthen pot well luted with beaſts dung, for the ſpace of forty daies, it will come to the colour of ſaffron: put then vnto it of Cadmia ſtone the like quan-
F titie in weight, you ſhall haue that medicine which is called Pſoricum. Alſo, if in this compoſition you put two parts of Chalcitis to one third part of Cadmia, & ſo temper them together, this foreſaid medicine will be more quick & ægre: but in caſe you would haue it yet more mordicant and ſtronger in operation, let the ſaid ingredients be tempered rather with vinegre than wine. Calcine the ſame or torrifie it, you ſhal find it more effectuall in all operations aforeſaid.

*i. The veine or minerall, whereof commeth the duskish Vitrioll.

As for * Sory, that which is brought out of Ægypt is counted beſt, and farre better than the Cyprian, Spaniſh, or African: neuertheleſſe, ſome hold that which commeth from Cypreſſe, to be more appropriat to the cure of the eies. But of what country ſoeuer it be, the principall is that which to ſmell vnto is of the rankeſt and moſt ſtinking ſauour: the ſame alſo in the bruiſing will grow black and be vncteous or fatty, and ſuch lightly is hollow in manner of a ſponge. A minerall this is altogether hurtfull to the ſtomack, and ſo contrary vnto the nature of it, that to ſome the very ſmell thereof is enough to ouerturne it and to cauſe vomit: and eſpecially the Ægyptian Sory is of this operation. That which commeth from other nations, when it is broken or braied, ſhineth againe. G

Touching Myſy, it is of a more hard and ſtony nature than Sory; but good it is for the tooth ache, if either it be held in the mouth, or a collution be made therewith to waſh the teeth and gums: alſo it healeth the grieuous and irkeſome ſores of the mouth, yea though they grow to be cancerous and corroſiue. The manner is to burne and calcine it vpon coles of fire as Chalcitis. Some neuertheleſſe haue written, that Myſy is engendred by the means of a fire made with pine wood, in the hollow veins or mines of braſſe ore: and they hold, that the cinders or aſhes of this pine fewell, being mingled with the yellow greines or floure of the ſaid mettall, is that which begetteth Myſy. But the truth is, of the foreſaid ſtone or ore it is ingendered naturally: howbeit, a thing it is by it ſelfe gathered, diſtinct and ſeparat from it apart: and the beſt is that which is found in the mines and forges of Cypreſſe. You ſhall know it by theſe ſignes: break it (for crumble it will) there appeare within it certain ſparks ſhining like gold: and in the braying or ſtamping, it runneth into the nature of a ſand or earth, like vnto Chalcitis. This Myſy is the Minerall that they put to gold ore, when it is to be tried and purified. H I

To come vnto the medicinable vertues thereof: being infuſed or powred into the eares with oile of roſes, it cureth the running with matter: the ſame being applied in a frontal within wool to the head, eaſeth the ach thereof: it doth extenuat alſo and ſubtiliat the aſperities of the eies, ſuch eſpecially as be inueterat and haue continued long: but ſoueraigne it is found to bee for the inflammation or ſwelling of the tonſils, for the ſquinancy, and all impoſtumat ſores growne to ſuppuration. For which purpoſe, prepared it would be in this wiſe, and after this proportion: Take of it 16 drams, ſeeth the ſame in one hemin of vineger with ſome addition of hony, vntil it begin to yeeld and relent; and in this manner ordred, it ſerueth in caſes aforeſaid: but whenſoeuer need requireth to mollifie the violence thereof, and make it more mild, it were good to wet it with ſome ſprinckling of hony. If there be a lotion or fomentation made with it in vineger, it doth conſume and eat away the hard calloſitie in fiſtuloes, and fortifieth greatly the collyries or tents to be made thereof, and put it into the concauity of the ſore: it ſerueth alſo for the colyries that be eie-ſalues: it ſtancheth bloud, repreſſeth the malice of fretting humors in corroſiue vlcers and ſuch as do putrifie: the excreſcence of proud or ranke fleſh it taketh downe and conſumeth: a peculiar property it hath to cure the accidents of the members of generation in men: and withall ſtoppeth the immoderat flux of the moneths in women. K

As concerning Vitrioll, which wee call in Latine Atramentum Sutorium, *i.* Shooe-makers blacke, the Greeks haue fitted it with a name reſpectiue vnto braſſe, and by a neere affinity therunto call it Chalcanthum: and verily there is not a mineral throughout all the mines, of ſo admirable a nature as it is. There haue been found in Spaine certaine pits or ſtanding pooles, containing a water of the nature of Vitrioll: they vſed to ſeeth the ſame, putting thereto of other freſh water a like quantitie, and poure it into certaine troughs or broad keelers of wood: ouer theſe veſſels, there be certaine barres [of yron] or tranſoms ouerthwart, lying faſt that they cannot ſtirre, at which there hang downe cords or ropes with ſtones at the end ſtretching them outright, that they reach to the bottome of the ſayd decoction within thoſe keelers, to the end that the viſcous ſubſtance of the water may gather about thoſe cords, which you ſhall ſee ſticking faſt thereto in drops, congealed in manner of a glaſſe, and it doth repreſent as it were the forme of grapes; and that is Vitrioll. Being taken forth and ſeparated from the cords aforeſaid, they let it dry for the ſpace of thirtie dayes. In colour it is blew, and carrieth with it a moſt pleaſant and liuely luſtre, ſo cleare, as a man would take it to bee tranſparent glaſſe. Of this being infuſed in water, is made that blacke tincture which Curriers and Coruiners occupie in colouring of their leather. This Vitrioll is ingendred many waies of the copperesſe vein within the mine, being hollowed into certaine trenches: out of the ſides whereof you ſhal ſee in the middeſt of L M

Winter

20030
copy 1

A Winter when it is a froſt, certaine yſickles depending, as the drops deſtilled and grew one to another: whereupon this kind of Vitrioll they call Stalagmias, and a purer or clearer thing there is not. But look what part thereof is whitiſh of colour, but not tranſparent, and the ſame incli-
ning to the wall floure or * white violet, the ſame they call Leucoion. There is a Vitrioll like- * *Viola alba.*
wiſe made artificially in receits and concauities (digged of purpoſe in the ſtonie mines of Co-
peroſe) by occaſion of raine water there congealed, which had been conueighed into them, and gathered a viſcous ſlime or mud in the paſſage. Alſo there is a caſt to make it in maner of ſalt by letting freſh water into ſuch hollow receptacles, and permitting the ſame to ferment in the ſun when he is at the height and full ſtrength of his heat in the ſummer, vntil it be gathered and hardened as ſalt. And therefore ſome there be who make two ſorts of Vitrioll, to wit, the Naturall,
B or Minerall, and the Artificiall: this that is made by the induſtry and art of man is paler than the other, and looke how much the colour is abated, ſo much inferior it is in goodneſſe. The Cyprian Vitrioll is thought beſt to be imploied in Phyſicke. For, to expell the wormes out of the belly, it is giuen vnto the patient to the weight of one dram in honey, after the manner of an electuary. If the ſame be diſſolued and conueyed vp into the noſthrils, it purgeth the head. In like manner it purgeth the ſtomacke, in caſe it be taken in hony or honied water. The aſperitie of the eies, their paine, and the dimneſſe or miſts ouergrowing the ſight, it diſpatcheth: and hea-
leth the ſores in the mouth. It ſtaieth bleeding at noſe, and the immoderat running of the Hæ-
morrhoids. It draweth forth ſpels of broken bones: and tempered with the ſeed of Henbane, it
C ſtoppeth the courſe of a rheum running to the eies, if it be laid in a cloth to the forehead in maner of a frontale. Of great effect is it in plaſters, both for to mundifie wounds and to conſume the excreſcence of fleſh in vlcers. If the Vvula be fallen, it putteth it vp againe, by touching it only with the decoction thereof. Moreouer, being incorporat with line-ſeed, it is ſingular good to be applied aloft vpon plaſters, for to mitigat pain. Of this kind, that which is white is prefer-
red before any that are of a yellowiſh colour like * wall-floures aforeſaid. Moreouer, if it be * *Violareis*: hee meaneth thoſe that reſemble *Leucoion*, and which he cal-led before by that name.
blown into the ears by the means of a pipe, it doth remedy the hardneſſe of hearing. A liniment made of Vitrioll alone, healeth vp wounds, but it draweth the skar too neare together: in regard of which aſtringencie of Vitrioll, there hath bin an inuention deuiſed of late, to caſt the pouder of Vitrioll into the mouths of Bears and Lions when they are to be baited: for ſo great a knitter and binder it is, that it will draw their chaws together in manner of a muzzle, that they ſhal not
D be able to bite.

Chap. XIII.

¶ *Of Pompholyx. Of Spodos, Antiſpodos, and of Diphryges. Of the Trient of Seruilius.*

THere be found ouer & beſides in braſſe ſmithies or furnaces, thoſe matters which they cal Pompholyx and Spodos: and the difference of the one from another, conſiſteth in this, that Pompholyx requireth waſhing for to be prepared; Spodos neuer commeth into water or liquor. And yet ſome diſtinguiſh them otherwiſe, calling the whiteſt and lighteſt part, Pom-
E pholyx: holding opinion, that it is nothing els but the very cinders of braſſe, or the Calamine ſtone Cadmia, whereof braſſe commeth: whereas Spodos (ſay they) is blacker and more weighty than Pompholyx, as being ſcraped from the wals and ſides of the furnaces; among which you ſhall ſee many times groſſe ſparks, yea, and otherwhiles coles intermingled. Well, this Pom-
pholyx being tempered or ſoked in vineger, ſmels of braſſe: and if a man touch it at the tongues end, hath a horrible taſt that goeth againſt ones ſtomacke. Proper it is to enter into thoſe com-
poſitions which be ordained for the eies, for it helpeth all the infirmities incident thereto: and in one word, ſerueth for the ſame purpoſes that Spodos doth: herein onely lieth the difference, that Spodos is thought to be more mundificatiue, by reaſon that the ſtrength of Pompholyx is
F delaied by the waſhing aforeſaid. It is one of the ingredients alſo to thoſe implaſters which are deuiſed for gentle refrigeratiues and exiccatiues. And for whatſoeuer it ſhall be imploied, better it is found to be, in caſe it were waſhed firſt with wine.

As touching Spodos, the Cyprian is moſt eſteemed: and ingendred it is, whiles Cadmia and the braſſe ore or ſtone be melted together in the furnace. Exceeding light it is, and apt to mount aloft with the ſmoake of the bloome ſmithie, very ſpeedily, yea, & ready to flie out of the

fur-

furnace: and much of it sticketh to the rouse and vppermost part thereof, differing onely from G
soot in whitenesse. That which is nor so white as the rest, signifies that the furnace was not quick ynough, and that it is not yet come to the full perfection & concoction: and this, some there be who call Pompholyx. But looke how much thereof is found of a redder colour, the same hath much acrimonie in it, and is of a more biting nature: yea, so fretting and corrosiue it is, that in the washing, if it chance to touch a mans eies, it will put out their light and make him blind. There is a kind of Spodos besides that looks yellowish like hony, wherin a man may perceiue that it standeth very much vpon brasse: but of what sort soeuer it is, washing mendeth it much. First, before it be washed, they vse to cleanse it lightly with a wing or a bristle brush: & then afterwards to wash it in grosser manner, till the water be thick and muddie, rubbing it well with the fingers, vntill it haue lost all the roughnesse that it had. That which is washed in wine, is H
thought to be of a middle and indifferent operation. And when I say wine, you must think there is some difference therin also. For being washed in a small & mild wine, it is thought to be very good for those colliries which serue to comfort and fortifie the eies that haue been vearied and weakened with long watching: the same also thus prepared, is more effectual to heale vlcers that be matterie and run: the sores likewise in the mouth that are moist and rheumatick: and generally it serueth well to go into those salues and plaisters which are deuised against gangreenes tending to mortification. Another kind there is besides of Spodos called Laurioris, found in the furnaces where siluer is tried. But commonly it is held, & for certain affirmed, That the best

* *Spodos* is called *Nil*, wherof commeth the prety ambiguous speech, *Nil prodest oculis.*

*Spodos for the eies, is that which commeth in the furnaces where gold is fined. Neither in any
thing belonging to our life, is the wit & inuention of man more admirable than in this. For, be- I
cause we should not take the pains to search into mines & furnaces for such matters, they haue deuised means to help themselues withal in the same cases, euen by the basest things that be in stead of Spodos, which thereupon they tearme by the name of Antispodos; for so they call the ashes of the Figtree, whether it be the gentle or the wild; the ashes likewise of the Myrtle tree leaues, and the tendrest parts of the branches; as also of the wild Oliue, the Quince, & the Lentiske trees. They haue a kind of Antispodos besides made of the vnripe Mulberries, that is to say, whiles they be white, dried in the Sun: like as, of the tops of the box tree or the bastard Cyperus, of brier crops, the leaues of the Terebinth or the wild vine Oenanthe floures. Finally, they vse in stead of Spodos, the ashes of strong Buls glew, or of linnen rags: which is found to be as effectuall as the right Spodos. Now for to haue the said ashes for this purpose, the manner is to K
burne and calcine all these matters abouenamed within some vessell of cley, and to set it into the ouen or furnace, where they are to be torrified vntill the said vessell be throughly baked.

In the smithies where brasse is made and wrought, there commeth a certaine refuse or offall thereof, called Psegma: to wit, when after the brasse ore is sufficiently melted and concocted, there be new coales put thereto, and the same set on fire and kept burning with the blast of bellowes: for then of a suddaine (as it were by some extraordinary strong puffe) there are rejected and cast forth from it certain huls or chaffe (if I may so say) of brasse. Now the ground or floore to receiue this refuse as it falleth, ought to be well paued.

There is another stuffe found in the said forges or bloom-smithies, easily discerned from this Psegma, which the Greeks (for that it is, as it were, twise burnt or concocted) call Diphryges. L
And this is made three maner of waies: For first they say it comes of the Marquesit stone burnt in a furnace vntill it be calcined and reduced in the red chalke Rubrica. It is engendred also of the earth or cley within a certain caue in Cyprus, first dried and soon after gently burnt in a fire round about it, maintained with small sticks put therto by little & little. There is a third way of making it, to wit, of the grosse dregs or drosse of brasse settling downe to the battome of the furnace: in which furnace a man shall perceiue these different matters, to wit, the brasse it selfe, which being melted, runneth into pans and vessels ready for to receiue it; the refuse, called Scoria, which flies out of the furnace; the florey that floteth aloft; & the Diphryges or drosse which remaineth behind. Some yeeld another reason and making of Diphryges in this manner, namely, That there be certain round bals or pellets (as it were) of hard stones found within the mines M
of brasse, which together with the Marquesit or brasse ore doth not melt in the furnace, & a man shall see the brasse it selfe boile about the same: which round hard stones are vnited and soudered only, one to another by this means; but themselues resolue not nor melt perfitly, vnlesse they be translated into other furnaces: for they be the very heart (as it were) of the whole matter.

But

20030
copy 1

A But in the ſecond triall and boiling, that which remaineth behind, is called Diphryges. Well, be it what it will, the ſame reaſon there is of it in Phyſicke, as of the reſt of this kind found in furnaces: for by nature it is deſiccatiue: it conſumeth beſides all excreſcences, & doth cleanſe mightily. The triall of it is by the tongue, for if it bee good Diphryges, no ſooner toucheth it the tongue, but it drieth it, and withall taſteth of braſſe.

But before I depart from theſe braſſe mines and furnaces, I cannot conceale from you one miraculous thing as touching this mettall. There is (you know) a noble family in Rome of the *Seruilij*, well renowned, as may appeare by the Roman Kalender and acts of record: and theſe haue among them a certaine piece of braſſe coine ealled a Triens (*i.* The third part *of a Roman Aſſe) which they do keep and feed with ſiluer and gold. For eat and conſume it doth both the B one and the other: from whence it came firſt, and what the reaſon in nature of this property is, I know not yet. But for my warrant, I will ſet downe as touching this matter the very words of old *Meſſala*: The houſe (quoth he) of the *Seruilij* hath a certain ſacred Trient, in the honor of which piece they do ſacrifice yerely with great deuotion and ſolemnity, omitting no magnificence nor ceremonies thereto belonging. And this Trient the common ſpeech is of them all, that it ſeemeth one while to grow bigger, and another while to diminiſh and be ſmaller: according to which increaſe or decreaſe, the ſaid *Seruilij* take preſage, That their family ſhall either riſe to more honour, or decay in credit and reputation.

*which is our farthing.

CHAP. XIV.

C ¶ *Of Yron, and Yron mines, and the different kindes of Yron.*

IT remaineth now in the next place to diſcourſe of the mines of yron, a mettal which we may well ſay is both the beſt and the worſt implement vſed now in the world: for with the helpe of yron we break vp and ear the ground, we plant and plot our groues, we ſet our hortyards and range our fruitful trees in rewes: we prune our vines, and by cutting off the ſuperfluous branches and dead wood, we make them euery yere to look freſh and yong againe: by meanes of yron and ſteele we build houſes, hew quarries, and cut in ſtone, yea, and in one word, wee vſe it to all other neceſſary vſes of this life. Contrariwiſe, the ſame yron ſerueth for wars, murders, and robberies, not onely to offend and ſtrike therewith in hand, but alſo to reach and kill afarre off, with diuers D ſorts of darts and ſhot; one while diſcharged and ſent out of engines, another while lanced and flung by force of the arme; yea, and ſometime let flie with wings: and this I take to be the wickedeſt inuention that euer was deuiſed by the head of man: for to the end that death may ſpeed away the faſter to a man, and ſurpriſe him more ſuddenly, we make it to flie as a bird in the aire, and to the arrow headed at one end with deadly yron, we ſet feathers at the other: whereby it is euident, that the miſchiefe proceeding from yron, is not to be imputed to the nature of it, but to the vnhappy wit of man. For good proofe wee had already by many experiments otherwiſe, that yron might be imploied and occupied, without any hurt or harme at all to mankinde. And verily in thoſe capitulations of peace, which after the expulſion of the kings, *Porſena*, king of the Tuſcans tendred to the people of Rome, I find this expreſſe article & impoſition, that they E ſhould not vſe yron, but only about tillage of the ground. And as our Chronicles of greateſt antiquity haue left recorded, it was not thought ſafe to permit writing and ingrauing letters with a ſtyle of yron. Certes, in the third Conſulſhip of *Pompey* the great, by occaſion of a tumult and commotion raiſed within the city of Rome for the murder committed vpon the perſon of *P. Clodius*, there was an edict come forth (which now is extant vpon record) after the manner of an inhibition in this form: *Ne vllum telum in vrbe eſſet*, *i.* That no man throughout all Rome ſhould be ſeene to weare a weapon. Neuertheleſſe men did not forbeare and giue ouer to doe ſome honour vnto yron alſo in ſome other occaſions of this life, tending to the entertaining of ciuility and humanity; for *Ariſtonidas* the cunning artificer, minding to repreſent in an image the furious rage of *Athamas*, beginning now to coole and be allaied, together with his repentance for the F cruell murdering of his owne ſonne *Learchus*, whom he flung headlong againſt the hard ſtones, and thereby daſht out his braines; made a temperature of braſſe and yron together, to the end, that the ruſtie yron appearing through the bright luſtre of the Braſſe, might liuely expreſſe a bluſhing red in the countenance, beſeeming a man confuſed and diſmayed for ſo vnnaturall a fact. This Statue is at this day to bee ſeene at Thebes. Within the ſame Citie there is another

*O *Pliny*, what wouldeſt thou ſay, if thou did deſtſee & hear the Piſtols, muskess, Culuerines, & Canons in theſe daies.

Image

image of *Hercules* all of hard yron or ſteele, which *Alcon* the famous workman ma de of purpoſe G
to ſignifie the vndaunted heart of that deified *Hercules*, who vnderwent and indured all labours
and perils whatſoeuer. Here alſo in Rome we may ſee certain drinking cups of ſteele dedicated
in the temple of *Mars* the Reuenger.

But to come vnto the nature of yron, herein appeareth ſtill the ſame goodneſſe of Nature,
that this mettall working ſuch miſchiefe as it doth, ſhould be reuenged of it ſelfe, and receiue
Nihil in rebus mortalius facientè, quam qd. infeſtiſſimum, mortalitati, the grace of this Latine cannot be ſo well expreſſed in Engliſh.
condigne puniſhment by the own ruſt. See alſo the wonderful prouidence of Nature, *who maketh nothing in the world more ſubiect to death and corruption, than that which is moſt hurtfull and deadly to mankind.

As touching mines of yron ore, they are to be found almoſt in euery country, for there is not
ſo much as the Iſland Ilua here within Italy, but it breedeth yron. And lightly whereſoeuer any H
ſuch be, they are eaſily found, for the very leere of the earth, reſembling the colour of ore, bewraieth where they lie. And when it is found out, they burn, try, and fine it, as other veins of mettall.
Onely in Cappadocia there is ſome queſtion and doubt made, whether in the making of yron
they be more beholden to the earth that yeeldeth the ore, or to the water for the preparing and
ordering of it? for this is certain, that vnleſſe the vein of ore bee well drenched and ſoked with
the water of one riuer there, it will neuer yeeld yron out of the furnace. As for the kinds of yron
*Some read *à ſtringẽda (oculorũ atie)* i of dazeling the eies; which irõ red hot, or the bright blade of ſword & other weapons, doth: but nether any copies of the author haue the word (*oculorum*) neither haue I read *ſtringere*, but *perſtringere*, to ſignifie, to dazle: others vnderſtand it of drawing a naked ſword: & yet it is not ſo proper in Latine to ſay in that ſence, *ſtringere aciem*, as *ſtringere ferrũ*, or *gladium*: howbeit, I incline rather to this, for that *Pliny* a little after calls the beſt ſteele *Acies*, which word haply is the primitiue, from whence *acies* alſo is vſed for an edg, &c. and yet it may be, that thoſe *ſtricturæ* i. ſparkling ſkales, flying frõ iron vnder the ſmiths hãmer, & frõ no other mettall, (which do *perſtringere aciem oculorũ*, if any thing els) may giue occaſion herof. *Sed hæc viderint Critici*
many they are, and all diſtinct. The firſt difference ariſeth from the diuerſity of the ſoile and
climats where the mines be found: for in ſome places, the ground & the poſition of the heauens
do yeeld onely a ſoft ore, and comming nearer to the ſubſtance of lead than yron: in another, the
mettall is * brittle and ſhort, ſtanding much vpon a veine of braſſe, ſuch as will not ſerue one I
whit for ſtroke and naile to bind cart-wheels withall, which tire indeed would be made of the other that is gentle and pliable. Moreouer, ſome kind of yron there is that ſerueth onely, if it be
wrought in ſhort and ſmal works, as namely, for nailes, ſtuds and tackes imploied about greeues
and leg-harneis: another againe, that is more apt to take ruſt and canker than the reſt. Howbeit,
all the ſorts of yron ore are termed in Latine Strictura, a word appropriat to this mettall & to
no other, **à ſtringenda acie*, *i.* of dazling the eies, or drawing a naked ſword. But the furnace it ſelf,
where the ore or yron ſtone is tried, maketh the greateſt difference that is: for therein you ſhall
haue to ariſe by much burning and fining, the pureſt part thereof, which in Latine is called *Nucleus ferri*, *i.* the kernell or heart of the yron [and it is that which we call ſteele] and the ſame alſo
of diuers ſorts: for the beſt is it that hardeneth the edge of any weapon or toole: there is of it K
which ſerueth better for ſtithy or anuill heads, the faces of hammers, bits of mattocks, and yron
crowes. But the moſt variety of yron commeth by the means of the water, wherein the yron red
hot is eſtſoons dipped and quenched for to be hardened. And verily, water onely which in ſome
place is better, in other worſe, is that which hath innobled many places for the excellent yron
that commeth from them, as namely, Bilbilis in Spaine, and Taraſſio, Comus alſo in Italy; for
none of theſe places haue any yron mines of their owne, and yet there is no talk but of the yron
and ſteele that commeth from thence. Howbeit, as many kinds of yron as there bee, none ſhall
match in goodneſſe the ſteele that commeth from the Ceres: for this commoditie alſo, as hard
ware as it is, they ſend and ſell with their ſoft ſilks and fine furs: in a ſecond degree of goodneſſe,
may be placed the Parthian yron. And ſetting aſide theſe two countries, I know not where there L
be any bars or gads tempered of fine and pure ſteel indeed, for all the reſt haue a mixtue of yron,
more or leſſe. And generally in this Weſt part of the world wherin wee liue, all our ſteel is of a
more ſoft and gentle temperature than that of the Leuant. This goodneſſe of ſteele in ſome
countries ariſeth from the nature of the mine, as in Auſtrich: in others from the handling and
temperature thereof, like as by quenching, as I ſaid before, and namely at Sulmo, where the water ſerueth eſpecially for that purpoſe: and no maruell, for we ſee a great difference in whetting and ſharpening the edge of any inſtrument, between oyle whetſtones that barbars vſe, and
the common water grind-ſtones: for ſurely the oile giueth a more fine and delicat edge. Furthermore, this is ſtrange, that when the ore or vein is in the furnace, it yeeldeth yron liquid & cleare
as water: and afterwards, being reduced into bars and gads when it is red hot, it is ſpungeous and M
brittle, apt to break or reſolue into flakes. And conſidering the difference that is betweene the
nature of oile and water (as I haue ſaid) this is to be obſerued, that the finer any edge tooles bee,
the manner is to quench them in oile for to harden the edge: for feare leſt the water ſhould
harden them ouer much, and make the edge more ready to breake out into nickes, than to bend

and

20030
copy 1

A and turne again. But wonderfull it is aboue all, that mans bloud ſhould haue ſuch a vertue in it, as to be reuenged of the yron blade that ſhed it; for being once embrued therin, it is giuen euer after eftſoones to ruſt and canker.

Concerning the load-ſtone, and the great concord or amity betweene yron and it, I meane to write more amply in the due place. Howbeit, for the preſent thus much I muſt needs ſay, that yron is the only mettall which receiueth ſtrength from that ſtone, yea, and keepeth the ſame a long time, inſomuch, as by vertue therof, if it be once well touched & rubbed withal, it is able to take hold of other pieces of yron: and thus otherwhiles we may ſee a number of rings hanging together in manner of a chaine, notwithſtanding they be not linked and incloſed one within another. The ignorant people ſeeing theſe rings thus rubbed with the load-ſtone, and cleauing
B one to another, call it quick-yron. Certes, any wound made by ſuch a toole, are more eager and angry than by another. This ſtone is to be found in Biskay, ſcattered here and there in ſmal pieces by way of bubbation (for that is the term they vſe,) but it is not that true Magnet or load-ſtone indeed, which growes in one continued rock. And I wot not whether theſe be ſo good for glaſſe-makers, and ſerueth their turn ſo well in melting their glaſſe, as the other: for no man yet hath made experiment therof. But ſure I am, that if one do rub the edge, back, or blade of a knife therewith, it doth impart an attractiue vertue of yron thereunto, as well as the right Magnet. An here I cannot chuſe but acquaint you with the ſingular inuention of that great architect and maſter deuiſer, of Alexandria in Ægypt, *Dinocrates*, who began to make the arched roofe of
C the temple of *Arſinoe* all of Magnet or this load-ſtone, to the end, that within that temple the ſtatue of the ſaid princeſſe made of yron, might ſeeme to hang in the aire by nothing. But preuented he was by death before he could finiſh his worke, like as K. *Ptolomæe* alſo, who ordayned that temple to be built in the honour of the ſaid *Arſinoe* his ſiſter.

But to returne again to our yron: of all mines that be, the vein of this mettall is largeſt, and ſpreadeth it ſelf into moſt lengths euery way: as we may ſee in that part of Biſcay that coaſteth along the ſea, and vpon which the Ocean beateth: where there is a craggy mountaine very ſteepe and high, which ſtandeth all vpon a mine or veine of yron. A wonderfull thing, and in maner incredible, howbeit, moſt true, according as I haue ſhewed already in my Coſmography, as touching the circuit of the Ocean.

D

Chap. XV.

¶ *The temper of yron. The medicinable vertues thereof, as alſo of the ruſt of Braſſe and yron. Of the skales that ſhed and flie from yron: and of the liquid emplaſter called by the Greekes Hygrimplaſtrum.*

IRon made once hot in the fire, vnleſſe it be hardened with the Hammer, doth ſoone waſte and corrupt. So long as it looketh but red, it is not ready for the hammer, neither would it be beaten before it begin to look white in the fire. Beſmeare it with vineger and Allum, it wil looke like copper or braſſe. If you be deſirous to keep any yron-worke from ruſt, giue it a verniſh with ceruſſe, plaſter, and tar, incorporat all together. And this is that compoſition, which is called
E by the Greeks * Antipathia. And ſome ſay alſo, that there is a kind of hallowing yron that will preſerue it from ruſt: as alſo that there is at this day to be ſeen the chaine of yron within the city called Zeugma, ſeated vpon Euphrates, wherwith king *Alexander* the Great ſomtime bound and ſtrengthened the bridge ouer the riuer there: the linkes whereof, as many as haue been repaired and made new ſince, doe gather ruſt, whereas the reſt of the firſt making, be all free therfrom. * Veſti as ſi imo.

As touching the vſe of yron and ſteele, in Phyſicke it ſerueth otherwiſe than for to launce cut and diſmember withall: for take a knife or dagger and make an imaginarie circle two or three times with the point thereof, vpon a yong child, or an elder body, and then goe round withall about the party as often, it is a ſingular preſeruatiue againſt all poiſons, ſorceries, or inchant-
F ments. Alſo to take any yron naile out of the coffin or ſepulchre wherein man or woman lieth buried, and to ſticke the ſame faſt to the lintle or ſide-poſt of a dore, leading either into the houſe or bed-chamber where any doth lie who is haunted with ſpirits in the night, hee or ſhee ſhall be deliuered and ſecured from ſuch phantaſticall illuſions. Moreouer, it is ſaid, That if one be lightly pricked with the point of ſword or dagger which hath beene the death of a man, it

is an excellent remedy againſt the paines of ſides or breſt, which come with ſudden pricks and ſtitches. An actuall cauterie of yron red hot, cureth many diſeaſes, and eſpecially the biting of a mad dog; in which caſe it is ſo effectuall, that if the poiſon inflicted by that wound, haue preuailed ſo far, that the patient be fallen into an Hydrophobie thereby, and cannot abide drinke or water, let the ſore be ſeared therewith, the party ſhall find help preſently. Gads of ſteele or other yron red hot quenched in water, ſo long vntil the ſame water be hot, cauſeth it to be a wholſome drinke in many diſeaſes, but principally in the bloudy flix. G

The very ruſt of yron alſo is counted medicinable: for ſo *Achilles* is ſaid to haue healed *Telephus*: but whether the head of his ſpeare were yron or braſſe, of which he vſed the ruſt, I doe not certainly know. Certes, he is paynted thus: with his ſword ſcraping and ſhaking off the ruſt into the wound. But if you would fetch off the ruſt from any old nails, ſcrape it with a knife wet before in water. As touching the vertues thereof, it is clenſing, exiccatiue, and aſtringent; it recouereth the haire in places deſpoiled thereof, if they be annointed therewith in the forme of a liniment: being reduced into a ſalue with wax and oile of Myrtles incorporate together, many vſe it for roughneſſe about the eie-lids: the pimples alſo breaking forth all ouer the body. For ſhingles and S. *Antonies* fire, it is ſingular good to apply it in an vnguent with vineger: likewiſe it killeth ſcabs, and healeth whitflawes of the fingers, and the excreſcence or turning vp of the fleſh about the roots of the nails, if linnen rags wet therein be applied conueniently. The ſame conueyed vp in wooll after the manner of a peſſary into the naturall parts of women, ſtaieth the immoderat flux both of whites and reds. The ruſt of yron tempered in wine, and wrought together with Myrrhe, is good for a greene wound: put thereto vineger, and then it helpeth the piles and ſwelling bigges of the fundament. A liniment made with it, mitigateth the paine of the gout. H I

As touching the skales of yron that flie from the edge or point of any weapon wrought in the ſmiths forge: they ſerue in the ſame caſes, that the ruſt doth, and haue the like effects, ſaue only this, that they haue greater acrimonie, and work more eagerly: in which regard they are emploied about the repreſſing of the flux that falleth into watering eies. But marke this one thing: Yron being that which woundeth moſt and ſheddeth bloud, yet the skales that come from it, ſtanch the ſame: a property they haue beſides to ſtop the flux in women: and being applied to the region of the ſpleene, they do open the obſtructions thereof, and eaſe other infirmities incident thereto: the running hæmorrhoids they repreſſe, and ſuch vlcers as are giuen to ſpread farther and corrode as they go. Reduced into a fine powder, and gently ſtrewed vpon the eye-lids, they are good for the accidents thereto belonging. But the principal vſe of them, and for which they are moſt commended, is in a certain liquid plaſter called Hygremplaſtrum; which ſerueth to mundifie wounds, vlcers, and fiſtulaes: to eat away all calloſities, and to incarnate and engender new fleſh about bones that are periſhed. And this is the receit of that compoſition: Take of the ſcouring Tuckers earth the weight of two oboli, of braſſe ſix drams, of the skales of yron as much, and no leſſe of wax, incorporat all theſe according to art in one ſextar of oile. But in caſe there be need to mundifie any ſores, or to incarnat, there would be put therto ſome plain cerot beſides. K

Chap. XVI. L

¶ *Of the Mines of Lead ore: of *white lead and blacke.*

*Which ſome hold to be Tin-glaſſe. *Our ordinary lead.

NOw inſueth the diſcourſe of lead, and the nature of it; of which there be two principall kindes, the blacke, and the white. The richeſt of all, and that which carrieth the greateſt price, is that which we in Latine name *Plumbum candidum*, *i.* the white bright lead, and the Greeks *Caſſiteron*. But I hold it a meere fable and vaine tale, that all of it is fetched as farre as from the Iſlands of the Atlanticke ſea, and that the inhabitants of thoſe parts doe conueigh it in little twiggen boats, couered all ouer with feathers. For the truth is, that there is found of it in theſe daies within Portugall and Gallæcia, growing ebbe vpon the vpmoſt face of the earth, being among the ſands, of a black colour, and by the weight only is knowne from the reſt of the ſoile: and here and there among, a man ſhall meet with ſmall ſtones of the ſame ſtuffe, moſt of all within the brookes that be dry ſometimes of the yere. This ſandie and grauelly ſubſtance, the mine maſters and mettall finers vſe to waſh, and that which ſetleth downeward, they burne M

and

20030
copy 1

A & melt in the furnace. There is found likewiſe in the gold mines a kind of lead ore which they cal Elutia; for that the water that they let into thoſe mines (as I ſaid before) waſheth and carrieth down withall certain little blacke ſtones ſtreaked and marked a little with a kind of white, and as heauy they be in hand as the very ore of gold; and therefore gathered they be with the ſame ore, and laid in the paniers together therewith: and afterward in the furnace when the fire hath made a ſeparation between them and gold, ſo ſoone as they are melted do reſolue into the ſubſtance of the white lead or tinglaſſe aforeſaid.

Moreouer, this is is ſtrange, that throughout all Gallecia you ſhal not find a mine of common black lead, & yet in Biskay (which confineth hard vpon it) there is abundance of it & no other; neither out of the vein of this white lead ſhal you try any ſiluer, wheras out of the black it is an
B ordinarie thing to extract ſiluer. Again, this is certain, that two pieces of black lead canot poſſibly be ſodered together without this tinglaſſe; neither can this be vnited to the other but by means of oile: nay it is vnpoſſible to conioyne a piece of tin-ſoder or white lead with another, but with a ſoder of the black. This white lead or tinglaſſe hath bin of long time in eſtimation, euen ſince the war of Troy, as witneſſeth the poet *Homer*, who calls it Caſſiteron. As for blacke lead, ingendred it is two maner of waies, for either it groweth in a vein of the owne without any other mettal with it, or els it doth participat with ſiluer in the ſame mine, and being intermixt in one piece or lump of ore, it is ſeparated from it at the melting and fining only; for the firſt liquor that runs from it in the furnace is tin, and the ſecond ſiluer. As for the third part of the vein which remaineth behind in the furnace, it is Galæna, that is to ſay, the very mettal it ſelfe
C of lead; which beeing once againe melted and tried in the fire, after two parts thereof be deducted, yeeldeth that black lead whereof we now do treat.

Chap. XVII.

¶ *Of Tin, of Argentine Lead, and other points pertinent to theſe matters.*

D Tin hath a proper vſe to enhuile veſſels of braſſe, partly to take away the euil taſt they haue, and to make them ſweeter, and partly to preſerue them from ruſt, or to qualifie the malitious nature of braſſe: and yet wonderfull it is, that ſuch veſſels thus tinned are neuer a iot the heauier by that means. Alſo in times paſt there were (as I haue already ſaid) excellent Mirroirs made of tin, and the ſame were tempered & wrought at Brundiſe: but thoſe of ſiluer haue put them down ſince, that euery chamber-maid and ſuch like ſeruing creature would be at their looking-glaſſes of ſiluer. But tin is found much counterfeit in theſe daies, by putting to White lead aboue ſaid a third prrt of white braſſe: yea and there is another deuiſe to ſophiſticate tin, to wit, by mixing white and blacke lead one with another by euen weight and portion: and this maſlen ſome call at this day, * ſiluer lead or argentine. As for that mixed matter wherin be two parts of black lead, and one of the white, they cal it Tertiarium: this kind of tinne is ſold after
*30 the pound, and it is that wherewith they vſed to ſoder conduit pipes: but the lewder diſpoE ſed pewterers haue a caſt to put vnto this tin called Tertiarium, an equal quantity of white lead and then they call it Argentarium: which mettall they employ in veſſells for the kitchen, to ſeeth meat or what they liſt in them: and this kind of pewter wanteth no price, for they ſet it at 130 the pound, whereas a pound of white lead or tinglaſſe pure and fine of it ſelfe, is ſould for thirty, and the blacke for ſixteen. As touching the temperature and nature of the white lead, it ſtandeth more vpon a dry ſubſtance; contrariwiſe, that of blacke is wholly moiſt and liquid: which is the reaſon that the ſaid white lead or tinglaſſe will ſerue to no vſe or purpoſe vnleſſe it be mixed with ſome other mettal; neither is it good to lead or ſoder ſiluer with, for ſooner will ſiluer melt in the fire than it. There is a deuiſe to tin pots, pans, and other pieces of braſſe ſo artificially with white lead or tinglaſſe (an inuention which came out of France) that hardly a
F man ſhall diſcerne them from veſſell of ſiluer; and ſuch leaded veſſels are commonly called Incoctilia. After the ſame maner they haue taken vp of late another cuſtome, to ſiluer the trappings eſpecially and capariſons of their horſes of ſeruice, yea and the harneſſe of coach-horſes and draught jades, and namely in the town Alexia. As for the former inuention, thoſe of Bourges haue the honour of it. Neither reſted they ſo, but haue proceeded to adorn and garniſh in

* *i.* Pewter, as ſome take it.

* This place ſeemeth to be corrupt.

that maner their chariots, wagons, and coaches. But our vain and waſtful wantons not herewith G
contented, are come now to their wagon ſeats, not of ſiluer only, but alſo of gold: and that which
in times paſt was condemned as monſtrous prodigalitie, to be put into drinking veſſels; the
ſame to tread vpon now with the feet, and to waſte and conſume about waggons and charriots,
is commended for fineneſſe, neatneſſe, and elegancie. But to return againe vnto our white lead,
if you would know whether it be right and good or no, the proof is to be made in paper: for put
it melted into a ſheet of paper, if it be not falſified, it wil ſeem to break and rend the paper with
the weight, and not with the ſcalding heat thereof.

Moreouer, it is worth the obſeruation, that the Indians haue no mines among them either of
braſſe or lead, but are content to part with their pearles and pretious ſtones vnto merchants, by
way of counterchange for theſe mettals. H

Black lead or common lead is much vſed with vs for ſheets to make conduit pipes; alſo it is
driuen with the hammer into thin plates and leaues. This mettal requireth much labor & toile
in Spain and France, before it be gotten out of the mine, ſo deepe it lieth; whereas in Brittaine
it runneth ebb in the vppermoſt coat of the ground, and that in ſuch abundance, that by an ex-
preſſe act among the Iſlanders themſelues, it is not lawfull to dig and gather ore aboue ſuch a
proportion, ſet down by ſtint. Furthermore, all the black lead which now men haue in requeſt,
is known by theſe names, to wit, Iouetanum, Caprarienſe, and Oleaſtrenſe. As for the droſſe and
refuſe that is purged from it, there is no difference at all, ſo that it haue the due clenſing by the
fire as it ought. Theſe mines alone of lead haue one wonderfull and admirable gift aboue all I
others, That if they be forelet a time and ſuffered to reſt, they will grow againe and be more fer-
tile of ore thereby. And in truth this ſeems to be the reaſon thereof, for that the aire hath good
means and libertie to infuſe it ſelfe, and to enter in at the pores and paſſages which it findes in-
larged and open: much like as we obſerue in certain women, who vpon their ſlips of abortiue
fruit, proue thereby more fruitfull and apt to conceiue. And that this is true that I ſay of lead
mines, it was found of late by good experience in the mines of Santaria in the prouince of Bo-
etica in Spain: for whereas in times paſt for two hundred yeares together, it was wont to be ſet
for a rent of ten pound weight, after it had taken repoſe and was opened againe, it yeelded for
euerie ten, 55. Likewiſe the lead mine named Antimonianum within the ſaid prouince, which
paid in old time but a chiefe of ten pound weight, is come now to a yearly reuenue of four hun- K
dred pound. To conclude, one maruellous quality lead hath beſides, That no veſſel made there-
of will melt ouer the fire, if there be water in it: and yet caſt into the ſaid water a little ſtone, or
a ſmall piece of braſſe coin, although it be no more than a Quadrant, you ſhall ſee it melt, and a
hole burnt through it by and by.

Chap. XVIII.

¶ *The medicines that we haue from Lead, and the refuſe and droſſe of Lead: of the veine of Lead called Molybdæna or Galena: of Ceruſe, white Lead, or Spaniſh White, called Pſimmithyum: and of Sandaracha.* L

GReat vſe there is in phyſicke of lead applied by it ſelfe alone, and namely to repreſſe and
keepe downe the skars and cicatrices that riſe aboue the other skin: alſo by the refrigera-
tiue quality that it hath to coole the heat of fleſhly luſt, if there be bound vnto the loins
and region of the reins a thin plate or leafe thereof. And verily *Calvus* the Orator, who by occa-
ſion of much dreaming in his ſleepe of venereous ſports, fell into mighty pollutions, and ſo
farther into the grieuous maladie of Gonorrhœa or running of the reines, with wearing ordina-
rily theſe leaden plates, ſtayed (by report) all ſuch vaine and wanton fantaſies and imaginati-
ons: by which means he preſerued alſo his ſtrength, and had a body able to endure the labor of M
much ſtudy and ſitting at his booke. And *Nero* the Emperor (ſince the gods would haue it ſo)
vſed ordinarily to weare a plate of Lead to his breaſt, vnder which he would chaunt out luſti-
ly with a wide throat and ſtrong voice, his filthy Sonnets and beaſtly Ballads: but hee ſhewed
thereby that Lead was a ſingular meanes to maintaine a good voice. But to ſerue otherwiſe in

Phyſicke,

A Phyſick, lead ought to be prepared and baked after this manner: take an earthen pan of potters worke, and lay one bed therin of brimſtone finely poudered; vpon which, beſtow another couch of thin leaues or plates of lead, and a third courſe ouer them of brimſtone and yron file duſt together, for to couer all: this being done, ſet the veſſel into a furnace; but while theſe things are calcining, meet it is and neceſſary that the veſſell or pan aforeſaid be well luted and ſtopped cloſe, that there be no venting or breathing hole at all; for otherwiſe the lead within the ſaid pan would ſend forth a noiſome vapour and peſtilent, moſt dangerous to all that be within the ſent thereof, but to dogges eſpecially, whom it killeth out of hand: and verily, as this exhalation of lead is deadly vnto them, ſo the aire of all mettals in generall, is aduerſe and contrary vnto flies and gnats: which is the reaſon, that a man ſhall neuer ſee any of theſe inſects in mines, forges,
B and bloome-ſmithies, where mettals be vſually tried. Now in the calcining of lead, ſome there be who chuſe rather to take the duſt of lead gotten off with a file, & to mix the ſame with brimſtone: others think it better to vſe ceruſſe rather than brimſtone. Furthermore, lead doth yeeld from it ſelfe a certaine ſubſtance by way of loture, which is of right great and manifold vſein phyſicke: the making whereof is in this manner, They take a leaden mortar, they pun and ſtamp the ſame with a leaden peſtill, caſting in raine water eftſoones; and thus they labour at it continually vntill ſuch time as the water grow to ſome conſiſtence and be thicke againe; this they permit to reſt and ſettle: the pure and cleare portion that is aloft, they ſuck and ſoke away with ſpunges: the groſſeſt part that is ſetled in the bottome, after it is dried, they reduce into trochiſks. There be ſome who ſtamp in the ſame order, the file-duſt which commeth of lead: o-
C thers put thereto ſome lead ore among: and as there be many that vſe vineger or wine in this operation, ſo there are ſome againe who take greace or roſes in lieu thereof. You ſhal haue thoſe that for this purpoſe make choice of a ſtone mortar, eſpecially of Thebaicke marble, but they take a leaden peſtill rather than any other, to bray and pun withall: and by this means the medicinable lead will be the whiter.

Now as touching the lead calcined in manner aforeſaid, it may be waſhed alſo after the order of Antimonie and Cadmia: and in this manner prepared, it is of power aſtringent, good to ſtop any flux or rheume; proper alſo to skin and make a ſmal skar. Much vſe there is of lead thus burnt and waſhed, in collyries or eie-ſalues, and principally if the eies either ſtand out too far, or be ſunke in too deepe: alſo it is ſingular to repreſſe the excreſcence of fleſh in vlcers, to heale
D the chaps in the ſeat or fundament, to cure the running hæmorrhoids, and to diſcuſſe or keepe downe the blind and ſwolne piles: and for all theſe accidents in generall, the loture of lead aforeſaid is moſt excellent. But the aſhes of lead burnt and calcined, is more proper for the cure of corroding vlcers and filthy ſores. And in one word, the ſame effects and operations it hath, that the aſhes of paper. Alſo the manner of burning and calcining lead, is to put into a pan certaine little plates thereof, together with brimſtone, turning the ſame euer and anone either with ſome yron rod or ſtiffe ſtalke and ſtem of Ferula plants, vntil ſuch time as both the one and the other being liquefied, be conuerted & turned into aſhes: the ſame, after that they be once cooled, ought to be punned and beaten againe, and reduced into a moſt pure and exquiſite fine pouder. Some there be who take file-duſt of lead, put the ſame in an earthen pot or greene potters
E clay, ſet the ſame into an ouen, and ſo let it calcine therein vntill ſuch time as the pot be well and throughly baked: others againe there are, who mix with lead the like quantity of ceruſſe, or els of barly, and pun the ſame like crude lead vncalcined in manner aforeſaid, for a loture; and when it is reduced thus into pouder, they make more reckoning of it than of the Cyprian Spodium.

Ouer and beſides, the droſſe or refuſe of lead is medicinable: and the beſt is that accounted, which commeth neareſt to a yellow colour, without any reliques at all of the lead among; or elſe inclining to the hew of brimſtone, and cleanſed from all earthly ſubſtance: this alſo beeing braied and broken into ſmall parcels, may be waſhed in manner aforeſaid, and ſtamped with water in a mortar, vntill ſuch time as the water looke yellow; then muſt it bee powred forth into
F a pure cleane veſſell; and this tranvaſation ought ſo long to be continued out of one veſſell into another, vntill ſuch time as it hauedone caſting any reſidence downeward; for the ſediment that reſteth in the bottome is the beſt, working the ſelf-ſame effect as lead doth, but with more acrimony. When I conſider all this, mee thinkes I cannot ſufficiently admire the diligence of men, who haue made ſuch experiments of al things in the world, ſparing not ſo much as the very

ordure, offall, and filthy excrements, but haue tried concluſions therein ſo many waies, and left nothing vnattempted. G

There is a kind of Spodium alſo made of lead in the furnace, after the ſame manner as I ſhewed before, of copper or Cyprian braſſe: the order of waſhing wherof, is this; to put it in a courſe linnen cloth, and to lay the ſame in rain water, that the terrene ſubſtance may be ſeparated from the reſt that is transfuſed or paſſeth through the cloth with the water: and yet the ſame muſt bee cribled or ſerced afterwards, and beaten to pouder. Some thinke it better to wipe and ſcoure off the duſt from the Calamine with wings, and then to beat it in a mortar with the moſt odoriferous wine they can get.

There is beſides, a minerall named Molybdena, which elſewhere I haue called Galæna; by which I meane in this place, the ore or veine that containeth within it, both ſiluer and lead: the better this is thought to be, the more that it inclineth to the colour of gold, and the leſſe that it ſtandeth vpon lead: the ſame alſo is brittle, apt to crumble, and in proportion of the quantity not very weighty in hand: the ſame, if it be boiled with oile, will in colour reſemble liuer. There is a kind of Galæna likewiſe that ſticketh to the furnaces of gold and ſiluer: but this (whereof I now ſpeake) they call Metallica, that is to ſay, the Minerall: and verily the beſt of this kinde, is that which is found in Zephyrium: the marks whereof are theſe; if it haue little or no earth in it, nor be any waies ſtony: the ſame is burnt, calcined, and waſhed, neither more nor leſſe than the droſſe Scoria. Much vſed this minerall is in thoſe vncteous liniments or ſalues called Liparæ, deuiſed as lenitiue & refrigerant, for vlcers: alſo it entreth into plaſters which are * not mordicant: but being applied to any ſore in tender and delicat bodies, and in the ſofteſt parts, it doth heale faire, and skin throughly. The compoſition of which plaſters, is after this manner; Take three pound weight of this minerall lead Molybdæna, put thereto of wax one pound, and of oile three hemines; which done, incorporat all together (according to art) into the forme of an emplaſtre. Now if it ſo fal out that the patient be an elderly body, there would be an addition put thereto of the lees or mother of oile olliue. This minerall may be tempered alſo to right good purpoſe, with litharge of ſiluer, and the droſſe of lead, and then it is a moſt excellent medicine (to be injected by a clyſtre) for the dyſenterie or bloudy flix; for the tineſm alſo, which is an inordinat deſire to the ſtoole without doing any thing; prouided alwaies, that the belly be fomented beſides with hot water. H I

* *Quæ non alligantur*: it is thought that *Plinie* miſtook in *Dioſcor.* and for *ἐπιδετικὰ*, read *ἐπιπλαστικὰ*, which he hath tranſlated without any ſence at all or congruity to the place.

There is another mineral beſides, called Pſimmithyum, which is al one with Ceruſe: and this, the furnace and mine of lead ore doth yeeld: but the beſt of this kind is brought from the Iſland Rhodes. The manner of making it is this: Take the fineſt pieces that are ſcraped from lead, let the ſame be hung ouer a veſſell of the ſtrongeſt and ſharpeſt vineger that poſſibly can be had, that they may diſtill thereinto: and looke what of it is fallen into the ſaid vineger, muſt be dried afterwards, ground into pouder, and ſearced; & then a ſecond time it ought to be tempered with vineger, and ſo reduced into ſeuerall trochiskes, to be dried in the Sun during Summer. There is another way of making Ceruſe beſides this; namely, to put lead into certaine pots or pitchers of vineger well and throughy ſtopped, that no aire go out, and therein to let it reſt for ten daies ſpace together: after which time, to take it forth, and ſcrape from it the mouldineſſe or vineweing that doth furre or gather about it: which done, to caſt it in againe into the ſaid veſſels, continuing ſo, vntill ſuch time as the lead be conſumed to nothing. Now that which hath been thus ſcraped from it, they take and beat into pouder, they ſerce it alſo very fine, calcin it ouer the fire in a pan, ſtirring and mixing it together with little ſlices or pot-ſtickes, vntill ſuch time as it wax red, and be like vnto Sandaracha. After all this, they waſh it in freſh water ſo long vntil that all the groſſeneſſe be ſcoured off: which when it is dry, in like manner as before, they digeſt into trochiskes. This Ceruſe ſerueth to the ſame purpoſes that the reſt abouenamed (onely of al the other it is lighteſt in operation) and beſides ſerueth to make an excellent blanch for women, that deſire a white complexion: but deadly it is, being taken inwardly in drink; like as letharge alſo. This ceruſe thus made, as white as it is, in caſe it be afterwards burnt againe, turneth to be reddiſh. K L M

As touching Sandarache, I haue already ſhewed in manner all that concerneth the nature of it; howbeit, this would be noted ouer and aboue, that it is found in the mines as well of ſiluer as of gold; the redder it is, and of a more ſtrong and violent ſmell, the better men take it to be; ſuch alſo is pure, clear, and brittle withal, or eaſie to crumble: mundificatiue it is and aſtringent,

heating

20030
copy 1

heating alſo and exceeding corroſiue: and the principal vertue that it hath, is to fret and putrifie whatſoeuer it worketh vpon: in a liniment with vineger, it cauſeth the haire to come vp thicke againe in places deſpoiled thereof by any diſeaſe. It entreth iuto collyries or eie-ſalues: reduced into a lohoch with hony, it clenſeth the throat, and maketh a cleare ſhrill, and loud voice: eaten by way of a bole with turpentine, it is a gentle and pleaſant medicine for thoſe that be ſhort-winded and troubled with the cough: a perfume alſo made with it and Cedar together, is good in the ſame caſes, ſo that the ſmoke be receiued vp at the mouth. As for * Arſenicke, it is of the ſame ſtuffe: that which is beſt of this kind, reſembleth burniſhed gold in colour: the paler kind inclining to the colour of Sandaracha, is thought to be the worſe. A third ſort there is, of a middle and medled color, compounded as it were of gold and Sandaracha. Theſe two later kinds be skaly aloft: as for the firſt, which is dry and pure, it is ful of ſmall veins running here and there, whereby it is apt to cleaue as the veine goeth. Of the ſame operation is Arſenicke as the reſt, but that it is more hot and biting; in which regard, it is vſed in potentiall cauteries, and depilatories: it taketh away the carnoſities and apoſtemations about the nailes of the fingers: the ſuperfluous fleſh alſo within the noſthrils: the bigs that hang forth of the fundament: and in one word, it eateth away any excreſcence whatſoeuer. To conclude, much better it is and more powerfull in operation, in caſe it be calcined in a new earthen pan, where it muſt torrifie ſo long vntill it change the colour.

* Yellow orpiment.

THE XXXV. BOOKE OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIVS SECVNDVS.

The Proem.

E *THE diſcourſe of Mines and Metalls, wherein principally conſiſteth the wealth of the world: of other Mineralls alſo growing to them, with the Natures, Operations, and effects of them all, is an argument ſo knit and annexed to Phyſicke, that the handling thereof, (which I haue alreadie well-neare performed) not onely diſcouereth a world of wholeſome medicines profitable for the life and health of man, but alſo inferreth a number of hidden ſecrets, couched within the Apothecaries ſhops; yea, and openeth the way vnto the curious Art and ſubtill deuiſes of Grauers, Painters, and Diers, inducing me withall to take them alſo before me, and to treat thereof accordingly: which when I haue done, there remaineth yet for mee a new worke to take in hand; namely, to write of ſundry kinds of Earth and Stone, and thoſe linked together & carying with them a longer traine by far, than the former minerals. Concerning which, other authors, and the Greeke writers*

F *eſpecially, haue ſo particularized, that of each one of them they haue written many volumes. For mine owne part, I mean not to follow their ſteps, but by way of compendious breuitie, to proceed as I haue begun, and yet to omit nothing that is neceſſary, profitable, and pertinent to Nature.*

Chap. I.

¶ *The honour of flat picture in old time.*

TO begin then with that which remaineth as touching Picture and Painting, this would be knowne, That in times past it was reputed a noble and excellent art: in those daies I meane, when Kings and whole Sates made account thereof; and when those onely were thought innobled and immortallized, whom Painters vouchsafed to commend by their workmanship to posterity. But now, the marble and porphyrit stones haue put painting clean down: the gold also laid vpon them hath woon all credit from painters colours: gold I say, wherewith not only plain and entire walls are richly guilded all ouer, but also the polished works of marble engrauen vpon them after the manner of inlaid work and marquetage of diuers pieces, resembling men, beasts, and floures, and all things else: for in these daies contented we are not with plaine squares and tables of marble, nor with the riches of mighty mountains, coucht vnder couert, & laid within our bed-chambers in that sort as they grew, but come we are now to paint-stones. Deuised this was first in the daies of *Claudius Cæsar:* but when *Nero* came to be Emperor, the inuention was taken vp, to giue those colours to stones in their superficiall outside, which they had not of their own; to make them spotted, which naturally were of one simple colour: that by the helpe of mans hand, the * Numidian red porphyrit should be set out with white spots in *eg-fashion: the *Sinadian grey marble distinguished with marks and strakes of purple: as if our delicate wantons shewed thereby how they could haue wished the stones to grow. Thus would they seem to correct the works of Nature, to supply the wants of mountains and quarries, and to make amends for the hils clouen in sunder for gold, and hewed in pieces for marble. And what is the end of all this prodigious prodigality and wastfull superfluity? but that the fire when it commeth, may consume in one houre a world of wealth.

*Numidicus.
*Ouatus.
*Sinadicus.

Chap. II.

¶ *The estimation and account that was made of Images in times past, represented by liuely pictures.*

THE manner was in antient time, to continue and perpetuat the memorial of men, by drawing their pourtraitures in liuely colours, as like to their proportion and shape as possibly could be; but this custome is growne now altogether out of vse: in stead whereof wee haue shields and scutcheons set vp of brasse: we haue faces of siluer in them, without any liuely distinction of one from another: and as for our sesterces, the heads vpon them otherwhiles bee * changed one for another: which hath giuen occasion long since of many a jest and libel spred abroad in rime and sung in euery street. Insomuch as all men now adaies are more desirous to haue the rich matter seene that goeth to the making of images, than to be knowne by their own personage and visage as it is: and yet euery man delighteth to haue his cabinet and closet well furnished with antique painted tables: the statues & images of other men they think it enough to honor and adore; whiles they themselues, measuring worship by wealth, & thinking nothing honorable that is not sumptuous and costly, see not how by this meanes they giue occasion to their heires for to break open their counters and make spoile of all, or els before that day come, entice a thiefe to be hooking or twitching them away with gins and snares. Considering then, that no man careth for a liuely picture, all the monuments that they leaue vnto their heires, are images rather of their monies, than resemblances of themselues. Howbeit, these great men take pleasure to haue their owne wrestling places and halls of exercise, yea and the roomes where they are annointed, beautified and adorned with the pourtraitures of noble champions: they delight also to haue the face of *Epicurus* in euery chamber of the house, yea and to carry the same about them vpon their rings whersoeuer they go: in the remembrance and honour of his natiuitie, they doe offer sacrifice euery 20 day of the Moone, and these moneth-mindes they keep as holy-daies duly, which thereupon they call Icades: and none so much as they who will not abide to be knowne another day by any liuely image drawne whiles they be aliue. Thus it is come to passe, that whiles artificers play them and sit still for want of worke, noble arts by the means

*for they were so made that they might be taken off and set on againe.

20030
copy 1

A means are decaied and periſhed. But I maruel nothing hereat: for thus it is verily and no otherwiſe, when we haue no reſpect or care in the world to leaue good deeds behind vs, as the Images of our minds, we do neglect the liuely portraitures and ſimilitudes alſo of our bodies. In our forefathers daies ywis it was otherwiſe: their hals and ſtately courts were not ſet out with images and pourtraitures after this ſort, there were not in them to be ſeene any ſtatues or images wrought by artiſan ſtrangers, none of braſſe they had, none of marble, their Oratories & Chappels were furniſhed with their own and their anceſtors * pourtraitures in wax, and thoſe liuely and expreſſely repreſenting their viſages; theſe were ſet out and diſpoſed in order, theſe were the images that attended the funerals of any that was to be interred out of that ſtock & linage. Thus alwaies as any gentleman died, a man ſhould ſee a goodly traine of all thoſe which were
B liuing of that houſe, accompanying the corps, cauſing alſo the images of their predeceſſors to march ranke by ranke in order, according to their ſeuerall deſcents: in which ſolemne ſhew, the whole generation that euer was of that family, repreſented by theſe images, is there preſent, ready to performe that laſt duty and honour to their kinſman. Moreouer, whereſoeuer theſe images ſtood within the oratory and chappell beforeſaid, there were lines drawne from them vpon the wall, directing to the ſeuerall titles and inſcriptions which contained their ſtile, their dignities and honors, &c. As for their ſtudies and counting houſes, full they were of books, records, and rols, teſtifying all acts done & executed by them both at home & abroad, during the time they were in place to beare office of ſtate. Ouer and beſides thoſe images within houſe, reſembling the bodily ſhape & countenance, there were others alſo without dores, to wit, about the portals
C and gates of the houſe, which were the teſtimonies of braue minds & valiant hearts: there hung fixed the ſpoiles conquered and taken from the enemies, which notwithſtanding any ſale or alienation, it was not lawfull for the purchaſer to pluck down; in ſuch ſort, as the houſe it ſelf triumphed ſtill and retained the former dignity, notwithſtanding it had a new lord and maſter: and verily, this was to the maſter and owner a great ſpur to valour and vertue: conſidering, that if he were not in heart & courage anſwerable to his predeceſſor, he could neuer come in at the gates, but the houſe was ready to reproch and vpbraid him daily for entering into the triumph of another. Extant there is vpon record, an Oration or act of *Meſſala* (a great Orator in his time) wherin vpon a great indignation he expreſſely forbad that there ſhould be intermingled one image that came from another houſe of the *Leuini*, among thoſe of his owne name and linage, for feare
D of confounding the race of his family and anceſtors. The like occaſion moued and inforced old *Meſſala* to put forth and publiſh thoſe bookes which he had made of the deſcents and pedigrees of the Roman houſes: for that vpon a time as he paſſed through the gallerie belonging to *Scipio Africanus* his houſe, he beheld therein his ſtile, augmented by the addition of *Salutio* (for that was one of his ſyrnames) which fel vnto him by the laſt wil and teſtament of a certain rich man ſo called, who adopted him for his owne ſon: as being greatly diſcontented in his minde, that ſo baſe a name as that (to the ſhame and diſhonor of the *Africans*) ſhould creepe into the noble family of the *Scipio's*. But if I may ſpeak without offence of theſe two *Meſſalæ*, it ſhould in my conceit be ſome token of a noble ſpirit and good mind that loueth and imbraceth vertue, to entitle his owne name, although vntruely, to the armes and images of others, ſo long as they
E be noble and renowned: and I hold it a greater credit ſo to doe, than to demeane our ſelues ſo vnworthily, as that no man ſhould deſire any of our armes or images. And ſeeing that I am ſo far entered into this theam, I muſt not paſſe ouer one new deuiſe and inuention come vp of late, namely, to dedicat and ſet vp in libraries the ſtatues in gold or ſiluer, or at leaſtwiſe in braſſe, of thoſe diuine and heauenly men, whoſe immortall ſpirits do ſpeak ſtill and euer ſhall, in thoſe places where their bookes are. And although it bee vnpoſſible to recouer the true and liuely pourtraits of many of them, yet we forbeare not for all that to deuiſe one Image or other to repreſent their face and perſonage, though we are ſure it be nothing like them: and the want thereof doth breed and kindle in vs a great deſire and longing, to know what viſage that might bee indeed which was neuer deliuered vnto vs: as it appeareth by the ſtatue of *Homer*. Certes, in my
I opinion there can be no greater argument of the felicity & happineſſe of any man, than to haue all the world euermore deſirous to know, What kinde of perſon hee was whiles he liued? This inuention of erecting libraries, eſpecially here at Rome, came from *Aſinius Pollio*, who by dedicating his Bibliotheque, containing all the bookes that euer were written, was the firſt that made the wits and workes of learned men, a publique matter and a benefit to a Commonweale.

But

*Theſe images were no other than theviſage & head as far as to the ſhoulders.

*Ptolomæus. Philadelphus. *Attalus.

But whether the kings of * Alexandria in Egypt,or of *Pergamus,began this enterprise before (who vpon a certain emulation and strife one with another, went in hand to make their stately and sumptuous libraries) I am not able to auouch for certain. But to returne againe to our flat images and pictures;that men in old time delighted much therein, yea, and were carried away with an ardent and extraordinary affection to them,may appeare by the testimony, not only of *Atticus* that great friend of *Cicero's* (who set forth a book intituled, A Treatise of painted images) but also of *M. Varro*,who in all his volumes,whereof hee wrote a great number, vpon a most thankfull and bountifull mind that he carried,deuised to insert not onely the names of 700 famous and notable persons, but also in some sort to set down their physiognomy & resemblance of their visage:not willing as it might seem that their remembrance should perish,but desirous to preserue the shapes and portraits of so worthy personages against the injury of time, which weareth and consumeth all things, indeuoring by this means,& as it were in a kind of emulation striuing to do as much for them in this behalf,as the gods could do,not only in giuing them immortality,but also by dispersing those pourtraits into all parts of the world, to shew them personally in euery place to the eies of men,as if they were present.

Chap. III.

¶ *At what time scutchions and shields,with images ingrauen in them,were first erected in publique place. Where they began to be set vp in priuat houses. The originall of pictures. The first pourtrait that was of one single colour. Of the first Painters. How antient the Art of Painting was in Italy.*

And this verily which *Varro* did,namely,to insert the names & counterfeits of famous men in his books,was to gratifie strangers only. But of those who were desirous in this kinde, to honour Romans,I find in the Chronicles,that *Appius Claudius* was the first (him I meane, who in the 259 yeare after the foundation of the city of Rome,bare the Consulship with *Seruilius*,and namely,by dedicating in temples and publicke places of the city,the shelds of his predecessours by themselues alone. For within the chappell of *Bellona*, hee caused to bee set vp the scutchions and shields of his ancestors;taking great contentment to haue the armes of his predecessors seen on high,and the same accompanied with the titles of their honorable dignities to be read. A goodly shew,no doubt,and a magnificent, in case there should be shewed withall a long descent of petty images representing a number of children, as it were the nest of a faire brood and off-spring: for who would not take great joy and pleasure to see such a sight, who would not fauorably behold the arms of such a race and linage? After that *Appius Claudius* had giuen this precedent at Rome, there followed *M. Æmilius*, companion in the same Consulship with *Q. Luctatius*,who not contented to haue the Armoires and coats of his Progenitors, to be aduanced aloft in the stately hall and pallace Æmilia only,tooke order,that they should stand also at home in his owne house: and this also was a matter of right great consequence, beeing done according to the pattern and example of the martiall worthies in *Homer:* for within these shields & scutchions,resembling those which were vsed in old time in the battels before Troy, were represented the images of such as serued with them,ingrauen therein: for thereupon such shields took the name * *Clypei*,*i.* chased and ingrauen,not of the old word in Latine *Cluere*,which signifieth to fight,or to be well reputed,as our thwarting Grammarians would with their subtile sophistrie seeme to etymologize and deriue it. Certes,this originall of shields and coats of armours,implied a braue mind and noble spirit ful of vertue and valour,when euery mans shield shewed the liuely pourtrait of him that bare it in the warres. The Carthaginians were wont to make their targuets of beaten gold, and those likewise they caused to bee ingrauen with their own portraits,& carried the same with them to the wars. And verily,*Q. Martius* that worthy warriour,and reuenger of the 2 *Scipio's* in Spain,hauing defeated the Carthaginians & taken many of them prisoners,found among other spoils and pillage,the shield of *Asdrubal*,made in maner aforesaid: Which shield was erected & hung vp ouer the porch of *Iupiters* temple vpon Capitoll hill,and remained there vnto the first fire that consumed the temple. And seeing I am fallen vpon this poynt, namely, of erecting the armours woon from enemies,in publicke place; I may not passe ouer in silence the securitie and careless regard that our forefathers had in this behalfe:

* *Quasi glypei, ἀπὸ τοῦ γλύφειν, i. à Cælando.*

20030
copy 1

A behalfe: which was so great, that *M. Aufidius*, who farmed and vndertook the custody or keeping of the Capitoll, the temple, and all therein, the same yeare wherein *L. Manlius*, and *Q. Fulvius* were Consuls, and which was from the foundation of the city of Rome 575 yeares, aduertised the Senat, That those shields there, which for so long together were appointed & assigned thither by the Censors, were not of brasse, as they had been taken for, but of siluer.

Concerning pictures, and the first originall of painters art, I am not able to resolue and set downe any thing for certain: neither is it a question pertinent to my designe and purpose. I am not ignorant that the Ægyptians do vaunt thereof, auouching that it was deuised among them and practised 6000 yeres, before there was any talk or knowledge therof in Greece: a vain brag and ostentation of theirs, as all the world may see. As for the Greeke writers, some ascribe the
B inuention of painting to the Sicyonians, others to the Corinthians. But they do all jointly agree in this, That the first pourtrait was nothing els but the bare pourfling and drawing onely the shadow of a person to his just proportion and liniments. This first draught or ground, they began afterwards to lay with one simple colour, and no more: which kind of picture, after that they fell once to more curious workmanship, they called Monochromaton, *i.* a pourtrait of one colour, for distinction sake from other pictures of sundry colours: which notwithstanding, yet this plaine manner of painting continueth at this day, and is much vsed. As for the linearie portraying or drawing shapes and proportions by lines alone, it is said, that either *Philocles* the Ægyptian, or els *Cleanthes* the Corinthian was the inuentor thereof. But whosoeuer deuised it,
C certes *Ardices* the Corinthian, and *Telephanes* the Sicyonian, were the first that practised it: howbeit colours they vsed none, yet they proceeded thus far as to disperse their lines within, as well as to draw the pourfle, and all with a coale and nothing els. And therefore their manner and order was to write also the names of such as they thus painted, and alwaies to set them close to the pictures. But the first that tooke vpon him to paint with colour, was *Cleophantus* the Corinthian, who (as they say) took no more but a piece of a red potsherd, which he ground into pouder, and this was all the colour that he vsed. This *Cleophantus*, or some other of that name, was he who by the testimony of *Cornelius Nepos*, as I will anon shew more at large, accompanied *Demaratus* the father of *Tarquinius Priscus* king of Rome, when he fled from Corinth to auoid the
D wrongs of *Cypselus* the tyrant, who persecuted and oppressed him. But it cannot be so: for surely before this *Tarquines* time, the art of painting was grown to some perfection, euen in Italy: for proofe wherof, extant there be at this day to be seen at Ardea within the temples there, antique pictures, and indeed more antient than the city of Rome: and I assure you, no pictures came euer to my sight, which I wonder so much at, namely, that they should continue so long, fresh, and as if they were but newly made, considering the places where they be, so ruinat and vncouered ouer head. Semblably, at Lanuvium there remaine yet two pictures of lady *Atalanta*, and queen *Helena*, close one to the other, painted naked, by one and the same hand: both of them are for beauty incomparable, and yet a man may discerne the * one of them to be a maiden, for her modest and chaste countenance; which pictures, notwithstanding the ruins of the temple where they stand, are not a whit disfigured or defaced. Of late daies, *Pontius* lieutenant vnder *C. Caligula* the Emperor, did what he could to haue remoued them out of the place, and carried them a-
E way whole and entire, vpon a wanton affection and lustfull fancy that he cast vnto them: but the plastre or porget of the wall whereupon they were painted, was of that temper that would not abide to be stirred. At Cære there continue certaine pictures of greater antiquity than those which I haue named. And verily, whosoeuer shall well view and peruse the rare workemanship therein, will confesse, that no art in the world grew sooner to the height of absolute perfection than it, considering that during the state of Troy no man knew what painting was.

* *i.* Atalanta.

Chap. IIII.

Of Romanes that were excellent Painters. When the art of painting came first into credit and estimation at Rome. What Romans they were that exhibited the pourtraits of their owne victories in pictures. And about what time painted tables made by strangers in forreine parts, were accepted and in great request at Rome.

AMongst the Romanes also this Art grew betimes into reputation; as may appeare by the *Fabij*, a most noble and honourable house in Rome, who of this science were surnamed

Pictores,

Pictores,i. Painters: & the firſt who was intituled with that addition, painted with his own hand G
the temple of *Salus*; and this was in the 450 yeare after the foundation of our city: which painting continued in our age, euen vnto the time of *Claudius Cæſar* the Emperor, in whoſe daies the temple it ſelfe with the painting, was conſumed with fire. Next after this, the workmanſhip of *Pacuvius* the Poet (who likewiſe painted the chappell of *Hercules* in the beaſt-market at Rome) was highly eſteemed and gaue much credit to the art. This *Pacuvius* was *Ennius* the Poets ſiſters ſonne: and being as he was a famous Tragædian beſides, and of great name vpon the ſtage, the excellency of his ſpirit that way, much commended at Rome his handy-work and painting aforeſaid. After him, I doe not finde that any perſon of worth and quality tooke penſill in hand and practiſed painting, vnleſſe haply a man would nominat *Turpilius* a gentleman of Rome in our time, and a Venetian born, of whoſe workemanſhip there be many faire parcels of paynting H
extant at this day in Verona: and yet this *Turpilius* was altogether left-handed, and painted therewith; a thing that I doe not heare any man did before him. As for *Aterius Labeo*, a noble man of Rome, late Lord Pretour, and who otherwiſe had been vice-conſull in Gallia, Narbonenſis or Languedoc, who liued to a very great age and died not long ſince, he practiſed painting; and all his delight and glory that he tooke, was in fine and ſmal works of a little compaſſe: howbeit he was but laughed at, and ſcorned for that quality, and in his time the handicraft grew to be baſe and contemptible. Yet I thinke it not amiſſe to put downe for the better credit of painters, a notable conſultation held by certaine right honourable perſonages as touching the Art, and their reſolution in the end. And this was the caſe: *Q. Pedius*, the little nephew of *Q. Pedius* who had bin Conſull in his time and entred Rome in triumph, him I mean whom *C. Cæſar* Di- I
ctator, made co-heire with *Auguſtus*, hapned to be born dumb: and *Meſſala* the great Oratour, out of whoſe houſe the grandmother of this child was deſcended, being carefull how the boy ſhould be brought vp; after mature aduiſe and deliberation, thought good that hee ſhould by ſignes and imitation be trained vp in the art of painting, which counſell of his was approoued alſo by *Auguſtus Cæſar*. And in truth, this yong gentleman being apt therto, profited maruellous much therein, and died in his youth. But the principall credit that painters attained vnto at Rome, was, as I take it, by the means of *M. Valerius Maximus*, firſt ſyrnamed *Meſſala*, who beeing one of the grand-ſeignieurs of Rome, was the firſt that propoſed to the view of all the world, and ſet vp at a ſide of the ſtately hall or court Hoſtilia, one picture in a table, wherein hee cauſed to be painted that battel in Sicily wherein himſelfe had defeated the Carthaginians and K. *Hiero*, K
which happened in the yeare from the foundation of Rome 490. The like alſo, I muſt needs ſay, did *L. Scipio*, and hung vp a painted table in the Capitol temple, containing his victory and conqueſt of Aſia, whereupon he was ſyrnamed *Aſiaticus*. But (as it is ſaid) *Africanus* although hee were his owne brother, was highly diſpleaſed therewith: and good cauſe he had to be angry and offended, becauſe in that battell his own ſon was taken priſoner by the enemy. The like offence was taken alſo by *Scipio Æmilianus*, againſt *Lucius Hoſtilius Mancinus*, who was the firſt that entred perforce the city of Carthage; for that hee had cauſed to bee ſet vp in the market place of Rome a faire painted table, wherein was liuely drawne the ſtrong ſcituation of Carthage; and the warlike means vſed in the aſſaulting and winning of it, together with all the particulars and circumſtances thereof: which *Mancinus* himſelfe in perſon ſitting by the ſaid picture, deſciphe- L
red from point to point vnto the people that came to behold it; by which courteſie of his hee woon the hearts of the people, inſomuch, as at the next election of Magiſtrates, his popularitie gained him a Conſulſhip. In the publicke plaies which *Claudius Pulcher* exhibited at Rome, the painted clothes about the ſtage and Theatre (which repreſented building) brought this art into great admiration: for the workmanſhip was ſo artificiall and liuely, that the very rauens in the aire, deceiued with the likeneſſe of houſes, flew thither apace for to ſettle thereupon, ſuppoſing verily there had been tiles and creſts indeed. And thus much concerning Painters craft, exerciſed in Rome.

To come now to forrain pictures, *Lu. Mummius*, ſyrnamed *Achaicus* (for his conqueſt of Aſia) was the firſt man at Rome, who made open ſhew of painted tables wrought by ſtrangers, and M
cauſed them to be of price and eſtimation: for when as in the port-ſale of all the bootie and pillage gotten in that victorie, king *Attalus* had brought one of them, wrought by the hand of
* VI.M. Seſterſium. *Ariſtides*, containing the picture only of god *Bacchus*, which was to coſt him * ſix thouſand Seſterces, *Mummius* wondering at the price, & ſuppoſing that this table had ſome ſpeciall and ſe-

cret

20030
copy 1

A cret propertie in it more than himſelfe knew of, brake the bargain, called for the picture again, & would not ſuffer it to be caried away, notwithſtanding *Attalus* complained much at the hard meaſure offered vnto him; and ſo he brought it with him to Rome, and dedicated it in the chappel of *Ceres*. And verily this I take to be the firſt painted table of a forreiners making, that euer was ſet vp in publick place at Rome. But after he had once begun, I ſee it was an ordinary thing to adorn and beautifie euen the common place alſo with ſuch like: for vpon this occaſion aroſe that prety ſcoffe which was giuen by *Craſſus* the Oratour, as hee pleaded vpon a time vnder the * old Roſtra: for when there was a Witneſſe produced to depoſe againſt him, whom hee would ſeeme to challenge and reproued, whereupon the party replied again and vrged him inſtantly in theſe termes, Speake out *Craſſus*, and in the face of all this Court ſay, what kinde of perſon you B would make me to be? Mary (quoth he again) I take thee to be ſuch an one (pointing directly to a table hanging there by, wherin was painted a certain Frenchman yawning and lelling out his tongue ful ilfauoredly.) In the ſame Forum or Grand place at Rome there ſtood ſometime the picture of an old ſheepheard leaning vpon his crooke, as touching which (for that as it ſhould ſeem it was very workmanlike made) when a certain Dutch Embaſſador who beheld it, was demanded, at what price he eſteemed it; anſwered ſhort & quick, What a queſtion is that? I would not haue ſuch an one (were he aliue, as I ſee he is but painted) though he were giuen me for nothing. But if I ſhould ſpeake at once, who it was that gaue the greateſt countenance vnto ſuch tables in open view, I muſt needs ſay it was *Cæſar* dictator, who ſhrined the pictures of *Ajax* and *Medea* in no meaner place than before the temple of *Venus Genetrix*. Next after him came *M.* C *Agrippa*, a man by nature inclined rather to ruſticitie than to delights, and more like a rude peaſant than a ciuill gentleman. But ſurely there is extant a worthy Oration of his, and beſeeming the principal perſon of a whole city, as touching the open ſale of all painted tables, ſtatues, and images, that were in the hands of priuat men, and the ſetting of them vp in publicke places for to adorn the city: which no doubt had bin far better than to haue them baniſhed (as it were) and ſent as they be into the country, to beautifie manors and retyring houſes of pleaſure: howbeit as ſterne and grim a ſir as he was, he could find in his heart to beſtow vpon two tables with the pictures of *Venus* and *Ajax*, 12000 ſeſterces, which he paid vnto the Cyzicenes for them. Alſo hee had cauſed to be ſet in marble ſtone inchaſed, within the hoteſt part of his baths, many rich pictures of a ſmall making, and couched in ſmall tables, the which were taken away but a D little before the ſaid baths were repaired. But aboue all that euer were, *Cæſar Auguſtus* the Emperor of famous memory, did ſet vp in the moſt frequented or perſpicuous place of his Forum or ſtately hal, two excellent painted tables, one containing the liuely portrait of War, the other of Triumph. He alſo dedicated the pictures of *Caſtor* and *Pollux*, beſides others, whereof I will write in my catalogue of Painters: which he hung vp all within the temple of *Iulius Cæſar* his father. The ſame *Auguſtus Cæſar* incloſed within the wall of that Curia, which hee erected and conſecrated in the common place called Comitium, two Tables painted; the one reſembling the Forreſt Nemea, in habit of a woman ſitting vpon a lion, ſhe carrieth in her hand a date tree; and there ſtandeth by her an old man reſting vpon his ſtaffe, ouer whoſe head there was a pretty tablet hanging down as a label, from a chariot drawn by two horſes, with this inſcription, *Nicias me inuſsit*; *i. Nicias* inamelled or wrought me with fire: for that verb [*inuſsit*] it pleaſed him to E vſe. As for the other table, the admirable workmanſhip therein was this, An old grey-beard accompanied with his ſon, a youth exceeding like his father, ſaue onely for the difference in age, which appeared in the yong down that ſprung vpon his cheeks and chin. A deuiſe there was beſides of an Ægle flying ouer their heads, claſping a dragon within her talons: and as it appeared by the ſuperſcription, *Philochares* was the workman. By which one table (if there were no more but it in the whole world) a man may make an eſtimate of the infinite power that is in this art, which could cauſe the Senat & people of Rome to take ſuch pleaſure ſo many yeares together to look vpon *Glaucion* and his ſon *Ariſtippus*, perſons otherwiſe moſt baſe and contemptible, only in reſpect of *Philochares* who painted them. As for *Tiberius Cæſar* the Emperor, albeit hee was F a prince of all other leaſt curteous and affable, yet he delighted to hang vp thoſe painted tables within the temple of *Auguſtus Cæſar*, whereof I mean to write hereafter.

* *Sub veteribus*, which ſome interpret *Tabernis*.

Quintilianus reporteth this otherwiſe.

Chap: V.

¶ *The art and manner of Painting: the Colours that Painters vſe.*

THus far forth may ſuffice to be ſpoken of the antient dignitie of that art, which begins already to decay and die. What were the colors alſo that the firſt painters vſed in old time, when they drew their portracts with one ſimple colour, I haue written already in my treatiſe of Mines & Minerals, where I diſcourſed likewiſe of painters colours. Touching thoſe that named certain kind of pictures Monochromatea, as alſo who inriched them with more colours, who inuented this or that for the bettering and perfecting of them, and at what time each of theſe additions accrued thereto, I mean to reſerue vnto my catalogue of painters: for the order and conſequence of my work requireth, that I ſhould firſt ſet down the nature of euery colour.

First and formoſt therefore this is to be noted, That in proceſſe of time the artificer who began with one bare colour, found out the difference himſelfe between * light and ſhadow, & deuiſed by this diſtinction to ſet vp and debaſe the one and the other alternatiuely, and the ſame more or leſſe according to his ſeueral intentions. After theſe lights and ſhadowes there was inuented a kind of luſtre or gloſſe, different from the light aforeſaid; which becauſe it is of a mean nature between the ſhade and the light, and participates of both, they called by a Greeke word Tonos. As for the apt coherence of one colour with another, the ioint as it were between, and the paſſage from one to another, they named it Harmoge.

* i. White and blacke.

Chap. VI.

¶ *Of Painters colours, naturall and artificiall.*

ALl colors be either ſad or liuely; and thoſe be ſo either naturally, or by artificiall mixture. Liuely or gay colors be ſuch as the [1] maſter deliuers to the painter by weight & meaſure: as namely, [2] Vermilion, [3] Verd d' Azur, [4] Sang-dragon, [5] Verd de terre, or Borras, [6] Indico, and [7] Roſet. The reſt be ſad or duskiſh, and as wel the one as the other be all either naturall or artificiall. Among the naturall of this ſort (to wit the ſad colours) I reckon the [8] common bole Armin, [9] Ruddel or red ſtone, [10] Paretonium, [11] Melinum, [12] Eretria, and [13] Orpin. The reſt of theſe kinds be artificial, & principally thoſe which I haue already ſpoken of in the treatiſe of mines. Moreouer, of the baſer ſort are Ocre and Ruddel, burnt Ceruſſe or Spaniſh white, Sandix mineral, and Scyricum, Sandaracha, Vitriol, or Black. As for Sinopis or common bole Armin, found out firſt it was at Sinope, a maritime town in the kingdom of Pontus, wherof it took that name; it groweth alſo in Egypt, the Baleare Iſlands, and Africk; but the beſt is found in the Iſle Lemnos, and in Cappadocia, digged out of certain caues and holes. That which ſtucke faſt vnto the rocks excelleth all the reſt. The pieces of this earth if a man do breake, ſhew the owne natural colour which is not mixed, without-forth they be ſpotted. And this earth in old time was vſed for to giue a luſtre vnto other colours. Of this Sinopis or Bole Armin common there be three kindes, the deepe red, the pale or weake red, and the meane between both. The beſt Sinopis is eſteemed worth * thirteene denarij Roman by the pound: this may ſerue the painters penſill, yea or in groſſer work, if a man liſt to colour poſts, beams, or wood: as for that which commeth out of Africk, it is worth eight aſſes euery pound; and this they call Cicirculum: that which is redder than the reſt ſerueth better for painting of tablements: as for that which is moſt brown and duskiſh, called in Latine Preſſior, it is of the ſame price that the other, and employed in the baſes and feet of ſuch tablements. And thus much for the vſe in painting. Touching Phyſicke and the medicinable properties thereof, milde it is of nature, and in that regard of gentle operation, whether it enter into hard emplaiſtres of a dry compoſition, or into immolitiue plaiſters that are more liquid, and principally ſuch as are deuiſed for vlcers in any moiſt part, as the mouth or fundament. This earth, if it be injected by a cliſtre, ſtoppeth a laske: and being giuen to women in drinke to the weight of one denarius, *i.* a dram, it ſtayeth their immoderate fluxes of the matrice. The ſame burnt or calcined drieth vp the fretting roughneſſe of the eies, principally if it be applied with vineger. This kinde of red earth ſome would haue to be counted in a ſecond degree of Rubrica for goodneſſe, for they alwaies reckoned that of Lemnos to be the chiefe

1 Becauſe they be rich and coſtly.
2 *Minium.*
3 *Armenium.*
4 *Cinnabaris.*
5 *Chryſocolla.*
6 *Indicum.*
Lasca mixta cum cæruleo.
7 *Purpuriſſum.*
8 *Sinopis.*
9 *Rubrica.*
10 A white kind of fattie earth like plaſtre.
11 A white earth like chalke.
12 A whitiſh earth or aſh-colour white.
13 *Auripigmentum.*
* Or rather three denarij, for otherwiſe there were no proportion betweene it and the othet of that kind.

20030
copy 1

A chiefe & ſimply beſt, as comming next in price to Minium, *i.* Vermilion. And in truth, this Terra Sigillata or Lemnia, was highly accounted of in old time, like as the Iſland Lemnos from whence it comes: neither was it lawfull to ſel any of it before it was * marked or ſealed, & thereupon they vſed to cal it Sphragis. The painters ordinarily lay a ground of this vnder their vermillion, and ſophiſticate it many waies. In phyſick it is holden to be a ſoueraigne thing: for if the eies be annointed round about therewith in manner of a liniment, it repreſſeth the flux of rheumatick humors and doth mitigat the pains incident to them: the fiſtulous ſores likewiſe about the angles or corners of the eies, it drieth vp that they ſhall not run as they vſe to doe. Inwardly alſo it is commonly giuen in vineger, to ſuch as caſt vp bloud at the mouth. It is taken alſo in drink, for the opilations and other accidents as wel of the ſpleen as kidnies: and beſides,

B to ſtop the exceſſiue fluxes that be incident to women. Singular it is againſt any poiſon or venomous ſting of ſerpents, either vpon land or ſea; and therefore is a familiar ingredient into all antidots or counterpoiſons. Of all other ſorts of red earth, the ruddle of Egypt and Africke is fitteſt for Carpenters; for if they ſtrike their line vpon timber with it, they ſhall be ſure that it wil take colour and be marked very well. Moreouer, another ſort there is of this red earth minerall, found with yron ore, and the ſame is good alſo for painters. There is a kind of ruddle alſo made of ochre burnt and calcined in new earthen pots well luted all ouer: and the greater fire that it meeteth withall in the furnace, the better it is. In generall, any ruddle whatſoeuer is exiccatiue, in which regard it agreeth wel with ſalues and healing plaſters, and is very proper for to repreſſe ſhingles & ſuch cutanean wild-fires that wil ſtand in drops. Take of Sinopis or Bolearmin com-

C mon that commeth out of Pontus *halfe a pound, of bright Sil or ochre 10 pound, of the Greek white earth Melinum 2 pound; pun them al together, and mix them wel, ſo as they may ferment 12 daies together: and hereof is made Leucophorum, *i.* a kind of gum or ſize to lay vnder goldfoile for to guild timber.

* With the image of a goat, as *Dioſc.* ſaith: or of *Diana*, according to *Galen.*

Thus *Dalechamp* readeth this place according to *Philander*, out of *Dioſcor.* and *Theophraſt.* * *Setibr.*: others read *Sex libr.*

Touching the white earth Parætonium, it carieth the name of a place in Egypt from whence it commeth: and many ſay, that it is nothing but the ſome of the ſea, incorporat and hardened together with the ſlime & mud of the ſhore: and therfore there be winkles and ſuch ſhell-fiſhes found therwith. It is ingendred alſo in the Iſle Candy, and the country of Cyrenæ. At Rome they haue a deuiſe to ſophiſticat it, namely by boiling fullers earth vntil it be of a faſt & maſſie conſiſtence: the price of the beſt is after 6 deniers the pound. Of al white colors it is the fatteſt,

D and for that it runs out ſmooth in the working, it is the faſteſt parget to ouercaſt walls withall.

As for the earth Melinum, white it is likewiſe; but the beſt is that which the Iſle Melos doth yeeld, whereupon it took that name. In Samos alſo it is to be found, but painters vſe it not, becauſe it is ouer clammy and vnctuous. The Iſlanders are wont to creep on all foure and to lie along at their work when they dig it forth of the rocks, for ſearch it they muſt among the veines that run therein. The ſame * operation it hath in phyſicke that the earth Eretria: alſo, if a man touch it with the tongue, he ſhal find it aſtringent and drying: howbeit, a depilatory it is in ſome ſort, and fetcheth away haire, or els cauſeth it to grow thin. A pound of it is worth a Seſterce.

* *i.* To ſtaunch bloud.

There is of white colors a third kind, and that is Ceruſſa or white lead, the reaſon & making whereof, I haue ſhewed in my diſcourſe of minerals: and yet there was found of it in the nature

E of a very earth by it ſelfe at Smyrna, within the land belonging to one *Theodotus*, wherewith in old time they vſed to color and paint ſhips. But in theſe daies we haue no other ceruſſe or Spaniſh white but that which is artificial, made of lead & vineger, in manner aforeſaid. As touching ceruſſe burnt, the inuention thereof came by meere chance, vpon occaſion of a skare-fire happening in the harbor of Piræum, which caught the pots and boxes wherein the Athenian dames that dwelt by the ſaid harbor kept their blanch of ceruſſe for complexion: and this ceruſſe thus calcined, the firſt that vſed in picture was *Nicias*, of whom I haue already ſpoken. The beſt that we haue in theſe daies comes out of Aſia, and for that it inclineth to a purple colour, they cal it Purpurea: a pound of it is ſold for 16 deniers Roman. This alſo is made in Rome, namely by cal

I cining Sil or ochre minerall, which ſtandeth much vpon marble, and then quenching it with vineger. Such vſe the painters make thereof thus burnt, that no ſhadowes will do well without it.

Concerning Eretria, another kind of white earth, it takes the name of the place from whence it commeth. *Nicomachus* & *Paraſius* vſed this colour much. In Phyſick, it is found to be cooling and emolitiue. Being burnt or calcined, it is an excellent incarnatiue: ſingular good for to drie any ſore; proper alſo to be applied to the forhead for the headach; like as, to diſcouer any feſtring

or rankling matter that lieth ſecret within: for if a place be anointed therwith, when it is reduced G
into a liniment with water, in caſe it wax not dry, be ſure there is ſome ſuppuration vnderneath

As touching Sandaracha and Ochra, K. *Iuba* writeth, that they are to be found in Tapazus, an Iſland within the red ſea; but that which we haue, was neuer brought from thence. How Sandaracha is ingendred, I haue ſaid already in the diſcourſe of mines. There is an artificiall and ſophiſticat Sandaracha, made of ceruſſe burnt in a furnace, The colour of Sandaracha ought to be fiery like a flame: a pound thereof is bought for 5 Aſſes, *i.* halfe a denier. Calcine this and Ruddle together, and of both, being concorporat in equall quantity, you ſhall haue the color called Sandyx. Howbeit, I do obſerue in *Virgil*, that he took Sandyx for an herb, as may appear by this verſe:

Sponte ſua Sandyx paſcentes veſtiet agnos. H
A ruddie fleece ſhall Sandyx yeeld,
To lambs, as they do graze in field.

This Sandyx to be bought and ſold, carrieth but halfe the price of Sandaracha: neither bee there any colours more weighty than theſe in the ballance.

Among the artificiall and made colors, I reckon Scyricum, which as I haue already ſaid, ſerueth for a good ground to take vermillon. The maner of making it, is to mix the beſt ruddle Sinopis and this Sandyx together.

Painters black [called in Latine Atramentum] I count an artificiall colour, although I know there is a vitrioll or coperoſe going vnder that name, which is minerall, and is ingendred two manner of waies: for either it iſſueth and ooſeth out of the mine in maner of a ſalt humor or li- I
quor; or els there groweth an earth it ſelf of a brimſtone colour, which ſerueth for it, that it may be drawn out thereof. Some painters haue bin knowne, who for to get black, haue ſearched into ſepulchres for the coles there, among the reliques and aſhes of the dead. But in mine opinion, all theſe be but new deuiſes, and fooliſh irregular toies without any reaſon; for a man need ſeek no farther but to ſoot, and that made many waies, by burning either of roſin or pitch: in which regard, many haue built places and forges of purpoſe to burn them in, without any emiſſaries, tunnels, or holes, that the ſaid ſoot or ſmoke may not get forth: but the beſt black in that maner made, comes of the ſmoke of torchwood. This fine ſoot is ſophiſticat with groſſe ſoot that doth gather and ingender in forges, furnaces, & ſtouphs: and this is that inke wherewith wee vſe to write our books. Some there be who take the lees or dregs of wine, and when it is dried, boile it K
throughly; and they affirme, that if the wine were good whereof thoſe lees came, the ſaid inke or black will make a colour like Indico. And in truth, *Polygnotus* and *Mycon* (two as renowned painters as euer were) vſed no other black at all, but that which they made of the mare or refuſe of grapes after they be preſſed, & this they cal Tryginon. *Apelles* deuiſed a way by himſelf, to make it of yuorie or the elephants tooth burnt, and this they named therupon Elephantinum: as touching the black called Indicum, it is brought from India: but as yet I know not the maner either of the making or the ingendring of it. A kind thereof I ſee the diers do make, of that black florie which ſticketh to their coppers. Alſo, there is a black made of torchwood burnt, & the coles that come of it punned to powder in a mortar. And here commeth to my mind the wonderfull nature of Cuttle fiſhes, which do yeeld a black humor from them like to ink: howbeit, I do not L
find that painters or writers make any vſe thereof. But all blacks whatſoeuer take their perfection by ſunning: if it be writing inke, with gum (Arabick;) if to colour pargetting or walls, with glew among: and looke what blacke is diſſolued and liquified in vineger, the ſame will hold well and hardly be waſhed off. And thus much of the ordinary colours low prized.

Of all the colours beſides, which (as I ſaid once before) for their high price the poore painters be ſerued with from their maſters hands who ſet them on worke, the rich roſet or purple red that is made of Tripolie or goldſmiths earth, is ſimply the beſt: for this Tripolie is commonly died together with purples; and no ſilk, wooll, or cloth, wil ſo ſoon take that tincture as it. The principal is that, which hauing had the floure of a fatt, hath drunk the fil as it were, whiles the liquor is yet boiling, and the drugs within the caudron be in their verdure and haue not loſt the M
heart. When this firſt Tripoly thus deepely died, is caſt vp and taken forth, that which is put in next into the ſaid liquor, is counted the ſecond in goodnes; & ſo conſequently by degrees; for the former euer taketh the higher die, & the oftner you dip therein, the weaker will the tincture be: which is the reaſon that the roſet or purple red of Puteoli, is more commended, than either

the

20030
copy 1

A the Tyrian, Getulian, or Lacedemonian, notwithstanding from thence come the most rich and pretious pearls. The reason is, because the Tripoli in Puteoli is died most with the juice of the Magaleb berries among, which yeelds the gallant red; & besides, is forced to drink the tincture of Mader. That roset which is made at Canusium is the worst of all other, and carieth the lowest price: a pound of roset costeth vsually * 30 deniers Roman. Painters or complexioners, when they would counterfeit a lustre or glosse of vermilion, lay a ground first with Sandyx, and then charge roset vpon it with the white of an egg: but if they be desirous to make a purple colour, the first course or ground is azur, and straitwaies they come vpon it with * roset and the white of an egg abouesaid. After this rich and liuely rosat or purple red, Indico is a colour most esteemed: out of India it comes, wherupon it took the name; and it is nothing els * but a slimy mud B cleauing to the fome that gathereth about canes and reeds: while it is punned or ground it looketh black, but being dissolued, it yeelds a wonderfull louely mixture of purple and azur. There is a second sort of it found swimming vpon the coppers or vats in purple Diers worke-houses: and in truth, nothing els but the very fome or scum that the purple casts vp as it boileth, in maner of a florey. Some there be that do counterfeit and sophisticat Indico, selling in stead therof pigeons dung, Selinusian earth, and Tripoli, died and deeply coloured with the true Indico: but the proofe thereof is by fire; for cast the right Indico vpon liue coles, it yeeldeth a flame of most excellent purple, and while it smoketh, the fume senteth of the sea; which is the reason that some do imagine it is gathered out of the rockes standing in the sea. Indico is valued at 20 denarij the pound. In physicke there is vse of this Indico, for it doth asswage swellings that doe C stretch the skin: it represseth violent rheums and inflammations, and drieth vlcers.

The land of Armenia doth furnish vs with the colour verd d' azur, and of that country it is named Armenicus: a stone it is that is likewise died before it can die, in manner of Borras or verd d' terre: the best is the greenest, & yet withall it doth participat the colour of azur; in which regard it may properly be called Verd d' azur. In times past a pound of it was held at 300 Sesterces: but since there was found in Spain a kind of sand that would take the like tincture and do as well, the price hath bin well abated, and is come downe to six deniers. All the difference between this colour and azur is this, for that it stands more vpon the white, which causeth this colour to be lighter and weaker. The only vse that it hath in physick, is to nourish hairs, & especially those of the eie lids. Ouer and besides all these colours aboue named, there be two more D newly come vp, and those beare but a very low price; to wit, the green called Appianum, & oft times it is taken for Borras or Verd d' terre, as if there were not other things enough that did counterfeit and resemble it. Made it is of a certain greene chalky earth, & is worth but one Sesterce a pound. The second new colour is a white, called Anulare, being that which in womens pictures giues a lightsom carnation white: this also is made of a kind of chalk, & certain glassy gems or bugles, which the common sort vse to weare in rings, & thereupon is called Anulare.

* *In singulas libras ad denarios triginta.*

* our painters in stead therof vse *Lac.*

* They say it is made of Oad: and in those countries from whence it commeth, Gali or Nil.

Chap. VII.

¶ *What Colours refuse to be layd vpon some grounds: with what colours they painted in old time: and when the fight of Sword-fencers was first proposed to be seen at Rome.*

E

OF all colours, Roset, Indico, Azur, Tripoli or Melinum, Orpiment, white lead or Ceruse, loue not to be laid vpon plaister-work or any ground, while it is moist; & yet wax wil take any of these colours abouesaid, to be imploied in those kind of works which are wrought by fire (so it be not vpon plastre, parget, & wals, for that is impossible) whether they be inameld or damaskd; yea and in their painting of ships at sea, as well hulks & hoies of burden, as gallies and ships of war: for now wee are come (forsooth) to inamel and paint those things that are in danger to perish & be cast away euery houre: so as we need not maruel any longer, that the coffin going with a dead corps to a funerall fire, is richly painted: and we take a delight when wee mind to fight at sea, to sail with our fleet gallantly dight & inriched with colours, which must F cary vs into dangers, either to our own death, or to the carnage of others. And when I consider so many colours, & those so variable, as be now adaies in vse, I must needs admire those artificers of old time; and namely of *Apelles*, *Echion*, *Melanthius*, and *Nicomachus*, most excellent painters, and whose tables were sold for as much apiece, as a good town was worth; and yet none of these vsed aboue foure colours in all those rich and durable workes. And what might those be?

Of all whites they had the white Tripoli of Melos; for yellow ochres they took that of Athens: G
for reds, they ſought no farther than to the red ochre or Sinopie ruddle in Pontus: & their black was no other than ordinarie vitriol or ſhoomakers black. And now adaies, when we haue ſuch plenty of purple, that the very walls of our houſes be painted all ouer therwith, when there commeth from India ſtore enough not only of Indico, which the mud of their riuers do yeeld, but alſo of Cinnambre, which is the mixed bloud of their fel dragons and mighty elephants, yet among all our modern pictures we cannot ſhew one faire piece of worke: inſomuch as wee may conclude, All things were done better then, notwithſtanding the ſcarſitie that was of ſtuffe and matter. But to ſay a truth, the reaſon is, Giuen wee are now (as I haue oftentimes ſaid) to eſteem of things that be rich and coſtly, neuer regarding the art that is imployed about them. And here I thinke it not amiſſe to ſet down the outragious exceſſe of this age, as touching pi- H
ctures. *Nero* the emperor commanded, that the portraict of himſelfe ſhould be painted in linnen cloth, after the maner of a gyant-like coloſſe 120 foot high; a thing that neuer had been heard or ſeen before. But ſee what became of it! when this monſtrous picture (which was drawne and made in the garden of *Marius*) was don and finiſhed, the lightning and fire from heauen caught it, and not only conſumed it, but alſo burnt withall the beſt part of the building about the garden. A ſlaue of his infranchiſing (as it is wel known) when he was to exhibit at Antium certain ſolemnities, and namely a ſpectacle of ſword-fencers fighting at ſharp, cauſed all the ſcaffolds, publique galleries, and walking places of that city to be hung & tapiſſed with painted cloths, wherein were repreſented the liuely pictures of the ſword-players themſelues, with all the wiffiers and ſeruitors to them belonging. But to conclude, the beſt and moſt magnanimous men, I
that for many a hundred yeares our country hath bred, haue taken delight (I muſt needs ſay) in this art, and ſet their minds vpon good pictures. But to portray in imagery tables and painted cloth the publick ſhews of fencers & ſword-plaiers, and to ſet them vp to be ſeen in open place to the view of the world, began by *C. Terentius* a Lucan: for this man to honour his grandfather, who had made him his own ſon by adoption, exhibited a ſhew for three days together of thirty paire of ſuch fencers fighting with vnrebated ſwords; and a faire painted table which carried the liuely reſemblance of this ſpectacle, hee ſet vp and dedicated within the ſacred groue of *Diana*.

Chap. VIII. K

This argumẽt or title reacheth to many chapters following.

¶ *The antiquitie of Painting, and the ſeuerall ages wherein the famous Painters liued. A ſuruey of excellent Pictures, and the Artificers that made them, together with the prices that their workmanſhip was valued at: and notable pictures to the number of* 305.

NOw will I after a curſorie ſort run through all the famous profeſſors and Artizans in this kind, and that with as great breuity as poſſibly I can; for the ſcope I haue propoſed to my ſelfe tends another way: and therefore let not the Reader think much if I do but touch the names of ſome, as it were paſſing by, and by occaſion of others whoſe catalogue I meane to L
deliuer. Howbeit, in making this haſt, my purpoſe is not to omit any excellent piece of worke which is worth the remembrance and relation, whether the ſame be extant at this day, or loſt and periſhed. Where I muſt aduertiſe the readers, that in this argument my meaning is not to ſtand much vpon the authoritie of Greeke writers, who indeed deliuer no certitude, nor agree in their records as touching this point (notwithſtanding that they would ſeeme diligent in that behalfe) and namely, in that they haue written, That the excellent painters flouriſhed ſo many Olympiads after the famous Imageurs; and haue nominated for the firſt and chiefe to haue liued in name, about the time of the 90 Olympiad: whereas this is for certain reported, that *Phidias* himſelf was a painter in the beginning, and that the noble ſhield of *Minerva* in Athens was by him painted: beſides, this is confeſſed and reſolued vpon for a truth, that *Panæus* his brother M
liued in the 83 Olympias, and painted the inſide of the ſaid ſhield; who alſo in another ſcutchion of *Minerva*, which *Colores* the apprentice of *Phidias* had made; as alſo in making the ſtatue of *Iupiter Olympius*, wrought with the ſaid *Colores* and helped him. But what ſhould I dwel long in this matter? Is there any doubt made, that *Candaules* King of Lydia, the laſt of the race and family

20030
copy 1

A family of the *Heraclidæ*, who alſo was commonly caled *Myrſilus*, bought the painted table which contained the battell of the Magnetes, and paid for it to *Bularchus* (the painter or workman ther-of) as much gold as it came to in weight. See of what price and eſtimation pictures were euen in thoſe daies! And needs it muſt be that this hapned about that age wherein K. *Romulus* liued: for the ſaid K. *Candaules* died in the 18 Olympias; or as ſome write, in that very yeare that *Romulus* departed this life: at what time this skill of painting (if I be not much deceiued) was in great requeſt euery where, and growne already to an abſolute perfection. Which being granted, as of neceſſitie it cannot be denied, euident and apparent it is, that the originall and beginning of this art, was much more antient: and that thoſe painters who vſed one colour and no more in their plain draughts called Monocromata (to wit, *Hygiænon*, *Dinias*, and *Charmas*) liued
B a good while before, although it be not recorded in any writer in what age preciſely they flouriſhed: as alſo that *Eumarus* the Athenian painter, who deuiſed firſt to diſtinguiſh male and female in painting; and beſides, vndertook to draw with his penſill the proportion & ſhape of any thing that he ſaw; together with *Cimon* the Cleonæan, who followed his ſteps, and practiſed his inuentions, could not chuſe but by al congruity & conſequence be of more antiquity than *Bularchus* aforeſaid, or the reign of *Romulus* & *Candaules*: this *Cimon* deuiſed the works called Catagrapha, *i.* pourtraits and images ſtanding byas and ſide-long: the ſundry habits alſo of the viſage and caſt of the eie, making them to look, ſome backward ouer their ſhoulders, others aloft, and ſome againe downward: his cunning it was to ſhew in a picture, the knitting of the members in euery ioint: to make the veins appeare how they branched and ſpread: and beſides, the firſt hee
C was that counterfeited in flat pictures, the plaits, folds, wrinckles, and hollow lappets of a garment. As touching *Phanæus* the brother of *Phidias*, hee painted alſo the battell betweene the Athenians and the Perſians, vpon the plains of Marathon; for now by this time were painters furniſhed in ſome ſort with colours to their purpoſe; and the art was growne to ſuch perfection, that in the picture reſembling the ſaid battell, the full perſonages were pourtraied moſt liuely, of the captains on both ſides, to wit, *Milciades*, *Callimachus*, and *Cynegyrus*, for the Athenians; *Datis* alſo and *Artaphanes*, for the Barbarians or Perſians.

Chap. IX.

D ¶ *The Painters that firſt entred into contention for to win the prize by their Art: and who deuiſed to paint with the penſill.*

MOreouer, during the time that the aboue-named *Panæus* flouriſhed, there were priſes propoſed at Corinth and Delphos, for thoſe painters that could win them: and the firſt that ſtriued for the beſt game, was the ſaid *Panæus*, who challenged *Timagoras* the Chalcidian vpon this occaſion, That the ſame *Timagoras* had giuen him the foile before at the Pythian games; which alſo doth appeare by certain verſes compoſed by *Timagoras* himſelfe as touching that argument, which ſauor of great antiquity. Whereby the error of Chronicles beforeſaid is manifeſtly conuinced, who haue failed much in the calculation of the times. Furthermore, be-
E ſides theſe painters aboue rehearſed, others there were of great name, and yet all of them before that 90 Olympiad whereof they write; as namely, *Polygnotus* the Thaſian, who was the firſt that painted women in gay and light apparell, with their hoods and other head attire of ſundry colours; and in one word, paſſed all others before him in deuiſes, for the bettering of this art. His inuention it was to paint images with their mouths open, to make them ſhew their teeth; and in one word, repreſented much variety of countenance, far different from the rigorous and heauy looke of the viſage beforetime. Of this *Polygnotus* workemanſhip, is that picture in a table which now ſtandeth in the ſtately gallerie of *Pompeius*, and hung ſometime before the Curia or Hall that beareth his name, in which table he painted one vpon a ſcaling ladder, with a targuet in his hand; but ſo artificially it is done, and with ſuch dexterity, that whoſoeuer looketh vpon him, cannot tell whether he is climbing vp or comming downe. All the painting of *Apollo* his
F temple at Delphos, was of this mans doing; who alſo beautified with pictures, the great gallery or walking place at Athens, which thereupon was called Pœcile; and this he did *gratis*, and would not take one penny for it; whereas *Mycon* afore him, painted one part thereof, & was well paid for his workmanſhip; which liberall mind of his, wan him the greater credit and honor beſides: for by a decree from the Amphyctions (who are the lords of the publick counſel of ſtate

in Greece) it was granted, that in all cities and towns of Greece whereſoeuer he came, he ſhould G
be lodged and entertained of free coſt. Beſides that *Mycon* before mentioned, there was another
of the name, diſtinguiſhed only by this, that the former was called *Mycon* the elder, and this *My-*
con the yonger, who had a daughter named *Timarate*, & ſhe could paint likewiſe excellently. But
to come now to that ninetieth Olympia, there flouriſhed in that time *Aglaophon*, *Cephiſſodorus*,
Phrylus, and *Euenor*, who was both father and maſter to *Paraſius* that moſt renowned painter, of
whom I purpoſe to ſpeak in his rank when the time comes; all theſe were reputed very good ar-
tizans in their time, howbeit not ſo excellent that I ſhould need ſtand long vpon them or their
workmanſhip, making haſte as I do vnto thoſe glorious and glittering painters indeed, who
ſhine as bright ſtars aboue all their fellowes; among whom, *Apollodotus* the Athenian was the
firſt that gaue light, and he liued in the 93 Olympias: this man led the way to others, & taught H
them to expreſſe the fauor and beauty of any thing, which he obſerued eſpecially; of whome I
may well and truly ſay, that he and none before him brought the penſill into a glorious name &
eſpeciall credit. Of his making there is one picture, of a prieſt at his deuotions, praying & wor-
ſhipping; as alſo another repreſenting *Ajax*, all on a flaming fire with a flaſh of lightning, which
at this day is to be ſeen at Pergamus, as an excellent piece of worke. And verily before his daies
there cannot be ſhewed a table of any ones painting worth the ſight, and which a man would
take pleaſure to behold and looke vpon any long time.

When this man had opened the dore once, and ſhewed the way to this art, *Zeuxis* of Heraclea
entred in, and that was in the fourth yere of the 95 * Olympias: and now that the penſill was ta- I
ken in hand (for now I ſpeak thereof) he ſeeing that it made good worke, followed on therewith,
and by continuall practiſe brought the ſame to great perfection, whereby he wan much credit
to the art, and reputation to himſelfe. Some writers there bee, who range him wrong in the 89
Olympias; at which time it muſt needs be, that *Demophilus* the Himeræan and *Neſeas* the Thra-
cian liued; for to one of them apprentice he was: but whether of the two was his maſter, there is
ſome doubt made; and verily ſo excellent he proued in his art, that the abouenamed *Appollodorus*
made verſes of him; in which he ſignifieth, that *Zeuxes* had ſtollen the cunning from them al, and
he alone went away with the art. He grew in proceſſe of time to ſuch wealth by the means only
of his excellent hand, that for to make ſhew how rich he was, when he went to the ſolemnity of
the games at Olympia, he cauſed his owne name to be imbrodered in golden letters, within the
lozenge worke of his clokes, whereof he had change, and which he brought thither to be ſeen. In K
the end, he reſolued with himſelfe to work no longer for mony, but to giue away al his pictures,
ſaying, That he valued them aboue any price. Thus he beſtowed vpon the Agrigentines, one pi-
cture of queen *Alcmena*; and to king *Archelaus* he gaue another of the ruſtical god *Pan*: there
was alſo the pourtraict of lady *Penelope*, which he drew in colours; wherein he ſeemeth not only
to haue depainted the outward perſonage and feature of the body, but alſo to haue expreſſed
moſt liuely the inward affections and qualities of her mind: and much ſpeech there is of a wre-
ſtler or champion of his painting; in which picture he pleaſed himſelfe ſo well, that hee ſubſcri-
bed this verſe vnder it, * *Inviſurus aliquis facilius quam imitaturus, i.* Sooner will a man enuy me,
than ſet ſuch another by me. Which thereupon grew to be a by-word in euery mans mouth. One
ſtately picture there is of his workmanſhip, *Iupiter* ſitting vpon a throne in his Majeſtie, with all L
the other gods ſtanding by and making court vnto him. Hee pourtraied *Hercules* alſo as a babe
lying in a cradle, and ſtrangling two fell ſerpents with his hand, together with his mother *Alc-*
mena, and her husband K. *Amphytrion* in place, affrighted both at the ſight thereof. Howbeit,
this *Zeuxis* as excellent a painter as he was, is noted for one fault and imperfection; name-
ly, that the head and joints of his pourtraicts, were in ſome proportion to the reſt ſom-
what with the biggeſt; for otherwiſe ſo curious and exquiſite hee was, that when he ſhould
make a table with a picture for the Agrigentines, to be ſet vp in the temple of *Iuno Lacinia*, at
the charges of the city, according to a vow that they had made, he would needs ſee all the may-
dens of the city naked; and from all that company he choſe 5 of the faireſt to take out as from
ſeuerall patterns, whatſoeuer he liked beſt in any of them; and of all the louely parts of thoſe M
fiue, to make one body of incomparable beaury. Many draughts he made of one color, in white.
There liued in his time *Timanthes*, *Androcydes*, *Eupompus*, and *Paraſius*, who were his concurrents,
and thought as well of themſelues as he did. *

CHAP.

* For *Olympias* was counted the ſpace of fiue yeares.

* *Græce melius* μιμησοιτο τις μᾶλλον, ἢ μιμήσεται: which Iambick verſe ſome attribute to *Apollodorus*.

Chap. X.

¶ *Of birds deceiued by pictures. What is the hardeſt point in the art of painting?*

OF thoſe foure before named, *Paraſius* by report was ſo bold as to challenge *Zeuxis* openly and to enter the liſts with him for the victory; in which contention and triall, *Zeuxis* for proofe of his cunning, brought vpon the ſcaffold a table, wherein were cluſters of grapes ſo liuely painted, that the very birds of the aire flew flocking thither for to bee pecking at the grapes. *Paraſius* againe for his part to ſhew his workmanſhip, came with another picture, wherin he had painted a linnen ſheet, ſo like to a ſheet indeed, that *Zeuxis* in a glorious brauery and pride of his heart, becauſe the birds had approoued of his handy-worke, came to *Paraſius* with theſe words by way of a ſcorn and frumpe, Come on ſir, away with your ſheet once, that we may ſee your goodly picture. But taking himſelfe with the manner, and perceiuing his own error, he was mightily abaſhed, & like an honeſt minded man yeelded the victory to his aduerſary, ſaying withall, *Zeuxis* hath beguiled poore birds, but *Parrhaſius* hath deceiued *Zeuxis*, a profeſſed artiſane. This *Zeuxis*, as it is reported, painted afterwards another table, wherein he had made a boy carrying certaine bunches of grapes in a flasket, and ſeeing again that the birds flew to the grapes, he ſhook the head, and comming to his picture, with the like ingenious mind as before, brake out into theſe words, and ſaid, Ah, I ſee well enough where I haue failed, I haue painted the grapes better than the boy, for if I had don him as naturally, the birds would haue bin afraid and neuer approched the grapes. He pourtraied alſo diuers pieces of earthen veſſels in potterie, which onely were left behind in Ambracia, at what time as *Fulvius* ſyrnamed *Nobilior*, remooued the Muſes from thence of his pourtraying, and brought them to Rome. Moreouer, there remaineth yet at Rome within the galleries of *Philippus*, the picture of *Helena*, wrought by the hand of *Zeuxis*: and in the temple of *Concord* another, reſembling *Marſias* the Muſitian bound to a tree.

As for *Paraſius* before named, borne hee was at Epheſus, and inuented alſo diuers things of himſelf to the aduencement of this art: for the firſt he was that gaue the true ſymmetrie to a portraiture, and obſerued the juſt proportions: he firſt exactly kept the ſundry habits and geſtures of the countenance: he it was, that firſt ſtood vpon the curious workemanſhip of couching and laying the haires of the head in order: the louely grace and beauty about the mouth and lips, he firſt exactly expreſſed: and by the confeſſion of all painters that ſaw his worke, he woon the priſe and praiſe from them all in making vp the pourfils and extenuities of his liniaments, which is the principall point and hardeſt matter belonging to the whole art: for to draw forth the bodily proportion of things, to hach alſo, yea, and to fill within, requireth (I confeſſe) much labour and good workmanſhip; but many haue bin excellent in that behalfe; mary to pourfil wel, *i.* to make the extremities of any part, to mark duly the diuiſions of parcels, & to giue enery one their juſt compaſſe and meaſure is exceeding difficult; and few when they come to the doing of it, haue been found to attaine vnto that felicity. For the vtmoſt edge of a worke muſt fall round vpon it ſelfe, and ſo knit vp in the end, as if it ſhadowed ſomwhat behind, and yet ſhewed that which it ſeemeth to hide. In this ſo curious and inexplicable a point, *Antigonus* and *Xenocrates* both, who wrote as touching this art, haue giuen him the honour of the beſt; not onely confeſſing his ſingular gift herein, but alſo commending him for it. Many other plots and projects there doe remaine of his drawing, pourtraied as well in tables as vpon parchment, which ſerue as patterns (they ſay) for painters to learn much cunning by. And yet for inward works, and to expreſſe the middle parts of a portraiture, he ſeemeth not ſo perfect, nor anſwerable to himſelfe otherwiſe. There is a notable picture of his making, which he called * *Demon Athenienſium*, that is to ſay, the common people of the Athenians; the deuiſe whereof was paſſing full of wit, and verie inuentiue: for his intention was in one and the ſame pourtrait, and vnder one obiect of the eye to expreſſe the nature of the people, variable, wrathfull, vnjuſt, and vnconſtant; the ſame alſo he would haue to appeare exorable, milde, and pittifull; haughtie, glorious and proud, and humble, lowly, and ſubmiſſe; fierce and furious, and the ſame coward-like, and ready to run away: all theſe properties, I ſay, he repreſented vnder one caſt of the eie. This workeman painted alſo *Theſeus*, which ſtood ſometimes in the capitoll of Rome; a certaine Admirall likewiſe of a nauie,

* Δῆμον.

nauie armed with a corſelet. In one table alſo which is at Rhodes, he depainted *Meleager*, *Hercules*, and *Perſeus*. This table was thrice blaſted with lightening; howbeit, the pictures were not defaced, but remained whole and entire as at the firſt: a miraculous thing, and that which maketh much for the credit of the picture. *Archigallus* was of his painting; a picture that *Tiberius* the Emperor tooke great pleaſure in; and as *Eculeo* mine author doth teſtifie, he eſteemeed it worth 60000 ſeſterces, and incloſed it within his bed-chamber. Moreouer, he counterfeited one *Greßa* a nource, with her infant in her arms: he pourtraied *Philiſcus*, and god *Bacchus* with the goddeſſe *Vertue* ſtanding by him: alſo two boies; on whom a man might ſee moſt liuely reſembled, the careleſneſſe and ſimplicity of that age: likewiſe a prieſt, attended vpon with a pretty boy, holding a cenſar in his hand, and a coronet. Ouer and beſides, two pictures there be of his handie-work, going vnder the name of *Hoplitides*, *i.* armed: the one running in his armour in battel-wiſe, ſo as he ſeemeth all in a ſweat: the other diſarming himſelf, all wearied, ſo as a man would think his wind were gone, or that he drew it very ſhort. Great praiſe there is of one table of his, wherin are depainted, *Æneas*, *Caſtor*, and *Pollux*; alſo of another, which contained *Telephus*, *Achilles*, *Agamemnon* & *Vlyſſes*. An artiſan ful of work, & who would euer be doing one thing or other; but ſo arrogant withall, as no man euer ſhewed more inſolency than he, in regard that hee was cunning and well thought of: which he knew well enough, and no man needed to tell him. In this proud ſpirit of his, he would take vpon him diuers titles and additions to his name: among others, he would call himſelfe * *Abrodiatus*: and other words he vſed, whereby hee would make himſelfe known that he was prince of painters, and the art by him made perfect and accompliſhed. But it exceedeth how vaine-glorious he ſhewed himſelfe, in that hee gaue out, hee was in right line deſcended from *Apollo*: alſo that the pourtrait of *Hercules*, which is in a table at Lindos, he drew from the very perſon of *Hercules* himſelfe, anſwerable in all points to the proportion and lineaments of his body; who (by his ſaying) had appeared to him oftentimes in his ſleep of purpoſe, that he might paint him liuely as he was. In this veine of vanity, being vpon a time put down by *Timanthes* the Painter at Samos, where, by the judgement of all that were preſent, his picture repreſenting *Ajax*, and the awarding of the armor of *Achilles* from him to *Vlyxes*, was not thought comparable to another of *Timanthes* his making: I am ill apaied (quoth he) and ſory at the heart, for this noble knight and braue warrior *Ajax*, whoſe euill hap it is thus to be foiled once againe by ſo vnworthy a weight, and a far meaner perſon than himſelfe. He delighted alſo to paint ſmall pictures in prety tables, and thoſe repreſenting wantonneſſe and lecherie: and this he did (as he was wont to ſay) for his recreation, and as it were to breath himſelfe when he had laboured hard at greater workes.

* *i.* fine, delicat and ſumptuos: for he would be in his purple, or his golden chaplets, his ſtaffe tipt with gold, and his ſhooebuckles of the ſame.

As for *Timanthes*, an excellent fine wit he had of his owne, & ful he was of rare inuentions: he it was that made the famous picture of *Iphigenia*, ſo highly commended by eloquent orators: and to ſay a truth, his conceit therin was admirable: for when he had deuiſed that the poor innocent lady ſhould ſtand hard at the altar, ready to be ſlain for ſacrfice, and had painted thoſe that were preſent about her, with heauy and ſad countenance, weeping & wailing all for the inſtant death of this young princeſſe, and her vnckle *Menelaus* aboue the reſt, full of ſorrow and lamentation, and ſhewing the ſame as much as poſſibly might be: hauing by this time ſpent in them all the ſignes that might teſtifie the hearts griefe, and that he was come to pourtray her own father *Agamemnon*, he repreſented his viſage couered with a vail, for that he was not able to expreſſe ſufficiently the extraordinary ſorrow aboue the reſt which he had to ſee his own daughter ſacrificed, and her guiltleſſe bloud ſpilt. Other pieces of worke there be, patternes all of ſingular wit: among the reſt, he deuiſed within a very ſmall table, a Cyclops lying a ſleep: and yet becauſe he would ſeem euen in that little compaſſe to ſhew his giant-like bigneſſe, hee deuiſed withall to paint little eluiſh Satyres hard by, and thoſe taking meaſure of one of his thumbes with long perches. In ſum, ſo inuentiue he was, that in the works which paſſed through his hand, a man ſhal euer conceiue & vnderſtand ſome hidden thing within more than is painted without: for albeit a man ſhall ſee in his pictures as much art as may bee, yet his wit went alwaies beyond his art. Moreouer, his picture of a prince was thought to be moſt abſolute; the majeſty whereof is ſuch, that all the art of painting a man, ſeemeth to be compriſed in that one pourtrait. This piece of worke remaineth at this day within the temple of *Peace*, in Rome.

In this age flouriſhed *Euxenidas*, and taught *Ariſtides* his cunning, who prooued afterwards a ſingular workeman. *Eupompus* alſo trained vp *Pamphilus* the painter vnder him, whoſe apprentiſe

was

20030
copy 1

A was *Apelles*. There is a fine picture of *Enpompus* his making, to wit, one who had obtained the victorie at the publique Gymnick exercises of actiuitie, painted naked as hee performed his deuoir, holding in his hand the branch of a date tree. This *Enpompus* was of such authoritie, that wheras before his time there were but two kinds of pictures, to wit, Helladicum, *i.* the Greekish; and Asiaticum, *i.* Asiatick; he brought in a new diuision, and made 3 distinct members thereof: for in loue of him, because he was a Sicyonian born, the foresaid Helladicum beeing parted in twain, there arose three seuerall sorts, the Ionnian, Sicyonian, and Attick.

As for *Pamphilius*, renowned he was for painting a confraternity or kindred; the battel fought before Phlius, and the victorie of the Athenians: semblably, of his making is the picture of *Vlysses* in a punt or small bottom. Himselfe was a Macedonian borne, but of all painters, the first
B that gaue his mind to other good literature, and especially to Arithmetick & Geometry; without the insight of which two sciences, hee was of opinion, that vnpossible it was to be a perfect painter. He taught none his cunning vnder * a talent of siluer for 10 yeares together: and thus much paid *Apelles* and *Melanthus* vnto him for to learn his art. His authoritie brought to passe, that ordained it was at Sicyone, and so consequently throughout all Greece, that gentlemens sons or free-born should go to painting schoole, and there be taught first aboue all other things the art Diagraphice, that is to say, the skil to draw and paint in box tables: and for the credit of Painters he brought to passe, that the art should be ranged in the first degree of liberall Sciences. And verily this craft of painting hath bin alwaies of that good respect and so honored, that none but gentlemen and free-born at the first beginning medled therewith, yea, and afterwards
C honorable personages gaue themselues to the practise thereof, with this charge from time to time, to teach no slaue the mysterie of painting, who by a strict and perpetuall edict were excluded from the benefit thereof. Neither shall you euer heare of any piece either of picture or grauerie and embossing, that came out of a seruile hand.

* *Minoris talento annis decem*: yet *Budæus* readeth *annuis talentis decem*, *i.* ten talents by the yeare.

Furthermore, about the 170 Olympias there flourished *Echion* and *Therimachus*, two renowned painters: as for *Echion*, ennobled he is for these pictures, god *Bacchus*, a Tragedie and a Comedie, represented by painting: also *Semiramis*, who of a bond-maiden came to be a queen; an antient woman carrying a torch or lamp, going before a yong wife newly wedded, and leading her to the bride-bed, who followeth with a modest, shamefast, and bashfull countenance most apparant to the eie.

D But what should I speake of these painters, when as *Apelles* surmounted all that either were before, or came after. This *Apelles* flourished about the 112 Olympias, by which time hee became so consummate and accomplished in the art, that hee alone did illustrate and inrich it as much, if not more, than all his predecessors besides: who compiled also diuers bookes, wherein the rules and principles, yea and the very secrets of the art are comprised. The speciall gift that he had was this, that he was able to giue his pictures a certain louely grace inimitable: and yet there were in his time most famous and worthy painters, whom he admired, whose works when hee beheld hee would praise them all, howbeit not without a but: for his ordinarie phrase was this, Here is an excellent picture, but that it wants one thing, & that is the *Venus* it should haue; which *Venus* the Greeks call *Charis*, as one would say, the grace: and in truth he would confesse,
E that other mens pictures had all things els that they should haue, this onely excepted; wherein hee was perswaded that he had not his peere or second. Moreouer, he attributed vnto himselfe another propertie, wherein hee gloried not a little, and that was that hee could see to make an end when a thing was well done. For beholding wistly vpon a time a piece of worke of *Protogenes* his doing, wherein he saw there was infinite pains taken, admiring also the exceeding curiositie of the man in each point beyond all measure, he confessed & said, That *Protogenes* in euerie thing else had done as well as himselfe could haue done, yea and better too. But in one thing he surpassed *Protogenes*, for that he could not skill of laying worke out of his hand when it was finished well enough. A memorable admonition, teaching vs all, That double diligence and ouermuch curiositie doth hurt otherwhiles. This painter was not more renowned for his skill
F and excellencie in art, than he was commended for his simplicitie and singlenesse of heart: for as he gaue place to *Amphion* in disposition, so hee yeelded to *Asclepiodorus* in measures and proportion, that is to say, in the iust knowledge how far distant one thing ought to be from another. And to this purpose impertinent it is not, to report a pretty occurrent that fell between *Protogenes* and him: for being very desirous to be acquainted with *Protogenes*, a man whom hee had

had neuer ſeen,and of his works,whereof there went ſo great a name,he imbarqued and ſailed to G
Rhodes,where *Protogenes* dwelt: and no ſooner was hee landed,but he enquired where his ſhop
was,and forthwith went directly thither. *Protogenes* himſelfe was not at home,only there was an
old woman in the houſe who had the keeping of a mighty large table ſet in a frame,and fitted
ready for a picture:and when he enquired for *Protogenes*,ſhe made anſwer, that he was not with-
in; and ſeeing him thereupon ready to depart,demanded what his name was,& who ſhe ſhould
tell her maſter asked for him. *Apelles* then,ſeeing the foreſaid table ſtanding before him, tooke
a penſil in hand and drew in colour a paſſing fine and ſmal line through the ſaid table, ſaying to
the woman, Tell thy maſter, that he who made this line enquired for him; and ſo he went his
wayes. Now when *Protogenes* was returned home,the old woman made relation vnto him of this
that hapned in his abſence; and as it is reported, the artificer had no ſooner ſeene and beheld H
the draught of this ſmall line,but he knew who had been there, and ſaid withall, Surely *Apelles*
is come to town; for vnpoſſible it is,that any but hee ſhould make in colour ſo fine workeman-
ſhip. With that hee takes me the penſill,and with another colour drew within the ſame line a
ſmaller than it: willing the woman when hee went forth of dores,that if the party came againe,
ſhe ſhould ſhew him what he had done,and ſay withall,that there was the man whom he inqui-
red after. And ſo it fell out indeed,for *Apelles* made an errand againe to the ſhop,and ſeeing the
ſecond line,was diſmaied at firſt and bluſhed withal to ſee himſelfe thus ouercome; but taking
his penſil,cut the foreſaid colours throughout the length,with a third colour diſtinct from the
reſt,and left no room at all for a fourth to be drawn within it. Which when *Protogenes* ſaw, hee
confeſſed that he had met with his match and his maſter both; and made all the haſt he could I
to the hauen to ſeek for *Apelles* to bid him welcome & giue him friendly entertainment. In me-
morial whereof it was thought good both by the one and the other,to leaue vnto poſterity this
table thus naked without any more work in it,to the wonder of all men that euer ſaw it, but of
cunning artiſans and painters eſpecially: for this table was kept a long time, and as it is well
known,conſumed to aſhes in that firſt fire that caught *Cæſars* houſe within the Palatine hil:and
verily we took great pleaſure before that,to ſee it many times,containing in that large & extra-
ordinarie capacitie that it had, nothing els but certaine lines,which were ſo fine and ſmall, that
vnneth or hardly they could be diſcerned by the eie. And in truth,when it ſtood among the ex-
cellent painted tables of many other workemen, it ſeemed a very blanke hauing nothing in it:
howbeit as void and naked as it was,it drew many to it euen in that reſpect,being more looked K
vpon and eſteemed better than any other rich and curious work whatſoeuer. But to come again
vnto *Apelles*,this was his manner and cuſtom beſides,which he perpetually obſerued,that no day
went ouer his head,but what buſineſſe ſoeuer he had otherwiſe to call him away,he would make
one draught or other (and neuer miſſe) for to exerciſe his hand and keepe it in vre,inſomuch as
from him grew the prouerbe, *Nulla dies ſine Linea, i.* Be alwaies doing ſomewhat, though you
doe but draw a line. His order was when he had finiſhed a piece of work or painted table, and
layd it out of his hand, to ſet it forth in ſome open gallerie or thorow-fare, to be ſeen of folke
that paſſed by,and himſelfe would lie cloſe behind it to hearken what faults were found there-
with; preferring the iudgement of the common people before his owne, and imagining they
would ſpy more narrowly, and cenſure his doings ſooner than himſelfe: and as the tale is told, L
it fell out vpon a time, that a ſhoomaker as he went by ſeemed to controlle his workemanſhip
about the ſhoo or pantofle that he had made to a picture, & namely,that there was one latchet
fewer than there ſhould be: *Apelles* acknowledging that the man ſaid true indeed, mended that
fault by the next morning,and ſet forth his table as his manner was. The ſame ſhoomaker com-
ming again the morrow after,and finding the want ſupplied which he noted the day before,took
ſome pride vnto himſelfe, that his former admonition had ſped ſo well, and was ſo bold as to
cauil at ſomewhat about the leg. *Apelles* could not endure that,but putting forth his head from
behind the painted table,and ſcorning thus to be checked and reproued, Sirrha (quoth hee) re-
member you are but a ſhoomaker,& therefore meddle no higher I aduiſe you,than with ſhoos.
Which words alſo of his came afterwards to be a common prouerbe, *Ne ſutor vltra crepidam.* M
Ouer and beſides,very courteous he was and faire ſpoken, in which regard King *Alexander* the
Great accepted the better of him,and much frequented his ſhop in his owne perſon: for, as I
haue ſaid before, he gaue ſtreight commandement, That no painter ſhould bee ſo hardie as to
make his picture but only *Apelles*. Now when the King being in his ſhop,would ſeeme to talke
much

20030
copy 1

A much and reaſon about his art,and many times let fal ſome words to little purpoſe, bewraying his ignorance; *Apelles* after his mild manner,would deſire his grace to hold his peace,& ſaid, ſir, no more words,for feare the prentiſe boies there that are grinding of colours, do laugh you to ſcorn: So reuerently thought the king of him,that being otherwiſe a cholericke prince, yet hee would take any word at his hands in that familiar ſort ſpoken in the beſt part, and be neuer offended. And verily, what good reckoning *Alexander* made of him,he ſhewed by one notable argument; for hauing among his courteſans one named *Campaſpe*, whom he fancied eſpecially aboue the reſt,in regard as wel of that affection of his as her incomparable beauty,he gaue commandement to *Apelles* for to draw her picture all naked: but perceiuing *Apelles* at the ſame time to be wounded with the like dart of loue as wel as himſelf, he beſtowed her on him moſt frankly. By which example, hee ſhewed moreouer,that how great a Commander,and high minded a
B prince he was otherwiſe,yet in this maſtering and commanding of his affections,his magnanimity was more ſeen: and in this act of his he wan as much honor and glory,as by any victory ouer his enemies; for now he had conquered himſelfe, and not onely made *Apelles* partner with him of his loue,but alſo gaue his affection clean away from her vnto him,nothing mooued with the reſpect of her whom before he ſo dearly loued,that being the concubin of a king,ſhe ſhould now become the bedfellow of a painter. Some are of opinion, That by the patterne of this *Campaſpe*, *Apelles* made the picture of *Venus* * *Anadyomene*. Moreouer, *Apelles* was of a kind bountiful * *i.Ortam mari* *i.*riſing out of the ſea.
diſpoſition euen to other painters of his time,who commonly as concurrents,do enuie one another. And the firſt he was that brought *Protogenes* into credit and eſtimation at Rhodes; for at
C the firſt,his owne countrymen made no account at all of him (a thing ordinarily ſeen,that in our own country we are leaſt regarded) but *Apelles*, for to countenance and credit the man,demanded of him what price he would ſet of al the pictures that he had ready made; *Protogenes* asked ſome ſmall matter and trifle to ſpeake of: howbeit, *Apelles* eſteemed them at fifty talents,and promiſed to giue ſo much for them: raiſing a bruit by this means abroad in the world,that he bought them for to ſel againe as his owne. The Rhodians hereat were moued and ſtirred vp to take better knowledge of *Protogenes*,what an excellent workeman they had of him: neither would *Protogenes* part with any of his pictures vnto them,vnleſſe they would come off roundly and riſe to a better price than before time. As for *Apelles*, he had ſuch a dexterity in drawing pourtraits ſo liuely,and ſo neer reſembling thoſe for whom they were made,that hardly one could be known
D from the other; inſomuch,as *Appion* the Grammarian hath left in writing (a thing incredible to be ſpoken) that a certain Phyſiognomiſt or teller of Fortune,by looking onely vpon the face of men and women,ſuch as the Greekes call Metopoſcopos,judged truly by the portraits that *Apelles* had drawne,how many yeres they either had liued or were to liue,for whom thoſe pictures were made. But as gracious as he was otherwiſe with *Alexander* and his train, yet he could neuer win the loue and fauor of prince *Ptolomæus*,who at that time followed the court of K. *Alexander*, and was afterwards king of Egypt. It fortuned,that after the deceaſe of *Alexander*,and during the reigne of K. *Ptolomæ* aforeſaid, this *Apelles* was by a tempeſt at ſea caſt vpon the coaſt of Ægypt,and forced to land at Alexandria; where, other painters that were no well willers of his,
E practiſed with a jugler or jeaſter of the kings,and ſuborned him in the kings name to train *Apelles* to take his ſupper with the king. To the court came *Apelles* accordingly, and ſhewed himſelf in the preſence. *Ptolomæ* hauing eſpied him,with a ſtern and angry countenance demanded of him what he made there,and who had ſent for him? and with that ſhewed vnto him all his ſeruitors who ordinarily had the inuiting of gheſts to the kings table,commanding him to ſay which of all them had bidden him: whereat *Apelles*, not knowing the name of the party who had brought him thither, and beeing thus put to his ſhifts, caught vp a dead cole of fire from the hearth thereby,and began therewith to delineat and draw vpon the wall the proportion of that couſiner beforeſaid. He had no ſooner pourfiled a little about the viſage,but the king preſently tooke knowledge thereby of the party that had played this pranke by him and wrought him
F this diſpleaſure. This *Apelles* drew the face of K. *Antiochus* alſo, who had but one eie to ſee withall: for to hide which deformity and imperfection,he deuiſed to paint him, turning his viſage a little away,and ſo he ſhewed but the one ſide of his face,to the end, that whatſoeuer was wanting in the picture,might be imputed rather to the painter,than to the perſon whom he portraied. And in truth,from him came this inuention firſt to conceale the defects & blemiſhes of the viſage,and to make one halfe face onely, when it might be repreſented full and whole, if it

pleaſed

pleaſed the painter. Among other principall pieces of worke, ſome pictures there be of his ma- G
king, reſembling men and women lying at the point of death, and euen ready to gaſp and yeeld vp the ghoſt. But of all the pictures & portraitures that he made, to ſay preciſely which be the moſt excellent, it were a very hard matter: as for the painted table of *Venus*, ariſing out of the ſea (which is commonly knowne by the name of *Anadyomene*) *Auguſtus Cæſar*, late Emperour of famous memory, dedicated it in the temple of *Iulius Cæſar*, his father; which hee inriched with an Epigram of certaine Greeke verſes, in commendation as well of the picture, as the painter. And albeit the artificiall contriuing of the ſaid verſes went beyond the worke, which they ſeemed to praiſe, yet they beautified and ſet out the table not a little. The nether part of this picture had caught ſome hurt by a miſchance: but there neuer could be found that painter yet, who would take in hand to repaire the ſame and make it vp again as it was at firſt: ſo as, this wrong & harm H
done vnto the work, and continuing ſtill vpon the ſame, turned to the glory of the workeman. This table remained a long time to be ſeen, vntill in the end for age it was worm-eaten and rotten: in ſuch ſort, as *Nero* being Emperor was fain to ſet another in the place, wrought by the hand of *Doratheus*. But to come againe vnto *Apelles*; he had begun another picture of *Venus Anadyomene*, for the inhabitants of the Iſland Coſor Lango, which hee minded ſhould haue ſurpaſſed the former: howbeit, before he could finiſh it, ſurpriſed he was with death, which ſeemed to enuie ſo perfect workmanſhip: and neuer was that painter knowne to this day, who would turne his hand to that piece of worke, and ſeeme to go forward where *Apelles* left, or to follow on in
*Of this picture *Apelles* was wont to ſay, That there were two *Alexanders*: the one begotten by *Philip*, who was ἀμίμητος: & the other painted by *Apelles*, and he was ἀμίμητος, inimitable.
thoſe traicts and liniments, which he had pourfiled and begun. One picture he drew of *K. *Alexander* the Great, holding a * thunderbolt and lightening in his hand, which coſt twentie ta- I
lents of gold, and was hung in the temple of *Diana* at Epheſus. And verily, this deuiſe was ſo finely contriued, that as *Alexanders* fingers ſeemed to bear out higher than the reſt of the work, ſo the lightening appeared to be clean without the ground of the table, and not once to touch it. [But before I proceed any farther, let the readers take this with them, and alwaies remember, that theſe rich and coſtly pictures were wrought with foure colours and no more.] And for the workmanſhip of this picture, the price thereof was paid him in good gold coine by weight and meaſure, and neuer told and counted by tale. Of his handy worke was the picture of a Megabyzus or guelded prieſt of *Diana* in Epheſus, ſacrificing in his pontificall habits & veſtiments accordingly. Alſo the counterfeit of prince *Clytus*, armed at all pieces ſaue his head, mounted on
* The manner was to expreſſe lightening, by three ſhafts bound together in the middeſt.
horſe-back and haſting to a battell, calling vnto his ſquire or henxman for his helmet, who was K
portraied alſo reaching it vnto him. To reckon how many pictures *Apelles* made of K. *Alexander* and his father *Philip*, were but loſſe of time, and a needleſſe diſcourſe. But I cannot omit the painted table, containing the pourtrait of *Abron* that wanton and effeminat perſon; which piece of work the Samians ſo highly extoll and magnifie: ne yet another picture of *Menander* the K. of Caria, that he made for the Rhodians, and which they ſo much admire. Neither muſt I forget the counterfeit of *Ancæus*: of *Gorgoſthenes* the Tragædian, which he made at Alexandria: or while he was at Rome, one table containing *Caſtor* and *Pollux*, with the image of *Victorie*, and *Alexander* the Great: Likewiſe another repreſenting the counterfeit of Warre in perſon, bound with his hands behind at the backe, and *Alexander* the king mounted in a charriot triumphant: both which tables *Auguſtus* late Emperor of immortall memory, had dedicated modeſtly, and in L
ſimplicity of heart cauſed them to be hung vp in the moſt conſpicuous places of his Forum or hall that he built: but when *Claudius Cæſar* came to weare the diademe, he thought it more for the honour of *Auguſtus*, to ſcrape out the face of *Alexander*, as well in the one as in the other, and to ſet in the place the liuely image of the ſaid *Auguſtus* to be ſeen. It is thought likewiſe, that the full pourtrait of *Hercules*, painted in a table, ſtanding now in the temple of *Antonia*, was of his doing: an exquiſite piece of worke no doubt, for notwithſtanding that the backe part ſtand toward them that looke vpon it, yet it ſheweth the entire viſage, which is an exceeding hard matter: a man that beholdeth this *Hercules*, would think that the picture it ſelfe turned the face
*Some thinke he meaneth *Hero* & *Leandere*: and they read, *Hero Leandrũ pinxit*, he painted *Hero* and *Leander*.
to be ſeen, which the painter ſeemed by the reſt of the work to hide from the eie. Of his painting there is a * prince or worthy knight all naked, in which picture he ſeemed to challenge Nature: M
and to haue pourtraied euery part ſo well, as ſhee her ſelfe could not haue framed the ſame better. There is or was at leaſtwiſe, a horſe of his painting: which he pourtraied, to ſet againſt other horſes painted by diuerſe workemen, with whom he was entred into contention for the victory: in which triall, he appealed from the ſentence of men to the judgement of foure-footed beaſts,

euen

20030
copy 1

A euen liuing horſes indeed: for perceiuing that his concurrents were in fauor too mighty for him and that they were like to carry away the prize by corrupting the iudges and vmpires, he cauſed liuing horſes to be brought vp into the place; and hauing preſented before them the pictures of his concurrents horſes one by one, they ſeemed not to ioy nor make toward them: but no ſooner had he ſhewed * that of his owne pourtraying, but they fell all to neigh, as taking it for one of their fellows; which experiment ſerued euer after for a rule, to know indeed a good piece of workmanſhip in that kind. Moreouer, he made a picture repreſenting *Neoptolemus* the ſonne of *Achilles*, in habit of a man of armes, ſitting on horſebacke and riding againſt the Perſians: likewiſe another, reſembling *Archelaus* with his wife and little daughter: alſo K. *Antigonus* armed before with a cuirace, & marching on foot with his horſe of ſeruice led by him. Howbeit thoſe

B Painters that are counted more skilfull and cunning than others, preferre before all other pieces of his work manſhip, one picture of the ſame king ſitting vpon his horſe; and another which doth repreſent the goddeſſe *Diana*, among a conſort or company of other virgins at ſacrifice; whom he depainted ſo artificially in this table, that he ſeemeth to haue ſurmounted *Homer* the Poet, who eftſoons in his poems deſcribeth the ſame maiden *Diana* with her traine of yong damoſels. What would you haue more? he would ſeeme to pourtray thoſe things which indeed cannot be pourtraied, crackes of thunder, leames or flaſhes of lightening, and thunderbolts; all which pictures go vnder the name of *Brontes*, *Aſtrape*, and *Ceraunobolos*; his inuentions ſerued as precedents and patterns for others in that art to follow. One ſecret he had himſelfe, which no man was euer able to attaine and reach vnto, and that was a certain blacke verniſh which hee v-

C ſed to lay vpon his painted tables when he had finiſhed them; which was ſo finely tempered, and withall driuen vpon the worke ſo thin, that by the repercuſſion thereof it gaue an excellent gloſſe and pleaſant luſtre to the colors; the ſame alſo preſerued the picture from duſt and filthineſſe: and yet a man could not perceiue any ſuch thing at all, vnleſſe he held the table cloſe at hand, and looked very neere. And great reaſon hee had beſides to vſe this verniſh, namely, leſt the brightneſſe of the colours without it, might offend and dazzle the eyes, which now beheld them as it were afarre off through a glaſſe ſtone; and withall, the ſame gaue a ſecret deeping and ſadneſſe to thoſe colours which were too gay and gallant. And thus much may ſuffice for *Apelles*.

D In his time liued *Ariſtides* the Thebane, a famous painter. This *Ariſtides* was the firſt that would ſeeme to paint the conceptions of the mind, and to expreſſe all the inward diſpoſitions and actions thereof, which the Greeks cal Ethe: yea, the very perturbations and paſſions of the ſoule he repreſented in picture: howbeit, his colours were vnpleaſant and ſomwhat too harſh: He repreſented in a table the winning of a towne by force, wherein was pourtraied moſt liuely a little infant winding it ſelfe and making pretty means to creep vnto the mothers pap, who lay a dying vpon a mortall wound receiued in her breſt; but it paſſed, how naturally the poor womans affection was expreſſed in this picture; for a man might perceiue in her, very ſenſibly, a certaine ſympathie and tender affection yet, vnto her babe, albeit ſhe were now in her deadly pangs and going out of the world, fearing euen then, leaſt the childe ſhould meet with no milke when ſhe

E was dead, but in ſtead of ſucking it, fall to licke her bloud, and doe it ſelfe hurt and injurie: this painted table K. *Alexander* the Great tranſlated from Thebes to Pella, the city where himſelfe was borne. The ſame *Ariſtides* painted the counterfeit of a battell betweene the Greeks and the Perſians: in which table, he compriſed an hundred fighting men: his bargaine was to haue of *Mnaſon* the tyrant or K. of Elate, for euery perſonage that hee made * ten pounds of ſiluer. Hee * *M.m.*
pourtraied the running in a race of charriots drawn with four ſteeds, ſo liuely, that a man would haue thought he ſaw the wheels running about. And as for an humble ſuter or ſuppliant, he depainted him ſo naturally, making his petition and following it with ſuch earneſtneſſe, that hee ſeemed in maner to cry with an audible voice from the very picture. He counterfeited in a painted table, hunters with their veniſon that they had taken. *Leontion* alſo the painter, and a woman

F vnder the name of *Anapauomene*, dying for kind heart and the loue of her brother: likewiſe prince *Bacchus*, and lady *Ariadne* his wife, which be pictures much looked vpon at Rome in theſe dayes within the temple of *Ceres*; a plaier beſides in a tragœdy, accompanied with a boy (& theſe are to be ſeen in the chappell of *Apollo*) howbeit, this table hath loſt the beauty which it firſt had, through the folly of an vnskilfull painter, vnto whom it was put forth to be ſcoured and refreſhed, by *M. Iunius* the Pretor, againſt the ſolemnitie of the Apollinar games. Moreouer, there was

Vitr. Mar. reporteth, that he painted a mare.

to be ſeen in the chappell of *Faith* within the Capitoll, the picture of an old man with an harp, G
teaching a boy to play; which was of *Ariſtides* his making; but there is a man lying ſicke in his
bed, of his painting, that cannot be praiſed ſufficiently. And verily to conclude with his owne
word, ſo accompliſhed he was in this art, that K. *Attalus* (by report) gaue vnto him for one table
with the picture, one hundred talents of ſiluer.

About the ſame time, there flouriſhed (as I haue ſaid before) *Protogenes*; born he was at Cau-
nos a city in Cilicia, and ſubiect to the Rhodians: he was ſo exceeding poore at the beginning,
and withall, ſo ſtudious, intentiue, and curious in his worke without all end, that fawer pictures
by that means came out of his hands, and himſelfe neuer riſe to any great wealth. Who it was
that taught him his art, it is not knowne for certaine: but ſome ſay that he painted ſhips vntill
he was 50 yeres of age: which they collect by this argument, That when at Athens in the moſt H
conſpicuous and frequented place of the city, he was to adorne with pictures the porch before
* Names of gallies. the temple of *Minerua*; wherein he depainted that famous * Paralus and * Hemionis, which
ſome call Nauſicaa, he deuiſed certaine borders without: wherein he painted among thoſe by-
works (which painters call Parerga) certaine ſmall gallies and little long barks, to ſhew therby
the ſmall beginnings of his art, and to what height of perfection hee was come to in the end,
when his workmanſhip was thought worthy to be ſeen in the moſt eminent place of that citie.
* A worthy knight, ſonne of *Ochimus*. But of all the painted tables that euer he wrought, that of * *Ialyſus* is accounted the principall,
which is now dedicated at Rome within the temple of *Peace:* whiles he was in painting this *Ialy-*
ſus, it is ſaid, that he liued only vpon ſteeped Lupines, which might ſerue him in ſtead of meat
and drinke both, to ſatisfie his hunger and quench his thirſt: and this hee did, for feare leaſt too I
much ſweetneſſe of other viands ſhould cauſe him to feed ouer liberally, and ſo dul his ſpirit and
ſenſes. And to the end that this picture ſhould be leſſe ſubiect to other injuries, and laſt the lon-
ger, he charged it with foure grounds of colours, which he laid one vpon another: that euer as
the vpper coat went, that vnderneath might ſucceed in the place and ſhew freſh againe. In this
table, the pourtraiture of a dog is admirable and miraculous; for not only art, but fortune alſo
met together in the painting thereof; for when he had done the dog in all parts to the content-
ment of his owne minde (and that ywis was a very hard and rare matter with him) & could not
ſatisfie and pleaſe himſelfe in expreſſing the froth which fell from his mouth as he panted and
blowed almoſt windleſſe with running; diſpleaſed he was with the very art it ſelfe: and albeit he
thought that he had bin long enough already about the ſaid froth, and ſpent therein but too K
much art and curioſitie, yet ſomewhat (he wiſt not what) was to be diminiſhed or altered there-
in: the more workmanſhip and skill that went thereto, the farther off it was from the truth in-
deed and the nature of froth (the onely marke that he ſhot at:) for when he had done all that he
could, it ſeemed ſtill but painted froth, and not that which came out of the dogs mouth; where-
as it ſhould haue been the very ſame and no other, which had been there before. Hereat he was
troubled and vexed in his mind, as one who would not haue any thing ſeene in a picture of his,
that might be ſaid like, but the very ſame indeed. Many a time he had changed his penſill and
colours; as often, he had wiped out that which was done, and al to ſee if he could hit vpon it; but
it would not be, for yet it was not to his fanſie. At the laſt, falling clean out with his own work-
manſhip, becauſe the art might be perceiued in it, in a pelting chafe he flings me the ſpunge-ful L
of colors that he had wiped out, full againſt that vnhappy place of the table which had put him
to all this trouble: but ſee what came of it! the ſpunge left the colours behind, in better order
than hee could haue laied them, and in truth, as well as his heart could wiſh. Thus was the froth
made to his full mind, and naturally indeed by meere chance, which all the wit and cunning in
his head could not reach vnto. [After whoſe example, *Nealces* another painter did the like, and
ſped as wel, in making the froth falling naturally from a horſes mouth; namely, by throwing his
ſpunge againſt the table before him, at what time as he painted a horſe-rider cheering and cher-
king vp his horſe, yet reining him hard as he champed vpon his bit.] Thus (I ſay) Fortune taught
Protogenes to finiſh his dog. This picture of *Ialyſus* and his dog, was of ſuch name and ſo highly
eſteemed, that K. *Demetrius* when hee might haue forced the city of Rhodes, on that ſide onely M
where *Protogenes* dwelt, forbare to ſet it on fire, becauſe he would not burne it among other pain-
ted tables: and thus for to ſpare a picture, he loſt the opportunitie of winning a towne. During
this ſtrait ſiege and hot aſſault of Rhodes, it chanced that *Protogenes* himſelfe was at worke in a
little garden that he had by the townes ſide, euen as a man would ſay within the compaſſe of

Demetrius

20030
copy 1

A *Demetrius* his camp. And for all the fury of warre and the daily skirmiſhes within his ſight and hearing, yet he went on ſtill with his workes that he had in hand, and neuer diſcontinued one hour. But being ſent for by the king, and demanded, How he durſt ſo confidently abide without the walls of the city in that dangerous time? he anſwered, That he knew full well that *Demetrius* warred againſt the Rhodians, and had no quarrell to good Arts and Sciences. The king then (glad in his heart that it lay now in his hand to ſaue thoſe things, which he had ſpared before, and whereof he had ſo good reſpect) beſtowed a very ſtrong guard about *Protogenes* for his better ſafety & ſecurity: and as great an enemy as he was to the Rhodians, yet he vſed otherwhiles to viſit *Protogenes* of his owne accord in proper perſon, becauſe he would not eftſoones call him out of his ſhop from worke: and ſetting aſide the maine point and occaſion of lying before
B Rhodes, which was the winning thereof, the thing that hee ſo much deſired; euen amid the aſſaults, skirmiſhes, and battels, hee would finde time to come to *Protogenes*, and took great pleaſure to ſee his worke. By occaſion of this ſiege and hoſtilitie, aroſe this tale moreouer of one table of his making, That all the whiles he painted it, the dagger (forſooth) was ſet to his heart, and a ſword ready to cut his throat: and it was the picture of a Satyre playing vpon a paire of bag-pipes, which he called * *Anapauomenos*: by which name, as well as by the thing it ſelfe, hee would ſeem to ſignifie, that he tooke but little thought and care during thoſe dangerous troubles. Moreouer, he made the picture of lady *Cydippe*, and of * *Tlepolemus*: he painted alſo *Philiſcus* a writer of Tragœdies, ſitting cloſe at his ſtudy meditating and muſing. Alſo, there be of his making, a wreſtler or champion, *Antigonus* the king, and the * mother of *Ariſtotle* the Philoſo-
C pher, who alſo was in hand with *Protogenes*, perſuading him to buſie himſelfe in painting all the noble acts, victories, and whole life of king *Alexander* the Great, for euerlaſting memoriall and perpetuitie: but the vehement affection and inclination of his minde ſtood another way, and a certaine itching deſire to ſearch into the ſecrets of the art, tickled him, and rather drew him to theſe kinds of curious workes whereof I haue already ſpoken. Yet in the later end of his daies, he painted K. *Alexander* himſelfe, and god *Pan*. Ouer and beſides this flat painting, he gaue himſelfe greatly to the practiſe of founderie, and to caſt certaine images of braſſe, according as I haue already ſaid.

* One at reſt, or repoſing himſelfe. Some reade, *Triptolemus*.

* *Phaſtias*.

At the very ſame time liued *Aſclepiodorus*, whom for his ſingular skill in obſeruing ſymetries and juſt proportions, *Apelles* himſelfe was wont to admire. This Painter pourtraied for *Mnaſon*
D the foreſaid king of the Elateans, the 12 principall gods, and receiued for euery one of them 300 pound of ſiluer. The ſaid *Mnaſon* gaue vnto *Theomnaſtus* for painting certaine Princes or Worthies, one hundred pounds apiece.

In this rank is to be ranged *Nicomachus*, ſon and apprentice both to *Ariſtodemus*. This *Nicho-machus* pourtraied the rauiſhing of *Proſerpine* by *Dis* or *Pluto*: which picture ſtandeth in a table within the Chappell of *Minerua* in the Capitoll, aboue the little cell or ſhrine of *Iuventus*. In the ſame Capitoll, another table there is likewiſe of his making, which *Plancus* (Lord Generall of an army for the time being) had there dedicated and ſet vp: the ſame doth repreſent *Victorie* catching vp a triumphant chariot drawn with four horſes aloft into heauen. He was the firſt that pourtraied prince *Vlixes* in a picture, with a * cap vpon his head. He painted alſo *Apollo* and *Di-*
E *ana*: *Cybele* likewiſe the mother of the gods, ſitting vpon a Lyon: of his workmanſhip is the table, repreſenting the religious prieſtreſſes of *Bacchus* in their habite, together with the wanton Satyres creeping and making toward them. Semblably, the monſtrous meermaid *Scylla*, which at this day is to be ſeen at Rome within the temple of *Peace*. A ready workeman he was, & you ſhall not heare of a painter that had a quicker hand than he, at his worke: for proofe wherof, this voice goeth of him, That hauing vndertaken for a certain ſum of money to *Ariſtratus* the tyrant of Sicyone, to paint a monument or tombe which he cauſed to bee made for *Teleſtes* the Poet, and to finiſh it by ſuch a day appointed and ſet downe in the couenants of the bargain, he made no great haſt to go about it, but came ſome few daies before the expiation of the preſcript term for to begin the ſame worke: whereat the tyrant was wroth, and menaced to puniſh him for ex-
F ample: howbeit, he quit himſelfe ſo well, and followed his worke with ſuch wonderfull celeritie, that in few daies ſpace he brought it to an end: and yet the art and workmanſhip therof was admirable. Vnder him were brought vp as apprentices, his brother *Ariſtides*, his owne ſon *Ariſtocles*, and *Philoxenus* the Eretrian.

* In token of nobility, as *Pierius* noteth in his Hieroglyphicks, Lib.

This *Philoxenus* made one painted table for *Caſſander* the king, containing the battel between

Alexander the Great and K. *Darius*, which for exquisit art commeth not behind any other whatsoeuer. One picture there is of his doing, wherein he would seeme to depaint lascious wantonnesse, which he pourtraied by 3 drunken Sylenes making merry and banquetting together. He gaue himselfe also to the speedy workemanship of his master before him, and for that purpose inuented other compendious meanes of greater breuitie to make riddance and quicke dispatch with his pencill. G

With these may be sorted *Nicophanes* also, a proper, feat, and fine workman, whose manner was to take out all pictures and paint them new againe, thereby as it were to immortalize the memory of things: a running hand hee had of his owne, and besides, was by nature hasty and furious: howbeit, for skill and cunning there were but few comparable vnto him. In all his workes hee aimed at loftinesse and grauity: so that a man may attribute the stately port that is in this Art, vnto him and no other. H

As touching *Perseus* apprentice to *Apelles*, & who wrote a book to him of the very art) he came far short both of his master & also of *Zeuxis*. As for *Aristides* the Theban, who also liued in this age, he brought vp vnder him his two sons, *Niceros* and *Aristippus*. This *Aristippus* pourtraied a Satyre crowned with a chaplet, and carrying a goblet or drinking cup: he taught *Antonides* and *Euphranor* his cunning; of whom I will write anon: for meet it is to annex vnto the rest, such as haue bin famous with the pencill in smaller works and lesse pictures; among whom I may reckon *Pyreicus*, who for art and skill had not many that went before him; and verily of this man, I wot not well, whether he debased himselfe and bare a low sale, of purpose, or no? for surely his mind was wholly set vpon painting of simple and base things: howbeit, in that humble & lowly carriage of himselfe, hee attained to a name of glory in the highest degree; his delight was to paint shops, of barbers, shoomakers, coblers, taylers; and semsters: hee had a good hand in pourtraying of poore asses, with the victuals that they bring to market, & such homely stuffe: whereby he got himselfe a by-name, and was called *Rhyparographus*. Howbeit, such rude and simple toies as these were so artificially wrought, that they pleased & contented the beholders, no thing so much. Many chapmen he had for these trifling pieces, and a greater price they yeelded vnto him, than the faireſt and largest tables of many others. Whereas contrariwise, *Serapion* vsed to make such great and goodly pictures, that (as *M. Varro* writeth) they were able to take vp & fill all the stals, bulks, and shops, jutting forth into the street vnder the old market place Rostra; this *Serapion* had an excellent grace in pourtraying tents, booths, stages, and theaters; but to paint a man or woman, he knew not which way to begin. On the other side, *Dionysius* was good at nothing els, and therefore he was commonly called *Anthropographus*. Moreouer, *Callicles* also occupied himselfe in smal works; and *Calaces* set his mind especially vpon little tables and pictures which were to set out comœdies and interludes; but *Antiphilus* practised both the one and the other; for he pictured the noble ladie *Hesione*, K. *Alexander* the Great, and *Philip* the king his father, with the goddesse *Minerva*: which tables hang in the Philosophers schoole or walking-place within the stately galleries of *Octauia*, where the learned clerks and gentlemen fauorers of learning, were wont to meet and conuerse. Within the galleries also of *Philippus*, there are to be seen, the picture of prince *Bacchus*, the pourtrait of *Alexander* in his childhood, and of *Hyppolitus* the yong gentleman, affrighted and astonied at the sight of a monstrous bull let loose and ready to incounter him. Likewise in the gallerie of *Pompey*, the counterfeits of *Cadmus* and *Europa*; all pictures of *Antiphilus* his making. Of his handy-worke, there is a fool with his bel, cockscomb, bable, and in other ridiculous habit, going vnder the name of *Gryllus*, deuised for the nones to make sport and pastime; wherupon all such fooliſh pictures be called Grylly. Himself was born in Ægypt, howbeit he learned all his cunning of *Cteſidemus*. In this bed-roll of painters, I should not do well to passe ouer in silence, the workeman that painted the temple of *Iuno*, at Ardea, especially seeing that he was infranchised free burgeois of that city, and honored besides with an Epigram or Tetrastichon, remaining yet to be read in the mids of his pictures in these foure Hexameter verses following; I K L M

Dignis digna loca picturis condecorauit,
Regina Iunonis supremi conjugis templum
Marcus Ludius Elotas Ætolia oriundus;
Quem nunc, & post semper ob artem hanc Ardea laudat.

This

copy 1

A This ſtately Church of *Iuno* Queen, with pictures richly dight,
Whom wife to mighty *Iupiter*, and ſiſter, men do call;
Commends the hand of *Myrke Ludie*, *Elotas* alſo hight,
Ætolian born: whom Ardea doth praiſe, and euer ſhall.

Theſe verſes are written in antique Latine letters. By occaſion of whoſe name, I muſt not defraud another *Ludius* of his due praiſe and commendation, who liued in the time of *Auguſtus Cæſar* Emperor of happy memory: for this *Ludius* was he who firſt deuiſed to beautifie the wals of an houſe with the pleaſanteſt painting that is in all varietie, to wit, with the reſemblance of manors, farms, & houſes of pleaſure in the country, hauens, vinets, floure-work in knots, groues, woods, forreſts, hils, fiſh-pooles, conduits, and drains, riuers, riuerets, with their banks, and what-
B ſoeuer a man would wiſh for to ſee: wherin alſo he would repreſent ſundry other ſhews of people, ſome walking and going to and fro on foot; others ſailing & rowing vp and down the ſtream vpon the riuer, or els riding by land to their farms, either mounted vpon their mules and aſſes, or els in wagons and coaches: there a man ſhould ſee folk in this place fiſhing and angling, in that place hauking and fouling: ſome hunting here, the hare, the fox, or deere both red and fallow; others buſie there in harueſt or vintage. In this maner of painting a man ſhould behold of his workmanſhip faire houſes ſtanding vpon mariſhes, vnto which all the ways that lead be tickliſh and full of bogs; where you ſhould ſee the paths ſo ſlipperie, that women as they goe are afraid to ſet one foot afore another; ſome at euery ſtep ready to ſlide, others bending forwards with their heads as though they caried ſome burdens vpon their neck and ſhoulders, and all for
C feare leſt, their feet failing vnder them, they ſhould catch a fal: and a thouſand more deuiſes and pretty conceits as theſe full of pleaſure and delight. The ſame *Ludius* deuiſed walls without dores, and abroad in the open aire to paint Cities ſtanding by the ſea ſide. All which kinde of painting pleaſeth the eie very well, and is beſides of little or no coſt. Howbeit, neither hee nor any other in this kinde (howſoeuer otherwiſe reſpected) grew euer to be famous and of great name, that felicitie they only attained vnto, who vſed to paint in tables: and therefore in this regard, venerable antiquitie we haue in greater admiration; for painters in old time loued not to garniſh wals for to pleaſure the maſter only of the houſe, ne yet to bedeck houſes in that maner which canot ſtir out of the place, nor ſhift and ſaue themſelues when fire commeth, as painted
D tables may, that are to be remoued with eaſe. *Protogenes*, as excellent a painter as he was, contented himſelfe to liue within a little garden in a ſmall cottage, and I warrant you no part thereof was painted. *Apelles* himſelfe might well haue the walls of his houſe rough caſt or finely plaiſtered, but neuer a patch thereof had any painting: they took no pleaſure, nay they had no luſt at all to paint vpon the whole wals, and to work vpon them from one end to another; al their skil and cunning attended vpon the publique ſeruice of ſtates and cities: and a painter was not for this or that place only, but imploied for the benefit indifferently of all countries and nations.

But to return again to our particular painters: there flouriſhed at Rome a little before *Auguſtus Cæſars* days, one *Arellius* a renowned painter, but that he had one notable foul fault that marred all and diſcredited his art; giuen he was exceedingly to wenching, and ſure hee would be to
E haue one woman or other all times in chaſe: which was the reaſon hee loued alife to be painting of goddeſſes, which were euer drawn by the pattern of his ſweet-hearts whom hee courted. A man might know by his pictures, how many queans he kept, and which were the miſtreſſes or rather goddeſſes whom he ſerued. Of late daies wee had among vs here at Rome one *Amulius* a Painter; he caried with him in his countenance and habit grauitie and ſeuerity; howbeit he loued to make gay and gallant pictures, neither ſcorned he to paint the moſt trifling toies & meaneſt things that were. The picture of *Minerua* was of his making, which ſeemes to haue her eie ful directly vpon you, looke which way ſoeuer you will vpon her. Hee wrought but ſome few houres of the day, and then would he ſeem very graue and antient, for you ſhould neuer find him out of his gown and long robe, but very formall, though he were cloſe ſet at work & euen lockt as it were to his frame. The golden houſe or palace of *Nero* caught vp all the workes hee made,
F where they remained as it were in priſon, and neuer came abroad; which is the reaſon that none of his pictures els be extant. After him ſucceeded *Cornelius Pinus*, and *Actius Priſcus*, two Painters of good reputation, who painted the temples of *Honour* and *Vertue* for *Veſpaſianus Auguſtus* the Emperor, when he cauſed them to be re-edified: but of the twaine, *Priſcus* in his workemanſhip came neerer to the painters of antient time.

Chap. XI.

¶ *The manner how to make Birds ſilent, and to leaue their chattering and ſinging. Who firſt deuiſed with fire and pencill to enamel and paint the arched roufes and embowed ſeelings of houſes. The admirable price of pictures inſerted here and there among other matters.*

SInce I haue proceeded ſo far in the diſcourſe of Painters and their art, I muſt not forget to ſet down a pretty jeſt, which hath bin reported by many as touching *Lepidus*: It hapned during the time of his Triumvirat, that in a certain place where he was, the magiſtrates attended him to his lodging enuironed as it were with woods on euerie ſide: the next morrow *Lepidus* took them vp for it, and in bitter tearmes and minatorie words chid them, for that they had laid him where he could not ſleep a wink all night long, for the noiſe and ſinging that the birds made about him. They being thus checked and rebuked, deuiſed againſt the next night to paint in a piece of parchment of great length a long Dragon or ſerpent, wherewith they compaſſed the place where *Lepidus* ſhould take his repoſe; the ſight of which ſerpent thus painted ſo terrified the birds, that they had no mind to ſing, but were altogether ſilent. By which experiment at that time, it was known afterwards, that birds by this means might be ſtilled.

*Encauſtice.

As touching the feat of ſetting colours with wax, and * enamelling with fire, who firſt began & deuiſed the ſame, it is not known. Some are of opinion, that the inuention therof came from *Ariſtides*; and that *Praxiteles* practiſed the ſame, & brought to an abſolute perfection. But ſurely there were pictures wrought by fire a good while before *Ariſtides* daies; and namely by *Polygnotus*, *Nicanor*, and *Arceſilaus* of Paros. *Lyſippus* alſo in his painted tables that he made at Ægina vſed to entitle them with this inſcription, Λύσιππος ἐποίησεν, *i.* *Lyſippus* painted this with fire: which verily he would neuer haue done, if the art of painting with fire (called Encauſtice) had not bin before deuiſed. Moreouer, *Pamphilus*, maſter to *Apelles*, is reported not onely to haue himſelfe practiſed this painting with verniſh, and to inamel by the means of fire, but alſo to haue taught it vnto *Pauſias* the Sicyonian, who was the firſt that excelled in this kinde, and caried away the name from all others in his time. This *Pauſias* was the ſon of *Brietes*, and apprentice alſo to his father in the beginning: he vſed alſo the plaine penſil, wherewith he wrought vpon the walls at Theſpiæ; which hauing been in times paſt painted by *Polygnotus*, were now to be refreſhed and painted new again by his hand: howbeit in compariſon of the former worke he was thought to come a great way ſhort of *Polygnotus*; and the reaſon was, becauſe he dealt in that kind of work which was not indeed his proper profeſſion. He it was that brought vp firſt the deuice of painting vaulted roufes; for neuer was it the manner to adorne and garniſh embowed ſeeling ouer head with colours, before his time. His delight naturally was to be painting little tables, and therein he loued to portray little boies. Other painters his concurrents, and no well-willers of his, gaue it out, that he made choice of this kind of work, becauſe ſuch painting went but ſlowly away, and required no quicke and nimble hand. Whereupon *Pauſias*, to diſproue his aduerſaries, and withall to get himſelfe a name, as well for celeritie and expedition, as for his art and skill otherwiſe in theſe ſmall pieces, began and finiſhed in a table the picture of a boy, within one day, and thereupon it was called *Hemereſios*. In his youthfull daies he fell in fancie with a woman in the ſame towne where he dwelt, named *Glycera*: a fine wit ſhe had of her owne, and eſpecially in making chaplets and guirlands of floures, ſhe was full of inuention. *Pauſias* by his acquaintance with her, and ſtriuing to imitate with his penſill her handiworke, and to expreſſe that varietie of floures which ſhe gathered and couched together full artificially in her Coronets, enriched his owne pictures alſo with a number of colours, and brought the art to wonderfull perfection in that point. In the end he painted *Glycera* alſo his loue, ſitting, with a Chaplet of floures her hand: and certes this is the moſt excellent peece of worke that euer went out of his ſhop: this table with the picture was thereupon called by ſome, Stephanoplocos, *i.* [A woman] plaiting and twiſting a guarland: by others, Stephanopolis, *i.* Selling guirlands: for that this *Glycera* got a poor liuing by making chaplets, and had no other good means to maintain her ſelfe. The counterfeit taken from this table and made by it (which kind of pattern the Greekes call Apographon) *L. Lucullus* bought of *Dionyſius* a painter of Athens, and it coſt him

*781 *lib.* 5 *ſo.* * two talents of ſiluer. Furthermore, this *Pauſias* made faire and great pictures alſo; and namely,

20030
copy 1

A namely, one of his making which doth repreſent a ſolemne ſacrifice of oxen, is to be ſeen at this day within the ſtately galleries of *Pompeius*: and verily, this maner of painting the ſolemnity of a ſacrifice he firſt inuented: but no man euer after could attaine to his dexteritie in that kinde: and notwithſtanding many gaue the attempt, and ſeemed to imitate him, yet they came al ſhort of him: aboue al, he had a ſingular gift to work by perſpectiue; for when he was minded to paint a bœuf or oxe, to ſhew the full length, he would not portray him ſidelong or aſlank, but afront; by which means the beaſt is beſt repreſented, not only how long, but alſo how large and big he is euery way. Again, whereas all other painters, whenſoeuer they would raiſe their work, & make any thing ſeeme eminent and high, vſe to colour the ſame white and bright, and the better to make their perſpectiue, do ſhadow or deep the ſame with black: this man in lieu thereof, would
B paint the oxe all of a black colour, and cauſe the body as it were of the ſhadow to ariſe out of it ſelfe. And verily ſo excellent he was in this perſpectiue, that a man would ſay, his euen, plaine, and flat picture were emboſſed and raiſed work, yea and imagin where fractures were, that al was ſound and entire. This man liued alſo at Sicyone, and verily for a long time this city was reputed the natiue countrey that bred painters, and the onely place ſtored with excellent pictures. But during that time wherein *Scaurus* was Ædile at Rome, all the rich tables which were in the publick places of that city, whether in the market ſteads, temples, or common halls, were ſeiſed vpon and brought to Rome, for to ſatisfie great ſums of money wherein the Sicyonians ſtood indebted.

After *Pauſias*, there aroſe one *Euphranor* the Iſthmian, whom flouriſhed about the 104 Oiym-
C pias, far ſurpaſſing all other painters of his time. This *Euphranor* is hee whom I haue named among the famous imageurs and founders. Of his workmanſhip there be Coloſſes of braſſe, ſtatues of marble ſtone, yea and faire drinking cups chaſed and engrauen. Of an excellent capacity he was, and apt to learn any thing, ſtudious withall, and painfull aboue all others, and whatſoeuer he gaue his mind vnto, therein he excelled: and in one word, a general man he was like himſelfe ſtill, that is to ſay, his craftsmaſter in all, and as good in one thing as another. This is hee who ſeems to haue expreſſed firſt the port and maieſtie that is in princes and great ſtates, and to haue obſerued ſymmetry and proportion: & yet he was not without his imperfection, for commonly as he made the bulk of the body too ſlender, ſo the joints and heads were ſomewhat with the biggeſt; howbeit he wrot books touching ſymmetrie and proportion, as alſo of colours. A-
D mong other works of his, there are reckoned theſe, to wit, the portraiture of a battel or skirmiſh of horſemen, the twelue chiefe gods and goddeſſes, alſo the liuely picture of *Theſeus*, of whom he was wont to ſay, That the *Theſeus* of *Paraſius* painting was fed with roſes, but this *Theſeus* of his with good fleſh. There be excellent tables of his making at Epheſus, to wit, *Vlyxes* feigning himſelfe mad, and in that fit coupling an oxe and a horſe in one and the ſame yoke: alſo diuers perſonages in their clokes and mantles after the Greekiſh faſhion, muſing and in a deep ſtudy; likewiſe a captain putting vp his ſword into his ſcabberd.

At the ſame time liued *Cydias*, he who in a table repreſented the * Argonauts, for which *Hor-
tenſius* the Orator was content to pay 144000 Seſterces. This picture he ſhrined in an Oratorie
E or chappell built of purpoſe for it, in a houſe of pleaſure that he had at Thuſculum.

As for *Antidotus*, apprentiſe he was to *Euphranor*: of his handiwork there is a picture at Athens reſembling one with a ſhield ready to enter into combat or fight; alſo a wreſtler and a plaier vpon the fife or hautbois, which is a piece of work highly commended, and few comparable vnto it: more curious and preciſe he was in the ſecrets of the art, than obſeruant of ſymmetry & proportion; being otherwiſe giuen to vſe ſad and duskiſh colours. The greateſt name that he had, was for bringing vp *Nicias* the Athenian, who of all others painted women moſt excellently. For lights and ſhadowes in perſpectiue he was excellent: alſo a paſſing great care and regard he had ſo to raiſe his worke, as that it ſeemed to be emboſſed and higher than the boord of his table: the pictures of *Nemea*, which out of Aſia were tranſported to Rome by *Syllanus*, and hung vp in the Senat houſe, as I haue ſhewed heretofore; of prince *Bacchus*, within the temple of *Concord*;
F of *Hyacinthus*, which *Auguſtus Cæſar* vpon a ſpeciall liking to it brought with him to Rome, after hee had forced and ſacked Alexandria; (in which regard *Tiberius Cæſar* his ſucceſſour, ſeeing what affection *Auguſtus Cæſar* had vnto it in his life time, dedicated it in the Temple of the ſaid *Auguſtus*) and laſtly of the goddeſſe *Diana*, were all proofes of his skill and workmanſhip. Moreouer, at Epheſus the Sepulchre of *Megabyzus* one of the Prieſts of the Or-

der

* *i.* Diuers valiant knights, who accompanied prince *Iaſon* in his voiage to Colchos for the golden fleece.

der of *Diana* of Epheſus was of his painting: like as at Athens, the necromancie of the Poet *Homer*. This picture *Nicias* held at ſo high a price, that he would not let it go vnto K. *Attalus* for 60 talents, but choſe rather to beſtow it freely vpon his own natiue country, being otherwiſe a man for his own priuat ſtate very wealthy. Beſides theſe before rehearſed, he made others of a larger ſize, among which are reckoned *Calypſo*, *Io*, and the lady *Andromeda*. The excellent picture alſo of K. *Alexander*, which is in the gallery of *Pompeius*, together with *Calypſo* painted ſitting, came out of his ſhop. The perfect pourtraying of fourfooted beaſts is aſcribed vnto him; and in truth, a ſingular grace he had and felicitie in painting dogs. This is that *Nicias* of whom *Praxiteles* gaue ſo good teſtimonie: for being asked vpon a time, what pieces he eſteemed beſt of all thoſe that himſelfe had cut in marble? he anſwered, Euen thoſe wherein *Nicias* hath had a hand: ſo much did he attribute vnto his * verniſh and poliſhing. Another *Nicias* there was, who liued in the 112 Olympias; but whether this man were he or no, it is not certainly knowne; howbeit ſome there be that would haue him to be the ſame. Certes, *Atheman* of Marona was taken for as good a workman euery way as *Nicias*, and in ſome reſpects better: he learned the art of *Glaucion* the Corinthian. In choice of his colours he ſtood not ſo much vpon gallantneſſe, but vſed thoſe that were with the ſaddeſt; howbeit thoſe dark and ſhadowed works of his ſhewed more pleaſant and delectable than his maſters: wherby appeared his profound knowledge and deep skil, in the very laying and couching of his colours. The picture of *Philarchus* he drew, which is in the Temple of *Ceres Eleuſine*. The frequent aſſembly alſo of the dames of Athens, which they call Polygynæcon, was of his pourtraying: likewiſe he repreſented *Achilles* in his youth, hidden vnder the habit of a yong damoſell, and how the crafty foxe *Vlyſſes* diſcouered and found him out, notwithſtanding he was ſo diſguiſed. But one table aboue the reſt woon him the greateſt credit, and that was, wherein he painted an horſekeeper training and nurturing his palfrey. Certes, but that he died in his youth, there had not been a painter in all the world comparable vnto him.

*Circumlitioni: others read *circumductioni*, i. the the firſt draught or pourfiling.

As touching *Heraclides* the Macedonian, he alſo may run in the range of famous Painters: at the beginning he employed himſelfe in painting ſhips: after that King *Perſeus* was taken priſoner, he left his natiue countrey and went to Athens, where liued at that time *Metrodorus*, a Painter and Philoſopher both, a man of great name and authoritie as well in the one profeſſion as the other: and therefore when *L. Paulus* after the defeature of the ſaid *Perſeus* ſent vnto the Athenians, and requeſted them to ſend vnto him an excellent Philoſopher to teach and inſtruct his children, together with a ſingular painter to ſet out his triumph with curious pictures, the Athenians made choice of *Metrodorus* onely, and commended him alone vnto *Lucius Paulus*, for the beſt approoued and moſt conſummate to ſerue his turne and ſatisfie both his deſires: which by good proofe and experience *Paulus* found true, and gaue iudgement of him accordingly.

Timomachus the Byzantine flouriſhed in the dayes of *Cæſar* Dictatour, for whom hee painted *Ajax* and *Medea*: which pictures when he bought of him for 80 talents, hee cauſed to be hung vp in the temple of *Venus* * *Genetrix*. Now when I ſpeake of a talent, you muſt vnderſtand the Attick talent, which *M. Varro* doth value at 6000 deniers Roman. There goeth as great praiſe likewiſe and commendation of other pieces that paſſed from vnder the hands of *Timomachus*, to wit, the pictures of *Oreſtes*, of *Iphigenia* in Tauris, and of *Lecythion*, who taught youths dancing, vaulting, and other feats of actiuitie: he pourtraied alſo in a table, a goodly race, deſcent, and kindred of gentlemen; two perſons beſides in their clokes or mantles, after the Greekiſh faſhion, ready to make a ſpeech vnto the people, the one ſet, the other ſtanding vpon his feet: but it ſeemed that art fauored and graced him moſt in painting *Minerva's* ſhield, where he portraied *Gorgon* or *Meduſa's* head moſt liuely.

* This Saint *Iulius Cæſar* honored moſt: for that hee would ſeem to bee deſcended from *Iulus* or *Aſcanius*, ſon of *Æneas*, and nephew to *Venus* by *Anchiſes*.

Ariſtelaus was the ſon of *Pauſias*, and vnder his father he learned the myſterie of painting, who is counted one of the greateſt painters that euer was. Of his workmanſhip are the tables containing the pictures of *Epaminondas*, *Pericles*, *Medea*, *Vertue*, and *Theſeus*. Hee alſo drew with his penſil in colours, the common people of Athens, and a ſolemne ſacrifice of Oxen.

There was alſo one *Mechopanes*, apprentiſe likewiſe vnto the ſame *Pauſias*, who is highly commended by ſome for his curious and exquiſit workmanſhip: but ſuch it is, as none but cunning artiſts can conceiue, for otherwiſe I aſſure you his colours are vnpleaſant, and hee loued to lay on too much of one thing, and that was Sil.

As

20030
copy 1

A As for *Socrates* the painter, his pictures were liked very well of all that saw them, and in truth, they deserued no lesse: for of his doing are these and such like, to wit, *Æsculapius*, with his daughters, *Hygia*, *Ægle*, *Panacea*, and (1) *Laso*: and an idle lazy lubber, knowne by a deuised name *Ocnos*, whom he pourtraied twisting a cord of Spart, and euer as he did it, an asse behind him gnawed it asunder. Thus much may serue concerning the principall painters that haue been knowne to excell in both kinds, to wit, with the pensill, and with fire: it remaineth now that I should discourse of those who were next vnto the principall, and so reputed.

In this second course of painters I must range *Aristoclides*, who beautified with his pictures the temple of *Apollo* in Delphos: as for *Antiphilus*, he is as much praised for painting a boy blowing hard at the coles; in which table, it is a prety sight to see how all the house (which was faire
B enough besides) shineth by the fire that he makes, as also what a mouth the boy makes: likewise for the picture of a company of Spinsters, so liuely, that one would imagin he saw euery woman making hast to spin off her distaffe, striuing avie who shal haue don her task first. He deuised also to portray *Ptolomæ* hunting, & this they call (2) *Aposcopon*, for which he is much commended: but principally for a braue Satyr of his workmanship, clad in a Panthers skin. *Aristophon* woone much credit by painting *Ancæus* wounded to death by a wild bore, & his wife *Astypale* standing hard by, who seemeth to lament for his sake, and (as it were) to feele part of his paine: he made also one faire table, inriched with a number of personages, to wit, K. *Priamus*, faire *Helena*, dame *Credulitie*, *Vlixes*, *Deiphobus*, and *Dolori*. *Androbius* got himself a great name by a picture, representing one (3) *Scyllus* [a cunning diver] cutting in two the anker cables of the Persian fleet, riding
C at sea. *Artemon* likewise was renowned for the counterfeit of lady *Danae*, found floting in the sea by (4) rouers or men of war, who seemed to wonder at her beauty, and to behold her with much contentment: also for picturing queene *Stratonice*: *Hercules* and *Deianira* his wife: but the most excellent pieces of his workmanship, be those which are to be seene in the galleries of *Octauia*, among other of her stately buildings; to wit, *Hercules* ascending vp into heauen from the mountaine Oeta within the region of Doris, where he changed this mortall life, and by the generall consent of all the gods, was receiued into their society: the whole history also of *Laomedon*, as touching his falshood to *Hercules* and *Neptune*. *Alcimachus* the painter was renowned for the
D picture of hardy *Dioxippus*, who (5) carried away the prize in all feats of actiuity, at the solemn games of Olympia, and neuer sweat nor touched (6) dust for it; which easie victory the Greekes call Aconiti. As for *Cænus*, he was excellent at painting Coronets & Garlands: also at drawing coats of arms in scutchions, of gentlemen and noble persons, with the stile of their titles & dignities. *Cteſilochus*, an apprentice to *Apelles*, became very famous for one picture aboue the rest, although it were but a wanton one and offensiue to chast eies; wherein forsooth hee depainted *Iupiter*, attired in a caule or coife about his head like a woman, groning and crying out also (as women do in trauell of childe birth) among the goddesses for their helping hand, who plaied the midwiues about him, vntil he was deliuered of god *Bacchus*, and brought to bed. *Cleon* was much spoken of, for the picture which hee made of K. *Admetus*: *Cteſidamus* for pourtraying the winning of Oechalia by *Hercules*. And for drawing the picture of lady *Laodamia*, the wife of *Protesilaus*. *Cleſides* was notorious for one picture which he made in despight of queene *Stratonice*, wife
E to K. *Antiochus*, and to be reuenged of her for a disgrace that he had receiued at her hands: for being in the court, and perceiuing that the queen did him no honour at all, nor gaue him any countenance, he made no more ado, but painted her in her colours, tumbling and wallowing along full vnseemly with an odde base fisherman, whom as the voice went, she was inamored vpon; and when he had done, set it vp in the very hauen of Ephesus, recouered a barke presently, and away he went vnder sale as fast as wind and tide would carry him. When the queene heard of it, she made but a jeast and mocke of it; neither would shee suffer the picture to be taken away, in regard of the wonderfull workmanship, which expressed her and him so like and liuely. *Craterus*
F was a Comœdian and plaier in Enterludes, howbeit, a fine Painter, as may appeare by his handy worke at Athens, within the publicke place Pompeium. *Eutychides* pourtraied a charriot drawne with two horses, and *Victorie* to guid and driue the same. *Eudoxus* had the name for his pictures which are seen at stage-plaies, to beautifie the place: who also was a good imageur and cast many faire pieces in brasse. *Iphis* was well thought of for *Neptune* and *Victorie* of his painting: and *Abron* was no lesse esteemed for the pictures resembling *Amity* and *Concord*, as also for the pourtraitures of the gods. *Leontiscus* pictured *Aratus* the Generall of the Achæans, returning

(1) I am not of *Dalechampius* his opinio, who takes *Laso* here for the valiant knight *Iason*, For the termination of the word is meere feminine as *Io*, *Ino*, *Sappho*, & such like: besides, who sees not, that *Laso* is respectiue to Physick, for that *Iasis* in Greek signifieth curing or healing, and it sorteth well with the names of her other sisters, which are likewise significant.

(2) *i.* (leuelling his shot at the Deere or wild beast) as *Dalechampius* doth interpret it: or els according to *Scaliger* (holding his hand ouer his ies to spie his game, & take his mark the better.

(3) or *Scyllias*, according to *Herod.*

(4) *rædonibus* otherwise *piscatoribus*, *i.* fishermen

(5) for he was the challenger & none would come forth against him.

(6) for at wrestling especially, they caught vp dust in their hands, to take hold the better of one anothers bodies, which were glib with oile.

turning with victory, and triumphing with his trophy. He painted also a minstrel wench playing vpon a Psaltry, and seeming to sing to it; which was thought to be a daintie piece of worke. As for *Leon*, he painted *Sappho* the Poetresse. And *Nicearchus* was much bruited abroad, for a picture, shewing *Venus* accompanied with the Graces and the pretty *Cupids*. And of his workemanship is *Hercules*, sad and pensiue: penitent also and repentant, for that which he had done in his furious madnesse. *Nealces* made one picture of *Venus* most curiously: for passing witty hee was, full of inuention, and exquisit in his art. When he painted the nauall battell betweene the Ægyptians and the Persians, which was fought vpon the riuer Nilus, the water whereof is rough and like the sea; because he would haue it knowne, that the fight was vpon the said riuer, he deuised another by-worke to expresse the same, which all the Art of painting otherwise could not performe: for he painted an Asse vpon the banke, drinking at the riuer, and a Crocodile lying in wait to catch him: whereby any man might soone know it was the riuer Nilus, and no other water. *Oenias* the painter made one pictiure aboue the rest, which he called *Syngenicus*. *Philiscus* became renowned by a painters shop of his painting, where he deuised a prentice boy blowing the coles to kindle a fire. *Phalerion* pourtraied *Scylla*, transformed into a monstrous Meeremaid. *Simonides* got credit by the picture of *Agatharrhus*, who woon the best game at running: and of the goddesse of Memory, named *Mnemosyne*. *Simus* took pleasure in painting a yong boy lying asleep in a waulke-mill or Fullers worke-house: another sacrificing vnto *Minerua* at the feast *Quinquatrus*: and of the same mans doing, there is an excellent picture of *Nemesis*, representing Iustice and Reuenge. *Theodorus* drew one snetting his nose: and the same painter represented in a table, how *Orestes* murdered his owne mother *Clytemnestra*, and *Ægysthus* the Adulterer that kept her. The warre of Troy hee depainted in many seuerall tables: and these hang in the galleries of *Philip* at Rome. Of his handy-worke is lady *Cassandra* the Propheteresse, which is to bee seen in the Chappell of *Concord*. Also, *Leontium* the courtisane belonging to *Epicurus* and his followers, was of his painting; like as king *Demetrius* musing and standing in a deepe studie. As for *Theon* the painter, hee described with his pensill the madnesse of *Orestes*, and pourtrayed *Tamyras* the Harper or Musitian. *Tauriscus* made one table, representing a man flinging a coit: and another resembling queene *Clytemnestra*. He pictured also a little *Pan*, whom he called *Panniscus*, in manner of an Anticke: *Polynices* also making claime to his kingdome, and marching in warlike manner to recouer the possession thereof againe: and last of all, signieur *Capaneus*, who lost his life in skaling the walls of Thebes. And here commeth to my minde one notable example as touching *Erigonus*, which I cannot passe with silence: This *Erigonus*, seruant somtime to *Nealces* the Painter, and employed onely in grinding colours, profited so much by seeing his master worke, that he became a Painter himselfe, and left behinde him an excellent workeman of his owne teaching, *Pausias* brother to *Ægineta* the Imageur. But one thing more there is, of rare admiration and worthie to be remembred, That the last peeces of excellent Painters, and namely such tables as bee left vnperfect, are commonly better esteemed than those that bee fully finished: as wee may see by the Raine-bow or Iris which *Aristides* was entered into, the two brethren *Castor* and *Pollux*, begunne by *Nicomachus*; the Picture of *Medea*, killing the children that shee had by *Iason*, which *Timomachus* was in hand with; and the *Venus*, that as I sayd before, *Apelles* liued not to make an end of: for in these and such like imperfect tables, a man may (as it were) see what traicts and lineaments remayne to bee done, as also the very desseignes and cogitations of the Artificers: and as these beginnings are attractiue allurements to mooue vs for to commend those hands that began such Draughts: so the conceit that they be now dead and missing, is no small griefe vnto vs, when wee behold them so raw and fore-let. But to come againe vnto our Painters: there be more yet behinde, and those of verie good regard in their time, howbeit, I will runne them ouer sleightly, and as it were passing and glauncing by them, namely, *Aristonides*, *Anaxander*, *Aristobulus* the Syrian, *Arcesilas* the sonne of *Tisicrates*, *Corybas* Apprentice to *Nicomachus*, *Carmanides* to *Euphranor*, *Dionysodorus* the Colophonian, *Diogenes* who followed the Court of King *Demetrius*, *Euthymedes*, *Heraclides* the Macedonian, *Mydon* of Solæ brought vp vnder *Pyromachus* the Imageur, *Mnasitheus* of Sicyone, *Mnasithemus* the sonne of *Aristonides*, who was Apprentice likewise vnto him, and *Nessus* the sonne of *Abron*, *Polemon* of Alexandria, *Theodorus* of Samos, and *Stodius*, (all three trayned vp vnder *Nicosthenes*) and *Xenon* of Sicyone, who learned his Craft of *Neocles*.

Moreo-

20030
copy 1

A Moreouer,women there were alſo,excellent * Paintreſſes, to wit, *Timarete*, the daughter of *Nicon*,who made that excellent pourtraiture of *Diana* at Epheſus,a moſt antique picture: *Irene* the daughter of *Cratinus* the painter,who learned vnder her father,& drew the picture of a yong damoſell,which is at Eleuſine: *Calypſo*, of whoſe workemanſhip there is the picture of an old man,and of *Theodorus* the juglar: *Alciſthene* painted a dauncer: and *Ariſtarete*, both daughter and apprentiſe to *Nearchus*,made prooſe how well ſhe had profited,by the picture of *Æſculapius*. And *M. Varro* ſaith, That when he was a yong man, there was at Rome one *Lala*,a Cyzecene borne,who paſſed her whole life in virginity;and ſhe was skilful both in painting with the penſill,and alſo in enamelling with hot ſteele in yuorie: her delight was principally in drawing women;and yet there is a Neapolitane of her pourtraying in a faire long table: laſt of all, ſhee B took out her owne counterfeit at a mirroir or looking glaſſe. This one thing is reported of her, that no painter had a quicker hand or went faſter away with his worke than ſhe: and look what pictures ſoeuer came out of her hands, they were ſo artificially done, that they did out-ſell a great deal the works of *Sopylos* and *Dionyſius* (the moſt famous painters in that age) notwithſtanding their pictures and tables were ſo faire,as that they take vp whole cabinets;and wel was he (before that her pictures came abroad) who could be furniſhed out of their two ſhops. There was yet one paintreſſe more,to wit, *Olympias*: howbeit I heare no great matter of her, but this onely,that ſhe taught *Autobulus* the art of painting.

* i. that knew how to handle the penſill.

To come now to painting by the means of fire: I find this agreed vpon by all, that practiſed it was in old time but two waies only,that is to ſay,with wax, and in yuorie with a little ſteele C or punching yron;vntill ſuch time as they fell to painting ſhips alſo with wax and fire: and in this third ſort the manner is to vſe great penſils or bruſhes dipt in wax molten ouer the fire: and this kind of painting ſhips is ſo faſt and ſure,that neither ſun will reſolue,nor ſalt water eat and fret,ne yet wind and weather pierce and chinke it.

Moreouer,in Ægypt they haue a deuiſe to ſtaine cloths after a ſtrange and wonderful maner: They take white clothes,as ſailes or curtaines when they haue bin worne,which they beſmeare not with colours but with drugs that are apt to drinke and take colour: when they haue ſo don, there is no apparence in them at all of any dye or tincture. Theſe clothes they caſt into a lead or cauldron of ſome colour that is ſeething and ſcalding hot: where, after they haue remained a pretty while,they take them forth againe,all ſtained and painted in ſundry colours. An ad- D rable thing,that there being in the ſaid cauldron but only one kind of tincture,yet out of it the cloth ſhould be ſtained with this and that colour,and the foreſaid boiling liquor change ſo as it doth,according to the quality & nature of the drugs which were laied vpon the white at firſt. And verily,theſe ſtains or colours are ſet ſo ſure,as they can neuer be waſhed off afterwards: thus the ſcalding liquor,which no doubt if it had diuers tinctures and colours in it,would haue confounded them all into one; now out of one doth diſpenſe and digeſt them accordingly, and in boiling the drugs of the clothes, ſetteth the colour and ſtaineth ſurely. And verily,this good moreouer haue the clothes by this ſcalding,that they be alwaies more firme and durable, than if they had not come into the boiling cauldron.

Chap. XII.

¶ *The firſt deuiſers of the art of Potterie, and in working in cley. Of Images made of earth. Of earthen veſſels, and their value in old time.*

NOw that I haue diſcourſed of painting enough, if not too much, it were good to annexe and joyne thereto the craft of Potterie,and working out of cley. And to begin with the original and inuention of making the image or likeneſſe of any thing in cley,it is ſaid,that *Dibutades*,a Sicyonian born,and a Potter,was the firſt that deuiſed at Corinth to form an image in the ſame clay whereof he made his pots,by the occaſion and means of a daughter which hee had: who being in loue with a certain yong man,whenſoeuer he was to take a long iourney far from home,vſed ordinarily to mark vpon the wal the ſhadow of her louers face by candle light and to pourfill the ſame afterwards deeper,that ſo ſhe might inioy his viſage yet in his abſence. This her father perceiuing,followed thoſe tracts,and by clapping cley therupon,perceiued that it took a print,and made a ſenſible forme of a face: which when hee ſaw, hee put it into the furnace to bake among other veſſels,& when it was hardned,ſhewed it abroad. And it is ſaid, that this

this very piece remained in the bains of Corinth safe, vntill *Mummius* destroied the city. How- G
beit, writers there be who affirme, That *Rhœcus* and *Theodorus*, both of the Isle Samos, were the
* i. The race of Bacchis, who for a time reigned at Corinth
first inuentors of this feat of forming shapes in cley, long before the expulsion of the * *Bacchiadæ* out of Corinth. And by their saying, when *Demaratus* was faine to flie out of that city, and to retire himselfe into Tuscan (where he begat *Tarquinius*, afterwards syrnamed *Priscus*, & king of Rome) there accompanied him from Corinth *Eucheir* and *Eugrammus*, two Imageurs in cley, and they taught in Italy the art of Potterie and Imagerie in that kind. As for *Dibutades* before-said, the inuentor he was not of his craft, but indeed he deuised to vse with other cley and earth, a ruddle, or els to colour the white cley with madder. His inuention it was to set vp Gargils or Antiques at the top of a Gauill end, as a finiall to the crest tiles, which in the beginning he cal-
* i. Moulds or patterns.
led * *Protypa*. The same man afterwards deuised other counterfeits, and those be termed *Ectypa*: H
and hence come the louvers and lanterns reared ouer the roofs of temples, which are so curiously wrought in earth. In sum, this man gaue the originall name *Plastica* to the craft, and *Plastæ*, to to the craftsmen in this kind. But *Lysistratus* of Sicyone, and brother to *Lysippus*, of whom I haue written before, was the first that in plaster or Alabaster represented the shape of a mans visage in a mould from the liuely face indeed; and when hee had taken the image in waxe, which the foresaid mould of plastre had giuen, vsed to form and fashion the same more exactly. This man staied not there, but began to make images to the likenesse and resemblance of the person: for before him euery man studied only to make the fairest faces, and neuer regarded whether they were like or no. *Lysistratus* also inuented to make counterfeits in cley, according to the images and statues in brasse, already made. And in the end, this feat of working in cley grew to such I
height, that no images or statues were made without moulds of cley: wherby it may appear, that the skill and knowledge of Potterie is more antient than founderie or casting brasse. To come now to Imageurs in cley, *Damophilus* & *Gorgasus* were counted most excellent & principal of all others, and they were good painters besides; as may appear by the temple of *Ceres* in Rome, that standeth at the greatest shew-place, called Circus Maximus, which these two workmen enriched both with pictures, and also with earthen images: for in the said temple there be certaine Greek verses set vp, which testifie, That all the work on the right hand was wrought by *Damophilus* & on the left hand by *Gorgasus*. Before this temple was built, *M. Varro* saith, that all Rome was furnished with images, of Tuscan work, and no other: but of this church, when it was re-edified, the pictures vpon the wals were esteemed so rich, that people thought them worthy to bee K
cut out in great crusts and flakes out of the said wals; and for to saue them, they bestowed cost to set them in frames fair crested about the edges: also (by his report) the images wherwith the festeries & louers of the said church stood adorned, were dispersed into diuers parts of the city, as singular pieces of work, and well was he that could haue one of them. Moreouer, I reade, that *Chalcosthenes* made diuers pieces of work in raw cley at Athens, and the place called Ceramicos tooke the name of his work-house. And *M. Varro* writeth, that himselfe knew at Rome a certaine man named *Posis*, who was wont to make of cley, clusters of grapes, and fishes, so liuely, that whosoeuer looked vpon them, could hardly haue discerned them by the eie from grapes and fishes indeed. The same author doth highly extoll and magnifie one *Arcesilaus*, a very familiar friend
* Hee meaneth those whereby images of brasse were cast.
of *Lu. Lucullus*, and whom he loued very well, whose * moulds were commonly sold dearer euen L
to workemen themselues, than the workes of others after they were finished. And hee sayth, That the image of *Venus Genetrix*, which standeth in the Forum of *Cæsar*, was of his making: but before hee had fully finished the same, for haste of dedication, it was set vp vnperfect. After which time (as he affirmeth) *Lu. Lucullus* bargained with him to make the image of *Felicitie*, for which he was to haue threescore thousand Sesterces, howbeit, the death both of the one and the other, was the cause that the worke was neuer finished. As for *Octauius*, a knight of Rome, being minded to make a fair standing cup, hee paied to him for the mould in plastre one whole talent. The same *Varro* praiseth also *Praxiteles*, who was wont to say, that the craft of Potterie and working in cley, was the mother of Founderie, and of all workes that are cut, engrauen, chased and embossed: who, albeit hee were an excellent founder and imageur in brasse, and knew how to M
carue, graue, and chase passing well, yet would he neuer goe in hand to make any piece of worke, but he would forme it first in cley, in a mould of his own making. Moreouer, this art (by his saying) was much practised in times past, in Italy and Tuscan especially: from whence, and namely out of the city Fregellæ, king *Tarquinius Priscus* sent for one *Turianus*, to no other purpose in

the

20030
copy 1

A the world, but to agree with him for to make the image of *Iupiter* in earth to set it vp in the capitoll: for surely, no better he was than made of clay, and that by the hand of a porter; which was the reason, that they vsed to colour him ouer with vermillon: yea and the charriots with foure horses which stood vpon the lanterne of the said temple, were of no other stuffe; concerning which, I haue spoken in many places. The same *Turianus* also made the image of *Hercules*, which at this day retaineth still in the city that name, which testifieth what matter he is made of. Lo, what kind of images there were in those daies made in the honour of the gods by our ancestors, for the most excellent! neither haue we cause to be ashamed of those our noble progenitors, who worshipped such and no other. As for siluer and gold, they made no reckoning thereof, either about themselues or the very gods whom they worshipped: and verily, euen at this day
B there continue still in most places, such images of earth. As for the festiers and lanterns of temples, there be many of them both within the city of Rome, and also in diuers burrough townes vnder the Empire, which for curious workmanship (as it were chased and ingrauen) are admirable; and for continuance of time more lasting and durable, than our louvers of gold; and for any harme they do, lesse subject I am sure to injurie. Certes in these daies, notwithstanding the infinit wealth and riches that we are growne vnto, yet in all our diuine seruice and solemne sacrifices, there is no assay giuen or tast made to the gods out of Cassidoine or cristall bols, but only in earthen cups. If a man consider those things aright, & weigh them duly in particular, he shall find the bounty and goodnesse of the earth to be inenarrable, though he should not reckon her benefits that she hath bestowed vpon mankind, in yeelding vs so many sorts of corne, wine, ap-
C ples, and such like fruits, herbs, shrubs, bushes, trees, medicinable drugs, mettals, and mineralls, which I haue already treated of: for euen in these works of earth and pottery, which we are glutted with (they be so vsuall and ordinary) how beneficiall is the earth vnto vs, in yeelding vs conduit pipes for to conuey water into our bains, tyles flat yet hooked and made with crochets at one end to hang vpon the sides of the roofe, chamfered for to lie in gutters to shoot off water, curbed for crests to clasp the ridge on both sides; brickes to lie in wals afront for building, and those otherwhiles to serue as binders in parpine-worke with a face on both sides; to say nothing of the vessels that be turned with the wheele and wrought round; yea and great tuns and pipes of earth deuised to contain wine and water also? In regard of which stone and earthen vessels, K.
D *Numa* ordained at Rome a seuenth confraternitie of potters. Ouer and besides, many men there haue bin of good worth and reputation, who would not be burnt to ashes in a funerall fire after they were dead, but chose rather to haue their bodies bestowed entire within coffins of earth, lying among leaues of myrtle, oliue, and blacke poplar, after the Pythagorean fashion: in which manner, *M. Varro* tooke order for to be interred. And if we looke abroad into the world, most Nations vnder heauen do vse these earthen vessels: and euen still, those that be made of Samian earth and come from that Isle, are much commended for to eat our meats out of, and to be serued to the bourd: and Eretum here in Italy, retaineth yet the name for such vessell: but for drinking-cups, onely Surrentum, Asia, and Pollentia, within Italy; Saguntum in Spaine, and Pergamus in Asia, be in credit: at Tralleis also a city in Sclauonia, and Modenna (to goe no farther
E than Lombardie in Italy) there is made much faire vessell of earth, appropriat vnto those places: for euen in this respect, some nations are innobled and growne into name. This earthen ware is of that price besides, that it is thought a commodity worth the transporting too and fro ouer land & sea, by way of merchandise. But if we speak of that kind that is wrought by turners craft with the wheele, the daintiest vessels come from Erythræ. And in very truth, such may the earth be, that much art and fine workmanship is shewed therein: in testimony whereof, there be two stone vessels or earthen (call them whether you wil) within the principal temple of that city to be seen at this day, thought worthy to be consecrated there, in regard of their cleane worke and their thinnesse besides, which a master and his prentise wrought in a strife and contention, whether of them could driue his earth thinnest: howeuer it be, they of the Island Cos are most commended for the faireſt vessels of earth; and yet those of Hadria beare the name to be more
F durable, and of a more fast and firme constitution. And since I am entred thus far, I will obserue vnto you some examples of seueritie not impertinent to this discourse: I find vpon record, That *Q. Ceponius* was condemned and fined for an ambitious man, onely for this, because hee had sent an earth- * amphor [of wine] as a present vnto one who was to giue him his voice when he stood for an office. And that you may certainly know that vessels of earth haue in some sort been

* *Vini amphoram*: I suppose that he means the vessell in it selfe for wine, and not full of wine.

been in request among riotous gluttons and wastfull spendthrifts, listen what *Feneſtella* saith as touching this point, the greatest exceeding (quoth he) and gaudiest fare at a feast, was serued vp in three platters, and was called Tripatinum: the one was of Lampreys, the second of Pikes, the third of the fish Myxon: whereby it may appeare, that euen in those daies men began at Rome to grow out of order, and to giue themselues to riot and superfluity: yet were not they so bad, but we may prefer them euen before the Philosophers of Greece: for it is written, that in the sale of *Aristotles* goods, which his heirs made after his decease, there were sold 60 platters, which were wont ordinarily to go about the house. As for that one platter of *Æsop* the plaier in tragœdies, which cost fix hundred thousand sesterces, I doubt not but their stomackes rise thereat when they reade thereof in my treatise as touching birds. But this is nothing (I assure you) to that charger of *Vitellius*, who whiles he was Emperor caused one to be made and finished that cost a * million of sesterces, for the * making wherof there was a furnace built of purpose in the field; the which I rather note, because they should see the monstrous excesse in these daies, that vessels of earth should be more costly than of Cassidonie. Alluding to this monstrous platter, *Mutianus* in his second Consulship (when he ripped vp in a publicke speech, the whole life of *Vitellius*, now dead) vpbraided the very memoriall of him in these very terms, calling his excesse that way, Patinarum paludes, *i.* platters as broad as pools. And verily (saith he) that platter of *Vitellius*, came nothing behind another, which *Cassius Seuerus* reproched *Asprenas* withall, whom he accused bitterly, and said, that the poison of that one platter had killed an 130 persons who had tasted thereof.

* *Decies sestertiũm*, according to *Budæus*; but if you read according to *Hotomanus*, *ducenties*, it is twenty times as much more

Furthermore, there are certaine townes that are in good account by reason onely of this vessell made therein, and namely Rhegium and Cumæ.

The priests of *Cybele* the mother of the gods, who are called Galli, vse to gueld themselues with a sheard of Samian earth; and they be of opinion, that if it be done with any thing els, they shall die thereof, if we may beleeue *M. Cælius*, who whetted that tongue of his (which shortly after was in that sort to be cut out) against *Vitellius*; which turned to his great reproch and infamie, for that himselfe euen then railed vpon *Vitellius* in so bad termes, and lost his tongue for his labour.

* This platter he called, the targuet of *Minerua*, and hee got himselfe thereby a name to be called *Patinarius*. See *Sueton.*

But to conclude, what is it, that Art and the wit of man hath not deuised? for there is a means found to make a strong kind of mortar or cement by the broken sheards of potters vessell, if the same be ground into powder and tempered with lime; and the ordering of it in this manner, causeth it to be more firme and last the longer; and such they call Signina. And hereby also men haue found out certain durable pauements of that kind.

Chap. XIII.

¶ *The varietie of sundry kinds of earth: of the dust or sand of Puteoli: and of other sorts of earth which will harden as a stone.*

OVer & besides the cement aboue named, there be other percels that the earth it self doth affoord, fit to be laid in pauing worke: for who can sufficiently wonder at this, namely, That the worst part of it (which thereupon is callled dust and sand, as it were the very excrement thereof) should be of that nature vpon the side of the hills of Puteoli, as being opposed against the waues of the sea, and continually drenched & drowned therwith, should become a stone so compact and vnited together as it were into a rock, that it scorneth all the violence of the surging billows; which are not able to vndermine and pierce the same, but hardeneth euery day more than other; euen as if it were tempered with the strong cement of Cumes. Of the same property is the earth within the country about Cyzicum: onely this is the difference, that not the dust or sand there, but the earth it selfe cut out into what parcels you will, in case it be drenched in the sea water a certaine time, is taken forth againe a very hard stone. The same (by report) happeneth about the citie Cassandria: as also about Gnidos in a fountaine of fresh water, wherein if earth do lye, within the space of eight moneths it will turne to be a stone. Certes, all the way as a man goeth from Oropus as farre as to Aulis, what ground soeuer is beaten vpon by the water, changeth into rockes and stones. There is found also in Nilus a certaine sand, whereof the finest part differeth not much from that of Puteoli before said: not in regard that

20030
copy 1

A that it is ſo ſtrong as to breake the force of the ſea-water & to beat back the waues, but to ſubdue and cruſh the bodies of our yong gentlemen, and therefore ſerueth well in the publicke place of wreſtling for thoſe that be giuen to ſuch exerciſes: and for this purpoſe verily was it brought from thence by ſea to *Patrobius*, a ſlaue lately infranchiſed by *Nero* the Emperor. I reade alſo, that *Leonatus*, *Cratus*, and *Meleager*, who were great captains vnder *Alexander* the Great, and followed his court, were wont to haue this ſand carried with them, with other baggage belonging to the camp. But I mean not to write any more of this argument, no more verily than of the vſe of earth in thoſe places where our youth annoint their bodies againſt they ſhould wreſtle; wherein our youths addict themſelues ſo much to the exerciſe of the body, that they haue ſpoiled themſelues otherwiſe, and loſt the vigor of the mind.

B

CHAP. XIIII.

¶ *Of mud walls: of Bricke walls, and the order and manner of making them.*

WHat ſhall we ſay? See we not in Africke and Spaine both, certain walls of earth, which they cal * Formacei, of the forme and frame that is made of planks and boords of each ſide, between which a man may ſay they are rather infarced & ſtuffed vp, than otherwiſe laid and reared orderly; but I aſſure you, the earth thus infarced, continueth a world of yeres and periſheth not, checking the violence of raine, winde and fire, no mortar and cement ſo ſtiffe and C ſtrong. There are yet to be ſeene in diuers parts of Spaine, the watch-towers of *Anniball*, the high turrets and ſconces alſo reared vpon the tops of hils, made all of earth: and hereof we haue our turfes, which naturally are ſo proper not only for the rampiers and fortifications of a camp, but alſo for wharfs, banks, and buttreſſes, to breake the violence and inundation of riuers. As for the manner of making walls, by dawbing windings and hurdles with mud and clay, alſo of rearing them otherwhiles with vnbaked bricke; who is ſo ignorant that he knoweth it not? howbeit, for to make good brickes, they ought not to be made of any ſoile that is full of ſand and grauell, much leſſe then of that which ſtandeth much vpon grit & ſtones, but of a greyiſh marle or whitiſh chalkie clay, or at leaſtwiſe a reddiſh earth: but in caſe wee bee forced to vſe that which is giuen to be ſandy, yet we muſt chuſe that kind of ſand which is tough and ſtrong. The D beſt ſeaſon to make theſe bricks or tyles, is in the ſpring time; for in the mids of Summer they will cleaue and be full of chinkes; but if you would haue good brickes for building, they ought to be two yeares old at the leaſt. Now the batter or lome that goeth to the making of them, ought to be well ſteeped and ſoked in water, before it be faſhioned into bricke or tyle. Brickes are made of three ſizes: the ordinarie bricke that we vſe, is called Didoron, which carrieth in length one foot and a halfe, and in breadth a foot: a ſecond ſort is named Tetradoron, *i.* three foot long: and the third, Pentadoron, of three foot and nine inches in length: for the Greeks in old time, called the ſpan or ſpace of the hand from the thumbe to the little fingers end ſtretched out, Doron; which is the reaſon that gifts and rewards be called in their language, Dora, for that they were preſented by the hand. You ſee therefore, how according to the length that they E carrie, either of foure or fiue ſpans, they haue their denomination of Tetradora, or Pentadora; for the breadth is one and the ſame in them all, to wit, one foot ouer. Now there beeing this difference in the ſize, in Greece the manner is to imploy the ſmaller ſort in their priuat buildings, but the bigger ſerueth for greater publicke workes. At Pitana in Aſia, and in Maſſia and Calentum, cities of low Spaine, the bricks that be made, after they are once dried, will not ſinke in the water, but flote aloft; for of a ſpungeous and hollow earth they be made, reſembling the nature of the pumiſh ſtone, which is very good for this purpoſe, when it may be wrought. The Greeks haue alwaies preferred the walls of bricke, before any others, vnleſſe it be in thoſe places where they had flint at hand to build withall: for ſurely ſuch brick wals, if they be made plump vpright & wrought by line and leuell, ſo as they neither hang nor batter, be euerlaſting: & ther- F fore ſuch bricks ſerue for wals of cities and publick works; their roial pallaces likewiſe be built therewith. After this ſort was that part of the wall at Athens laid and reared, which regards the mount Hymettus: ſo they built alſo at Patræ, the temples of *Iupiter* & *Hercules*, although all the columns, pillars, and architraues round about them, were of aſhler ſtone: thus was the pallace of K. *Attalus* built at Tralleis; likwiſe that of K. *Cræſus* at Sardis, which afterward was conuerted

* Some reade *fornacti*, i. arched walls.

to their Senat-houſe, named Geruſia: likewiſe the ſumptuous and ſtately houſe of king *Mauſolus* at Halicarnaſſus: which goodly ædifices continue at this day. Wee read in the Chronicles, that *Muræna* and *Varro* when they were the high Ædiles at Rome, cauſed the outmoſt coat which was ouercaſt of the brick-wals of Lacedæmon, to be cut out whole and entire, and to bee ſet and encloſed within certaine frames or caſes of wood, and ſo to be tranſlated from thence to Rome, for to adorne and beautifie the publicke hall for elections of Magiſtrates, called Comitium; and all for the excellent painting vpon that parget. The workmanſhip therein although it were excellent and wonderfull in it ſelfe, yet being thus remoued and brought ſo far ſafe, it was eſteemed more admirable. Moreouer, here within Italy the walls of Aretine and Meuania be made all of bricke: mary at Rome they dare not build their houſes with this kind of bricke, becauſe a wall bearing in thickneſſe but one foot and an halfe, wil not ſuſtain aboue one* ſingle ſtory; for the order of the city permitted not the common wals and thoſe which were outmoſt, to be thicker than a foot and an halfe: neither wil the partition wals within abide that thicknes, but are made after another ſort.

*For by reaſon that Rome was ſo populous, they made many lofts ouer head, ſo that the building was raiſed to 60 and 70 foot in vpright wals: & theſe ſerued as tenements, & were called *Cœnacula*, and one paire of ſtaires leading into the ſtreet, ſerued them all: wheras the lord and maſter of the houſe kept beneath with his houſhold, and was not troubled with theſe tenants or in-mates.

Chap. XV.

¶ *Of Brimſtone and Alume, with their ſeuerall kinds: alſo their medicinable properties.*

HAuing ſpoken ſufficiently of Bricks, it remaineth that I ſhould proceed to other kinds of earth: wherein the nature of ſulphur or brimſtone is moſt wonderfull, being able as it is to tame and conſume the moſt things that be in the world: it is ingendred within the Iſlands Æoliæ, which lie between Italy and Sicily; thoſe I meane which (as I haue ſaid before) doe alwaies burne by reaſon thereof. Howbeit, the beſt ſulphur is that which commeth from the Iſle Melos. There is found thereof likewiſe in Italy, within the territory about Naples and Capua, and namely in the hills called Leucogæi: that which is digged out of the mines, is fined and brought to perfection by fire. Of brimſtone there be foure kinds; to wit, Sulphur vif or Quicke-brimſtone, which the Greeks call Apyron, becauſe it neuer came into the fire: the ſame is found ſolid of it ſelfe, *i.* by whole pieces and in maſſe, which their Phyſitians doe vſe, and none but it; for all the other kindes conſiſt of a certaine liquid ſubſtance, and being boiled in oile are made vp and confected to their conſiſtence: whereas the ſulphur vif is digged out of the mine ſuch as we ſee, that is to ſay, tranſparent, cleere, and greeniſh. The ſecond kind is named Gleba, good onely for Tuckers and Fullers. The third ſort alſo yeeldeth but one vſe and no more, and that is, for tincture of wooll, by reaſon that the ſmoke and perfume thereof wil bring it to be white and ſoft; and this brimſtone they call Egula. As for the fourth kinde, it ſerueth moſt of all for matches and wieks.

As touching the nature of Brimſtone, ſo forcible it is, that if it be caſt into the fire, the verie ſmell and ſteeme thereof will driue thoſe in the place into a fit of the falling ſickneſſe, if they be ſubject thereunto. As for *Anaxilaus*, he would commonly make ſport withall at a feaſt, and ſet all the gueſts into a merriment: for his manner was to ſet it a burning within a cup of new earth ouer a chafing diſh of coales, and to carry it about the table where they were at ſupper: and in very truth the reuerberation of the flame would make all that were neere it to looke pale and wan after a moſt fearefull manner, like as if there were as many griſly ghoſts or dead mens faces. And to come more neere to the properties that it hath reſpectiue vnto Phyſicke, it healeth mightily, and is a maturatiue: it doth reſolue withall and diſcuſſe any gathering of impoſtumes; in which regard it entereth ordinarily into ſuch plaſters that bee diſcuſſiue and emollitiue. A cataplaſme made with it, incorporate with greaſe or ſewet, and ſo applyed vnto the loynes and regions of the Kidnies, doth wonderfully aſſuage the paine and griefe in thoſe places: being tempered with turpentine, it riddeth away the foule tetters called Lichenes that ariſe in the face, yea and cleanſeth the leproſie. The Greekes haue a pretty name for it and call it Harpacticon, for the ſpeedy remouing and ſnatching it from the place where it is applied; for eftſoones it ought to be taken away. The ſame reduced into a lohoch or liquid Electuarie, is good to be licked and let downe ſoftly towards the lungs, in caſe of ſhortneſſe and difficultie of winde: in which ſort it ſerueth for them that ſpit and reach out of the breaſt by coughing, filthie matter: and ſoueraigne it is for thoſe that be ſtung with ſcorpions. Take ſulphur-vif,

mix

20030
copy 1

A mix it with ſal-nitre, grind the ſame together with vinegre, it maketh a ſingular good liniment for to ſcoure the foule morphew: let the ſame be tempered and prepared with vineger of Sandaracha, it killeth the nits that breed in the eie-lids. Moreouer, brimſtone is imployed ceremoniouſly in hallowing of houſes; for many are of opinion, that the perfume and burning thereof, will keep out all inchantments, yea, and driue away foule fiends and euill ſpirits that doe haunt a place. The ſtrength of Sulphur is euidently perceiued & felt in the ſprings of hot waters, that boile from a vain of it: neither is there in all the world, a thing that ſooner catcheth fire; wherby it is apparant, that it doth participat much of that element. Thunderbolts & lightnings in like manner do ſent ſtrongly of brimſtone: the very flaſhes and leames thereof ſtand much vpon the nature of ſulphur, and yeeld the like light. Thus much ſhall ſuffice as touching the nature of
B ſulphur.

The nature of Bitumen approcheth neere vnto brimſtone: where it is to be noted in the firſt place, that the Bitumen whereof I ſpeake, is in ſome places in manner of a muddy ſlime; in others, very earth or minerall. The ſlimy bitumen ariſeth (as I haue ſaid before) out of a lake in Iurie; as for the minerall bitumen, it is found in Syria, about a maritime town vpon the ſeacoaſt called Sidon: but both the one and the other are of a compact and maſſie ſubſtance, growing together faſt and vnite. And yet there is a kind of Bitumen liquid, and namely that of Zacynthus, and the Bitumen which is brought from Babylon, where verily it is white naturally as it groweth. The Bitumen alſo which commeth from Apollonia is liquid: and all theſe the Greeks doe comprehend vnder one name Piſſaſphalton, a word deriued of Pitch and Bitumen. There is a
C fatty kind of Bitumen likewiſe reſembling an vncteous or oleous liquor, within the territorie of Agragentum in Sicilie, ariſing out of a fountaine, and it floteth aloft: The inhabitants of the countrey vſe to ſcum and fleet it off by the meanes of certaine chats or catkins which grow vpon many reeds and canes, for quickly will it hang and cleaue to the downe of ſuch. Great vſe they haue of this Bitumen, for it ſerueth their turnes to maintain lamp-light, in ſteed of oile: & therewith alſo they kill the farcins, ſcabs, and mange in their jades and laboring garrons. Some writers there be who reckon Naphtha (whereof I haue written in my ſecond book) to be a kinde of Bitumen; but ſo ardent it is, and holdeth ſo much of the fire, that wee know not which way to make any vſe thereof. Concerning the marks of good Bitumen, the beſt is knowne by the gloſſe that it carrieth, if it ſhine exceeding much: the ſame alſo is ponderous and weighty: whereas the
D lighter ſort is but indifferent heauy, and argueth ſome ſophiſtication with pitch. In operation it hath the qualities of brimſtone; aſtringent it is, and yet reſolutiue: it draweth together, and ſoldereth withall. A perfume thereof while it burneth, chaſeth away ſerpents. The Babylonian Bitumen is thought to be very effectuall for the cataracts, pearles, and filmes that ouerſpred the eies: ſoueraigne likewiſe for the leprie, and filthy tettars of the face called Lichenes, and the itch in any part of the body: it ſerueth in a liniment for the gout: and there is no kind thereof, but it cauſeth the haires of the eie-lids, which grow vntowardly and fal into the eies, for to turn vp againe. If the teeth be well rubbed with bitumen and ſal-nitre together, it doth eaſe and aſſuage their paine: and being giuen in wine, it helpeth an old cough, and the ſhortneſſe of wind.
In caſe alſo of the diſſenterie, it is taken in that manner, for it ſtaieth a bloudy flix: but if it
E bee drunke with vineger, it doth diſcuſſe and diſſolue * cluttered bloud which is within the body, and expelleth the ſame downeward by ſeege: it doth likewiſe aſſuage the paine of the loynes or ſmall of the backe, and generally mitigateth any griefe of the joints, if it bee layed too in manner of a cataplaſme with Barley meale. There is a ſpeciall plaſtre or cataplaſme made of Bitumen, which carrieth the name thereof; it ſtancheth bloud, it bindeth and draweth together the edges of a wound, alſo it knitteth and vniteth again ſinews which be cut in twain. There is an ordinary medicine alſo for the quartane ague, made in this wiſe: Take of Bitumen one dramme, of Mints the like weight, of Myrrhe the quantitie of one Obolus, mix and incorporat all theſe together: a perfume or ſmoke thereof will bewray the falling ſickneſſe. The very ſmell of Bitumen alſo diſcuſſeth the fits of the mother when it riſeth and ſtoppeth the wo-
F mans breath: A ſuffumigation thereof, doth likewiſe reduce the matrice and tiwill into the right place, if they bee ſlipped and fallen downe too low, and ready to hang forth of the bodie: beeing drunke with Wine and Caſtoreum, it bringeth the ordinary courſe of the monethly termes in women. It ſerueth alſo for diuerſe and ſundrie other vſes than in Phyſicke: For if any braſen Pots, Chaufers, pannes or kettles, or ſuch like veſſels, bee enhuiled there-

* Hereupon it is an ordinary medicine, to giue *Mumia* (which is *Piſſaſphaltō*) vnto thoſe that are falne from on high and bee inwardly bruiſed.

therwith,it hardeneth them againſt the violence of fire. I haue ſaid already,that they were wont G
in old time to verniſh their images with bitumen: it hath beene vſed in mortar alſo in ſtead of lime,and with that kind of cement were the walls of Babylon laid, and the ſtones ſodered together. Iron-ſmiths alſo haue much vſe of bitumen, and namely,in ſanguining or colouring their ironworke;and nailers eſpecially about their naile heads;many other waies likewiſe it ſerueth their turne.

As touching Alume,which we take to be a certain ſalt ſubſtance or liquor iſſuing out of the earth, there is no leſſe vſe therof than of bitumen, and the emploiment is not much vnlike. Of alume there be many kinds: in the Iſland Cypreſſe there is found alume which they call White, and another named Blacke: and albeit the diſtinction in the colour be but ſmall,yet it is occupied to farre different vſes; for the cleare alume which they name the white,is proper for to co- H
lour wooll with any bright tincture;contrariwiſe,the blacke ſerueth for ſad, darke, and browne colours. The foreſaid black alume is occupied much by goldſmiths,to purge and purifie their gold: and yet all theſe alumes the one as well as the other,be engendred of water & ſlimie mud, that is to ſay,of a certaine ſweat that the earth naturally doth yeeld: it is ſuffered to run and gather togither into a place,during winter; and in the heat of ſummer,it fermenteth and taketh the perfection: that which commeth ſooneſt to concoction and ripeneſſe, the ſame is alwaies the whiteſt and pureſt. As touching the mines of alume,they grow naturally in Spaine, Ægipt, Armenia, Macedonia, Pontus and Affricke, which be all countries of the continent: in the Iſlands likewiſe it is found,namely in Sardinia, Melos, Lipara, and Strongyle. The beſt ſimply is that which commeth out of Ægypt,and in the next place is that accounted of Melos. In ſum, I
alume may be reduced into two principal kinds;for either it is pure aud cleare,or els thick and groſſe: as for the former kind, it may be knowne whether it be good and naturall,if it be bright like water,& white as milk,not offenſiue to their hands that rub it,& yet participating in ſome ſort of a fiery heat;this they cal Phormion: but in caſe it is ſophiſticat,you may ſoon find it by the juice of a pomegranat, for that which is true and the right kind, is no ſooner mixed therewith,but it waxeth black. The ſecond ſort is of a pale color,and beſides naturally rugged in the hand,and lightly it will ſtain like gall nuts;which is the reaſon that the Greeks cal it Paraphoron. The vertues of the cleare alume,be aſtringent,hardning,and fretting: if it be tempered with hony,it healeth the cankers or ſores in the mouth: wheals and itch it likewiſe cures in any part of the body: but this inunction muſt be vſed in a baine;and regard ought to be had of it in the K
proportion,namely,that there be two third parts of hony to one of alume. The ranke ſmell of the arme-holes it doth allay, and repreſſeth ſweat and the ſtinke therof: it is taken in pills, for the obſtructions and ſchirroſities of the ſpleene: and in that ſort, it driueth away an itch & ſendeth forth corrupt bloud by vrine: made into an vnguent with Sal-nitre and Nigella Romana, it healeth the bleach or ſcabs. Of alume that is thick,hard,and maſſiue,there is one kind which the Greeks call * Schiſtos, and the nature thereof is to cleaue along into certaine filiments or threads like haires, of a greeniſh colour;which is the reaſon that ſome haue giuen it rather the name of Trichitis: howſoeuer it be named, it commeth of a certaine marqueſit ſtone,wherupon alſo they call it Chalcitis;ſo as it may be counted a very ſweat of the ſaid ſtone,gathered together or congealed into a ſome. This kind of alume is exiccatiue; howbeit,not ſo good as the o- L
ther to repreſſe any offenſiue humors in the body: but ſurely it is ſingular for the ears,either infuſed,or applied as a liniment: it helps alſo the ſores of the mouth,if a man let it melt together with the ſpittle or moiſture of the mouth: for eyeſalues likewiſe it ſerues fitly among other ingredients;and is very appropriat for the accidents befalling to the ſecret parts of either ſex, as well men as women: but before it be vſed,it would be boiled vpon a pan ouer the fire,till it giue ouer to melt. There is another ſort of alume,that is weaker in operation, which the Greeks call Strongyle: and this likewiſe is found of two ſorts; the one is hollow and light in manner of muſhroms,eaſie to be melted in any kind of liquor; and this is altogether reiected as good for nothing: the other is hollow alſo and light in manner of a pumiſh ſtone,full of holes too,but reſembling the pipes rather of ſpunges; the ſame is round in forme, and enclining to a white co- M
lour;a certaine vnctuoſitie or fattineſſe it carrieth with it, apt to breake and crumble, and yet without ſand, neither will it colour and ſtaine the fingers blacke in the handling: this muſt be calcined by it ſelfe vpon cleare burning coales, vntill ſuch time as it be reduced into aſhes. But would you know the beſt and principall alume of all the ſorts that are? it is that (no doubt)

which

* Some take this for Alume de plume: others,for the ſtone *Amiantus*.

20030
copy 1

A which (as I haue ſaid before) is brought out of the Iſland Melos, and therefore called Melinum. Certes, there is not an Alume more aſtringent, nor more proper to harden: none more firm and thicke than it. It doth ſubtiliat the roughnes of the eies: and being calcined, it is the better for to repreſſe the fluxion of humors into the eies: and in the ſame ſort prepared, it killeth the itch in any part of the body: generally, wherſoeuer it is applied outwardly, it ſtaunceth bloud: being vſed in a liniment with vinegre vnto any place where the haire hath been plucked vp, it cauſeth that which commeth again to be but ſoft and in maner of a downe. There is no kind of it, but the ſame is exceeding aſtringent, wherupon it took the name in *Greek. In regard of which * συστηϛικὸν.
ſtypticitie, they are all very good for the accidents of the eies. Alume incorporat with ſome greaſe or fat, is ſingular to repreſſe the flux of bloud: very proper alſo for the red gum incident
B to children: and in ſome ſort ſtaieth ſuch vlcers as tend to putrifaction, yea, it drieth vp the breaking forth of *wheales and puſhes. With the juice of the Pomgranat, it is good for the in- * Papularum.
firmities of the eares; in which ſort it doth amend the ruggedneſſe of the nailes, the hardneſſe and nodocitie of cicatrices or skars, the excreſſence and turning vp of the fleſh about the naile roots, and the kibes of the heeles. With vinegre, or calcined with the like weight of gall nuts, it is excellent for cankers and inflammation of ſuch vlcers as be corroſiue. Tempered with the iuice of Beets or Coleworts, it cleanſeth the leproſie. Incorporat with two parts of ſalt, it healeth thoſe ſores which are giuen to eat and ſpread farther: and mingled with water it riddeth away nits, lice, and ſuch vermine breeding in the head; in which manner it healeth burnes and ſcalds. But with pitch and the floure of Eruiles, it ſcoures away dandruffe and ſcurfe in any part
C of the body. In a clyſtre, Alume is ſoueraigne for the bloudie flix. It ſerueth likewiſe for the uvula in the mouth, and the inflammation of the Amygdales. In one word, for all thoſe purpoſes which I haue ſaid, other ſorts of Allume are good for, we muſt alwaies thinke, that the Alume brought from Melos, is the beſt and moſt effectuall. As touching other vſes beſides Phyſicke, wherein it is emploied neceſſarily, and namely in dreſſing of skins and colouring wooll, of what reckoning it is, I haue ſhewed already. It remaineth now to treat of all other kinds of earth reſpectiuely, as they ſerue in the vſe of Phyſicke.

Chap. XVI.

D ¶ *Of the diuerſe ſorts of earth, to wit, of Samia, Eretria, Chia, Selinuſia, Pnigitis, and Ampelitis, together with their medicinable properties.*

FRom the Iſle Samos there be brought two kinds of earth: whereof the one is called by the Greekes Syropicon, the other Aſter. As for the former, the commendation of it, is to be freſh, light, and cleauing to the tongue: The other, is white and of a more compact conſtitution: but both the one and the other, before they be vſed, ought to be calcined and waſhed. Some there be who preferre the former: but both be very good for thoſe that ſpit bloud. They enter into emplaiſtres, which are deuiſed and made for to exiccat; and they are mingled alſo with eie-ſalues.

Touching the earth Eretria, diſtinguiſhed it is likewiſe by two kindes, for ſome there is of it
E white, other of aſh colour: and this for Phyſick is held to be the better. It is known to be good, if it be ſoft in hand; and, if vpon a piece of braſſe it draw a line of purple colour. What power it hath, and how it is to be vſed in Phyſicke, I haue ſhewed already in my diſcourſe of painters colours. But this is a general rule in all kinds of earth (for I will put it off no longer) that are to be waſhed, Firſt to let them lie well ſteeped in water, then ought the ſame to be dried in the Sun; which done, it ought once againe to be braied in water, and let to reſt vntil they be ſettled, that they may be digeſted and reduced into trochiskes. But for the burning and calcining of theſe earths, it ought to be done in certaine pots, and eftſoones followed and plied with ſhaking and ſtirring.

Among the ſorts of earth that be medicinable, there is reckoned that which commeth from
F Chios, & the ſame is white, hauing the ſame effects that the earth of Samos: but our dames vſe it moſt for to embelliſh & beautifie the skin. To which purpoſe, the earth of Selenus likewiſe is emploied: White this earth is as milke, and of all others, will ſooneſt reſolue in water; which if it be tempered with milke, ſerues to whiten and refreſh the pargetting and painting of wals.

The earth called *Pignitis, is very like vnto Eretria beforenamed, only it is found in greater * Some read Pnigitis.
clots

clots or pieces,& otherwiſe is glutinous. The ſame effects it hath that Cimolia, howbeit, ſomewhat weaker in operation. G

There is an earth called Ampelitis, which reſembleth Bitumen as neer as may be. The triall of that which is good indeed, is, if in oile it be gentle to be wrought as wax; and if when it is torrified, it continue ſtill of a blacke colour. It entreth into medicines and compoſitions, which are made to mollifie and diſcuſſe: but principally it ſerueth to beautifie the eie-browes, and to colour the haire of the head blacke.

Chap. XVII.

¶ *Sundry ſorts of chaulkes for to ſcoure clothes, and namely the Tuckers earth Cimolia, Sarda, and Vmbrica. Of the common chaulke: and of Tripolium.* H

OF Chaulks there be many kinds: of which, Cimolia doth affoord two ſorts, and both pertinent to Phyſick; the one is white, the other inclineth to the colour of Roſet. Both the one and the other is of power to diſcuſſe tumors, and to ſtay diſtillations, if they be vſed with vineger. They do keep downe biles and emunctories and ſwellings behind the eares: the foule tettars alſo, and other offenſiue pimples and puſhes they repreſſe, applied in the forme of a liniment: incorporat therewith ſalt-petre, ſalnitre, and put vineger thereto, it is an excellent medicine to allay the ſwellings of the feet; with this charge, that this cure be done in the Sun, and that after ſix houres, the medicine be waſhed off with ſalt water. Put thereto the cerot Cyprinum, it is ſingular good for the ſwelling of the genetoirs. This Fullers earth Cimolia is of a cooling nature, and being vſed in the forme of a liniment, it ſtaieth immoderat ſweats: the ſame taken inwardly with wine in the baine or hot-houſe, reſtraineth the breaking forth of pimples. The beſt of this kind, is that which commeth out of Theſſalie. It is to be found alſo in Lycia about Bubon. There is ouer and beſides, another vſe of this Cimolia or Tuckers cley, to wit, in ſcouring clothes. As for the chaulke Sarda, ſo called becauſe it is brought out of Sardinia, it is employed only about white clothes, for if they be moteley or pied coloured, it is of no vſe. Of al kinds of Cimolia it is the cheapeſt, and of baſeſt account: yet that of Vmbria is of more price, and that which they call Saxum in Latine, and is our ordinary white chaulke: this property it hath, that with lying in water it groweth; this is commonly bought therefore by weight, whereas the other is ſold by meaſure. As for the foreſaid earth of Vmbria, it ſerueth only for to poliſh and giue a gloſſe to clothes: for why ſhould I ſcorne or thinke much to handle this matter alſo? ſeeing there is the expreſſe law or act Metella, prouided for Fullers, the which *C. Flaminius* and *Lu. Æmylius*, when they were Cenſors, propoſed vnto the people for to be enacted; ſo carefull were our predeceſſors, to take order for all things. To come then to the myſterie of Fullers craft: Firſt they waſh and ſcour a piece of cloth with the earth of Sardinia, then they perfume it with the ſmoke of brimſtone, which done, they fall anone to burling of it with Cimolia; prouided alwaies that it be the right and haue the natiue colour, for if it be ſophiſticat, it is ſoone knowne by this, that it waxeth blacke, and wil chaune and cleaue, if it come after ſulphur: and if it be the true Cimolia, it doth refreſh and giue a cheerefull hew to precious and rich colors, yea it ſetteth a certain gloſſe and luſtre vpon them, if they were made duskiſh & ſad by the ſmoake of ſulphur. But in caſe the clothes be white, then the common chaulke is better to be vſed preſently after the brimſtone: for hurtfull it is to other colors. In Greece, they vſe in ſtead of Cimolia, a certaine plaſtre which they haue from Tymphe. Yet is there another kind of chalke or white cley, named* Argentaria, for that it giueth a gliſtering ſiluer color to clothes. Howbeit, one ſort more there is of chalk, which of all others is moſt baſe and leaſt eſteemed; this is that chalke, wherwith our aunceſtours in old time ordained to whiten the cirque, in token of victory: wherewith alſo they vſe to marke the feet of thoſe ſlaues which were brought ouer from beyond ſea, to be bought and ſold in the markets: ſuch an one ſomtime was that *Publius*, the deuiſer of riming and wanton jeſtures vpon a ſtage: ſuch another was his couſin germaine, *Manilius Antiochus*, the Aſtrologer; yea, and *Taberius Erotes* the excellent Grammarian: whom all three, our great grandfathers ſaw in that manner brought ouer in one and the ſame ſhip. Chap. XVIII.

¶ *Who they were in Rome, and of whom enfranchiſed, that of ſlaues riſe to be mightie, and of exceeding wealth.*

BVt what meane I to ſtand vpon thoſe who had learning to commend and bring them into ſome ſtate of credit and honour? Haue not the ſame forefathers of ours ſeene in the like plight ſtanding within a cage, with a marke of chaulke vpon their feet, and a locke about their heeles, *Chryſogonus* the ſlaue to *Sylla*, *Amphion* to *Qu. Catulus*, *Hero* to *Lu. Lucullus*, *Demetrius* to *Pompey*, *Auge* the bondmaid to *Demetrius* (though ſhe was thought to be the baſe daughter of *Pompey*,) *Hipparchus* the ſlaue of *Antonius*, *Menas* and *Menecrates* of *Sex. Pompeius*, and an infinite ſort of others, whom I cannot reckon vp? and yet they all being by their maſters enfranchiſed, became wonderfull rich by the bloudſhed and goods of Romane citizens, in that licentious time of proſcriptions. Well, this was the marke of ſlaues ſet out by companies in the market to be ſold: and this is the opprobrious and reprochful note, to twit thoſe by, that in their fortunes are growne inſolent. And yet we in our daies haue knowne the ſame perſons to climbe vnto the place of higheſt honour and authority, inſomuch, as we haue ſeene with our owne eies the Senat (by commandement from *Agrippina* the Empreſſe, wife to *Claudius Cæſar*) to decree vnto enfranchiſed ſlaues, the robes of Pretours, with the badges and ornaments to that dignity belonging; yea, and ſuch to bee ſent againe as it were with the axes and knitches of rods decked with Lawrell, into thoſe countries to gouerne, from whence they came at firſt poore ſlaues with their feet chalked and marked for the market.

Chap. XIX.

¶ *Of the earth of Galata, and Clupea: of the Baleare earth, and Ebuſitana.*

OVer and aboue thoſe before rehearſed, there be other ſorts of earth, hauing a property by themſelues, which I haue named heretofore, but in this place I am to ſet downe their nature and vertues alſo. There is a kind of earth comming out of the Iſle Galata, and about Clupea in Affricke, which killeth ſcorpions: like as the Balearike and Ebuſitane earth, is the death of other ſerpents.

The Proem.

CHAP. I.

¶ *The natures and properties of Stones: The exceſſiue expence in columnes and buildings of Marble.* I

IT remaines now to write of the nature of ſtones, that is to ſay, the principal point of all enormious abuſes, and the very height of waſtful ſuperfluities, yea though we ſhould keep ſilence, and ſay nothing either of precious ſtones and Amber, or of Chryſtall and Caſſidonie. For all things els which we haue handled heretofore euen to this Booke, may ſeem in ſome ſort to haue been made for man; but as for mountaines, Nature had framed them for her owne ſelfe; partly to ſtrengthen (as it were) certaine ioints within the veines and bowels of the earth; partly to tame the violence of great riuers, & to break the force of ſurging waues and inundations of the ſea; and in one word, by that ſubſtance and matter whereof they ſtand, which of all others is moſt hard, to reſtraine and keep K within bounds that vnruly element of the water. And yet notwithſtanding, for our wanton pleaſures and nothing els, we cut and hew, we load and carry away thoſe huge hils and inacceſſible rockes, which otherwiſe to paſſe only ouer, was thought a wonder. Our Anceſtors in times paſt reputed it a miracle, and in manner prodigious, that firſt *Annibal*, and afterwards the Cimbrians, ſurmounted the Alps: but now, euen the ſame mountains wee pierce through with picke-axe and mattocke, for to get out thereof a thouſand ſorts of marble; wee cleaue the capes and promontories: we lay them open for the ſea, to let it in; downe we goe with their heads, as if wee would lay the whole world euen, and make all leuell. The mightie mountains ſet as limits to bound the frontiers of diuers countries, and to ſeparate one Nation from another, thoſe wee tranſport and carrie from their natiue ſeat: ſhips wee build of purpoſe for to fraught with mar- L ble: the cliffes and tops of high hills they carrie too and fro, amid the waues and billowes of the ſea, and neuer feare the danger of that moſt fell and cruell element: wherein verily wee ſurpaſſe the madneſſe and vanitie of thoſe, who ſearch as high as the clouds for a cup to drink our water cold; and hollow the rocks that in manner touch the heauen, and all to drink out of * yce. Now let euery man thinke with himſelfe what exceſſiue prices of theſe ſtones hee ſhall heare anone, and what monſtrous pieces and maſſes he ſeeth drawne and carried both by land and ſea; let him conſider withall, how much more faire and happy a life many a man ſhould haue without all this, and how many cannot chuſe but die for it, whenſoeuer they go about to doe, or if I ſhould ſpeake more truely, to ſuffer this enterpriſe: alſo, for what vſe elſe, or pleaſure rather, but onely that they might lie in beds and chambers of ſtones that forſooth are ſpotted, as if they neM uer regarded how the darkneſſe of the night bereaueth the one halfe of each mans life of theſe delights and ioies. When I ponder and weigh theſe things in my mind, I muſt needs think great ſhame, & impute a great fault to our forefathers that liued long ſince, & bluſh in their behalfe. Lawes were enacted, and prohibitions publiſhed by the Cenſors, and thoſe remaining vpon record,

* *Vt bibatur glacie*, for hey held Cryſtall to be a kinde of yce.

20030
copy 1

A cord, forbidding expreſſely, That neither the kernelly part of a Bores neck, nor dormice, & other ſmaller matters than theſe to be ſpoken of, ſhould be ſerued vp to the boord at great feaſts: but as touching the reſtraint of bringing in marble, or of ſailing into forraine parts for the ſame, there was no act or ſtatute ordained.

Chap. II.

¶ *Who was the firſt that ſhewed Marble ſtones in Columnes, or any publicke workes at Rome.*

B BVt ſome man haply might reply againe vpon me, and ſay: what need was there of any ſuch ordinance, conſidering there was no marble in thoſe daies brought in from ſtrange countries? Vnto whom I anſwer, That it is a meere vntruth, for euen our progenitors, of whom I ſpeak, ſaw well enough how in that yere when *M. Scaurus* was Ædile, there were not fewer than 360 pillars of marble tranſported to Rome, for the front and ſtage of a Theater, which was to continue a ſmall while, and ſcarcely to be vſed one moneth to an end: and yet no law there was to checke and controule him for it. But it may be inferred againe, the Magiſtrats winked hereat, becauſe he did all this for a publicke pleaſure to the whole citie, during the plaies exhibited by him in his Ædileſhip: marrie that is it that I would haue, What reaſon I pray you had they ſo to doe? By what means more doe abuſes and inormities creepe into a citie or ſtate, than by a publicke preſident giuen? for I aſſure you it was nothing elſe but ſuch examples at the firſt C that brought thoſe other things, I meane, yvorie, gold, jewels, and precious ſtones, to be vſed by priuat perſons, ſo commonly as they be, in their houſes, plate, and ornaments. And what haue we left and reſerued at all for the very gods to haue, ſince that we lay ſo much vpon our ſelues? but ſay that in thoſe daies they did tolerat this exceſſe in *Scaurus*, becauſe of the paſtimes he did exhibite to the whole city; What, were they ſilent alſo and made no words, when the ſaid *Scaurus* cauſed the biggeſt of all theſe columnes (yea thoſe that were fortie foot high within twain, and the ſame of Lucullean black marble) to be erected and placed in the court before his owne houſe in mount Palatine? And leaſt any man ſhould ſay, that this is done in ſecret and hucker mucker, know he, That when theſe pillars were to be carried vp into the mount Palatine where D his houſe ſtood, the Bailife that had the charge of the publick ſinkes vaulted vnder the ground, dealt with *Scaurus* for good ſecuritie, yea, and demanded cautions and ſureties for ſatisfying of all harmes and dammages that might be occaſioned by their carriage, ſo huge and heauie they were. Conſidering then this bad example, ſo prejudiciall to all good manners, and ſo hurtful to poſterity, had it not bin better for the city to haue cut off theſe ſuperfluities by wholſome laws and edicts, than thus to permit ſuch huge and proud pillars to be carried vnto a priuat houſe vp into the Palatine mount, euen vnder the noſe of the gods, whoſe images were but of earth, and hard by their temples that had for their couers and louvers no better than ſuch as were made of potters cley?

Chap. III.

E ¶ *The firſt man who had at Rome for his owne vſe, pillars of Marble brought from forraine Lands.*

NEither can it be alledged for excuſe of this tolleration in *Scaurus*, that hee tooke the vantage and ſpied his time when the city of Rome was not ware of any ſuch matter toward, as hauing not been acquainted beforetime with the like, and therefore he ſtale vpon them with theſe ſuperfluous pompes, as doubting nothing leſſe than ſuch new deuiſes, and therefore hauing no time to preuent and ſtay them: for long before this, *L. Craſſus* that great Orator, who was the firſt that inriched his houſe (within the ſame Palatium) with pillars of outlandiſh marble, although they were but of the Quarry in Hymettus hill, and neither more in number than F ſix, nor carying in length aboue 12 foot apiece, was reproued and reproched for this pride and vanity by *M. Brutus*, who among other hot words and biting terms that paſſed interchangeably between them, taunted him by the name of *Venus Palatina*. Certes, conſidering how all good orders and cuſtoms otherwiſe were trodden vnder foot, we are to preſume thus of our predeceſſors, That when they ſaw other injunctions and prohibitions as touching diuers abuſes crept in, take

no effect, but daily broken, they thought it better policy to make no lawes at all for restraint of G
such columns, than to haue them infringed, or at leastwise, not obserued when they were made: yet are we in these daies in better order than so, and I doubt not but the age and generation following will justifie and approue of vs in comparison of them: for where is there one in Rome at this day, who hath in the portaile or entrie of his house any columns, that for bignesse and pride come near to those of *Scaurus*? But before that I enter farther into this discourse of marbles and other rich stones, it shal be good to speak somwhat of the men that haue excelled in the cutting thereof, and whose workmanship hath carried the greatest price. First therfore I wil go through with the artificers themselues.

Chap. IIII. H

¶ *The first Imageurs that were in name for cutting in Marble, and in what ages they flourished.*

THe first that we reade renowned for grauing and caruing in marble, were *Dipœnus* and *Scyllis*, both Candiots borne: who during the Empire and Monarchie of the Medes, and before that *Cyrus* began his reigne in Persia, liued in great fame; and that was in the fiftieth Olympias or thereabout. These men went together vnto Sicyone (a city, which I may truly say was for a long time the very natiue country that brought forth the excellent workemen in all kinds of mettals and minerals.) It fortuned at the same time, that the magistrates of Sicyone, had bargained with them for certaine images of the gods to be made at the publicke charges I
of the city; but these artificers, who had vndertaken the thing, agrieued at some wrongs offered to them, departed in Ætolia before they had finished the said images, and so left them vnperfect. Presently vpon this, there insued a great famine amongst the Sicyonians, by occasion that the earth failed to yeeld increase: the citizens therefore full of sorrow and heauinesse, fearing vtter desolation, had recourse to the Oracle of *Apollo Pythius*, to know what remedy for this calamity; and this answer was deliuered vnto them from the said god, That according to their petition, they should finde meanes for to be eased of this plague, in case *Dipœnus* and *Scyllis* had once finished the images of the gods, which they begun: and this was performed accordingly, but with much difficulty, for they were faine to pay whatsoeuer they would demand: they were glad also to pray vnto them with cap in hand. And what images mought these be? Euen *Apollo*, *Diana*, *Hercules*, and *Minerua*: and this last named, was afterwards smitten and blasted with fire from heauen. K

Chap. V.

¶ *Of singular pieces of worke, and excellent artificers in cutting and grauing Marble, to the number of 126. Of the white Marble of Paros, and of the stately sepulchre called Mausoleum.*

LOng time before *Dipœnus* and *Scyllis*, there had been in the Island Chios one *Melas*, a cutter and grauer in marble: after whom, his son *Micciades* succeeded, and he likewise left a sonne L
behind him, named *Anthermus*, of the said Isle, a cunning workman: whose two sons *Bupalus* and *Anthermus*, proued also most skilfull Imageurs. These flourished in the daies of *Hipponax* the Poet, who (as it is well knowne) liued in the 60 Olympias. Now, if a man will calculate the times, according to the genealogie of these two last named, and count backeward in ascent no higher than to their great grandsire, he shall find by the ordinary course of Nature, that the art of cutting and grauing in stone, is equall in antiquity to the originall and beginning of the Olympiades. But to proue that these two, *Bupalus* and *Anthermus*, liued in the daies of *Hipponax* aboue named, recorded it is, That the said Poet had a passing foule & ill-fauored face of his own: and these Imageurs could find no better sport, than to counterfeit both him and his visage, as liuely as possibly might be in stone; and in a knauery to set the same vp in open place where me- M
ry youths met in knots together, and so to propose him as a laughing stock to the whole world. *Hipponax* could not indure this indignitie, but for to be reuenged vpon these companions, sharpened his style or pen against them, and so coursed them with bitter rimes & biting libels, that as some do thinke and verily beleeue, being weary of their liues, they knit their necks in halters,

and

20030
copy 1

A and so hanged themselues. But sure this canot be true, for they liued many a faire day after, yea and wrought a number of Images in the Islands adiacent to Chios, and namely in Delos; vnder which pieces of their worke they subscribed certain arrogant verses to this effect, That the Island of Chios was not only enobled for the vines there growing which yeelded so good wine, but renowned as well for *Anthermus* his two sons, who made so many fine and curious images. The Islanders also of Iasus haue to shew the image of *Diana*, their handiworke: within the Isle of Chios their natiue country, there was likewise another *Diana* of their making, whereof there goeth much talke, and which standeth aloft in a temple there; the visage of which *Diana* is so disposed, that to as many as enter into the place it seemes sad and heauy; but to them that goe forth it appeareth pleasant and merry. And in very truth there be certaine statues at Rome of
B these mens doing, to wit, those which stand vpon the lanterne of *Apollo's* Temple in the mount Palatine, and almost generally in all those chappels which *Augustus Cæsar* Emperor of glorious memory erected. Moreouer, their father *Anthermus* left behind him certain images both in Delos, and also in the Island Lesbos. As for *Dipænus*, his workes were rife in Ambracia, Argos, and Cleone, in which cities a man should not see a corner without them. But all the race of these, both father, grandsire, sons, & nephewes, wrought only in white marble digged out of the Iland
Paros; and this stone men began to call Lychnites, that is to say, the candle marble, not for the
light some white colour which it caried (for many quarries were found afterwards of whiter and brighter marble, and namely of late daies in those about Luna in Tuscane) but as *Varro* mine Author saith, for that the pioners vndermined the ground for that stone, and laboured in hew-
C ing it continually by candle light. But here commeth to my remembrance a strange thing that is recorded of the quarries in the Island Paros; namely, That in one quarter thereof there was a vein of marble found, which when it was clouen in twain with wedges, shewed naturally within, the true image and perfect portraiture of a Silenus imprinted in it. Neither must I forget to note, That this art of grauing images in stone is of greater antiquitie by farre, than either painters craft, or founderie and casting statues; for both painters and also images in mettal began with *Phidias*, about the 83 Olympias, which falleth out to be* 332 yeers after *Malas* the first grauer in stone of name. This *Phidias* [though otherwise a painter at the beginning, and a caruer in Ivorie] was himselfe also a grauer in marble, and the image of *Venus*, which now stands
D among the stately buildings of *Octauia*, was (as they say) of his cutting, a braue piece of worke, and in beauty surpassing. This is knowne for certaine, That *Alcamenes* the Athenian, a most excellent grauer in stone, learned his skill vnder him, of whose workmanship there be a number of statues to be seene at Athens, within the sacred temples. Besides, one image there is of *Venus* most exquisitly wrought, standing without the wall of the city, and is knowne by the name of *Aphrodite* * ἐν κήποις, [*i.* *Venus* in the gardens;] and as it is said, *Phidias* with his own hands finished this *Venus*: who also had another prentise vnder him, named *Agoracritus* of Paros, whom he loued also for his sweetly youth; in regard of which affection it is said, that many braue pieces of his own handiwork he was content should passe vnder his name, which hee dedicated to the immortal memorie of *Agoracritus*. Now these two apprentises of his stroue a-vie, whether
E of them could make the statue of *Venus* better? and so it fell out, that *Alcamenes* won the victorie, not in regard of finer and more cunning workmanship, but for that the city of Athens in fauor of their own countryman, gaue sentence on his side against *Agoracritus*, a stranger and Parian borne: who tooke this repulse and disgrace in such displeasure and indignation, that (by report) when he sold the said *Venus* of his owne making, he would by no meanes passe it away, but with this condition, That it should neuer stand in the city of Athens; and withall he named it *Nemesis* [*i.* Vengeance:] and therefore set vp it was at Rhamnus, a village so called within the
F territorie of Attica. Which image of *Venus*, *M. Varro* preferred before all other statues whatsoeuer. Within the foresaid city of Athens, and in the chappell dedicated to the honor of *Cybele* the great mother of the gods, there was another most excellent statue or image wrought by the
I hands of *Agoracritus*.

As touching *Phidias*, no man doubteth but he was the most excellent grauer that euer was, as all nations will confesse who euer haue heard of that statue of *Iupiter* * *Olympius*, which his own hands wrought: but that all others also may know (who neuer saw his work nor the statues that

* By this it is euident, *Olympias* was but the space of foure yeares compleat, although it be taken for fiue yeare.

* Some read ἐξωπύλιος, *id est*, without the citie.

* Out of yvorie: which when he had finished, being demanded after what pattern he had made the said image, and how he went vp into heauē for to take it forth? answered out of *Homer*, ἢ, ἐμὸν νοήσαντα ἐπορούσαι πρὸς Κρονίδην· ἀλλὰ σύγε δ' ἄρα χείρας, &c. *Iliad. a.* whereby hee signified that he had made him according as *Homer* the poet pourtrained and described him in his verses.

he made, that he wel deserued the name which went of him. I wil lay abroad some smal pieces G
as arguments of his handiwork, and those only that may testifie his fine head & rare inuention:
neither wil I alledge for proofe hereof, either the beautifull image of *Iupiter Olympius*, which hee
made at Olympia; nor the stately statue of * *Minerva* that he wrought at Athens, which carried
in height 26 cubits and was all made of Iuory and gold: but I will take the shield or targuet
that the said goddesse is portraied with; in the embossed and swelling compasse whereof he in-
graued the battel wherin the Amasons were defeated by [*Theseus*;] within the hollow part and
concauitie he inchased the conflict between the gods and the gyants: vpon the shoos or panto-
fles that she weareth, he portraied the fight betwixt the Lapithæ and the Centaurs; so ful com-
pact of art was euery thing about her, and so curiously and artificially contriued. Now in the
base or pied stall vnder the statue, the work that was cut he called the Genealogie of *Pandora*: A H
man might there see the natiuity of the gods, to the number of 30; among them the goddesse
Victory, of admirable workmanship. Moreouer, artificers that are seen & skilful in these matters
do greatly admire the fel serpent, as also the monster *Sphinx* made in brasse, vnder the very spear
that *Minerua* holdeth in her hand. This may serue by the way in a word or two, touching that
famous & most renowned Artist *Phidias*, whom no man is able to commend sufficiently, that it
may be known likewise that the sufficiencie of his workmanship was the same stil, euen in small
matters as well as great.

To come now to *Praxiteles*: what time hee liued I haue declared already in my catalogue of
Founders and Imageurs in brasse: who albeit he was singular in that kind, yet in marble he went
beyond himselfe: his workes are to be seen at Athens, in that conspicuous street called Ceram- I
nicum: but of all the images that euer were made (I say not by *Praxiteles* onely, but by all the
workmen that were in the world) his *Venus* passeth that hee made for them of Gnidos: and in
deed so exquisit and singular it was, that many a man hath embarked, taken sea, and sailed to
Gnidos for no other busines, but onely to see and behold it. Hee made two of them, and sould
them both togethe[r], the one with a vaile and arraied decently in apparell, which in that regard
the men of Cos bought for being put to their choice, they like honest men preferred it before
the other which was naked (notwithstanding *Praxiteles* tendred them both at one and the same
price) in the good mind that they carried, and hauing respect and regard vnto their grauity and
modest carriage of themselues: that which they refused and reiected, the Gnidians bargained
for: and indeed, to speak of workmanship, it was infinitely better, and there was no comparison K
betweene them, by the generall fame and opinion of all men: and verily King *Nicomedes* would
afterwards gladly haue bought it againe of the Gnidians, and offered them enough; for he pro-
mised in consideration thereof to discharge al debts that their city was ingaged in, which were
very great summes; but they would not giue eare or hearken vnto him: content they were ra-
ther to liue in debt and danger still, yea and to abide and endure any forfeitures, exigents, exe-
cutions, and extents whatsoeuer, than to part with their *Venus*. And to say a truth, good reason
they had so to do, for, that one image of *Praxiteles* his making was their chiefe credit, innobled
their city, and drew resort from all parts thither. This *Venus* was shrined in a little chappell by
her selfe within a tabernacle; but of purpose so deuised, that it might be set open on all sides,
for to be seen and viewed all and whole on euery part: wherewith the goddesse her selfe (as men L
were verily persuaded) was well enough pleased, and shewed her contentment therein to al com-
mers; for looke vpon her as one would, amiable shee was, and admirable euery way. It is repor-
ted, that a wretched fellow was inamoured of this *Venus*, and hauing lurked one night secretly
within the chappell, behaued himselfe so and came so neere vnto the image, that he left behind
him a marke of his leaud loue and beastly lust; the spot of which pollution appeared afterward
vpon the body. In the same Gnidos there be diuers other pieces more of Marble, wrought by
excellent workmen; to wit, one god *Bacchus* made by *Brixiades*, and another by *Scopas*, of whose
handiworke there is *Minerua* also: yet there goeth no speech nor voice of any but onely of *Ve-*
nus aboue said; than which, there cannot be a greater argument to proue the excellencie of M
Praxiteles his work; they all seem but foils, to giue a lustre to his *Venus*. Of his making there
is the picture of *Cupid* also, that *Cicero* reproched *Verres* with; the same for whose sake there is
such resort and pilgrimage to Thespiæ, & which standeth now shrined within the * Schooles
of

* Surnamed *Lemnia*, because the Lemnians dedicated it.

* *Scholæ*: certain galleries where learned mē were wont to meet, & (either walking or sitting) to discourse of learning, and to dispute. And yet there were other *Scholæ*: withdrawing places in baines, where those that came gaue attendance vntill there were roume void by others going forth,

copy 1

A of *Octauia*. He made alſo another *Cupid* all naked, for them of Parium, a city within Propontis, howbeit in the nature of a colony gouerned by the Roman lawes, and owing ſeruice to their high court: comparable it was vnto *Venus* at Tenedos, as wel for beauty and excellency of workmanſhip, as for the like abuſe and villanie done vnto it; for one *Alchidas* a Rhodian loued this *Cupid*, and (a ſhamefull thing to ſpeake) defiled both himſelfe and it, like a moſt filthy and profaine villaine. Moreouer, at Rome there be diuers pieces of *Praxiteles* his making, to wit, *Flora*, *Triptolemus*, and *Ceres*, within the gardens of *Seruilius*; the images of *Good-aduenture*, and *Good-fortune* both, which are in the Capitoll; alſo the religious women of the order of *Bacchus*, to wit, the furious *Mænades* which alſo they name *Thyades*: alſo the holy nuns or votaries called *Caryatides*; and *Silenus*, ſtanding amongſt the Monuments and Bookes within the Librarie of *A-*
B *ſinius Pollio*, together with *Apollo* and *Neptune*. Thus much may ſuffice to haue beene ſpoken of *Praxiteles*.

Praxiteles left behind him a ſon named *Cephiſſodorus*, who was his fathers heire euery way, as well of his excellent and ſingular cunning as his worldly goods: of his handy worke there is to be ſeene at Pergamus, a * couple of little boies clipping, embracing, and kiſſing one another: a moſt dainty and exquiſit piece of worke, and much ſpoken of and highly praiſed: a man that ſaw them would verily beleeue and ſay, they dented with their fingers into a bodie of fleſh, rather than a ſtatue of marble. At Rome there be images that came out of his hand, to wit, *Latona* within the temple vpon mount Palatine, *Venus* within the librarie or monuments of *Aſinius Pollio*, *Æſculapius* and *Diana* in the temple of *Iuno*, ſtanding within the pourpris or quadrant of *Octa-*
C *uias* galleries.

* *Symplegma*: this may be meant of two wreſtlers beeing at handy-gripes.

Scopas followeth theſe in order of narration, but ſtriueth to match them in praiſe of worthy workemanſhip: hee engraued and wrought the images of *Venus*, *Pothos*, and *Phaëton*, which three be honored among the Samothracians in all ceremonious deuotion, as right holy ſaints: likewiſe of *Apollo*, which ſtandeth within mount Palatine: of the fierie goddeſſe *Veſta*, ſitting in a chaire, accompanied with two * hand-maidens ſet vpon the ground of each hand of her, which are to be ſeene within the gardens of *Seruilius*: like vnto which, there be other ſuch Damoſels, and Lady *Veſta*, remaining within the monuments or Librarie of *Aſinius* before ſaid: where alſo there is one *Canephoros*, to wit, a virgine bearing vpon her head a flasket of holy reliques: all of *Scopas* his making. But of all that euer he wrought, there is moſt account made of thoſe images
D which are in the chappell of *Cneus Domitius*, within the cirque of *Flaminius*, to wit, *Neptune* himſelfe, and dame *Thetis*, and her ſonne *Achilles*; the Sea-nymphs or Meere-maides alſo called *Nereides*, mounted vpon Dolphins, Whales, and mightie Sea-horſes called Hippocampi, and ſitting vpon them: moreouer, the ſea trumpeters *Tritones*, with all the quire and traine attending vpon ſir *Phorcus* a Sea-god, and the mighty fiſhes called Priſtes, beſides many other monſters of the ſea: all wrought by one & the ſame hand ſo curiouſly, that if he had ſitten about the making of them al his life time and done nothing at all els, a man would haue thought it worke enough, and a great deed. But moreouer and beſides theſe aboue rehearſed, and many more which wee are not come to the knowledge of, we haue here with vs at Rome the image of *Mars* made gyant like after the manner of a coloſſe, yet ſitting within the temple of *Brutus Callaicus*, which ſtands
E cloſe vnto the ſaid cirque, in the way as men goe from thence to the gate Labicana. In the ſame place there is moreouer another *Venus* naked, and wrought by the hands of *Scopas*, which ſeemeth to goe beyond that other *Venus* of Gnidos that *Praxiteles* made; which image alone were able (no doubt) to giue name to any other citie where it ſhould ſtand, and to innoble the place: But at Rome verily there bee ſo many pieces beſides, and thoſe ſo ſtately and ſumptuous withall, that they obſcure and darken it (as it were) in ſome ſort. Moreouer, the exceeding great affaires and the buſie negotiations (whereof there is ſuch a multitude and a world as it were in that Citie) withdraw all men from the contemplation and beholding of ſuch things, bee they neuer ſo ſingular: for to ſay a truth, it belongeth rather to idle perſons to look and gaze vpon theſe matters, and fitter for a place where there is little or no ſtirring, but all
F quiet and ſilent: which was the cauſe that no man knoweth who was the workeman that made the images of *Venus*, which *Veſpaſian* the Emperour dedicated in the rampars and building of his temple of *Peace*: and yet if it ſtood any where elſe than at Rome, it might ſeeme nothing inferiour in name to the antient workes of old time. As little certaintie there is likewiſe of that image wrought in marble, which repreſents dame *Niobe* ready to die, together

* *Chamaetergæ*.

with all her sweet children, and standeth in the temple of *Apollo* syrnamed *Sosianus*, whether G
Scopas or *Praxiteles* made it: no more than father *Ianus*, which *Augustus Cæsar* brought out of E-
gypt and dedicated in his owne temple, is known ont of whose shop it came; notwithstanding
now it be guilded all ouer: semblably, there standeth in the courtly pallace of *Octauia*, the image
of *Cupid* holding a thunderbolt or lightning in his hand, ready to shoot; but it is a question who
was the maker of him? And yet this is affirmed, That the same *Cupid* was made by the liuely pat-
terne of *Alcibiades*, who at that age was held to be the faireſt youth that the earth did beare. In
the same place, and namely in the schoole or gallerie of learned men, there be many more ima-
ges highly commended, and yet no man knoweth who wrought them: As for example, four that
resemble Satyres; of which, one seemeth to carry on his shoulders prince *Bacchus* arraied like a
girle in a side coat or gown; another likewise beareth yong *Bacchus* in the same order, clad in the H
robe of his mother *Semelle*; the third maketh as though he would stil the one *Bacchus* crying like
a childe: the fourth offereth the other a cup of drink to allay his thirst: furthermore, there be two
images in habit and form fœminine, representing gales of wind, & these seem to make sail with
their owne clothes. As doubtfull also it is, who made the images within the railed inclosure in
Mars field named Septa, which do represent *Olympus*, *Pan*, *Chiron*, and *Achilles*; and yet so excel-
lent pieces they be, that men esteeme them worthy to be kept safe, & satisfaction to be made
with no lesse than their death, vnder whose hands and custody they should miscarrie. But to re-
turne againe vnto *Scopas*; he had concurrents in his time, and those that thought themselues as
good workmen as himselfe, to wit, *Bryaxis*, *Timotheus*, and *Leochares*, of whom I must write joint-
ly together, becaus they joined all foure in the graving and cutting of the stately monument I
Mausoleum.

This Mausoleum was the renowned tombe or sepulchre of *Mausolus*, a petty king of Caria,
which the worthy lady *Artemisia* (somtime his queene, and now his widow) caused to be erected
for the said prince her husband, who died in the second yeare of the hundredth Olympias: and
verily so sumptuous a thing it was & so curiously wrought, by these artificers especially, that it
is reckoned one of those matchlesse monuments which are called the * seuen Wonders of the
world: from North to South it carrieth in length, 63 foot; the two fronts East and West, make
the bredth, which is not all out so large; so as the whole circuit about, may containe foure hun-
dred and eleuen foot: it is raised in heigth fiue and twenty cubits, and inuironed with sixe and
thirty columnes: on the East side, *Scopas* did cut; *Bryaxes* chose the North end; that front which K
regardeth the South, fell to *Timotheus*; and *Leochares* engraued at the west side: but Queene *Ar-*
temisia (who caused this rich sepulchre to be made for the honour and in the memoriall of her
husband late deceased) hapned her selfe to depart this life before it was fully finished: howbe-
it these noble artificers whom she had set aworke, would not giue ouer when she was dead and
gone, but followed on still and brought it to a finall end, as making this account, that it would
be a glorious monument to all posterity, both of themselues and also of their cunning: and in
truth at this day, it is hard to judge by their handyworke, who did best. There was a fifth work-
man also came in to them; for aboue the side wall or wing of the tombe, there was a Pyramis
founded, which from the very battlements of the said wal was carried to the heigth of the buil-
ding vnderneath it: the same grew smaller still as the worke arose higher, and from that heigth L
at euery degree (which in the whole were 24) was narrowed and taken in, vntill at last it ended in
a pointed broch: in the top whereof, there is pitched a coach with foure horses wrought curiou-
sly in marble; and this was the worke of *Pythis* for his part. * So that reckoning this charriot
with the sharp spire, the Pyramis vnder it vnto the battlements, and the body of the sepulchre
founded vpon the bare ground, the whole worke arose to an 140 foot in heigth. But to come to
some particular works of *Timotheus* beforesaid: his hand wrought that statue of *Diana* in mar-
ble which standeth at Rome in the chappell of *Apollo*, scituate in mount Palatine: and yet the
head belonging thereto, which now this image carrieth, *Aulanius Evander* set vnto it in place
of the former.

As touching *Menestratus*, men haue in high admiration *Hercules* of his making; as also *Heca-* M
te, which standeth in a chappell at Ephesus behinde the great temple of *Diana*: the sextons or
wardens of which chappell, giue warning vnto those that come to see it, that they looke not too
long vpon it for dazling and hurting their eyes, the lustre of the Marble is so radiant and re-
splendent.

I can-

* 1. The temple of *Diana* in Ephesus.
2. The sepulchre of *Mausolus*.
3. The coloſſe of the Sun at Rhodes.
4. The statue of *Iupiter Olympias*.
5. The wals of Babylon.
6. The Ægyptian Pyramides.
7. The obeliske of *Semiramis*. See *Cæl. Rhod. antiquar. lect. l.* 23. *c.* 6.

* *Dalechampius* suspecteth this place: but me thinkes a man may conceiue, euen by the very words of *Pliny*, that vpō the first *pyramis* of 2 cubits ther was raised another spire which lessened by 24 degrees, (like as wee may see in many steeples with vs) and that might cary so many foot, as being added to the rest, will make vp the whole 140 from the ground.

A I cannot range in a lower degree vnto theſe, the three Charites or Graces, which are to bee ſeen in the Baſſe court before the Citadell of Athens, the which * *Socrates* made; I meane not that *Socrates* whom I reckoned among painters, although ſome thinke he was the ſame man. As for *Myro* (whom I commended for a ſingular imageur in braſſe) there is in marble of his portraying and ingrauing, an old woman drunken, which he made for them of Smyrna; a piece of worke as much eſteemed and ſpoken of, as any other. And here I cannot but thinke of *Pollio Aſinius*, who (as he was a man of a ſtirring ſpirit and quick conceit) delighted to haue his librarie and monuments to be inriched with ſuch antiquities as theſe: for among them, a man ſhall ſee the Centaurs carry behind them vpon their croup, the Nymphs, which *Archeſitas* wrought; the Muſes named Theſpiades, of *Cleomenes* his cutting; *Oceanus* and *Iupiter*, done by the hand of *Eutochus*; the ſtatues on horſe back reſembling women called Hippiades, which *Stephanus* wrought; joint Images of *Mercurie* and *Cupid*, called Hermerotes, the workmanſhip of *Tauriſcus* (I meane not the grauer, of whom I ſpake before, but another *Tauriſcus* of Tralleis;) *Iupiter* ſyrnamed *Xenius* or *Hoſpitalis*, which came out of the hands of *Pamphilus* an apprentice to *Praxiteles*: as for the braue piece of worke, to wit, *Zetus*, *Amphion*, *Dirce*, the Bull, and the bond wherewith *Dirce* was tied, all in one entier ſtone, which was brought from Rhodes to Rome; it was done by *Apollonius* and *Tauriſcus*; theſe men made queſtion of themſelues, who ſhould be their fathers? profeſſing in plaine termes, that *Menocrates* was taken and ſuppoſed their father, but indeed *Artemidorus* begat them, and was their father by nature; & in the ſame place among other monuments, the ſtatue of father *Bacchus* made by *Eutychides*, is much commended. Moreouer, neare vnto the
B C gallerie of *Octauia*, there is the Image of *Apollo*, wrought by *Phyliſcus* the Rhodian; and hee ſtandeth in a chappell of his owne. *Item*, *Latona*, *Diana*, the nine Muſes, and another *Apollo* naked. As for that *Apollo*, who in the ſame temple holdeth in his hand a harp, *Timarchides* was the workman of it; but in the precinct or cloiſter of the ſaid galleries, and in the chappell of *Iuno*, there is the goddeſſe her ſelfe curiouſly made in marble, the handy worke of *Dionyſius* and *Polycles*; but the image of *Venus* in the ſame place, *Philiſcus* wrought: al other ſtatues there, came out of *Praxiteles* his hands. Moreouer, *Polycles* and *Dionyſius*, the ſons of *Timarchides*, made that *Iupiter* which is in the next chappell; the images of *Pan* and *Olympus*, wreſtling together in the ſame place, were the workmanſhip of *Heliodorus*; and this is one of the faireſt images coupled together as wreſtlers, that are knowne in the world; as for *Venus*, bathing her ſelfe, he alſo made her; but *Dædalus* ſtanding by, *Polycharmus*. As touching one piece of worke that *Lyſias* made, it may appear
D how highly it was eſteemed, by the honourable place wherein it ſtood: for *Auguſtus Cæſar* late Emperor of happy memorie, to the honour of *Octauius* his father, dedicated it in mount Palatin ouer the triumphant arch there, and placed it within a ſhrine or tabernacle adorned with columnes: but what might this worke be? ſurely nothing elſe but a charriot with foure horſes ſet vnto it, *Apollo* and *Diana*, all of one entire piece. Within the gardens of *Servilius*, I finde there is great praiſe of *Apollo* made by *Calamis*, that ſingular grauer in mettall: the religious prieſts and propheteſſes alſo of *Phœbus*, called Pytheæ, done by *Dactylis*: and *Calliſthenes* the Hiſtoriographers ſtatue, wrought by *Amphiſtratus*.

E Moreouer, many cunning workmen there were, whoſe fame notwithſtanding is obſcured, by reaſon that albeit many ſingular pieces & thoſe vnmatchable, haue paſſed through their hands, yet for that many haue ioined in the workmanſhip together, the number hath bin a checke and barre to the excellency of ſome that went beyond their fellowes, for neither is there one among them that goeth away cleare with the honor from the reſt, nor many together can well bee named for one thing: and this may be ſeene in the image of *Laocoon*, which remaineth within the pallace of Emperor *Titus*, a piece of worke to be preferred (no doubt) before all pictures or caſt images whatſoeuer; and yet we know not what one artificer to praiſe for it. *Ageſander*, *Polydorus*, and *Athenodorus*, Rhodians, moſt excellent workmen all, agreed by one generall conſent to expreſſe liuely in one entire ſtone, *Laocoon* himſelfe, his children, and the wonderful intricat winding of the ſerpents, claſping and knitting them about: ſemblably, the houſes Palatine of the
F *Cæſars*, a man ſhall ſee fully furniſhed with right excellent ſtatues, which *Craterus* and *Pythidorus*, *Polydectes* and *Hermolaus*, another *Pythodorus* alſo joyned with his fellow *Arthemon*, wrought together; as alſo thoſe that *Aphrodiſius Trallianus* alone himſelfe, did cut. As for the temple called Pantheon, which *Agrippa* built, *Diogenes* of Athens inriched it with marble images. The Virgins alſo going vnder the name of *Caryatides*, erected vpon the chapters of the columnes in that

• Some take this for the wiſe Philoſopher ſo famous.

temple are commended, as few like vnto them for workmanship: like as the other images which be aduanced vp to the very top of the lantern of the foresaid temple, are thought to be excellent pieces; howbeit, for that they stand so high and cannot well be discerned, lesse speech there is of them. As touching that *Hercules*, in the honour of whom the Carthaginians were won euery yere to sacrifice the flesh of mankind, it is an image not regarded; for he hath no place in any temple or chappell, neither is he erected vpon pillar, no nor so much as vpon a base, but standeth vpon the bare ground, iust ouer-against the entrie to those galleries in Rome, called * Ad Nationes: howbeit, the workmanship of this *Hercules* is not to be despised. There stood also beneath, the nine Muses called *Thespiades* vnder the temple of *Felicity*, and as *Varro* saith, one *Iunius Piſciculus* (by place a gentleman of Rome) was enamored vpon one of them, so beautifull they were made: and yet to this day, *Pasiteles* cannot look enough thereupon, but hath the same in great admiration: who also wrote fiue books, comprising all the famous and principall pieces of worke that are to be found in the world. This *Pasiteles* was borne in the marches and coasts of Italy called Græcia, and together with the townes of that tract, was made a Romane free denizen; being himselfe also a good cutter in stone, hee made that image of *Iupiter* in Yvory which standeth in the chappell of *Metellus*, in the way which leadeth into [*Mars*] field. It happened vpon a time, that being about the Arsenall, where certaine wild beasts were, newly brought out of Affricke, hee looked in at a grate to behold a lyon and to take out the counterfeit of him; but as hee was ingrauing in stone according to the patterne, behold, out of another cage a panther brake loose, to no small danger of that most curious and painfull workeman: it is said, that hee made many works; but in particular which were of his doing, it is not precisely set down. Moreouer, *M. Varro* doth highly magnifie *Arcesilaus*, of whose handy-worke hee saith that hee had a lioness in marble, and certaine winged *Cupids* playing with her: of which, some seemed to hold her fast bound, others forced her to drinke out of a horne others againe would seeme to shooe her with their sockes; and all this prettie anticke worke was of one entire stone. The same *Varro* writeth, that *Coponius* made the images of the foureteene Nations, which are about the galleries or theatre of *Pompeius*. I finde also by my reading, that *Canachus* (whom I commended for a good founder or imageur in brasse, in my catalogue of such artisans) wrought in marble likewise and cut many faire statues: neither is it meet, that *Sauros* and *Batrachus* should be forgotten, who wrought the chappels that are within the close or cloister belonging to the galleries of *Octauia*, notwithstanding they were themselues Lacedæmonians borne. Some also are of opinion, that they were exceeding rich men, and that of their owne purses they defraied the charges of building those chappels, hoping to haue had the honour to be immortalized with the inscriptions in the forefront thereof: which being denied them, yet in another place and after another sort, they made meanes to eternize their name; for they deuised in the foot or base of euery pillar (as it appeareth yet at this day) to cut the forme of a * frog and a lizard, to represent thereby their owne names. Moreouer, I cannot conceale from you one pretty thing to be obserued, and which we all know to be true, That in one chappell of *Iupiter*, all the pictures therein, as also all the ceremoniall seruice, thereto belonging, are respectiue altogether to the fœminine sex: the which happening at first by meere chance, continued afterwards: for when the temple of *Iuno* was finished, the porters who had the carriage of the images ordained there to stand, mistooke their markes and carried thither those which were appointed for the chappell of *Iupiter*; and contrariwise those for *Iuno*, into the chappell of *Iupiter*; which beeing once done, was not altered againe, but taken for a presage, and religiously euer after kept, as if the very gods themselues had so ordered and appointed it, and made a counterchange: which is the reason also, that in the foresaid chappell of *Iuno*, there is that kinde of seruice which was meant for *Iupiter*.

To conclude, there haue been certaine workemen that haue growne to great name, by cutting and grauing in small pieces of marble; and namely, *Myrmecides* deuised to inchase in marble, a charriot and foure horses, and a man to driue the same, in so smal a roome, that a poor flie might couer all with her little wings. As for *Callicrates*, he cut in stone the similitude and proportion of pismires in so narrow a compasse, that a man cannot easily discerne the feet and other parts of the body.

*So named, by occasion of the statues of 14 nations there erected, as appeareth a little after.

*For in Greek *Batrachos* is a frog, and *Sauros* a lizard.

CHAP.

copy 1

Chap. VI.

¶ When firſt began Marble ſtones to be vſed in building of priuat houſes. Who began at Rome to parget and couer walls with thin leaues of Marble. In what ages each kinde of Marble came into vſe and requeſt. Who inuented cutting of Marble into thin plates: the deuiſe and manner thereof. Of ſand proper for building.

THus far forth haue I diſcourſed of the cutters and ingrauers of marble, and of thoſe excellent artificers, who haue bin moſt renowned. In which treatiſe I remember wel, that the diapred and ſpotted marble all this while was of no regard: for all the antique pieces which I haue rehearſed, were made of the marble of Thaſos, of the Iſlands Cyclades, as alſo of Lesbos; and yet this inclineth to a blackiſh or blewiſh colour ſomwhat more than the reſt. As for marble ſpotted in ſundry colours, as alſo of the ordering, workmanſhip and vſe of any kinds of marble in building, *Menander*, who in his time was moſt curious of all others in diſcuſſing all ſuch ſuperfluitie, dealt firſt therein, but ſeldome medled he withall. Howbeit, true it is, that at length pillars of marble were taken vp to be vſed in temples, not vpon any pride, brauerie, or magnificence (for as yet they knew not what ſuch things meant) but for that it was thought, that they could not be erected nor beare vpon any thing ſtronger: and in that manner was begun the temple at Athens of *Iupiter Olympias*, out of which, *Sylla* brought thoſe columnes which ſerued for his houſe and pallace in the Capitoll. Howbeit, euen in *Homers* time a difference there was made betweene ordinary ſtone and marble: for this Poet ſaith plainely, that *Paris* caught a rap vpon the mouth with a marble ſtone: and yet whenſoeuer he extolleth and ſetteth out in the higheſt degree the moſt ſtately pallaces of kings and princes, he neuer makes mention of any other matter to adorne them withall, but of Braſſe, Gold, Electrum, Siluer, and Yvory, and not one word of Marble. But, as I take it, the firſt time that theſe marbles of ſundry ſpots and colors were diſcouered, was in the quaries of the Iſlanders of Chios, by occaſion that they digged for ſtone to fortifie their city with walls; whereupon *M. Cicero* plaies merily vpon them with a pleaſant conceit, for when they made ſhew to all that came, and among the reſt to him, what walls they had built of marble, and ſeemed to take great pride in their ſumptuous and magnificent building; What ado is here (quoth *Cicero*) I would haue maruelled much more at your wall, and thought you had done a greater deed, if you had built it out of the quary of Tyburtum. Certes, if marble had bin of any name and credit in old time, painters had not bin ſo highly honored as they were, nay, had there bin (thinke ye) any reckoning made of them at all?

As touching the manner of ſlitting marble into thin plates, therewith to couer and ſeel as it were the outſides of walls, I wot not well whether the inuention came from Caria, or no. The palace of *Mauſolus* K. of Caria, built at Halicarnaſſus, is the antienteſt building that I can find in any record, garniſhed, ſet out and inriched with marble of Proconneſus, notwithſtanding all the wals were reared of brick. This prince changed his life in the ſecond yere of the 100 Olympias which fel out to be the 302 yeare after the foundation of the city of Rome. As for our Romans, *Cornelius Nepos* writeth, That *Mamurra*, borne at Formiæ, a gentleman of Rome, and ſometime a Prouoſt ouer the Pioners, Maſons, Smiths, and Carpenters vnder *Cæſar* in France, was the firſt who couered all the walls throughout his houſe which he had vpon mount Cœlius, with leaues of marble. Now when I ſpeak of *Mamurra*, you muſt not be offended, and think that I aſcribe the inuention hereof to a mean perſon; for I tell you, this is that *Mamurra*, whom the Poet *Catullus* my countryman of Verona, ſo tanted and reuiled in his verſes; this is the man, whoſe houſe beforeſaid, teſtifieth better by proofe and effect, than *Catullus* could by his Poeſie expreſſe, That he had laid vpon it and gathered into it all the riches of Gallia Comata: which was as much to ſay as all France, ſaue only Prouance, Languedoc, Sauoy, and Dauphine. And well it might be ſo, for *Cornelius Nepos* before named addeth moreouer and ſaith, that he was the firſt man, who cauſed the pillars of his houſe to be of marble, & had not one of other matter, neither were thoſe ſleight and ſlender, but ſolid & maſſie, euen hewn out of the quaries either of Caryſtus or Luna. But after him, in proceſſe of time, *M. Lepidus* who was ioined companion in the Conſulſhip to *Catulus*, was the firſt man known to lay the ſils, lintels, & cheeks of his dores thorowout his houſe with Numidian marble; being Conſul in the 666 yere, reckoning from the foundation of Rome:

but

but well ſhent and rebuked he was for his labor. And verily, this was the firſt Numidian marble G
as far as I can find by any mention or token at all, brought ouer to Rome; not to ſerue in pillars
only and pannels in the ſeeling of walls, as *Mamurra* imploied his Caryſtian marble, but in
* *Miſai* * middle workes, and in the baſeſt of all, namely, in dore ſils, lentils, and jambes. After this, *Lepidus* ſome foure yeares, ſucceeded Conſull *L. Lucullus*, who, as it ſhould ſeeme by that which fell
out, gaue the name to Lucullean marble, for that he was ſo much delighted therein: he brought
it firſt to Rome, and had a ſpeciall fancy thereto, notwithſtanding it were black otherwiſe: whereas all other men eſteemed better of other coloured marble, or els ſpotted. This marble growes
in an Iſland lying within the riuer Nilus, and no marbles (as many kinds as there be) took name
of him that loued them, but it alone. But among theſe men that were giuen to build with marble, *M. Scaurus* was the firſt man, as I take it, that for the ſtage and forefront of his Theatre, made H
the wals of marble: but whether the ſame were of ſlit and ſawne marble, or laid with good ſound
ſquare aſhler or no (as the temple of *Iupiter Tonans* in the Capitoll hil, is at this day built) I am
not able to ſay for certaine: for as yet I do not reade or find by any ſign, that Italy knew how to
ſlit marble into leaues. But ſurely, whoſoeuer deuiſed that inuention, to ſaw marble ſtone, and
to ſlit it into leaues for to ſerue the turne of riotous and wailful perſons, had a perillous head of
his own, and a ſhrewd. But would you know the caſt of ſlitting marble? It is done with a kind of
ſand, and yet a man would think that it were the ſaw alone that doth the deed; for when there is
an entry once made by a very ſmal line or trace, they ſtrew the ſaid ſand aloft al the length ther
of: then they ſet the ſaw to it, and by drawing it to and fro, the ſand vnder the teeth thereof, ma-
keth way downwards ſtill, & ſo the ſtone, as hard as it is, they cut through in a trice: now for this I
purpoſe the Æthyopian ſand hath no fellow: and to this paſſe forſooth we are come, that we can-
not haue marble to ſerue our turns, vnleſſe we ſend as far as into Ethyopia: nay, we muſt bee pro-
uided of ſand to ſlit our marble with, out of India; from whence in times paſt, during the antient
diſcipline of Rome, it was thought too much and a ſhamefull thing, to fetch rich pearles. And
yet this Indian ſand is commended in a ſecond degree; but the Æthyopian is the ſofter and bet-
ter ſimply; for that ſand cutteth ſmooth and cleane as it goeth, and leaues no race at all in the
work; the Indian maketh not ſo euen and neat plates, howbeit, they that poliſh marble, fit them-
ſelues with this ſand when it is burnt and calcined; for if they rub their leaues and plates there-
with, it wil make them ſlick & fair; for otherwiſe, if it be not calcined to a fine pouder, of it ſelf
it is churliſh and rugged; which is the fault likewiſe of the ſand that commeth from Naxos and K
Coptis, which commonly is called the Ægyptian ſand; for theſe ſands verily were vſed in old
time to the cutting of marbles. Afterwards they met with a ſand as good as the beſt, and went no
farther than to a certain bay or creek in the Adriatick ſea or Venice gulfe, which being left bare
when the tide is gone, they may at a low water eaſily diſcerne to haue bin caſt vp by the floud.
And now adaies our ſawyers of marble, make no more ado, but take the firſt ſand they come by,
(it makes no matter out of what riuer it be) this ſerues their turne well enough, and thus they a-
buſe and deceiue the world, although few chapmen there bee that know what loſſe there is by
their marble leaues ſawne in that ſort: howbeit, ſuch groſſe ſand as that, firſt makes a wider ſlit
in the main ſtone, and by conſequence ſpendeth and conſumeth more of the marble; again, there
is more work and labour about the poliſhing thereof, the ſaw and ſand beforeſaid leaueth the L
faces of the ſtone ſo rugged and vneuen: and by this meanes the plates become ſleight and thin
before they can be imploied. To conclude, the ſand from Thebais in high Egypt, is very good
to poliſh withall: like as the grit that commeth of grauelly ſtones or pumiſh ground, ſerueth ve-
ry well for the ſaid purpoſe.

Chap. VII.

¶ *Of Whetſtones and Grindſtones, comming out of Naxos and Armenia. Of diuers kindes of Marble.*

For poliſhing of ſtatues and images made of Marble; for cutting, filing, and trimming of pre- M
cious ſtones, Naxium ſerued a long time, and was commended before any other ſtone: for
by this word Naxium I vnderſtand the whet-ſtones and grinde-ſtones that come out of the
Iſland Cyprus: but afterwards, thoſe which were brought from Armenia, woon the name from
them, and were eſteemed better.

As

A As for the ſundry ſorts of Marble and their colours, to diſcourſe of them in generall, were needleſſe, they are ſo well and eaſily knowne: and to reckon them all in particular, were endleſſe, they be in number ſo many and infinit: for what corner of the world is there, where you ſhal not find one marble or other different from the reſt? And yet in my Coſmography, I haue already written of the beſt and moſt excellent kinds of marble, as I had occaſion to ſpeak of the nations and countries where they be found. Howbeit, this would be noted, that all ſorts of marble bee not found in quarries and rocks, that ſtand vpon veines thereof: for much you ſhall meet with, lying ebbe in the ground, and the ſame ſcattering by pieces here and there. But the green marble that commeth from Lacedæmon, is eſteemed moſt precious, and to be more gay and pleaſant than all other. As touching the marbles called Auguſtum and Tiberium, they were found in
B Ægypt firſt after that ſort lying looſe and ſcattered, during the time that *Auguſtus* and *Tiberius* were Emperors of Rome, of whom they took their name. And albeit theſe marbles bee flecked and ſpotted, yet they differ from the Serpentine marble called Ophites; for that the ſpeckles in Ophites, do reſemble thoſe in a ſerpents skin, whereupon it took that name: whereas the other two be diſtinguiſhed with ſpots after a diuers ſort: for Auguſtum hath veines curled, after the manner of waues, running round as it were like whirle pooles; and Tiberium ſpreadeth rather abroad in ſtrakes, winding yet and turning after the order of whitiſh haire. Neither be there any pillars found of the foreſaid Serpentine marble, vnleſſe they be very ſmall. And of this marble there be two kinds: the white, which is gentle and ſoft: the blacke, which is churliſh and hard. Both of them are ſaid to eaſe the head-ache, and to cure the ſting of ſerpents, if they be but car-
C ried about one in pieces, either hanging at the neck, or otherwiſe tied to any part. Some there be who preſcribe the whiter kind to be applied accordingly for the phrenſie and lethargy: howbeit againſt ſerpents, there be who commend eſpecially aboue the reſt, that which of the colour of aſhes they commonly cal * Tephria. As touching the marble of Memphis or great Caire in Ægypt, named thereupon Memphites, it is of the nature of theſe * precious ſtones, rather than of quarries. The vſe herof is to be ground into pouder, & with vineger to be reduced into a liniment, for to be applied to thoſe parts that are to be cauterized or cut: for it ſo aſtonieth and benummeth the member, that it feeleth no pain, either by the ſearing iron or the Chyrurgians lancet. The Porphyrite marble, which alſo comes out of Ægypt, is of a red colour: of which kinde, look which hath white ſpots or ſtreaks running among, is called thereupon Leucoſticos: And
D quarries there be in Egypt, ſtanding wholly vpon this marble, which yeeld ſo ſufficient, cut and hew therout as big and as huge pieces as you will. *Triarius Pollio*, Procurator generall vnder *Claudius Cæſar*, in the prouince of Egypt, brought for the Emperor certain ſtatues of this Porphyry, out of Ægypt: which new deuiſe of his was not very well liked and accepted, for no man tooke example by him afterwards to do the ſemblable. The Ægyptians alſo found in Æthyopia another kind of Marble, which they call Baſaltes, reſembling yron as well in colour as hardnes: and thereupon it took the name. The greateſt piece of this marble that euer was found, *Veſpaſian Auguſtus* the Emperor dedicated in his temple of *Peace*, and it was a ſtatue reſembling the riuer Nilus, with 16 little children playing about it, whereby is ſignified the number of cubits, to which height the ſaid riuer riſeth when it is at the higheſt. It is ſaid alſo, that within the temple of *Se-*
E *rapis* in Thebes, a city of high Egypt, there is another ſtatue not vnlike to this marble Bazaltes, and many think it was made for *Memnon*; & by report, euery day at the Sun-riſing, ſo ſoon as the raies or beames do beat thereupon, it ſeemeth to cracke or cleaue. As for * Onyx, our antient writers were of opinion, That it was found in thoſe daies vpon the mountains of Arabia, and no where els: yet *Sudines* ſaith, that it is gotten in Germany. *Cornelius Nepos* affirmeth, That there was at firſt great wonder made at the drinking cups of this ſtone: and afterwards, at the feet of tables and beds, of chaires and ſtooles likewiſe thereof: howbeit, afterwards (quoth he) *L. Lentulus Spinter* ſhewed at Rome wine veſſells, as big as good barrels, ſuch as came out of the Iſle Chios with wine: but within fiue yere after by his ſaying, hee ſaw pillars alſo, and thoſe 32 foot long, all of Onyx or Chalcedonie. But in proceſſe of time this ſtone altered and varied much:
F for *Cornelius Balbus* brought foure ſmall pillars thereof, and ſhewed them in his Theatre for a ſtrange and miraculous ſight. And in my time I haue ſeen of them aboue thirty, much fairer and bigger, which went to the making of a Summer parlour for pleaſure, that *Calliſtus*, one of the infranchiſed ſlaues of *Claudius Cæſar* (a man wel known for his exceeding riches and power) built for his owne ſelfe.

* Here *Pliny* remembreth himſelfe, and makes a third kind of *Ophites* as *Dioſcor.* did before him. *Dioſ.* ſaith it is no bigger thã a little pebble or grauel ſtone

* or rather *Onychites Caſſidonie*

CHAP

Chap. VIII.

¶ *Of the stone called Alabastrites: likewise, of Lygdinus and Alabandicus.*

THis Onyx stone, or Onychitis aforesaid, some name Alabastrites; whereof they vse for to make hollow boxes & pots to receiue sweet perfumes and ointments, because it is thought that they will keepe and preserue them excellently well, without corruption. The same being burnt and calcined, is very good for diuers plasters. This Cassidony or Alabaster is found about Thebes in Ægypt, and Damascus in Syria: and this Alabaster is whiter than the rest: Howbeit, the best and principall simply is that which commeth out of Carmania: next to it in goodnesse is that of India: and then the Alabaster of Syria and Asia. The least esteemed of all other, is brought out of Cappadocia, and no beauty or lustre it hath at all. In sum, come it from what country it will, those pieces which stand most of a yellowish colour, like hony, spotted also in the head and nothing transparent, goe for the best. And generally throughout, look where you meet with any in colour white, or resembling horne, is rejected for naught, like as whatsoeuer of it is like glasse.

As touching the stones Lygdinus, found in the mountaine Taurus, many are of opinion, that they be well neare as good as the former, for to keep odoriferous ointments: and those for bignesse and capacity, exceed not bowls and good broad platters: passing faire and white they be: and in times past were wont to be brought only out of Arabia. Moreouer, there be two kindes besides of Marble, well esteemed both, and in great price, notwithstanding in nature they be very contrary: the one is called Coraliticus, found in Asia; you shal not light vpon any aboue two cubites long: in whitenesse they come passing neare vnto yvorie, and otherwise also they haue a certaine resemblance vnto it. The other called Alabandicus, after the name of the countrey that yeeldeth it, is contrariwise blacke: howbeit, there is of it to be found growing in Miletus, but not altogether so blacke, for it inclineth or declineth rather to a purple colour. This stone of Miletus will resolue in the fire, and commonly they vse to melt it for drinking cups, in manner of glasses. To come now to the Thebaicke marble, marked it is with certain drops here and there of a golden colour: and naturally it is found growing in that part of Africke, which confineth vpon the Ægyptians, and lyeth vnder their iurisdiction. A peculiar propertie it hath by a secret in Nature, respectiue vnto the eies, to serue for to grinde collyries with, that is to say, those pouders which are appropriat to the diseases of that part. But about Syene, in the prouince of Thebaies, there is a marble (thereupon called Syenites) which sometime they named Pyrrhopœcilos: the kings of Ægypt in times past (as it were vpon a strife and contention, one to exceed another) made of this stone certaine long beames, which they called Obeliskes, and consecrated them vnto the Sun, whom they honoured as a god: And indeed, some resemblance they carry of Sun-beames, when they are made to the forme of Obeliskes, and the very Egyptian name implieth so much. The first that euer began to erect these Obeliskes, was *Mitres*, king of Ægypt, who held his royall seat and court in Heliopolis, the citie of the Sunne; where hee was admonished in a dreame by a vision, so to doe: and thus much may appeare by the inscription of certaine letters engrauen vpon the said Obeliske: for those Characters, figures, and formes that wee doe see inchased in them, be the verie * letters that the Ægyptians vse themselues. After him, other princes also set vp more of these Obeliskes in the aboue named citie: and namely king *Sochis* for his part, foure in number, those carrying in length eight and fortie cubits apiece. And *Ramises* (in whose reigne Troy was woon by the Greekes) erected an Obeliske fortie cubits long, in the said city: but being departed from thence (for that he took pleasure in another city, where sometimes stood the royal pallace of king *Mnevis*) he pitched on end another Obeliske, which carried in length * a hundred foot wanting one, and on euery side foure cubits square.

* Hieroglyphice

* *Vndecenti*, by the Grammaticall Analogie should signifie nine or eleuen: but I take it, that here it is put for *vndecentesis*: other wise there was no proportion betweene the height & the bredth. Neither is it like that this proud prince, being remoued from his former seat (where he had erected Obeliske threescore and twelue foot high) vnto another citie which he loued better, would set vp a monument of nine or eleuen foot, for his memoriall, as may appeare more in the next chapter.

Chap. IX.

¶ *Of three Obelisks. The firſt of Thebes in high Egypt: the ſecond of great Alexandria in Egypt: and the third which ſtandeth at Rome in the large Cirque or Shew-place.*

IT is ſaid, that *Ramiſes* abouenamed kept 20000 men at work about this Obeliske. The King himſelfe in perſon, when it ſhould be reared on end, fearing leſt the engins deuiſed to raiſe it, and hold the head thereof betwixt heauen and earth, in the rearing ſhould faile and not be a-
B ble to beare that monſtrous weight; becauſe hee would lay the heauier charge vpon the artificers that were about this enterpriſe, vpon their vtmoſt perill, cauſed his own ſon to be bound to the top thereof; imagining withall, that the care of the engineers who vndertooke the weighing vp this Obeliske, ouer the young prince, for feare of hurting him, would induce them alſo to be the more heedfull to preſerue the ſtone. Certes, this Obelisk was a piece of work ſo admirable, that when *Cambyſes* had woon the city where it ſtood, by aſſault, and put all within to fire and ſword, and burnt all before him, as far as to the very foundation & vnderpinning of the obelisk, commanded expreſly to quench the fire: and ſo in a kind of reuerence yet vnto a maſſe and pile of ſtone, ſpared it, who had no regard at all of the city beſides. Other Obeliskes there be twaine,
C the one erected by K. *Smarres*, the other by *Exaphius*, both without characters, and the ſame are 48 cubits in height apiece. At Alexandria, K. *Ptolomæus* ſyrnamed *Philadelphus*, ſet vp another obelisk 80 cubits high, the which king *Nectabis* had cauſed to be hewed out of the quarry, plaine without any work: but much more difficultie there was in carying it from the quarry, & ſetting it vpright, than there had bin labor in the hewing: ſome write, that *Satyrus* a great architect & enginer, conueied it to Alexandria by means of flat bottoms or ſleds. But *Calixenus* ſaith, that one *Phœnix* did the deed, who cauſed a trench to be cut from the riuer Nilus, and to be carried with water as far as to the place where the obelisk lay along: then he deuiſed two broad barges, prepared & well fraught with ſmal ſquares of the ſame ſtone, a foot euery way, to the double poiſe or weight of the Obelisk it ſelfe in proportion, by reaſon whereof the veſſels hauing their full
D load, might come vnder the Obelisk iuſt, as it lay hollow ouerthwart the head of the foſſe, with either end reſting vpon the banks: which done, he began to diſcharge the veſſels vnderneath, & to throw out the ſtones werewith they were laden, by meanes whereof, as they were lightened, they roſe vp higher and higher to the very Obelisk, and receiued the charge ordained for them. He writes moreouer, that there were ſix other like to it hewed out of the ſame mountain, & the workmen who cut and ſquared them had fifty talents for a reward. But the foreſaid Obelisk was afterwards by the abouenamed king erected in the hauen of Arſinoë, in teſtimonie of loue to *Arſinoë* his wife and ſiſter both. But for that it did hurt to the ſhip-docke there, one *Maximus* a gouernor of Egypt vnder the Romans, remoued it from thence into the market place of the ſaid city, cutting off the top of it, intending to put a filiall thereupon gilded, which afterwards was
E forelet and forgotten. Two Obelisks more there were in the hauen of Alexandria neere to the temple of *Cæſar*, which were hewed out of the rocke by *Meſphees* king of Egypt, being 42 cubits high. But aboue all other difficulties, it paſſeth, what a do there was to tranſport them by ſea to Rome: and verily, the ſhips prepared of purpoſe therefore were paſſing faire and wonderfull to ſee to. As for one of the ſaid ſhips which brought the former Obelisk, *Auguſtus Cæſar* the Emperor of famous memorie, had dedicated it vnto the harbor or hauen of Puteoli, there to remain for euer as a miracle to behold, but it fortuned to be conſumed with fire: the other, wherein *C. Cæſar* had tranſported the ſecond Obeliske into the riuer, after it had bin kept ſafe for certaine yeares together, to be ſeen (for that it was the moſt admirable Carrick that euer had bin known to flote vpon the ſea) *Claudius Cæſar* late Emperour of Rome cauſed it to be brought to Oſtia,
F where for the ſafetie and ſecuritie of the hauen he ſunk it, and thereupon, as a ſure foundation, he raiſed certaine piles or baſtions like turrets or ſconces, with the ſand of Puteoli: which being done, a new care and trouble there was to bring the Obeliske vp the riuer Tiberis to Rome. Which being effected, it appeared well by that experiment, that vpon the riuer Tiberis a veſſel draweth as much water full as Nilus. As touching the ſaid Obelisk which *Auguſtus Cæſar* late Emperor erected in the great ſhew-place or cirque at Rome, it was firſt cut out of the rock by

* Semni-

* Whom some take to be *Amasis*.

* *Semneserteus* King of Egypt, in the time of whose reign *Pythagoras* soiourned in Egypt; & the same contains 125 foot nine inches, besides the foot or base of the said stone. As for the other, standing in *Mars* field, being 9 foot lower than it, hewed and squared it was by commandement from *Sesostris* K. of Egypt. In the characters ingrauen in both of them a man may see all the philosophie and religion of the Egyptians, for they contain the interpretation of nature. G

Chap. X.

¶ *Of that Obelisk at Rome which standeth in Mars field, and serueth for a Gnomon.*

And as for that Obelisk which standeth in Mars field, *Augustus Cæsar* deuised a wondefull means that it should serue to mark out the noontide, with the length of day and night, according to the shadowes that the Sun doth yeeld by it: for hee placed vnderneath at the foot of the said Obelisk, according to the bignes and length therof, a pauement of broad stone, wherein a man might know the sixt houre or mid-day at Rome, when the shadow was equall to the Obelisk; and how by little and little, according to certain rules (which are lines of brasse inlaid within the said stone) the daies do increase or decrease. A thing no doubt worth the knowledge, and an inuention proceeding from a pregnant wit. *Manlius* a renowned Mathematician & Astronomer, put vnto the top of the said Obelisk a gilded ball, in such sort, that all the shadow which it gaue fell vpon the Obeliske, and this cast other shadowes more or lesse, different from the head or top of the Obeliske aforesaid. The reason whereof (they say) was vnderstood from the sundry shadowes that a mans head yeelds. But surely for these thirty yeares past, or thereabout, the vse of this quadrant aforesaid hath not been found true: and what the reason of it should be I know not; whether the course of the Sun in it self be not the same that hertofore, or be altered by some disposition of the heauens; or whether the whole earth be somwhat remoued from the true centre in the midst of the world (which I heare say is found to be so in other places) or that it proceed by occasion of the earthquakes which haue shaken the city of Rome, and so haply wrested the Gnomon from the old place: or lastly, whether by reason of many inundations of Tyber, this huge and weighty Obelisk hath setled and sunk down lower (and yet it is said, the foundation was laid as deep vnder ground as the obelisk it selfe is aboue ground.) H I K

Chap. XI.

¶ *Of the third Obelisk in the Vaticane.*

There is a third Obelisk at Rome, standing within the cirque or shew-place of the two Emperors *C. Caligula* and *Nero*: and this is the only Obeliske known to haue bin broken in the rearing. This was hewn and erected in Egypt by *Nuncoreus* the son of *Sesostris*: which *Nuncoreus* caused another to be set vp of 100 cubits high, and consecrated it vnto the Sun, after hee had recouered his sight vpon blindnesse, being so aduertised by the Oracle, which remaines at this day. L

Chap. XII.

¶ *Of the Egyptian Pyramides, and of Sphinx.*

Hauing thus discoursed of the Obelisks, it were good to say somwhat of the Pyramids also in Egypt; a thing I assure you that bewraieth the fooliish vain-glory of the Kings in that countrey, who abounding with wealth, knew not what to doe with their money, but spent it in such idle and needlesse vanities. And verily most writers doe report, That the principall motiues which induced them to build these Pyramides, was partly to keepe the Common people from idlenes, partly also becausse they would not haue much treasure lying by them, lest either their heirs apparant, or other ambitious persons who aspired to be highest, should take occasion thereby to play false and practise treasons. Certes a man may obserue the great follies of those princes herein, That they began many of these Pyramides, and left them vnfinished; as M

may

20030
copy 1

A may appeare by the tokens remaining thereof. One of them there is within the territory vnder the jurisdiction of *Arsinoë*; two within the prouince that lieth to the gouernment of Memphis, not far from the Labyrinth, whereof also I purpose to speake: there are other twaine likewise in the place where sometimes was the lake Mœris, which was nothing else but a mighty huge fort intrenched by mans hand in manner of a mote or poole: but the Ægyptians (among many other memorable and wonderfull works wrought by their princes) speake much of these two * Pyramides, the mighty spires and steeples whereof (by their saying) do arise out of the very water. As for the other three which are so famous throughout the world (as indeed they are notable marks to be kenned a far off by sailers, and directions for their course) these are scituat in the marches of Affrick vpon a craggy and barren mountaine, betweene the city Memphis and a cer-
B taine Iland or diuision of Nilus (which as I haue said before) was called Delta, within foure miles of Nilus and six from Memphis, where there standeth a village hard vnto it named Busiris, wherein there be certaine fellows that ordinarily vse to clime vp to the top of them. Ouer against the sayd Pyramides there is a monstrous rocke called Sphinx, much more admirable than the Pyramides, and forsooth the peisants that inhabit the countrey esteemed it no lesse than some diuine power and god of the fields and forrests: within it, the opinion goeth, that the body of K. *Amasis* was intombed; & they would bear vs in hand, that the rock was brought thither, all and whole as it is: but surely it is a meere crag growing naturally out of the ground; howbeit wrought also with mans hand, polished and very smooth and slippery. The compasse of this rocks head (resembling thus a monster) taken about the front, or as it were the forehead,
C containeth one hundred and two foot, the length or heigth 143 foot, the heigth from the belly to the top of the crowne in the head, ariseth to 62 foot. But of all these Pyramides, the biggest doth consist of the stone hewed out of the Arabicke quarries: it is said, that in the building of it there were 366000 men kept at worke twentie yeares together: and all three were in making threescore and eightene yeares and foure moneths. The writers who haue made mention of these Pyramides, were *Herodotus*, *Euhemerus*, *Duris* the Samian, *Aristagoras*, *Dionysius*, *Artemidorus*, *Alexander Polyhistor*, *Butorides*, *Antisthenes*, *Demetrius*, *Demoteles*, and *Apion*: but (as many as haue written hereof) yet a man cannot know certainly and say, This Pyramis was built by this king: a most just punishment, that the name and authors of so monstrous vanity, should be buried in perpetuall obliuion: but some of these Historiographers haue reported, that there were
D a thousand and eight hundred talents laid out only for raddish, garlicke, and onions, during the building of these Pyramides. The largest of them taketh vp eight acres of ground at the foot, foure square it is made, and euery face or side thereof equall, containing from angle to angle eight hundred fourescore and three foot, and at the top fiue and twenty: the second made likewise foure cornered, is on euery side euen, and comprehendeth from corner to corner seuen hundred thirty and seuen foot: the third is lesse than the former two, but far more beautifull to behold, built of Æthiopian stones; it carrieth at the foot in each face betweene foure angles, three hundred threescore and three foot. And yet of all these huge monuments, there remaine no tokens of any houses built, no apparence of frames and engins requisit for such monstrous buildings; a man shall find all about them far and neare, faire sand and small red grauell, much like
E vnto Lentill seed, such as is to be found in the most part of Affricke. A man seeing all so cleane and euen, would wonder at them how they came thither; but the greatest difficultie mouing question and maruell, is this, What meanes were vsed to carry so high as well such mightie masses of hewen squared stone, as the filling, rubbish, and mortar that went thereto? for some are of opinion, that there were deuised mounts of salt and nitre heaped vp together higher and higher as the worke arose and was brought vp; which being finished, were demolished, and so washed away by the inundation of the riuer Nilus: others thinke, that there were bridges reared with bricks made of clay, which after the worke was brought to an end, were distributed abroad and imploied in building of priuat houses; for they hold, that Nilus could neuer reach thither, lying as it doth so low vnder them when it is at the highest, for to wash away the heaps
F and mounts aboue-said. Within the greatest Pyramis there is a pit 86 cubits deep, and thither (some thinke) the riuer was let in. As touching the heigth of these Pyramides & such like, how the measure should be taken, *Thales Milesius* deuised the meanes; namely, by taking just length of a shadow when it is meet and euen with the bodie that casteth it. These were the wonderfull Pyramides of Egypt, whereof the world speaketh so much. But to conclude this argument,

* *Herodotus* saith, they were 250 foot high aboue the water, and as many deepe vnder.

That no man should need to maruell any more of these huge workes that kings haue built, let him know thus much, that one of them, the least (I must needs say) but the faireſt and most commended for workmanship, was built at the cost and charges of one *Rhodope*, a very strumpet: this *Rhodope* was a bondslaue together with *Æsope* a Philosopher in his kind, and writer of morall fables, with whom she serued vnder one master in the same house: the greater wonder it is therefore and more miraculous than all I haue said before, that euer she should bee able to get such wealth by playing the harlot. Ouer and aboue the Pyramides abouesaid, a great name there is of a tower built by one of the kings of Egypt within the Island Pharos, and it keepeth & commands the hauen of Alexandria, which tower (they say) cost 800 talents the building. And here because I would omit nothing worth the writing, I cannot but note the singular magnanimity of K. *Ptolome*, who permitted *Sostratus* of Gnidos (the master workeman and architect) to graue his owne name in this building. The vse of this watch-tower, is to shew light as a lanthorne, and giue direction in the night season to ships, for to enter the hauen, & where they shall auoid bars and shelues; like to which there be many beacons burning to the same purpose, and namely, at Puteoli and Rauenna. This is the danger onely, lest when many lights in this lanterne meet together, they should be taken for a star in the skie; for that a far off such lights appeare to sailers in manner of a star. This enginer or master workman beforesaid, was the first man that is reported to haue made the pendant gallery and walking place at Gnidos. G H

Chap. XIII.

¶ *Of the Labyrinths in Ægypt, Lemnos, and Italy.* I

Since wee haue finished our Obelisks and Pyramides, let vs enter also into the Labyrinths; which we may truly say, are the most monstrous workes that euer were deuised by the head of man: neither are they incredible & fabulous, as peraduenture it may be supposed; for one of them remaineth to be seen at this day within the jurisdiction of Heracleopolis, the first that euer was made, to wit, three thousand and six hundred yeares ago, by a king named *Petesuccas*, or as some thinke *Tithoes*: and yet *Herodotus* saith, it was the whole worke of many KK. one after another, and that *Psammerichus* was the last that put his hand to it and made an end thereof: the reason that moued these princes to make this Labyrinth, is not resolued by writers, but diuerse causes are by them alledged: *Demoteles* saith, that this Labyrinth was the roiall pallace and seat of king *Motherudes*: *Lycias* affirmeth it to be the sepulchre of K. *Maris*: the greater part are of opinion, that it was an ædifice dedicated expressely and consecrated vnto the Sun, which in my conceit commeth neareſt to the truth. Certes, there is no doubt made that *Dædalus* tooke from hence the pattern and platforme of his Labyrinth which he made in Crete; but surely he expressed not aboue the hundreth part thereof, chusing onely that corner of the Labyrinth which containeth a number of waies and passages, meeting and incountring one another, winding and turning in and out euery way, after so intricat manner and so inexplicable, that when a man is once in, he cannot possibly get out againe: neither must wee thinke that these turnings and returnings were after the manner of mazes which are drawne vpon the pauement and plain floore of a field, such as we commonly see serue to make sport and pastime among boies, that is to say, which within a little compasse and round border comprehend many miles; but here were many dores contriued, which might trouble and confound the memorie, for seeing such variety of entries, allies, and waies, some crossed & encountred, others flanked on either hand, a man wandred still and knew not whether he went forward or backward, nor in truth where he was. And this Labyrinth in Crete is counted the second to that of Ægypt: the third is in the Isle Lemnos: the fourth in Italy: made they were all of polished stone, and besides vaulted ouer head with arches. As for the Labyrinth in Ægypt, the entrie thereof (whereat I much maruell) was made with columns of stone, and all the rest stuffed so substantially and after such a wonderfull maner couched and laid by art of Masonrie, that impossible it was they should in many hundred yeres be disjointed and dissolued, notwithstanding that the inhabitants of Heracleopolis did what they could to the contrary; who for a spight that they bare vnto the whole worke, annoied and impeached it wonderfully. To describe the site and plot therof, to vnfold the architecture of the whole, and to rehearse euery particular therof, it is not possible; for diuided the building is into sixteene regions or quarters, according to the sixteene seuerall gouernments in Ægypt (which they K L M

20030
copy 1

A they call Nomos) and within the same are contained certain vast & stately pallaces which bear the names of the said jurisdictions, and be answerable to them: besides, within the same precinct are the temples of all the Ægiptian gods: ouer and aboue, fifteen little chappels or shrines, euerie one enclosing a *Nemesis*, to which goddesse they be all dedicated: to say nothing of many Pyramides forty ells in height apiece, and euery of them hauing six walls at the foot, in such sort, that before a man can come to the Labyrinth indeed which is so intricat & inexplicable, & wherein (as I said before) he shall be sure to lose himselfe, he may make account to be weary & tyred out: for yet he is to passe ouer certain lofts, galleries, & garrets, all of them so high that he must clime staires of ninety steps apiece ere he can land at them; within the which, a number of columns and statues there be, all of porphyrit or red marble, a world of images and statues
B representing as well gods as men, besides an infinit sort of other pieces pourtraied in monstrous and ougly shapes, and there erected. What should I speake of other roums and lodgings which are framed and situat in such manner, that no sooner are the dores and gates opened which lead vnto them, but a man shall heare fearfull cracks of terrible thunder: furthermore, the passages from place to place are for the most part so conueighed, that they be as dark as pitch, so as there is no going through them without fire light: and still be we short of the Labyrinth, for without the main wall therof, there be two other mighty vpright wals or wings, such as in building they call Ptera; & when you are passed them, you meet with more shrouds vnder the ground, in manner of caues and countermines vaulted ouer head, and as dark as dungeons. Moreouer, it is said, that about 600 yeares before the time of K. *Alexander* the Gteat, one *Circamnos* (an eunuch or
C groome of K. *Nectabis* chamber) made some small reparations here about this Labyrinth, & neuer any but hee would go about such a piece of work. It is reported also, that while the main arches and vaults were in rearing (and those were made all of foure square ashler stone) the place shone all about and gaue light with the beams and plancher made of the Ægyptian Acacia sodden in oile. And thus much may serue sufficiently for the Labyrinths of Ægipt and Candy.

The Labyrinth in Lemnos was much like to them, only in this respect more admirable, for that it had a hundred and forty columns of marble more than the other, all wrought round by turners craft, but with such dexterity, that a very child was able to weld the wheele that turned them, the pins and poles wherby they hung were so artificially poysed. The master deuisers and architects of this Labyrinth, were *Zmilus*, *Rholus*, and a third vnto them, one *Theodorus* who was
D borne in the same Island. Of this, there remaine some reliques to be seene at this day; wheras a man shall not find one smal remnant either of the Italian or Candian Labyrinths: for meet it is that I should write somewhat also of our Labyrinth here in Italy, which *Porsena* K. of Tuscane caused to be made for his own sepulchre; and the rather, because you may know that forein KK. were not so vain in expences, but our princes in Italy surpassed them in vanity: but for that there go so many tales and fables of it which are incredible, I think it good in the description therof to vse the very words of my author *M. Varro*: King *Porsena* (quoth he) was interred vnder the citie Clusinum in Tuscane, in which very place he left a sumptuous monument or tombe built all of square stone; thirty foot it carried in bredth on euery side, and fifty in height; within the base or foot whereof (which likewise was foure square) he made a Labyrinth, so intricat, that if a
E man were entred into it without a bottom or clue of thread in his hand, and leauing the one end therof fastned to the entry or dore, it was impossible that euer he should find the way out again. Vpon this quadrant there stood fiue Pyramides or steeples, foure at the foure corners, and one in the mids, which at the foot or foundation caried 75 foot euery way in bredth, & were brought vp to the height of 150: these grew sharpe spired toward the top, but in the very head so contriued, that they met all in one great roundle of brasse which wrought from one to the other, & couered them all in manner of a cap, and the same rising vp in the mids with a crest most stately; from this couer there hung round about at little chains, a number of bels or cimbals, which being shaken with the wind, made a jangling noise that mought be heard a great way off, much like to that ring of bels which was deuised in times past ouer the temple of *Iupiter* at Dodona:
F & yet are we not come to an end of this building mounted aloft in the aire, for this couer ouer head serued but for a foundation of 4 other Pyramides, and euery one of them arose a hundred foot high aboue the other worke, vpon the tops whereof there was yet one terrace more to sustaine fiue Pyramides, and those shot vp to such a monstrous height, that *Varro* was ashamed to report it: but if we may giue credit to the tales that go currant in Tuscane, it was equall to the

* Which was 250 foot: ſo that the whole was 500 foot.

whole * building vnderneath. O the outragious madneſſe of a fooliſh prince, ſeeking thus in a vaineglorious mind to be immortalized by a ſuperfluous expence which could bring no good at all to any creature, but contrariwiſe weakened the ſtate of the kingdome! And when all was done, the artificer that enterpriſed and finiſhed the worke, went away with the greater part of the praiſe and glory. G

CHAP. XIIII.

¶ *Of a garden made vpon Terraces. Of a citie ſtanding all vpon vaults and arches from the ground. And of the temple of Diana in Epheſus.*

H

WE reade moreouer of gardens made in the aire; nay it is recorded, that a whole city (and namely Thebes in Ægypt) was built ſo hollow, that the Ægyptian KK. were wont to lead whole armies of men vnder the houſes of the ſaid city, and in ſuch ſort as none of the inhabitants could beware thereof, yea and ſodainly appeare from vnder the ground: a maruellous matter I aſſure you, but much more wonderfull in caſe the riuer Nilus alſo ran thorow the mids of the ſaid towne. But ſurely of this opinion I am, that if this be true, *Homer* no doubt would haue written of it, conſidering he hath ſpoken ſo much in the praiſe and commendation of this city, and eſpecially of the * hundred gates that it had. But to ſpeake of a ſtately and magnificent work indeed, the temple of *Diana* in Epheſus is admirable, which at the common charges of all the princes in Aſia was * two hundred and twenty yeres a building. Firſt and foremoſt, they choſe a mariſh ground to ſet it vpon, becauſe it might not be ſubiect to the danger of earthquakes, or feare the chinkes and opening of the ground: againe, to the end that ſo mighty and huge building of ſtone-worke ſhould ſtand vpon a ſure and firme foundation (notwithſtanding the nature of the ſoile giuen to be ſlipperie and vnſtedfaſt) they laid the firſt couch and courſe of the ground-worke with charcole well rammed in manner of a pauement, & vpon it a bed of wool-packs: this temple carried in length throughout, four hundred twenty and fiue foot, in breadth two hundred and twenty: in it were a hundred and ſeuen and twenty pillars, made by ſo many KK. and euery one of them threeſcore foot high; of which, ſix and thirtie were curiouſly wrought and engrauen, whereof one was the handiworke of *Scopas*: *Cherſiphron* the famous architect was the chiefe deuiſer or maſter of the workes, and who vndertooke the *rearing thereof: the greateſt wonder belonging thereto was this, How thoſe huge chapters of pillars, together with their frizes and architraues, being brought vp and raiſed ſo high, ſhould be fitted to the ſockets of their ſhafts: but as it is ſaid, he compaſſed this enterpriſe and brought it to effect, by the meanes of certaine bags or ſacks filled with ſand; for of theſe he made a ſoft bed as it were raiſed aboue the heads of the pillers, vpon which bed reſted the chapters, and euer as he emptied the nethermoſt, the foreſaid chapters ſettled downeward by little and little, and ſo at his pleaſure he might place them where they ſhould ſtand: but the greateſt difficultie in this kind of worke, was about the very frontiſpiece and maine lintle-tree which lay ouer the jambes or cheekes of the great dore of the ſaid temple; for ſo huge and mighty it was, that hee could not weld it to lay & beſtow the ſame as it ought, for when he had done what he could, it was not to his mind, nor couched and ſettled in the right place: whereupon the workman *Cherſiphron* was much perplexed in his mind, and ſo wearie of his life, that he purpoſed to make himſelf away: but as he lay in bed in the night ſeaſon, and fell aſleep all wearie vpon theſe dumpiſh and deſperat cogitations, the goddeſſe *Diana* (in whoſe honor this temple was framed, and now at the point to be reared) appeared ſenſibly vnto him in perſon, willing him to be of good cheare and reſolue to liue ſtill, aſſuring him that ſhe her ſelf had laid the ſaid ſtone of the frontiſpice, and couched it accordingly: which appeared true indeed the morrow morning, for it ſeemed that the very weight thereof had cauſed it to ſettle iuſt into the place, and made a joint as *Cherſiphron* would haue wiſhed it. As touching all the other ſingularities belonging to this temple, and namely the gorgeous ornament that ſet it out, they would require many volumes to diſcipher and particularize vpon them; and when all is done, little or nothing pertinent they are to the illuſtration of Natures worke, which is the principall marke I aime at.

* Θηβαι ἑκατόμπυλαι.

Chap. XV.

¶ *Of the proud temple in Cyzicum. The fugitiue ſtone. The eccho which reſoundeth ſeuen times to one cry. Of a great building without pin or naile of yron. The ſumptuous and admirable ædifices in Rome.*

THere is at this day a temple ſtanding at Cyzicum, wherin the maſon had beſtowed threds of gold in all the joints vnder euery ſtone throughout, and thoſe were all faire poliſhed: within this temple, prince *Cyzicus* (who cauſed it to be built) minded to dedicat the image of *Iupiter* in yvorie, and of *Apollo* in marble, ſetting a crowne vpon his head. Certes, theſe joints thus enterlaced with moſt fine and dainty threads, gaue a wonderfull grace and beautie to the whole Church, by ſending and breathing (as it were) from them certaine raies, which by reuerberation cauſe all the images therin to haue a glittering luſtre: in ſuch ſort, that ouer and aboue the deuiſe and wittie inuention of the workeman, the very matter alſo (although it be cloſe couched and hidden betweene each ſtone) commendeth the price and riches of the worke.

Within the ſaid town there is a ſtone called the Fugitiue and Runnaway: The braue knights of Greece called Argonauts, who accompanied prince *Iaſon* in his voyage for the golden fleece, after they had vſed it for an anchor, left it there: but for that this ſtone was ready many times to run away and be gone out of their Prytaneum (for ſo they call their publick hall) they ſoudred it faſt with lead. In the ſame city neer vnto that gate which is called Thracia, there ſtand ſeuen turrets, which doe multiply a voice, and ſend backe many againe for one: this miraculous rebounding of the voice, the Greekes haue a pretty name for, and call it Echo. True it is, that this repercuſſion and redoubling of the voice, proceedeth otherwhiles from the nature of the place, and moſt of all in vallies lying betweene hils; but at Cyzicum it commeth by fortune, and no ſuch reaſon can be giuen thereof. At Olympia the like is wrought by art, for there is a gallerie there made of purpoſe, which after a wonderfull manner deliuereth the ſame voice which it receiueth, ſeuen times backe, whereupon they call it Heptaphonon. Moreouer, in Cyzicum there is a faire and large building, which (becauſe they keep courts and ſit in counſell there) is named Buleuterion: the ſame is built in ſuch ſort, as there goeth not one pin or naile to all the carpentrie thereof: and the ſtories are ſo laid, that a man may take away the beams and rifters without any prop or ſhoare to ſupport them, yea and beſtow them againe faſt enough without laces to bind them. After which manner, the wooden bridge at Rome was ſo framed ouer the riuer Tyberis; and a matter of religion and conſcience was made thereof, to maintaine it ſo, in remembrance of the difficultie in taking it apieces and breaking it downe, at what time as *Horatius Cocles* made the place good againſt the power of K. *Porſena*.

And now ſince the coherence of matters hath brought me to Rome, me thinks I ſhould not doe amiſſe to proceed vnto the miraculous buildings of this our city, to ſhew the docilitie of our people, and what proofe there is of their progreſſe in all things, during the ſpace of nine hundred yeres; that it may appeare how not only in magnanimitie and proweſſe they haue conquered the world, but in magnificence alſo of ſtately and ſumptuous buildings ſurmounted all nations of the earth: and as a man ſhall find this ſingularity and excellencie of theirs in the particular ſuruey of euery one of their ſtately and wonderfull ædifices as they haue bin reared from time to time, ſo if he put them all together and take a generall view of them at once, he ſhall conceiue no otherwiſe of their greatneſſe, than of another world aſſembled (as it were) to make ſhew in one place: for if I ſhould reckon among great workes (as needs I muſt) the grand cirque or ſhew-place built by *Cæſar* Dictator, which took vp of ground three ſtadia or furlongs in length, and one in breadth, containing alſo in ædifices and roums foure acres of jugera, wherin were beſtowed to ſit at eaſe and behold the ſight with pleaſure, two hundred and threeſcore thouſand perſons: what tearme ſhall I giue, but of Stately and magnificent buildings, either vnto the royall pallace of *Paulus Æmilius*, enriched with goodly pillars of Sinadian marble out of Phrygia, moſt admirable to behold; or to the ſumptuous Forum of *Auguſtus Cæſar* late Emperour, or yet the temple of *Peace* built by the Emperour *Veſpaſianus Auguſtus*, now liuing, the goodlieſt and faireſt buildings that euer were? what ſhould I ſpeake of the temple * *Pantheon*, made by *Agrippa* to the honor of *Iupiter Reuenger*? as alſo how before this time, *Valerius* of Oſtia the architector enginer, made a rouſe ouer the great Theatre at Rome againſt the time that

* The round church of Noſter dame, now at Rome.

Libo exhibited his ſolemnitie of games and plaies to the people? Wonder we at the diſpences G
that KK. were at about their Pyramides: and wonder we not rather that *Iulius Cæſar* Dictatour
diſburſed for the purchaſe of that plot of ground only and no more wherin he built his Forum,
* HS. *millies.* a*hundred millions of ſeſterces? And if there be any here that take pleaſure to hoord vp mo-
ny, and be loth to part with a penny, and loue not to be at charges and lay forth ought, wil they
not make a wonder when they heare that *P. Clodius* (whom *Milo* ſlew) paid for the houſe wherein
he dwelt, fourteene millions and eight hundred thouſand ſeſterces? ſurely if they do not, I do;
and take it to be as fooliſh an expence and as wonderfull, as that of the KK. in Ægypt aboue na-
med: likewiſe when I conſider the debts that *Milo* himſelfe ought, and which amounted to
ſeuenty millions of ſeſterces, I count it one of the moſt prodigious enormities that a mans cor-
rupt mind can bring forth. But old men maruelled euen in thoſe daies at the mighty thick ram- H
piers that K. *Tarquinius Priſcus* cauſed to be made, the huge foundations alſo of the Capitoll
that he laid, the vaulted ſinks alſo and draughts (to ſpeake of a piece of worke the greateſt of all
others) which he deuiſed, by vndermining and cutting through the ſeuen hils whereupon Rome
is ſeated, and making the city hanging as it were in the aire between heauen and earth, like vnto
Thebes in Ægypt, whereof erewhile I made mention; ſo as a man might paſſe ouer the ſtreets
& houſes with botes. But how would they be aſtonied now, to ſee how *M. Agrippa* in his Ædile-
ſhip, after he had been Conſull, cauſed ſeuen riuers to meet together vnder the city in one main
channell, and to run with ſuch a ſwift ſtreame and current, that they take all afore them whatſo-
euer is in the way, and carry it downe into Tyber: and being otherwhiles encreaſed with ſodaine
ſhoures & land-flouds, they ſhake the pauing vnder them, they flank the ſides of the wals about I
them: ſometimes alſo they receiue the Tyber water into them when he riſeth extraordinarily,
ſo as a man ſhall perceiue the ſtreame of two contrary waters affront and charge one another
with great force and violence within vnder the ground: And yet for all this, theſe water-workes
aforeſaid yeeld not a jot, but abide firme & faſt, without any ſenſible decay occaſioned therby,
Moreouer, theſe ſtreames carrie downe eftſoons huge and heauie pieces of ſtones within them,
mighty loads are drawne ouer them continually, yet theſe arched conduits neither ſettle and
ſtoup vnder the one, nor be once ſhaken with the other; down many an houſe falls of it ſelfe, and
the ruins beat againſt theſe vaults: to ſay nothing of thoſe that tumble vpon them with the vio-
lent force of skarefires, ne yet of the terrible earthquakes which ſhake the whole earth about
them: yet for all theſe injuries, they haue continued ſince *Tarquinius Priſcus*, almoſt eight hun- K
dred yeres inexpugnable. And here by the way I will not conceale from you a memorable ex-
ample which is come into my mind by occaſion of this diſcourſe, and the rather, for that euen
the beſt & moſt renowned Chroniclers who haue taken vpon them to pen our Romane hiſtory,
haue paſſed it ouer in ſilence: When this K. *Tarquinius* ſurnamed *Priſcus*, cauſed their vaults vn-
der the ground to be made, and forced the common people to labour hard therat with their own
hands, it happened that many a good Roman citizen being now ouer-toiled in this kind of work
(which whether it were more dangerous or tedious, was hard to ſay) choſe rather to kill them-
ſelues for to be rid of their irkeſome and painfull life; in ſuch ſort, that daily there were people
miſſing, and their bodies found after they were periſhed. This king therefore, to preuent farther
miſchiefe, and to prouide that his works begun might be brought to an end, deuiſed a remedy L
* At Rome. which neuer was inuented before, nor practiſed * afterwards, and that was this, That the bodies
of as many as were thus found dead, ſhould be hung vpon jebbets, expoſed not onely to the view
of all their fellow citizens to be deſpiſed as curſed creatures, but alſo to the wild and rauenous
foules of the aire to be torne and deuoured. The Romans (as they are the only nation vnder hea-
uen impatient of any diſhonor) ſeeing this obiect preſented before their eies, were mightily a-
baſhed; and as this mind of theirs had gained them victory many a time in deſperat battels, ſo at
this preſent alſo it guided & directed them: and being (as they were) diſmaied at this diſgrace,
they made account no leſſe to be aſhamed of ſuch an ignominie after death, than they now blu-
ſhed thereat in their life. But to return again vnto theſe ſinks and water-works of ours vnder the
ground: K. *Tarquine* aboue-named, cauſed them to be made ſo large and of ſuch capacitie, that M
a good wain load of hay might paſſe within them. But al that euer I haue ſaid already is nothing
or at leaſtwiſe very little, in compariſon of one wonderful thing which I am content to ſet down
before I come to our new and moderne buildings: In that yeare when *M. Lepidus* and *Q. Catulus*
were Conſuls at Rome (according as I find all the beſt writers to agree) there was not a fairer

and

20030
copy 1

A and more ſumptuous houſe in all Rome, than that wherein *Lepidus* himſelfe dwelt: but verily before fiue and thirty yeres were come and gone, there were a hundred houſes and more brauer than it by many degrees. Now, if a man liſt by this reckoning to make an eſtimat of the infinite maſſe of marble, as well in pillars as ſquare Aſhler, the rich and curious pictures, beſides other ſumptuous furniture, meet indeed for a king, which muſt of neceſſitie be emploied in a hundred ſuch houſes, as might not onely compare with that moſt beautifull and gorgeous houſe of *Lepidus*, but alſo exceed the ſame; as alſo the infinit number of other houſes afterwards euen vntil this day, which haue gone beyond thoſe hundred in ſumptuoſities: What would he ſay, and to what an vnmeaſurable proportion will all this ariſe? Certes, it cannot be denied, but fire (which burneth many a ſtately pallace) doth ſay well to the plucking down of mans pride, & puniſhing
B ſuch waſtfull ſuperfluities; and yet theſe & ſuch like examples, will not reforme the abuſes that reign in the world: neither wil this leſſon enter into our heads, That there is ought vnder heauen more fraile, mortall, and tranſitory, than man himſelfe. But what do I ſtand vpon thoſe glorious edifices, when two pallaces only haue ſurpaſſed them all in coſtlines and magnificence. Twice in our time we haue ſeen the whole pourpriſe of Rome to be taken vp, for to make the pallaces of two Emperours, *C. Caligula*, and *Nero*: and as for that of *Nero* (becauſe there might bee nothing wanting of ſuperfluitie in the higheſt degree) he cauſed it to be all guilded, and called it was, The golden pallace. For why? thoſe noble Romans who were the founders of this our Empire, dwelt (no doubt) in ſuch glorious and ſtately houſes; thoſe I mean who went from the very plough taile, or els out of their country cabines (where they were found at repaſt by the fire ſide)
C to manage the wars, to atcheeue braue feats of armes, to conquer mighty nations, and to return with victory rriumphant into the citie; ſuch, I ſay, as had not ſo much free land in the whole world as would ſerue for one of the cellars of theſe prodigals. And here I cannot but think with my ſelfe, how little in proportion to the magnificent buildings of theſe daies were thoſe plots of grounds which in old time the whole ſtate gaue vnto thoſe inuincible captaines by publick degree for to build them houſes vpon, and how many of ſuch places would go to one of theſe in out time, and yet this was the greateſt honour that they could deuiſe to beſtow vpon thoſe valiant and hardy knights, as it may appeare by **L. Valerius Publicola*, the firſt conſull that euer was at Rome, and had companion with him in that gouernment *L. Brutus*, who had no other reward in recompence of his good ſeruice to the Commonweale, and ſo many demerits; as alſo by his
D brother who in the ſame Conſulſhip defeated the Samnites twice: where it is worth the noting that in the patent this branch went withall, *That they were allowed to open the gates of their houſes outward, ſo as the doores might be caſt to the ſtreet ſide:* this was in thoſe daies the moſt glorious and honourable ſhew that ſuch mens houſes made, euen thoſe who had triumphed ouer the enemy. Howbeit, as ſumptuous in this kind, as either *C. Caligula* or *Nero* was, yet ſhal they not enjoy the glory of this fame, though you put them two and two together: for I wil ſhew, that al this pride & exceſſe of theirs in building their pallaces (princes though they were & mighty monarchs) came behind the priuat works of *M. Scaurus*: Whoſe example in his Ædileſhip was of ſo ill conſequence, as I wot not whether euer there were any thing that ouerthrew ſo much all good manners and orderly ciuility: in ſuch ſort, as hard it is to ſay, whether *Sylla* did more dammage
E to the ſtate, in hauing a*ſon in law ſo rich & mighty, than by the proſcription of ſo many thouſand Romane citizens. And in truth, this *Scaurus* when he was Ædile, cauſed a wonderfull piece of worke to be made, and exceeding all that euer had been knowne wrought by mans hand, not only thoſe that haue been erected for a moneth or ſuch a thing, but euen thoſe that haue bin deſtined for perpetuitie; and a theatre it was: the ſtage had three lofts one aboue another, wherin were there hundred and threeſcore columnes of marble; (a ſtrange and admirable ſight in that citie, which in times paſt could not endure ſix ſmall pillars of marble, hewed out of the quarry in mount Hymettus, in the houſe of a*moſt honourable perſonage, without a great reproch and rebuke giuen to him for it;) the baſe or nethermoſt part of the ſtage, was all of marble; the middle of glaſſe (an exceſſiue ſuperfluitie, neuer heard of before or after;) as for the vppermoſt, the
F bourds, planks, and floores were guilded; the columnes beneath, were (as I haue ſaid before) fortie foot high, wanting twaine: and between theſe columns (as I haue ſhewed before) there ſtood of ſtatues and Images in braſſe to the number of three thouſand. The theatre it ſelfe was able to receiue foureſcore thouſand perſons to ſit well, and at eaſe. Whereas the compaſſe of *Pompeies* Amphitheatre (notwithſtanding the city of Rome ſo much enlarged, and more peopled in his time)

* *Publius*, out of *Liuie*.

* For *Sylla* married the mother of *Scaurus*

* *L. Craſſus*.

time) was deuiſed for to contain no greater number than fortie thouſand ſeats at large. As touching the other furniture of this Theatre of *Scaurus* in rich hangings, which were cloth of gold: painted tables, the moſt exquiſit that could be found: plaiers apparrell and other ſtuffe meet for to adorne the ſtage, there was ſuch abundance thereof, that there being caried back to his houſe of pleaſure at Tuſculum the ſurpluſage therof, ouer and aboue the daintieſt part, wherof he had daily vſe at Rome, his ſeruants and ſlaues there, vpon indignation for this waſt and monſtrous ſuperfluitie of their maſter, ſet the ſaid country houſe on fire, and burnt as much as came to a hundred millions of ſeſterces. Certes, when I conſider and behold the monſtrous humours of theſe prodigall ſpirits, my mind is drawn away ſtil from the progreſſe of mine intended iourny, and forced I am to digreſſe out of my way, and to annex vnto this vanity of *Scaurus* as great follie of another, not in maſonry and marble, but in carpentry and timber: and *C. Curio* it was, he who in the ciuile warres betweene *Cæſar* and *Pompey*, loſt his life in the quarrell of *Cæſar*. This gentleman, deſirous to ſhew pleaſure vnto the people of Rome at the funerall of his father deceaſed, as the manner then was, and ſeeing that he could not outgo *Scaurus* in rich and ſumptuous furniture (for where ſhould he haue had ſuch a father in law again as *Sylla*? Where could he haue found the like mother to dame *Metella*, who had her ſhare in all forfeitures and confiſcations of the goods of outlawed citizens? and where was it poſſible for him to meet with ſuch another father as *M. Scaurus*, the principall perſon of the whole city ſo long together, who parted ſtakes with *Marius* in pilling and polling of the prouinces, and was the very receptacle & gulfe which receiued and ſwallowed all their ſpoiles and pillage?) and *Scaurus* himſelfe verily, if he might haue had all the goods in the world, could not haue done as he did before, nor make the like Theatre, againe, by reaſon that his houſe at Tuſculum was burnt, where the coſtly and rich furniture, the goodlieſt rare ornaments which he had gotten together from al parts of the world were conſumed to aſhes: by which fire yet this good hee got and prerogatiue aboue all other, That no man euer after him was able to match that ſumptuoſitie of his Theatre. This gentleman (I ſay) *Curio*, al things conſidered, was put to his ſhifts, & deuiſed to ſurpaſſe *Scaurus* in wit, ſince hee could not come neere him in wealth. And what might his inuention be? Certes, it is worth the knowledge, if there were no more but this, that we may haue ioy of our own conceits and faſhions, and call our ſelues worthily, as our manner is, *Majores, that is to ſay, ſuperiour euery way to all others. To come then to *C. Curio*, & his cunning deuiſe, he cauſed two Theatres to be framed of timber, and thoſe exceeding big, howbeit ſo, as they might be turned about as a man would haue them, approch neere one to the other, or be remoued farther aſunder as one would deſire, & all by the means of one hooke apiece that they hung by, which bare the weight of the whole frame, the counterpoiſe was ſo euen, & all the whole therfore ſure and firme. Now he ordered the matter thus, that to behold the ſeuerall ſtage plaies and ſhews in the forenoone before dinner, they ſhall be ſet back to back, to the end that the ſtages ſhould not trouble one another: and when the people had taken their pleaſure that way, he turned the Theatres about in a trice againſt the afternoone, that they affronted one another: and toward the latter end of the day, and namely, when the fencers and ſword-plaiers were to come in place, he brought both the Theatres nearer together (and yet euery man ſat ſtil & kept his place, according to his rank and order) inſomuch, as by the meeting of the horns and corners of them both together in compaſſe, he made a faire round Amphitheatre of it: and there in the middeſt between, he exhibited indeed vnto them all jointly, a ſight and ſpectacle of ſword-fencers fighting at ſharpe, whom he had hired for that purpoſe: but in truth, a man may ſay more truly, that he caried the whole people of Rome round about at his pleaſure, bound ſure enough for ſtirring or remooving. Now let vs come to the point, and conſider a little better of this thing. What ſhould a man wonder at moſt therin, the deuiſer or the deuiſe it ſelfe? The workeman of this fabricke, or the maſter that ſet him on worke? Whether of the twaine is more admirable, either the venturous head of him that deuiſed it, or the bold heart of him that vndertook it? to command ſuch a thing to be don, or to obey and yeeld to goe in hand with it? But when we haue ſaid all that we can, the follie of the blind & bold people of Rome went beyond al; who truſted ſuch a tickliſh frame, & durſt ſit there, in a ſeat ſo moueable. Loe where a man might haue ſeen the body of that people, which is commander and ruler of the whole earth, the conquerour of the world, the diſpoſer of kingdomes and realmes at their pleaſure, the deuiſer of countries and nations at their wil, the giuer of lawes to forreinſtates, the vicegerent of the immortall gods vnder heauen, and repreſenting their

* The Romans delighted much in this word *Maiores*, as may appear by their *More Maiorum*, &c.

20030
copy 1

A their image vnto all mankind: hanging in the air within a frame at the mercy of one only hook, rejoicing and ready to clap hands at their owne danger. What a cheape market of mens liues was here toward! What was the losse at Cannæ to this hazard, that they should complaine so much as they do of Cannæ? How neere vnto a mischiefe were they, which might haue happened hereby in the turning of a hand? Certes, when there is newes come of a city swallowed vp by a wide chinke and opening of the earth, all men generally in a publicke commiseration doe grieue thereat, and there is not one but his heart doth earne; and yet, behold the vniuersall state and people of Rome, as if they were put into a couple of barkes, supported between heauen and earth, and sitting at the deuotion only of two pins or hookes. And what spectacle do they behold, a number of fencers trying it out with vnrebated swords? nay ywis, but euen themselues ra-
B ther entered into a most desperat fight, and at the point to break their necks euery mothers son, if the scaffold failed neuer so little, & the frame went out of joint: Now surely by this proofe, *Curio* had gotten a good hand ouer the people of Rome, & no Tribunes of the Commons with all their Orations could do more: from that time forward he might make account to be so gracious, as to lead all the tribes after him in any suits; and haue them hanging in the air at his plea-
sure. What a mighty man with them might he be (thinke you) preaching vnto them from the Rostra? What would not he dare to propose, hauing audience in that publick place before them who could persuade them thus, as he did, to sit vpon such turning and tickliſh Theatres. And in truth, if we wil consider this pageant vpright, we must needs confesse & may be bold to say, that *Curio* had all the people of Rome to perform a braue skirmish and combat indeed to honor and
C solemnize the funerals of his father before his tombe. And yet here is not all: for he was at his change and variety of magnificent shewes: and when he perceiued once that the hookes of his frames were stretched ynough and began to be out of order, hee kept them still close together round in forme of a perfect Amphitheatre, and the very last day of his funeral solemnities, vpon two stages just in the middest, he represented wrestlers and other champions to performe their devoire, and then all on a suddaine causing the said stages to be disjointed and hailed one from another a contrary way, he brought forth the same day the fencers and sword players who had woon the prize, and with that shew made an end of all. See what *Curio* was able to do! And yet was he neither king nor Kesar: he was not so much as a generall or commander of an army; nay, he was not named for any great rich man: as whose principall state depended vpon this, That
D when the great men of the city, *Cæsar* and *Pompey*, were skuffling together by the eares, he knew well how to fish in a troubled water. But to leaue *Curio* & such as he was, with their foolish and idle expences, let vs come to the miraculous workes that *Q. Marcius Rex* performed, and that to some good purpose: which if we consider & esteeme aright, passe all the other before rehearsed. This gentleman when he was Pretor, hauing commandement & commission both from the Senat, to repaire the conduits to the waters of Appia, Anio, and Tepula, which serued Rome, did not that only, but also conueighed a new water into the city, which of his owne name he called Martia: and notwithstanding that he was to pierce certaine mountains, & make trenches quite through them vnder the ground, for to bring the water thither from the Spring, yet he perfourmed all within the time of his Pretourship. As for *Agrippa*, whiles he was Ædile, besides the
E conduits from all other fountaines which he scoured, repaired, and caused to keep their currant: he brought another of his own to the city, which is known by the name of Virgo: he made seuen hundred pooles for receit of waters: a hundred and fiue conduits, yeelding water at rockes and spoutes, besides a hundred and thirtie conduit heads in the fields, and the most of them built strongly with vaults, and adorned right stately. Moreouer, vpon these workes of his he erected statues & images, to the number of three hundred, partly of brasse and partly of marble, besides foure hundred pillars of marble, and all within the compasse of one yeare. And if wee may beleeue his owne speech, discoursing of the acts done by him during his Ædileship, hee addeth moreouer and saith, That the plaies and games which he exhibited that yeare, for to doe the people pleasure, continued threescore daies together, wanting one: that he caused a hundred
F threescore and ten baines or stouves to be made within the city, wherein people of all sorts and degrees might bathe and sweat of free cost, and not pay a denier: the which remain at this day, and haue brought with them an infinit number of others. But of all the conduits that euer were before this time, that which was last begun by *C. Caligula Cæsar*, and finished by *Claudius Cæsar* his successour, passeth for sumptuousnesse: for they commanded the waters from the two fountaines,

tains, Curtius & Cæruleus, whose heads were 40 miles off: and these they carried before them with such a force and to such an height, that they mounted vp to the top of the highest hils of Rome, and serued them that dwelt therupon. This work cost *three hundred millions of sesterces. Certes, if a man would well and truly consider the abundance of water that is brought thereby, and how many places it serues, as well publicke as priuat, in baines, stewes, and fishpooles, for kitchins and other houses of office, for pipes and little riuerets to water gardens, as well about the citie, as in manors and houses of pleasure in the fields neere the city; ouer and besides, what a mighty way these waters be brought; the number of arches that of necessitie must be built of purpose for to conueigh them; the mountaines that be pierced and mined through to giue way together; with the vallies that are raised and made euen and leuell with other ground: he will confesse, that there was neuer any desseine in the whole world enterprised and effected, more admirable than this. In the ranke of these most memorable workes of man, I may well raunge the mountaine that was digged through by the same *Claudius Cæsar*, for to void away the water out of the lough or meere Fucinus, although this work was left vnfinished for hatred of his *successour: which I assure you cost an incredible and inenarrable sum of mony, besides the infinit toil and labour of a multitude of workemen and labourers so many yeres together, as well to force the water which came vpon the pioners from vnder the ground with deuise of engines and windles vp to the top of the hill, whereas it stood vpon meere earth; as to cut and hew through hard regs and rockes of flint: and all this by candlelight within the earth, in such sort that vnlesse a man had bin there to haue seene the manner of it, vnpossible it is either to conceiue in mind or expresse with tongue the difficultie of the enterprise. As for the peere and hauen at Ostia (because I would make an end once of these matters) I will not say a word thereof, nor of the waies and passages cut through the mountaines, ne yet of the mighty piles and damns to exclude the Tuscane sea, for the Lucrine lake, with so many rampiers and bridges made of such infinit cost. Howbeit, among many other miraculous things in Ægypt, one thing more I will relate out of mine author *Papyrius Fabianus*, a great learned Naturalist, namely, That marble doth grow daily in the quarries: and in very truth, the farmers of those quarries, and such as ordinarily do labour and dig out stone, do affirme no lesse; who vpon their experience doe assure vs, that looke what holes and caues be made in those rockes and mountaines, the same will gather againe and fill vp in time: which if it be true, good hope there is, that so long as marbles do liue, excesse in building will neuer die.

* *Sestertiûm ter millies.* howbeit *Budæus* reads *quingenties, quinquagies, quinquies*, and that is not much more than the sixt part: & yet by his computation ariseth to a million three hundred eightie fiue thousand and fiue hûdred French crownes.

* *Nero.*

Chap. XVI.

¶ *The sundry kinds of the Load-stone, and the medicines thereto depending.*

NOw that I am to passe from marbles to the singular & admirable natures of other stones; who doubts but the Magnet or Loadstone will present it self in the first place? for is there any thing more wonderfull, and wherein Nature hath more trauelled to shew her power, than in it? True it is, that to rockes and stones she had giuen * voice (as I haue already shewed) whereby they are able to answer a man, nay, they are ready to gainsay and multiply words vpon him. But is that all? what is there to our seeming more dull than the stiffe and hard stone? And yet behold, Nature hath bestowed vpon it, sence, yea & hands also, with the vse thereof. What can we deuise more stubborne and rebellious in the own kind, than the hard yron, yet it yeelds, and will abide to be ordered: for loe, it is willing to be drawne by the load stone: a maruellous matter that this mettall, which tameth and conquereth all things els, should run toward I wot not what, and the nearer that it approcheth, standeth still as if it were arrested, and suffereth it selfe to be held therwith, nay, it claspeth and clungeth to it, and will not away. And hereupon it is, that some call the load-stone * Sideritis, others Heracleos. As for the name Magnes that it hath, it tooke it (as *Nicander* saith) of the first inuentor and deuiser thereof, who found it (by his saying) vpon the mountaine Ida (for now it is to be had in all other countries, like as in Spaine also;) and (by report) a neat-heard he was: who, as he kept his beasts vpon the foresaid mountaine, might perceiue as he went vp and downe, both the hob-nailes which were in his shooes, and also the yron picke or graine of his staffe, to sticke vnto the said stone. Moreouer, *Sotacus* ascribeth and setteth downe fiue sundry kinds of the load-stone: the first which commeth out of Æthyopia; the second, from that Magnesia which confineth vpon Macedonie, and namely,

* *i.* The eccho.

* σίδηρος in Greek is yron.

20030
copy 1

A namely, on the right hand, as you go from thence toward the lake Bœbeis; the third is found in Echium, a town of Bœotia; the fourth about Alexandria, in the region of Troas; and the fift in Magneſia, a country in Aſia Minor. The principall difference obſerued in theſe ſtones, conſiſts in the ſex (for ſome be male, others female;) the next lieth in the colour. As for thoſe which are brought out of Macedonie and Magneſia, they be partly red, and partly blacke. The Bœotian loadſtone ſtandeth more vpon red than black: contrariwiſe, that of Troas is black, and of the female ſex, in which regard it is not of that vertue that others be. But the worſt of all comes from Magneſia in Natolia, and the ſame is white: neither doth it draw yron as the reſt, but reſembles the pumiſh ſtone. In ſum, this is found by experience, That the blewer any of theſe loadſtones be, the better they are and more powerful. And the Ethyopian is ſimply the beſt, inſomuch, as it
B is worth the weight in ſiluer: found it is in Zimiri, for ſo they cal the ſandy region of Ethyopia, which country yeeldeth alſo the ſanguine load-ſtone, called Hæmatites, which both in color reſembleth bloud, and alſo if it be bruiſed, yeeldeth a bloudy humour, yea and otherwhiles that which is like to ſaffron. As for the property of drawing yron, this bloud-ſtone Hæmatides is nothing like to the loadſtone indeed. But if you would know and try the true Ethyopian Magnet, it is of power to draw to it any of the other ſorts of loadſtones. This is a generall vertue in them all, more or leſſe, according to that portion of ſtrength which Nature hath indued them withal, That they are very good to put into thoſe medicines which are prepared for the eies: but principally they do repreſſe the vehement flux of humors that fall into them: beeing calcined and beaten into pouder, they do heale any burne or ſcald. To conclude, there is another mountaine
C in the ſame Ehyopia, and not far from the ſaid Zimiris, which breedeth the ſtone Theamedes that will abide no yron, but reiecteth and driueth the ſame from it. But of both theſe natures, as well the one as the other, I haue written oftentimes already.

Chap. XVII.

¶ *Of certaine ſtones which will quickly conſume the bodies that be laid therein. Of others againe that preſerue them a long time. Of the ſtone called Aſſius, and the medicinable properties thereof.*

D WIthin the Iſle Scyros there is a ſtone (by report) which ſo long as it is whole & ſound will ſwim and flote vpon the water; breake the ſame into ſmall pieces, it will ſink. Near vnto Aſſos, a city in Troas, there is found in the quarries a certaine ſtone called Sarcophagus, which runneth in a direct veine, and is apt to be clouen and ſo cut out of the rocke by flakes. The reaſon of that name is this, becauſe that within the ſpace of forty daies it is knowne for certaine to conſume the bodies of the dead which are beſtowed therein, skin, fleſh, and bone, all ſaue the teeth. And *Mutianus* mine author affirmeth, that look what mirroirs, * currycombs, cloth, or ſhoos ſoeuer be caſt into the ſaid coffins with the dead, they will turn all into ſtone. Of this nature there be ſtones in Lycia, and in the Eaſt countries, which if they be hung or applied to liuing bodies alſo, will eat and fret them away. Yet the ſtone called Chernites, reſembling
E yvorie, is more mild and gentle: for keepe it will and preſerue dead bodies without conſuming them at al, & in a ſepulchre or coffin of this ſtone, the body of K. *Darius* (they ſay) was beſtowed Touching the ſtone called Porus, like it is vnto the marble of Paros for white colour and hardneſſe, howbeit nothing ſo weighty. *Theophraſtus* writeth, That there be found in Ægypt certain cleare and tranſparent ſtones, and thoſe he ſaith bee like vnto the Serpentine marble Ophites: haply ſuch there were in his time, for now are there none of them to be found; but as they are gone, ſo there be new come in their place. As for the ſtone Aſſius, in taſt it is ſaltiſh, but ſingular good to allay the paine of the gout, if the feet onely be put into a trough or hollow veſſell made of that ſtone. Moreouer, all griefes, pains, and infirmities of the legs, will be healed in ſuch quarries: wheras in all mettall mines, the legs take harm. Furthermore, this ſtone yeeldeth in the top
F of the quarrie a certain light ſubſtance, apt to be reduced into a ſoft pouder, which they call the floure of the ſaid ſtone, and is as effectuall as the ſtone it ſelfe in ſome caſes. Like it is for al the world to a red pumiſh ſtone. If it be mixt with Cyprian braſſe or copper, it cures the accidents of womens breſts; but being incorporat with pitch or roſin, it diſcuſſeth the kings euill, and any biles or botches. The ſame reduced into a lohoch to be licked down leaſurely, ſerueth well in a phthy-

* *Strigiles.* He meaneth thoſe that be vſed in baines to fetch off the ſweat and filthineſſe of our bodies.

phthyſicke: and tempered with hony, it healeth vp old vlcers and skinneth them cleane: and yet this property it hath, to eat away any excreſcence of proud fleſh. The ſame is good for the bitings of wild and venomous beaſts. Such morimals or ſores as ſcorne ordinary cures & be full of ſuppuration, it drieth. Finally, there is an excellent cataplaſme made with it and beane floure put together, for the gout.

Chap. XVIII.

¶ Of Yvorie minerall, digged out of the ground. Of ſtones that are of a bonie nature, and ſuch, as their veines repreſent Date trees within: and of other kinds of ſtone.

Theophraſtus and *Mutianus* aboue named, are verily perſuaded, That there be ſome ſtones which ingender others. And as for *Theophraſtus*, he affirmeth, That there is a minerall Yvorie found within the ground, as well black as white: alſo, that there be bones growing within the earth, yea, and ſtones of a bony ſubſtance. About Munda, a city in Spaine, where *Cæſar* dictator defeated *Pompey*, there are found ſtones reſembling Date-trees, breake them as often as you will. There be alſo certaine black ſtones, whereof there is as great account made as of marbles: like as the ſtone alſo of the cape Tænara. And ſuch black ſtones (*Varro* ſaith) be more firm and hard which come out of Africa, than thoſe of Italy; and contrariwiſe, that there be white ſtones harder to be wrought by the Turner, than the marble of Paros: the ſaid *Varro* affirmeth, that the flint of Luna may be ſlit with the ſaw; whereas that of Tuſculum will cracke and flie in pieces in the fire; alſo, That the darke and duskiſh Sabine ſtone, if it be ſprinckled with oil, will burne of a light fire: moreouer, That about Volſinij there haue been found quernes or hand mill-ſtones framed ready for worke, yea, and ſome we haue ſeen to turne about and grind of their owne accord; but ſuch haue bin taken for prodigies. And ſince I am fallen vpon the mention of ſuch mill-ſtones, there is not a country in the world affoordeth better of that kinde than Italy doth: neither do ſuch grow in the rocke, and are hewed forth, but be entire ſtones of themſelues apart: and yet in ſome prouinces there are none of them to be had at all. And in this kind there be of a more free and ſofter grit, which being ſmoothed and poliſhed with a ſlicke ſtone, may ſeem a far off as if they were Serpentine marble; and verily, there is not a ſtone wil indure better, or lie longer in building. For thus you muſt thinke, that all ſtones bee not of one and the ſame nature to abide rain and weather; heat of Summer and cold in Winter alike; for ſome be more durable than others, like as we find in ſundry kinds of timber. Finally, there be ſtones alſo, which may not away with the raies of the Moon: which in continuance of time wil gather ruſt, yea, and with oile will change their white colour.

Chap. XIX.

¶ Of Curalium or Pyrites, i. the Marcaſin: and the medicinable vertues thereof. Of the ſtone Oſtracites, and the Amiant: together with the properties ſeruing in Phyſicke: alſo, of the ſtone Melitites, and the vertues thereof. Likewiſe of the Geat, and the effects that it worketh in Phyſick, Of Spunges. Laſtly, of the Phrygian ſtone, and the Nature of it.

THe mill-ſtone Curalium, ſome call Pyrites, becauſe it ſeemeth to haue great ſtore of fire in it: howbeit, there is another fire ſtone going vnder the name of Pyrites or Marcaſin, that reſembleth braſſe ore in the mine. And they ſay, that of it there is found great plenty in the Iſle Cypros, and in thoſe mines which are about Acarnania, where a man ſhal meet with one in colour like ſiluer, and another like gold. Theſe ſtones be calcined many & ſundry waies: ſome boile them two or three times in hony, ſo long, vntill all the liquor be conſumed: others burne them firſt in fire of coales, then they calcine them with honey, and afterwards waſh them, after the maner of braſſe. Theſe ſtones thus prepared, are good in Phyſick, namely, to heat, to dry, to diſcuſſe, to ſubtiliat groſſe humors, and to mollifie all ſchirrhoſities or hard tumors. The ſame are much vſed alſo crude and vncalcined (being reduced into pouder) for the kings euill, and fellons. Moreouer, in the rank of theſe Marcaſines, ſome range certaine ſtones, which we cal quicke fire-

20030
copy 1

A fire-ſtones, and of all others they be moſt ponderous: theſe be moſt neceſſarie for the eſpials belonging vnto a camp, if they ſtrike them either with an iron ſpike or another ſtone, they will caſt forth ſparks of fire, which lightning vpon matches dipt in brimſtone, dry pufs or leaues, wil cauſe them to catch fire ſooner than a man can ſay the word.

As touching the ſtones Oſtracitæ, they haue a reſemblance to oiſter ſhels, wherof they took their name: vſed they are much in ſtead of a pumiſh ſtone to ſmooth and ſlick the skin: taken in drink they ſtanch any flux of bloud; and in forme of a liniment applied with hony, they heale the vlcers in womens breſts, and aſſwage their paine.

The * Amiant ſtone is like Alume, & being put into the fire, loſeth nothing of the ſubſtance: a ſingular propertie it hath to reſiſt all inchantments and ſorceries, ſuch eſpecially as Magitians do practiſe. As for Gæodes, the Greeks haue giuen it this ſignificant name, becauſe it containeth incloſed within the belly, a certaine earth, a medicine ſoueraigne for the eies, as alſo for the infirmities incident as well to womens paps, as mens genitoirs. * It is taken for Alume de plume.

The ſtone Melitites hath that name, becauſe if it be bruiſed or braied, it yeeldeth from it a certaine ſweet juice in manner of honey: the ſame being incorporat in wax, is good to cure the flegmatick wheales, and other puſhes or ſpecks of the body; it healeth likewiſe the exulceration of the throat: applied with wool, it takes away the chilblanes or angry bloudi falls called Epinyctides: alſo the griefe of the matrice it eaſeth in the ſame manner.

The Gete, which otherwiſe we call Gagates, carrieth the name of a towne and riuer both in Lycia, called Gages: it is ſaid alſo, that the ſea caſteth it vp at a full tide or high water into the C Iſland of Leucola, where it is gathered within the ſpace of twelue ſtadia, and no where els: black it is, plaine and euen, of an hollow ſubſtance in manner of a pumiſh ſtone, not much differing from the nature of wood, light, brittle, and if it be rubbed or bruiſed, of a ſtrong ſauor. Looke what letters are imprinted in it into any veſſel of earth, they will neuer be got out again: whiles it burneth it yeelds a ſmel of brimſtone: but a wonderful thing it is of this jeat ſtone, that water will ſoone make it to flame, and oile will quench it againe: in burning, the perfume thereof chaſeth away ſerpents, and recouers women lying in a trance by the ſuffocation or riſing of the mother: the ſaid ſmoke diſcouereth the falling ſickneſſe, and bewraieth whether a yong damſell be a * maid or no: being boiled in wine, it helpeth the tooth-ache; and tempered with wax it cures the ſwelling glandules called the Kings euil. They ſay that Phyſitians vſe this jet ſtone D much in their ſorceries, practiſed by the means of red hot axes, which they call Axinomantia; for they affirme, that being caſt thereupon, it will burn and conſume, if what we deſire and wiſh ſhall happen accordingly. * If ſhe drinke it faſting, preſently it prouoketh vrine, if ſhe bee a pure virgin.

As for Spunges, I mean by them in this place certain ſtones found in Spunges, and the ſame alſo do ingender naturally within them. Some there be who cal them Tecolithos, becauſe they are good for the bladder, in this reſpect, that they breake the ſtone, being drunk in wine.

As concerning the Phrygian ſtone, it beareth the name of the country where it is ordinarily found, and it groweth in hollow lumps in manner of a pumiſh ſtone: the order is to ſteep it well in wine before it be calcined, and in the burning to maintain the fire with blaſt of bellows, vntil it wax red; then to quench it again in red wine, continuing this courſe three times: & being thus E prepared, it is good only to ſcoure cloth, and make it ready for the Dier to take a colour.

Chap. XX.

¶ *Of the red Bloud-ſtone Hæmatites, and the fiue ſorts thereof: alſo of the blacke ſanguine ſtone called Schiſtos.*

THe bloud-ſtone Schiſtos and Hœmatites both haue great affinitie one with another. As for the bloud-ſtone Hœmatites, a meere mineral it is, and found in mines of mettal: being burnt it comes to the colour of Vermilion: the manner of calcining it is much after that of the Phrygian ſtone, but wine ſerueth not to quench it. Many ſophiſticate it with Schiſtos, F and obtrude the one for the other: but the difference is ſoon known, for that the right Hœmatites hath red veins in it, and beſides is by nature fraile and eaſie to crumble: of wonderful operation it is to help bloud-ſhotten eies: the ſame giuen to women to drink, ſtaieth the immoderat flux that followes them: they alſo that vſe to caſt vp bloud at the mouth, find helpe by drinking it with the juice of a pomgranat: in the diſeaſes likewiſe of the blader it is very effectual;

and being taken in wine, it is ſouerain againſt the ſting of ſerpents. In all theſe caſes the bloud- G
ſtone Schiſtos is effectual, but weaker only it is in operation: and yet among theſe ſanguine or bloud-ſtones, thoſe are taken for the beſt and moſt helpfull which in colour reſemble ſaffron; & ſuch haue a peculiar reſplendant luſtre by themſelues. This ſtone being applied to weeping and watery eies with womans milk, doth them much good, and is ſoueraign alſo to reſtrain and keep them in, if they be ready to ſtart out of the head. And this I write according to the mind and opinion of our modern writers. But *Sotacus* a very antient writer hath deliuered vnto vs fiue kinds of bloud-ſtones, beſides that Hœmatites called Magnes, or the Load-ſtone: among which he giues the chiefe prize and principall praiſe to the Æthiopian, for that it is ſo ſouerain to be put into medicines appropriat to the eies; as alſo into thoſe which for their excellent operation be called Panchreſta. A ſecond ſort he ſaith is called Androdamas, black of colour, and for H
weight and hardneſſe ſurpaſſing all the reſt, whereupon it took that name, and of this kind there are found great ſtore in Barbary. He affirmeth moreouer, That it hath a qualitie to draw vnto it ſiluer, braſſe, and iron: and for triall whether it be good or no, it ought to be ground vpon the touch called Baſanitis; for it will yeeld a bloudy juice, the which is a right ſoueraign remedie for the diſeaſes of the liuer. The third kind of bloud-ſtone he maketh Arabick, for that it is brought out of Arabia: as hard it is as the other, for hardly will there any juice come from it, though it be put to the grindſtone, and the ſame otherwhile is of a Saffron colour. The fourth ſort he ſaith is called Elatites, ſo long as it is crude; but being once calcined, it is named Miltites: a very excellent thing for burns and ſcaldings, and in all caſes much better than any ruddle whatſoeuer. In the fift place he reckons that which is called Schiſtos: this is held to be ſingu- I
lar for repreſſing the flux of bloud from the hemorrhoid veins. But generally of all theſe bloud ſtones he concludes thus, That if they be pulueriſed, and taken in oile vpon a faſting ſtomack to the weight of 3 drams, they be right ſoueraign for all fluxes of bloud. The ſame author writes of another Schiſtos which is none of theſe Hœmatites, and this they call Anthracites: and by his ſaying, found there is of it in Africk, black of colour, which if it be ground vpon a whetſtone or grindſtone with water, yeelds toward the nether end or ſide thereof that lay next the ground, a certaine blacke juice; but on the other ſide of a ſaffron colour: and he is of opinion, that the ſaid juice is ſingular for thoſe medicines appropriat to the eies.

Chap. XXI. K

¶ *Of the foure kindes of the Ægle-ſtone, Aëtius: of the ſtone Callimus: of the ſtones Samnus and Arabus: and of Pumiſh ſtones.*

THe Ægle-ſtones called Aëtites be much renowned in regard of the very name they carry: found they are in Ægles neſts, as I haue ſhewed already in my tenth book, & it is ſaid that they be two together, to wit, the male and female: alſo, that without them the Ægles cannot hatch, which is the reaſon that they neuer haue but two young Ægles at one airie. Of this Ægle-ſtone there be foure kinds; for one ſort thereof is bred in Africk, and is very ſmall & ſoft, containing within it as it were in a wombe, a certaine clay which is ſweet, pleaſant, and white; L
the ſtone it ſelfe is brittle and apt to crumble, and this is thought to be the female ſex. The ſecond, which is taken for the male, groweth in Arabia, hard this is, and reſembleth a gall-nut in faſhion, and the ſame otherwhile is of a reddiſh colour, hauing incloſed within the belly thereof another hard ſtone. The third is found in the Iſland Cypros, for colour much like to thoſe that be engendred in Africke, otherwiſe bigger, and made more flat and broad than they: The reſt be vſually round in manner of a globe. This hath alſo within the wombe a ſweet ſand and other ſmall grauelly ſtones, but it ſelfe is ſo tender that a man may crumble it betwixt his fingers. The fourth kind is named Taphiuſius, for that it is bred neere vnto the cape Leucas, in a place neere Taphiuſa, on the right hand as men ſaile from the ſaid Taphiuſa toward Leucas: there is found of it in riuers, but the ſame is white and round: within the belly of it there is a- M
nother ſtone called Callimus, and there is not a thing more tender than it. But to come to the properties of theſe Ægle-ſtones: They are commended as ſingular for women with childe, or four-footed beaſts that are with yong; for being hung about their necks, or otherwiſe tied vnto any part within the skin of a beaſt ſacrificed, they will cauſe them to go out their full time; but

remoued

20030
copy 1

A remoued they muſt not be but at the very time of deliuerance, for otherwiſe the very wombe or matrice would ſlip out withall; and vnleſſe they be remoued then, they ſhall neuer be deliuered. Within the ſame Iſle Samos (wherin we praiſed the goldſmiths earth Tripoly) there is a ſtone likewiſe called Samius, very good to burniſh and poliſh gold: the ſame ſerueth alſo in phyſicke together with milk, for vlcers of the eies, beeing applied in manner aforeſaid; and in that ſort it cureth alſo their weeping and watring which hath continued a long time: the ſame being taken in drinke, helpeth the infirmitie and other accidents of the ſtomack; it cureth the dizzineſſe of the head, & reſtoreth thoſe to their right ſences again who be troubled in their brain. Some are of opinion, that it is wholſome to be giuen to thoſe that are ſubject to the falling ſickneſſe, or difficulty of making water: beſides, it is one of the ingredients that go to the making of thoſe
B medicines which be called Acopa: for to know whether it be good, ſee that it be paſſing white and heauy withall. It is ſaid, that if a woman weare it hanging or tied about her, it will keep her from vntimely ſlips of her abortiue fruit, and withall containe the matrice though it were giuen to fall downe too low.

Touching the ſtone Arabus, like it is to yvorie; a proper thing for dentifrices, if it be calcined and reduced to pouder: a peculiar property it hath beſides, to cure the hæmorrhoids, beeing applied thereto in lint, ſo that there be fine linnen clothes laid afterwards thereupon.

I muſt not ouerpaſſe in ſilence, the treatiſe of pumiſh ſtones and their nature: I am not ignorant that in architecture and maſonrie, they vſe to call by the name of Pumices or Pumiſhes thoſe hollowed ſtones or bricks as if they were eaten into, which hang downe from thoſe vaulted buildings which they call Muſea, to repreſent a caue or hollow vault artificially made. But
C to ſpeake more properly of thoſe Pumiſhes which are vſed by women for to ſmooth and ſlicke their skin, yea, and by your leaue by men alſo in theſe daies; alſo for to polliſh books, as *Catullus* ſaith, the beſt of them are found in Melos, Scyros, and the Iſlands of Ætolia: and thoſe ought to be very white, and according to their proportion exceeding light: the ſame ſhould bee alſo as ſpungious as is poſſible, and dry without; eaſie to be beaten to pouder, & in the rubbing between the fingers not apt to yeeld from them any ſand. As for their medicinable vertues, they do extenuat and dry, after 3 calcinings, ſo that regard be had in the torrifying, that it be done with cleane charcoles that burn cleare, and that they be euery time quenched with white wine: which done, they are to be waſhed like to Cadmia or the Calamine ſtone; and being dried again, they
D would be laied vp in ſome dry place which is in any wiſe dank or giuen to gather mouldineſſe. The pouder of this ſtone is commended principally in medicines for the eies, for a gentle mundificatiue it is, and clenſeth the vlcers and ſores incident to them: it doth incarnate hollow skars & maketh them euen with the reſt about them. Some, after the third burning, ſuffer them to coole of themſelues, and not by quenching: and chuſe rather to beat them afterwards with ſome ſprinckling of wine among: they enter likewiſe into thoſe emollitiue or lenitiue plaſtres which are deuiſed for the ſores of the head or vlcers in the priuities. The beſt dentifrices for to cleanſe or whiten the teeth, be made of the pumiſh. *Theophraſtus* writeth, that great drunkards who drink for a wager, vſe to take the pouder of the pumiſh ſtone before-hand; for then they
L may, nay they muſt quaffe luſtily indeed, for vnleſſe they be filled with drinke, they are indan-
E gered by the foreſaid pouder. To conclude, he ſaith, that ſo exceeding refrigeratiue it is, that if new wine do work or purge neuer ſo much, caſt but a little pumiſh ſtone into it, you ſhall ſee it giue ouer immediatly.

CHAP. XXII.

¶ *Of ſtones which be good for Apothecaries to make their mortars of: of ſoft ſtones: of the glaſſe-ſtone: of flints and the ſhining ſtone Phengites: of whetſtones and grindſtones: of other ſtones that ſerue in building, which reſiſt the violence of fire and tempeſts.*

F OVr antient writers in old time were carefull to finde ſtones fit for mortars, and not onely to ſerue Apothecaries for to beat and puluerize their drugs, or painters to grinde their colours, but the cooks alſo in the kitchin for to pouder their ſpices: and in very truth, they preferred the Epheſian marble before all others: and next to it, that of Thebais in high Ægypt, which I called before Pyrrhopœcilon, though ſome there be that name it Pſaronium: in a

third degree they place a kinde of Chalazius named Chryſites; but the Phyſitians make moſt G
account of that kind of whetſtone which they cal Baſanites, becauſe this ſtone ſendeth nothing
from it, for all the ſtamping and punning that is made in it. As for ſuch ſtones as yeeld a cer-
taine moiſture from them, they are ſuppoſed to be good for eie ſalues; and therefore in that re-
gard the Æthyopian marble is beſt eſteemed for that purpoſe. As for the marble of Tænara, of
Carthage called Pœnicum, and the bloud-ſtone Homatites, they are al good (they ſay) for thoſe
compoſitions which ſtand vpon ſafron: but that Tænarian marble which is blacke, as alſo the
white marble of Paros, is not ſo good for Phyſitians, who rather chuſe the Alabaſtrite of Egypt,
or the white Serpentine marble: for this kind of Ophites it is whereof they make their veſſells
and barels. In the Iſland Siphnus there groweth in the quarries, a ſtone, which they vſe to hew
hollow, and by Turners craft make veſſels for the kitchin good to boile viands in: alſo very hand- H
ſom for platters and diſhes to ſerue vp meat to the table; much like to the green ſtone that com-
meth from Comus in Italy, which wee ſee ordinarily imploied to thoſe vſes: but this propertie
hath the Siphnian ſtone by it ſelfe, that if it be once heat with oile, it beginneth to look blacke
and waxes hard withal, being otherwiſe naturally exceeding ſoft: ſuch difference there is among
ſtones. For on the further ſides of the Alps there be ſtones found exceeding ſoft: and in the pro-
uince Belgica or Picardy, they haue a certaine white ſtone, which they ſlit through with a ſaw
as they do timber, yea and with much more facility, wherewith they make plates that ſerue to
couer their houſes in manner of ſlates or tiles, both on the ſides and alſo in gutter and ridge; yea
and if they liſt, to make fine work vpon the roofs that may ſhine like to peacocks feathers, which
they call Pauonacea: and verily this kind of ſtone is apt alſo to be clouen. I

Specularis lapis As touching * Talc (which alſo goeth in the name of a ſtone) it is by nature much more ea-
ſie to be clouen into as thin flakes as a man will. This kind of glaſſe ſtone, the hither part of
Spaine only in old time did affoord vs, & the ſame not all throughout, but within the compaſſe
of a 100 miles, namely about the city Segobrica: but in theſe daies we haue it from Cypros,
Cappadocia, and Sicilie, and of late alſo it hath been found in Barbary: howbeit, the beſt glaſſe
ſtone comes from Spaine and Cappadocia, for it is the tendreſt and carrieth largeſt pannels, al-
though they be not altogether the cleareſt, but ſomwhat duskiſh. There be alſo of them in Italy
about Bononia, but the ſame be ſhort and ſmall, full of ſpots alſo and joined to pieces of flint;
and yet it ſeemeth that in nature they be much like to thoſe that in Spaine bee digged out of
pits which they ſinke to a great depth. Moreouer, there is found of this Talc betweene other K
ſtones incloſed in a rocke and lying vnder the ground, which muſt be hewed out if a man would
haue them. But for the moſt part, this Talc lieth in manner of a vein in the mine by it ſelfe, as if
it were perfectly cut already by nature; and yet was there neuer any piece knowne to be aboue
fiue foot long. Some are of opinion, that it is a liquid humour of the earth congealed to an yce
after the maner of Cryſtall. Certes, that it groweth hard into the nature of a ſtone, may appeare
euidently by this, That when any wild beaſts are chanced to fall into ſuch pits where this glaſſe
ſtone is gotten, the very marow of their bones (after one winter) wil be conuerted and turned in-
to a ſtony ſubſtance like to the Talc it ſelfe. Otherwhiles there is found of this kinde which is
blacke: but the white is of a ſtrange and wonderfull nature, for being (as it is well knowne) ten-
der and brittle, nothing more, yet it wil indure extreme heat and frozen cold, and neuer cracke; L
nay you ſhal neuer ſee it decay for age, keep it ſo long as you wil, ſo that it may eſcape outward
injuries: notwithſtanding we doe ſee many ſtones in building laied with ſtrong mortar and ce-
ment, yet ſubject to age. There hath beene deuiſed another vſe alſo of Talc in ſmaller pieces,
namely, to paue therewith the floore of the great ſhew-place or cirque in Rome, during the run-
ning of chariots and other feats of actiuitie there performed, to the end that their whiteneſſe
might giue a more louely gloſſe to commend the place. In the daies of *Nero* late Emperour,
there was found in Cappadocia a ſtone as hard as marble, white and tranſparent, and ſhining
through, yea euen on that ſide where it hath certaine reddiſh ſtreakes or ſpots: in which regard,
(for that it is ſo reſplendent) it hath found a name to be called Phengites. Of this ſtone, the ſaid
Emperor cauſed the temple of *Fortune* to be built called Seia (which king *Seruius* had firſt de- M
dicated) compriſed within the compaſſe of *Neroes* golden houſe: and therefore when the
doores ſtood open in the day time, a man might ſee within, the day light, after the manner of
glaſſe ſtones; yet ſo, as if all the light were within-forth onely, and not let in from the aire tho-
row the windowes. Moreouer, king *Iuba* writeth, that in Arabia there is a certaine ſtone found,

which

20030
copy 1

A which likewise shineth as glasse, whereof the inhabitants of those parts do make their mirroirs or looking-glasses.

It remaineth now, that I should proceed to those stones which are by workmen imploied to good and necessary vses: first of all, to those which serue to whet tools and instruments of yron, of which there be many sorts: Those of Candie, for a long time were of greatest name & most in request: in a second degree were those accounted which came from the mountaine Targetus in Laconia: but both the one and the other serue for no vse, without oile. But among the grind-stones and whetstones which are occupied with water, those of Naxos were in greatest price and most commended; next to them, those of Armenia, whereof I haue already written. The stones of Cilicia wil do wel enough either with water or oile, it skills not whether: but the whetstones,
B that come from Arsinoë, are onely vsed with water. There bee found in Italie whetstones, which with water will giue a wonderfull keene edge; also beyond the Alps, and such they call Passernices. In a fourth rank are to be reckoned those stones which serue for a mans spittle, and such be the bones that Barbers occupie for to sharpen their raisors; but they are of little or no vse at all because they be so soft and brittle: and of this kind, the chiefe are sent out of the higher part of Spain from the country Flamminitana. As for other stones whereof I haue not written already, they be all naught for building, so soft they be, and by that means nothing durable: and yet in some countries they haue none other to build withall, as namely at Carthage in Affrick, notwithstanding the wals of the houses there are subject to the waters of the sea, are pinched and pierced with winds, yea and beaten with rain and weather; against which inconueni-
C ences the inhabitants are forced to keep their wals with pitching, for otherwise (the stones are so tender and soft) the ordinary parget of lime would fret and eat them: wherupon there goeth a pretty speech of the Carthaginians, that they do contrary to all others, in that they vse pitch to their houses, and lime to their wines; for in truth they tun vp their new wines with lime. There be found moreouer about Rome other soft stones, to wit, in the territories belonging to Fidena and Alba: in Liguria likewise, Vmbria, and Venice, they haue a white free stone, which may be easily cut with a toothed saw: these are very tractable and easie to be wrought, and wil last reasonable well, but within house only; for if the weather lie vpon them, if the rain beat, and the pinching frost come, they will pill and skale, yea and break into pieces; neither be they durable a-
D gainst the breath and vapor of the sea. The Tyburtine stones, they will indure all other things well enough, only they may not abide hot vapors, for if the heat of summer take them, they will gape and be ready to cleaue in sunder. As for flints, the black, and in some places the red also, are much commended: in certaine countries, the white be very good; as namely, those in the quaries about Anicia within the territory of Tarquinij about the lake neere vnto Volsinij: also along the tract of Statona, there be good building stones that wil take no harm by fire; these are commonly vsed for those monuments and memorials wherin ought is to be ingraued, for they continue a long time, and are not the worse for age: Of this kind of stone, the founders make their moulds for to melt brasse in. Moreouer, there is a kind of greene stone, which wonderfully cheeketh and scorneth all fire; but in no place is there plenty thereof to be had: and wheresoeuer it is found, it groweth not in manner of a rock or quarrie, but lieth scattered here and there. Of the
E rest that hitherto are not named, the pale stone is not good for building, and seldome will it serue to make mortar of. The round pebbles are lasting enough, and will indure any hardnesse, but surely in building nothing trusty, vnlesse they be knit and bound with strong mortar and couched well together. Those that are gathered out of riuers make no sure building, for they seeme alwaies to relent and be moist: but for such stones as these, and generally for all those that we doubt, the only remedy is to dig them out of the ground in Summer, to let them haue two yeres seasoning in lying abroad and taking all kinds of weather before they be imployed in building; and look how much thereof hath caught harme by this means, the same will serue very well in ground works and foundations: and that which continueth still sound, you may bee bold to put it in building, yea, in open workes without dore. The Greekes haue a kinde of wall
F which they make of hard pebbles or flint couched euen and laid in order by line and leuell, like as we do in bricke wals: and this kind of building they call in Masonrie Isodomon: but in case they be not euen laid nor ranged streight, but that some part of the wall is thicker than others, they terme it Pseudisodomon. A third manner they haue which they name Emplecton, namely, when the front onely of the wall is smooth and euen, for otherwise within they huddle & fill

one with another. Moreouer, to lay a wal artificially and to bind the ſtones wel, they ought in alternatiue courſe to ride and reach one ouer another halfe, ſo that the joint may fall out in the mids of a ſtone both aboue and vnder; a neceſſarie point to be conſidered in the very mids of a wal if it be poſſible: if not ſo, yet in any caſe toward the ſides & ends therof: as for the middle of the wall within, it would be well ſtuffed and filled with any rubbiſh, rammel, and broken ſtones. There is a kind of net-work building in Maſonry called Dictyotheton, ordinarily vſed in Rome, but ſubject it is to cracke and chinke. In ſum, a wall would be built by rule and ſquare, by line and leuell, and anſwerable to the plumb. G

CHAP. XXIII.

¶ *Of Ciſterns, and Lime: of ſundry ſorts of Sand: of the tempering of Sand and Lime together for mortar: of faults in Maſonrie: of Pargetting and other Rough-caſting: of the proportion of Columnes and Pillars.* H

FOr to make good ciſterns which might hold water, the mortar that goeth thereto ought to be made of fiue parts of fine pure ſand and grauelly together, to two parts of the moſt ſtrong and binding lime that may be gotten; prouided alwais that the fragments of flint which are to be imploied herein, be ſmall, and exceed not the weight of one pound a piece: this done, not only the bottome or pauing, but the ſide-walls and the ends, ought to be rammed downe hard with yron beetles: howbeit, for to keep good and cleare water, it were the better way to haue alwaies two ciſterns together, that in the former the water may ſettle and caſt down al the grounds I to the bottome, and ſo the cleare water only paſſe into the other as if it were ſtrained through a fine colonder. As touching lime, *Cato Cenſorius* diſalloweth that which is made of diuers ſtones, or of ſundry colours: and to ſpeake a truth, white ſtones are better to make lime than the hard, and ſuch is more meet to lay ſtone withall in Maſonrie; howbeit the lime which commeth of hollow and fiſtulous ſtones, is thought to ſerue better for to couer and parget walls. The lime which commeth of flint, is rejected both for the one and the other: alſo the lime made of ſtones digged out of the ground, is farre better than of pebbles gathered from riuer ſides: that which commeth of milſtones is moſt profitable, for it is more fatty and glutinous than others. A ſtrange and wonderfull matter it is, that any thing after it hath bin once burnt and calcined, ſhould be ſet on fire againe with water. And thus much of Lime. K

As touching Sand, there be three kinds thereof: the one is digged out of pits in the ground, and this requireth a fourth part of lime to be put vnto it in making mortar: a ſecond commeth out of riuer ſides or the ſea ſhore, and this would haue a third part: and if there be beſides another third part of potſherds beaten to pouder and put thereto, the ſtuffe or mortar will be the better. Between the Apennine hill and the riuer Po, there is no ſand digged out of the ground, ne yet any ſea ſand at all. And verily, the greateſt reaſon that cities fal to decay and be ſo ruinat, is this, for that the mortar being robbed of the due proportion of lime, hath not that binding as it ought, and ſo the walls built therewith are not ſodred accordingly. Alſo, this would be obſerued, that mortar the elder that it is, the better it is found for building. Moreouer, in the old laws which prouide for the perpetuitie of houſes in antient time, we find it expreſſely ſet down, that the vndertaker to build a houſe at a certain price, ſhall vſe no mortar vnder three yeres of age: and this was the reaſon that in thoſe daies a man ſhould not ſee any rough-caſt or parget to riſe or chawne illfauouredly as now they do: and in truth, vnleſſe there be laid vpon wals three coats or couches (as it were) of mortar made with ſand and lime, and two courſes ouer them of other mortar made of marble grit and lime tempered together, the wals will not be permanent nor otherwiſe faire and reſplendent as they ought to be: and look where wals be dampiſh and giuen to ſweat a certaine ſalt humor or ſal-petre, it were very well to lay a ground vnderneath of mortar made of the pouder of potſheards and lime wrought together. In Greece they haue a caſt by themſelues, to temper and beat in mortars, the mortar made of lime and ſand wherewith they meane to parget and couer their walls, with a great woodden peſtill. As for the mortar made M of marble-grit and lime together, the true marke to know whether it haue making ſufficient for building, is this, namely, if it will not ſticke to the ſhouell that worketh it, but wil come out of the heap neat and clean: but contrariwiſe, in whiting and fret work, the lime being ſoked and wet in water, ought to cleaue faſt like glew; neither ought it to be tempred with water, but in the groſſe

20030
copy 1

A groſſe maſſe or lumpe. At Elis there ſtandeth a temple conſecrated to the honour of *Minerua*, wherein *Panneus*, the brother of *Phidias*, vſed a parget (as they ſay) which he tempered with milk and ſaffron together; and therefore at this day, if a man wet his thumb with ſpittle, and rub it againſt the wall, he ſhall perceiue both the ſmell and taſt of ſaffron to remaine ſtill.

As touching pillars in any building, the thicker they ſtand one to another, the bigger & groſſer they ſeem to be. Our architects and maſons make foure ſorts of them: for they ſay, that ſuch pillars as beare in compaſſe or thickneſſe toward the foot, as much as commeth to the ſixt part of the height, be called Dorique: thoſe that carry but a ninth part, are Ionique: ſuch as haue a ſeuenth part, be Tuſcanique. And as for the Corinthian pillars, their proportion is anſwerable to the Ionique; onely this is the difference, that the Chapters of the Corinthian pillars ariſe in
B height to as much as the compaſſe at the baſe taketh vp: in which regard they ſeem more ſlender than others. As for the height of the Ionick chapter, it is juſt the third part of the thicknes. The proportion ordinarily in old time for the height of pillars, was anſwerable to the third part of the bredth of the temple. In the temple of *Diana* at Epheſus, the inuention was firſt practiſed to pitch the footſtall of pillars vpon a quadrant or ſquare below, and to ſet chapiters vpon their heads. And as touching the proportion, it was thought ſufficient in the beginning, if a columne contained in compaſſe or thickneſſe the eight part of the height; alſo, that the ſquare of the quadrant vnder the baſe, ſhould containe halfe the thickneſſe of the pillar: finally, that the pillars ſhould be ſmaller by one ſeuenth part in the head, than at the foot. Ouer and beſides theſe pillars, there be others alſo of the Atticke faſhion, and thoſe be made with foure corners, and the
C ſides are equall.

CHAP. XXIIII.

¶ *The medicinable properties of Lime. Alſo, as touching the Maltha vſed in old time, and of Plaſtre.*

MVch vſe there is of Lime alſo euen in Phyſick: but then there muſt be choſen that which is quick and vnqueint. Such lime is cauſtick, diſcuſſiue, and extractiue: the ſame alſo is proper to repreſſe corroſiue vlcers that begin to ſpread and run far. If the ſaid lime bee tempered with vineger and oile of roſes, it maketh an excellent healing plaſtre, which will skin
D vp a ſore clean. The ſame if it be incorporat with ſwines greaſe or liquid roſin and hony together, ſerues alſo to ſet bones in ioint: & the ſame compoſition is likwiſe good for the kings euil

Concerning Maltha, it was wont to be made of quick and new lime: for they took the Lime-ſtone and quenched it in wine, which done, preſently they punned it with ſwines greaſe and figs; hereof they made ordinarily two couches: and being thus tempered and laid, it was thought to be the faſteſt whitening that could be deuiſed, and in hardneſſe to exceed a ſtone. But looke whatſoeuer is to be pargetted with this Maltha or morter thus prepared, ought firſt to be rubbed throughly with a ſize of oile.

Of neare affinity to lime is plaſtre, whereof be many kinds: for there is a kind of plaſtre artificiall, and namely in Syria and about Thurium, made of ſtone calcined in manner of lime: and
E there is of it that is digged out of the ground naturally, as namely, in the Iſle Cyprus, and about the Perrhœbians. Neare Thymphæa, a city in Ætolia, it lieth very ebbe and as it were euen with the ground: as for the ſtone that is to be burnt for it, the ſame ought to be not vnlike to the ſtone Alabaſtrites, or at leaſtwiſe to that which ſtands much vpon marble. In Syria they chuſe for this purpoſe the hardeſt, and they burne the ſame with cow dung, that it may the ſooner bee calcined. But the beſt plaſtre of all other is known (by experience) to be made of the Talc or the glaſſe ſtone aforeſaid, or at leaſtwiſe of ſuch as haue the like flakes as Talc. Plaſtre muſt be wrought and driuen preſently whiles it is wet and will run, for nothing in the world wil ſo ſoon thicken and dry: and yet when it hath bin vſed already, it may be beaten again to pouder, & ſerue the turn in new workes. Plaſter ſerueth paſſing wel to white wals or ſeeling; alſo for to make lit-
F tle images in fretwork, to ſet forth houſes; yea, and the brows of pillars and wals, to caſt off rain. To conclude, I may not forget that which befell to *C. Proculeius*, a great fauorit and follower of *Auguſtus Cæſar*, who in an extreame fit of the paine of the ſtomacke, dranke plaſtre, and ſo killed himſelfe wilfully.

CHAP.

Chap. . XXV.

¶ *Sundry kindes of paued floores: and when at firſt they began to be vſed at Rome. Of open terraces paued. Of Greekiſh pauements. And the firſt invention of arched or embowed roofes.*

THe deuiſe of paued floores aroſe firſt from the Greeks, who made them with great art, and curiouſly, in regard of the painting in ſundry colours which they beſtowed therupon: but theſe braue painted floors were put downe, when pauements made of ſtone and quarrels came in place: the moſt famous workman in this kind, was one *Soſus*, who at Pergamus wrought that rich pauement in the common hall, which they cal Aſaroton œcon, garniſhed with bricks or ſmall tiles enealed with ſundry colours: and he deuiſed, that the worke vpon this pauement ſhould reſemble the crums and ſcraps that fel from the table, and ſuch like ſtuffe as commonly is ſwept away, as if they were left ſtil by negligence vpon the pauement. Among the reſt, wonderfull was his handiworke there, in pourtraying a Doue drinking, which was ſo liuely expreſſed, as if the ſhadow of her head had dimmed the brightneſſe of the water: there ſhould a man haue ſeen other Pigeons ſitting vpon the brim of the water tankard, pruning themſelues with their bils, and diſporting in the Sunſhine. The old paued floors, which now alſo are much vſed eſpecially vnder roofe and couvert, how ſoeuer they came from barbarous countries, were in Italy firſt patted and beaten downe with heauie rammers; as we may collect by the verie name it ſelfe, Pauement, which comes of Pavire, *i.* to ram downe hard. As for the manner of pauing with ſmal tiles or quarrels ingrauen, the firſt that euer was ſeen at Rome, was made within the temple of *Iupiter Capitolinum*, and not before the third Punicke war begun. But ere the Cimbrian wars began, ſuch pauements were much taken vp in Rome, and men tooke great delight and pleaſure therein, as may appeare ſufficiently by that common verſe out of *Lucilius* the Poët.

Ante Pavimenta ætas emblemata vermiculata, &c.

Before the Pauements checker-wrought in painted Marquettry, &c.

As touching open galleries and terraces, they were deuiſed by the Greeks, who were wont to couer their houſes with ſuch. And in truth, where the country is warme, ſuch deuiſes doe well: howbeit, they are dangerous and deceitfull, where there is ſtore of rain and froſt. But for to make a terrace ſo paued, neceſſary it is firſt to lay two courſes of boords or plankes vnderneath, and thoſe croſſe and ouerthwart one the other: the ends of which planks or boords ought to be nailed, to the end they ſhould not twine or caſt atoſide; which done, take of new rubbiſh two third parts, and put thereto one third part of ſhards ſtamped to pouder, then with other old rubbiſh mix two fiue parts of lime, and herewith lay a couch of a foot thickneſſe, and be ſure to ram it hard together. Ouer which there muſt be laid a coat or courſe of mortar, ſix fingers bredth thick; and vpon this middle, couch broad ſquare pauing tiles or quarrels, and the ſame ought to enter at leaſt two fingers deep into the ſaid bed of mortar. Now for that this floore or pauement muſt riſe higher in the top, this proportion is to be obſerued, that in euery ten foot it gain an inch and a halfe. After which, the pauement thus laid is to be plained and poliſhed diligently with ſome hard ſtone: and aboue al, regard would be had, that the planks or boorded floor were made of oke. As for ſuch as do caſt or twine any way, they be thought naught. Moreouer, it were better to lay a courſe of flint or chaffe between it and the lime, to the end, that the ſaid lime might not haue ſo much force to hurt the bourd vnderneath. Requiſit alſo it were to put vnderneath round pebbles among. After the like maner be the ſpiked pauements made of flat tiles & ſhards. And here I muſt not forget one kind of pauing more, which is called Grecanicke, the manner wherof is thus. The Greeks after they haue well rammed a floore which they mean to paue, lay therupon a pauement of rubbiſh, or elſe broken tile ſhards; and then vpon it, a couch of charcoale well beaten and driuen cloſe together, with ſand, lime, and ſmall cindres well mixed together: which done, they do lay their pauing ſtuffe to the thickneſſe of halfe a foot, but ſo euen, as the rule and ſquare will giue it; and this is thought to be a true earthen paued floore of the beſt making. But if the ſame be ſmoothed alſo with a hard ſlicke ſtone, the whole pauement wil ſeem all black: as for thoſe pauements called Lithoſtrata, which be made of diuers coloured ſquares couched in workes,

20030
copy 1

A works, the inuention began by *Syllaes* time, who vſed thereto ſmall quarrels or tiles at Preneſte within the temple of *Fortune*, which pauement remaines to be ſeen at this day. But in proceſſe of time pauements were driuen out of ground-floores, and paſſed vp into chambers, and thoſe were ſeeled ouer head with glaſſe: which alſo is but a new inuention of late deuiſed: for *Agrippa* verily in thoſe baines which he cauſed to be made at Rome, annealed all the potterie worke that there was, and enamelled the ſame with diuers colours: whereas all others be adorned only with whiting: & no doubt he would neuer haue forgotten to haue arched them ouer with glaſſe if the inuention had bin practiſed before, or if from the wals & partitions of glaſſe which *Scaurus* made vpon his ſtage, as I ſaid before, any one had proceeded alſo to roofe chambers therwith. But ſince I am fallen vpon the mention of glaſſe, it ſhall not be impertinent to diſcourſe ſome-
B what of the nature thereof.

Chap. XXVI.

¶ *The firſt inuention of glaſſe, and the manner of making it. Of a kind of Glaſſe, called Obſidianum. Alſo of ſundry kindes of Glaſſe, and thoſe of many formes.*

THere is one part of Syria called Phœnice, bordering vpon Iurie, which at the foot of the mount Carmell, hath a meere named Cendeuia; out of which the riuer Belus is thought to ſpring, and within fiue miles ſpace, falleth into the ſea, near vnto the colony Ptolemais:
C This riuer runneth but ſlowly, and ſeemeth a dead or dormant water, vnwholeſome for drinke, howbeit, vſed in many ſacred ceremonies with great deuotion; full of mud it is, and the ſame very deepe ere a man ſhall meet with the firm ground: and vnleſſe it be at ſome ſpring tide, when the ſea floweth vp high into the riuer, it neuer ſheweth ſand in the bottom; but then, by occaſion of the ſurging waues, which not only ſtir the water, but alſo caſt vp & ſcoure away the groſſe mud, the ſand is rolled too and fro, and being caſt vp, ſheweth very bright and cleare, as if it were purified by the waues of the ſea: and in truth, men hold opinion, That by the mordacity and aſtringent quality of the ſalt water, the ſands become good, which before ſerued to no purpoſe. The coaſt along this riuer which ſheweth this kind of ſand, is not aboue halfe a mile in all, and yet for many a hundred yeare it hath furniſhed all places with matter ſufficient to make glaſſe.
D As touching which deuiſe, the common voice and fame rnnneth, that there arriued ſometimes certain merchants in a ſhip laden with nitre, in the mouth of this riuer, & being landed, minded to ſeeth their victuals vpon the ſhore and the very ſands: but for that they wanted other ſtones, to ſerue as treuets to beare vp their pans and cauldrons ouer the fire they made ſhift with certaine pieces of ſal-nitre out of the ſhip, to ſupport the ſaid pans, and ſo made fire vnderneath: which being once afire among the ſand and grauell of the ſhore, they might perceiue a certaine cleare liquor run from vnder the fire in very ſtreams, and hereupon they ſay came the firſt inuention of making glaſſe. But afterwards (as mans wit is very inuentiue) men were not content to mix nitre with this ſand, but began to put the Load-ſtone among, for that it is thought naturally to draw the liquor of glaſſe vnto it, as well as yron. Then they fell to calcine and burne in many o-
E ther places ſhining grauell ſtones, ſhels of fiſhes, yea, and ſand digged out of the ground, for to make glaſſe therewith. Moreouer, diuers authors there be who affirme, That the Indians vſe to make glaſſe of the broken pieces of Cryſtall, and therefore no glaſſe comparable to that of India. Now the matter whereof glaſſe is made, muſt be boiled or burnt with a fire of dry wood, and the ſame burning light and cleare without ſmoke, and there would be put thereto braſſe of Cypros, and nitre, eſpecially that which commeth from Ophyr. The furnace muſt bee kept with fire continually, after the manner as they vſe in melting the ore of braſſe. Now the firſt burning yeeldeth certaine lumps of a fatty ſubſtance, and blackiſh of colour. This matter is ſo keen and penetrant whiles it is hot, that if it touch or breath vpon any part of the body, it will pierce and cut to the very bone ere one be aware or do feele it. Theſe maſſes or lumps be put into the fire
F againe, and melted a ſecond time in the glaſſe houſes, where the colour is giuen that they ſhall haue: and then ſome of it with blaſt of the mouth, is faſhioned to what form or ſhape the workman will: other parcells poliſhed with the Turners inſtrument, and ſome againe engrauen, chaſed, and emboſſed in manner of ſiluer plates: in all which feats, the Sidonians in times paſt were famous artificers: for at Sidon were deuiſed alſo mirroirs or looking glaſſes. Thus much as touching

ching the antique maner of making glaſſe. But now adaies there is a glaſſe made in Italy of a G
certain white ſand, found in the riuer Vulturnus for ſix miles ſpace along the ſhore townes, from
the mouth where he diſchargeth himſelfe into the ſea, and this is betweene Cumes and the lake
Lucrinus. This ſand is paſſing ſoft and tender, whereby it may be reduced very eaſily into fine
pouder, either to be beaten in morter or ground in mill: to which pouder the manner is to put
three parts of nitre, either in weight or meaſure; and after it is the firſt time melted, they vſe to
let it paſſe into other furnaces, where it is reduced into a certain maſſe, which, becauſe it is com-
pounded of ſand and nitre, they call Ammonitrum: this muſt be melted againe, and then it be-
comes pure glaſſe, and the very matter indeed of the white clear glaſſes: & in this ſort through-
out France and Spain the maner is to temper their ſand, & to prepare it for the making of glaſſe
Moreouer, it is ſaid, That during the reigne of *Tiberius* the Emperor, there was deuiſed a certain H
temper of glaſſe, which made it pliable and flexible to wind and turne without breaking: but
*It is ſaid, that whē a ſupplīt to this emperor came before him, and ſhewed to him a glaſſe whole and ſound which had bin of purpoſe broken before, hee cauſed him preſently to be put to death. *Cæl. Rhodig. l. 29. cap. 30.*
the * artificer who deuiſed this, was put downe, and his work-houſe, for feare leſt veſſels made of
ſuch glaſſe ſhould take away the credit from the rich plate of braſſe, ſiluer, and gold, and make
them of no price: and verily, this bruit hath run currant a long time (but how true, it is not ſo cer-
tain.) But what booted the aboliſhing of glaſſe-makers, ſeeing that in the daies of the Empe-
ror *Nero* the art was growne to ſuch perfection, that two drinking cups of glaſſe (and thoſe not
big, which they called Pterotos) were ſold for 6000 ſeſterces.

There may be ranged among the kinds of glaſſes, thoſe which they call Obſidiana, for that
they carry ſome reſemblance of that ſtone, which one *Obſidius* found in Æthyopia; exceeding
blacke in colour, otherwhiles alſo tranſparent: howbeit, the ſight therein is but thicke and duſ- I
kiſh. It ſerueth for a mirroir to ſtand in a wall, and inſtead of the image yeeldeth back ſhadows.
Of this kind of glaſſe many haue made jewels in maner of precious ſtones: and I my ſelfe haue
ſeene maſſiue pourtraitures made thereof, reſembling *Auguſtus* late Emperor of famous memo-
ry, who was wont to take pleaſure in the thicknes of this ſtone, inſomuch as he dedicated in the
temple of *Concord* for a ſtrange and miraculous matter, foure Elephants made of this Obſidian
ſtone. Alſo *Tiberius Cæſar* ſent back again to the citizens of Heliopolis, a certain image of prince
Menelaus, found among the moueable goods of one who had bin lord gouernor in Ægypt, which
he had taken away out of a temple, among other cerimoniall reliques: and the ſaid ſtatue was
all of the Iaiet, called Obſidianus. And by this it may appeare, That this matter began long
time before to be in vſe, which now ſeemeth to be renued again and counterfeited by glaſſe that K
reſembleth it ſo neare. As for the ſaid Obſidian ſtone, *Xenocrates* writeth, That it is found natu-
rally growing among the Indians; within Samnium alſo in Italy, and in Spaine along the coaſt
of the Ocean. Moreouer, there is a kind of Obſidian glaſſe, with a tincture artificiall, as blacke
as Iaiet, which ſerueth for diſhes and platters to hold meat: like as other glaſſe, red throughout,
and not tranſparent, called for that colour Hæmatinon. By art likewiſe there be veſſels of glaſſe
made white and of the colour of Caſſidony, reſembling alſo the Iacinct and Saphire, yea, & any
other colors whatſoeuer. In ſum, there is not any matter at this day more tractable and willing
either to receiue any forme or take a color, than glaſſe: but of all glaſſes, thoſe be moſt in requeſt
and commended aboue the reſt, which be white, tranſparent and cleare throughout, comming as
neare as it is poſſible to Cryſtall. And verily, ſuch pleaſure do men take now adaies in drinking L
out of faire glaſſes, that they haue in maner put downe our cups and boules of ſiluer or gold: but
this I muſt tell you, that this ware may not abide the heat of the fire, vnleſſe ſome cold liquor
were put therin before: and indeed, hold a round bal or hollow apple of glaſſe ful of water againſt
the Sun, it will be ſo hot, that it is ready to burne any cloth that it toucheth. As for broken glaſ-
ſes, well may they be glued and ſodered againe by a warme heat of the fire, but melted or caſt a-
gain they cannot be whole, vnleſſe a man make a new furnace of pieces broken one from ano-
ther: like as we ſee there be made counting rundles thereof, which ſome call Abaculos, whereof
ſome are of diuers and ſundry colors. Moreouer, this would be noted, That if glaſſe and ſulphur
be melted together, they will ſouder and vnite into a hard ſtone. To conclude, hauing thus diſ-
courſed of all things that are knowne to be done by wit or art, according to the direction of Na- M
ture, I cannot chuſe but maruell at fire and the operations thereof, ſeeing that nothing in a man-
ner is brought to perfection but by fire; and thereby any thing may be done.

A

Chap. XXVII.

¶ The wonderfull operations of fire: the medicinable properties that it hath; and the prodigious ſignifications obſerued thereby.

Fire receiueth ſundry ſorts of ſand & earth, out of which it doth extract and melt one while glaſſe, another while ſiluer, in this place vermilion, in that diuers ſorts of lead and tin; ſomtime Painters colours, and another while matters medicinable. By fire, ſtones are reſolued into braſſe; by fire iron is made, and the ſame is tamed likewiſe therewith: fire burneth and calcineth ſtone, whereof is made that mortar which bindeth all worke in maſonry. As for ſome things, the more they be burnt, the better they are; and of one and the ſame matter a man ſhall ſee one ſubſtance ingendred in the firſt fire, another in the ſecond, and another alſo in the third. As for the coles that go to theſe fires, when they be quenched they begin to haue their ſtrength and after they are thought extinct and dead they are of greateſt vertue. This element of Fire is infinit, and neuer ceaſeth working, inſomuch as it is hard to ſay whether it conſume more than it ingendreth. The very fire alſo is of great effect in phyſick; for this is known for certain by experience, there is not a better thing in the world againſt the peſtilence (occaſioned by the darkneſſe of the Sun, and the want of cleare light from him) than to make fires and perfumes in diuers ſorts, either to clarifie or to correct the aire; according as *Empedocles* and *Hippocrates* haue teſtified in diuers places. *M. Varro* writeth, that fire is good for conuulſions, cramps, and contuſions of the inward parts: and for this purpoſe I will alledge the very words he vſeth: the Latine word *Lix* (quoth he) is nothing elſe but the aſhes of the hearth; and hereupon comes *Lixiuus cinis*, *i*. Lie aſhes, which being drunk is medicinable; as we may ſee by fencers and ſword-plaiers, who after they haue done their flouriſhing, and be ready to enter into fight at ſharpe, refreſh themſelues with this potion. Furthermore it is ſaid, That a cole of oke wood being reduced into aſhes and incorporat with hony, cureth the carbuncle, which is a peſtilent diſeaſe, whereof two noblemen at Rome, both Conſuls in their time, died of late, according as I haue ſhewed already. See the wonderfull power in nature, that things deſpiſed and of no account, as aſhes and coles, ſhould afford remedies for the health of man! But before I make an end of fire, and the hearth where it burneth, I will not paſſe one admirable example commended vnto vs by the Roman Chronicles: in which we reade, That during the reign of *Tarquinius Priſcus* king of Rome, there appeared all on the ſudden vpon the hearth where hee kept fire, out of the very aſhes, the genital member of a man, by vertue whereof, a wench belonging vnto *Tanaquil* the queen, as ſhe ſate before the ſaid fire, conceiued and aroſe from the fire with childe; and of this conception came *Servius Tullus* who ſucceeded *Tarquin* in the kingdome. And afterwards, while hee was a yong childe, and lay aſleep within the court, his head was ſeen on a light fire; whereupon he was taken to be the ſon of the domeſtical ſpirits of the chimney. Which was the reaſon, that when he was come to the crown, he firſt inſtituted the Compitalia, and the ſolemne games in honour of ſuch houſe-gods or familiar ſpirits.

THE

THE XXXVII. BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

The Proem.

TO the end that nothing might be wanting to this historie of mine concerning Natures works, there remaine behind nothing but pretious stones, wherein appeareth her Maiesty, brought into a narrow and streight roome: and to say a truth, in no part of the world is she more wonderfull, in many respects; whether you regard their varietie, colours, matter, or beauty, which are so rich and pretious, that many make conscience to sell with them, thinking it vnlawfull to engraue any print in them, or to diminish their honour and estimation by that means. Some of them are reckoned inestimable, or valued at all the goods of the world besides, insomuch as many men thinke some one pretious stone or gem sufficient to behold therein the very perfection of Nature, and her absolute worke. Touching the first inuention of wearing such stones in jewels, and how it tooke first root, and grew afterwards to that height as all the world is in admiration thereof, I haue alreadie shewed in some sort in my treatise of Gold and Rings. And yet I will not conceale from you that which poets do fable of this matter, who would beare vs in hand, that all began at the rocke Caucasus, whereunto Prometheus *was bound fast, who was the first that set a little fragment of this rocke within a peece of iron, which being done about his finger, was the ring, and the foresaid stone the gemme: whereof the Poets make much foolish moralization.*

Chap. I.

¶ *Of the rich precious stones of* Polycrates *the Tyrant, and King* Pyrrhus. *The first Lapidaries or Cutters in pretious stones. And who was the first that had a case of rings and gems at Rome.*

PRometheus hauing giuen this precedent, brought other stones into great price and credit, insomuch as men were mightily inamoured vpon them: and *Polycrates* of Samos, the puissant prince and mighty monarch ouer all the Islands and coasts thereabout, in the height of his felicitie and happy estate, which himselfe confessed to be excessiue, being troubled in his mind, that he had tasted of no misfortune, and willing after a sort to play at Fortunes game, one while to win, and another while to lose, and in some measure to satisfie her inconstancie, was perswaded in his minde that he should content her sufficiently in the voluntarie losse of one gem that he had, and which he set so great store by: thinking verily, that this one hearts griefe for parting from so pretious a jewell, was sufficient to excuse and redeeme him from the spightful enuy of that mutable goddesse. Seeing therefore the world to come vpon him still, and no soure sorrowes intermingled with his sweet delights, in a wearinesse of his continual blessednesse, he imbarked himselfe and sailed into the deep, where wilfully he flung into the sea a ring from his finger, together with the said stone so pretious, set therein. But see what ensued! A mighty fish euen made as a man would say for the king,

20030
copy 1

A king,chanced to ſwallow it down as if it had bin ſome bait;which being afterwards caught by fiſhers,& thought to be of an extraordinary bignes,was brought as a preſent into the kings pallace,and ſo ſent into the kitchen;where the cook found within the belly therof the foreſaid ring of his lords & maſters. Oh the ſubtiltie of ſlie Fortune,who all this while twiſted the cord that another day ſhould hang *Polycrates!* This ſtone(as it is wel known)was a Sardonyx:&if we may beleeue it,the very ſame it is,which at Rome is ſhewed in the temple of *Concord*, where *Auguſta* the Empreſſe dedicated it as an oblation,enchaſed within a golden horne:and verily if it be the ſame,one of the leaſt Sardonyches it is among many other there which be preferred before it.

Next to this ſtone of *Polycrates*,there goeth a royall name of the gem which *Pyrrhus* K.of Albanie had;him I mean,who warred againſt the Romans:for(by report)an Agath he had,where-
B in a man might ſee the nine Muſes,and *Apollo* with his harpe, liuely repreſented, not by art and mans hand,but euen naturally imprinted:for the veins and ſtreaks of the ſtone were ſo diſpoſed, that a man might diſtinguiſh euery one of the Muſes aſunder,& ech one diſtinguiſhed by their ſeueral marks and ornaments. Setting aſide theſe two gems aboue-named,we do not read in authors of any great reckoning made of ſuch iewels; vnleſſe wee ſpeake of one *Iſmenias* a famous minſtrell, who had the name to weare many of them ordinarily about him, and thoſe very gay and glittering:and ſurely his vanity that way was ſuch, that there goeth a notable tale of him; for meeting vpon a time in a merchants hand with an Emeraud in the Iſland Cyprus,wherin ladie *Amymone* was engrauen,and wherof the price was at firſt held at ſix deniers in gold,he made no more ado but cauſed the mony to be paid preſently: but the merchant being a man of ſome
C conſcience, and thinking indeed the price to high,gaue two of them back again vnto *Iſmenias:* whereat being ill apaid,I beſhrew you, (qd.he) for this bating of the mony hath much empaired the worth of the ſtone. This *Iſmenias* (as it is thought)was the firſt who brought vp the order that all ſuch muſicians and minſtrels as himſelfe,ſhould be known by their gems,and eſteemed skilfull in that art according as they were ſet out therwith more or leſſe. And in very truth, *Dionyſodorus* a great minſtrell,who liued in thoſe daies with him, vſed likewiſe to be in his change and variety of pretious ſtones, becauſe he would not ſeeme any way to come behind *Iſmenias*. There was a third alſo as vaine as the beſt,a muſician in that age named *Nicomachus*, who loued to haue a number of gems about him, but no iudgement hee had in the world to chuſe them. Theſe examples which offer themſelues by fortune to me in the beginning of this my booke,
D may ſerue to pull downe their plumes who ſtand ſo much vpon the vaine oſtentation of theſe ſtones,when they ſhal ſee how all the pride they take herein,ſmelleth but of the vain humor of ſome odd minſtrels. But to return againe to *Polycrates* his gem,at this day it is to be ſeen within the temple of *Concord*,whole & ſound. And not only in the time of *Iſmenias*,but alſo many yeres after,it ſhould ſeem that Emerauds were wont to be cut and engrauen. This opinion alſo may be confirmed by the act & edict of K. *Alexander* the Great,which forbad expreſly, That no man ſhould be ſo hardy as to engraue his image in pretious ſtone, but *Pyrgoteles*;who(no doubt)was ſimply the beſt in that art. After him, *Apollonides* and *Cronius* were of great fame:& principally one *Dioſcorides*,who counterfeited in ſtone the liuely forme of *Auguſtus Cæſar*, the which ſerued the Emperors his ſucceſſors as a ſignet to ſeale withall. *Sylla* Dictator was wont alwais to ſigne
E with a ſeale repreſenting K. *Iugurtha*,tied & bound as he was yeelded to him. We read in Chronicles alſo,that a certaine Spaniard of Intercatia,whoſe father *Scipio Æmilianus* ſlew in ſingle fight,vſed afterwards no other ſeale but that which repreſented this combat: whereupon grew this merry conceit of *Stilo Præconinus*, who asked, What this Spaniard would haue done if his father had killed *Scipio? Auguſtus* late Emperour of worthy memory, vſed at the beginning to ſeale with the image Sphinx vpon his ſignet:and verily in the caſket of his mothers iewels,two of theſe he found ſo like one to the other,that one could not be known and diſcerned from the other:& as he was wont to weare one of them about him wherſoeuer he went,ſo in his abſence (during the ciuile wars which he leuied againſt *M. Antonius*) his friends who managed his affairs at Rome,ſigned with the other Sphinx,al thoſe letters & edicts which paſſed in his name,
F for the performance of ſome demands which tho e times did require. And from hence it came, that thoſe who receiued any ſuch letters or edicts, containing ſome matter of difficulty, were wont pleaſantly and merrily to ſay, That the ſaid Sphinx came euer with ſome hard riddle or other that could not be expounded. Moreouer,the frog, wherwith *Mæcenas* vſed to ſeale,was alwaies terrible to thoſe who receiued any letters ſigned therewith;for euermore they were ſure

vpon the receit of it to make some paiment of impost or taxes leuied vpon them. But *Augustus Cæsar*, to auoid the obloquie that arose by his Sphinx, gaue ouer sealing therewith, and signed euer after with the image of K. *Alexander* the Great. G

As touching a cabinet or case for many rings and such jewels, which they call by a forreine Greeke name Dactyliotheca, the first that euer was known to haue any such at Rome, was *Scaurus*, whose mother *Sylla* the Dictator married: and for a long time there was no other besides; vntill *Pompeius* the Great met with the jewel-casket of K. *Mithridates*, which among many other rich oblations, he presented in the Capitoll; and by the relation of *M. Varro* and other approued authors of that time, it was much preferred before that of *Scaurus*: in imitation of whose example, *Cæsar* Dictator consecrated in the temple of *Venus Genitrix*, six such like cabinets or caskets of rings and jewels: and *Marcellus* sonne to *Octauia*, dedicated one in the temple Palatine of *Apollo*. Finally, this is to be obserued, that the said victorie of *Pompeius* which he atchieued ouer K. *Mithridates*, set mens teeth at Rome a watering after pearls and precious stones; like as the conquests obtained by *L. Scipio* and *Cn. Manlius*, brought them into loue with siluer plate curiously enchased and imbossed: also with rich hangings of cloth of gold, siluer, and tissue, together with beds and tables of brasse; euen as the brasen statues and vessels of Corinthian brasse, and the curious painted tables, came in request vpon the victorie that *L. Mummius* gained ouer Achæa. H

Chap. II.

¶ *Of Iems and precious stones that* Pompeius *shewed in his triumph. The nature of Crystall, and the medicinable properties thereof: the sumptuous and superfluous expences in vessels made of it. The first inuention of Cassidoine vessels, and the excesse that way: the nature and properties of those Cassidoins. And what vntruths the writers in old time haue deliuered as touching Amber.* I

TO the end that it may appeare more euidently, what the triumph of *Pompey* wrought in this respect, I will put downe word for word what I find vpon record in the registers that beare witnesse of the acts which passed during those triumphs. In the third triumph therefore which was decreed vnto him (for that he had scoured the seas of pyrats and rouers, reduced Natolia and the kingdome of Pontus vnder the dominion of the Romans, defeated kings and nations, according as I haue declared in the seuenth booke of this my history) he entred Rome the last day of September, in the yere when *M. Piso*, and *M. Messala* were Consuls, on which day there was carried before him in shew, a chesse-boord with all the men, and the same bourd was made of two precious stones, and yet it was 2. foot broad and 4 foot long: and lest any man should doubt hereof and thinke it incredible, considering no jems at this day come neare thereto in bignesse, know he, That in this triumph hee shewed a golden Moone weighing thirtie pounds, three dining-tables also of gold, other vessell likewise of massie gold and precious stones as much as would garnish nine cup-boords; three images of beaten gold representing *Minerva*, *Mars* and *Apollo*; coronets made of stones to the number of three and thirtie; a mountaine made of gold foure square, wherein a man might see red deare, lyons, fruit-trees of all sorts, and the whole mountaine inuironed and compassed all about with a vine of gold: moreouer, an oratorie or closet consisting of pearle, in the top or louver whereof there was a clocke or horologe: Hee caused also to be borne before him in a pompous shew, his owne image made of pearles, the pourtraiture (I say) of that *Cn. Pompeius*, whom regall majestie and ornaments would haue better beseemed; and that good face and venerable visage so highly honoured among all nations was now all of pearls; as if that manly countenance and seueritie of his had beene vanquished, and riotous excesse and superfluitie had triumphed ouer him, rather than hee ouer it. O *Pompey*, ô *Magnus*, how could this title and syrname *Le-grand*, haue continued among those nations, if thou hadst in thy first victorie triumphed after this manner! What, *Magnus*, were there no means else but to seek out pearles (things so prodigal, superfluous, and deuised for women, and which it had not beseemed *Pompey* once to weare about him) and therewith to pourtray and counterfeit thy manly visage! And was this the way indeed to haue thy selfe seeme precious? doth not that pourtraiture come nearer vnto thee and resemble thy person farre liker, K L M

which

20030
copy 1

A which thou didſt cauſe to be *erected vpon the top of the Pirænean hils? Certes, a foule ſhame and ignominious reproch it was to be ſhewed in this maner; nay, to ſay more truly, a wonderfull prodegie it was, preſaging the heauie ire of the gods; for ſo men were to beleeue and euidently to conceiue therby, that euen then and ſo long before, the head of *Pompey* made of orient pearle, euen the richeſt of the Leuant, ſhould be ſo preſented without a bodie. But ſetting this aſide, how manlike was all the reſt of his triumph, and how anſwerable to himſelfe? For firſt and foremoſt, giuen freely by him vnto the chamber of the citie, there were a thouſand talents, ſecondly, vpon his leutenants and treaſures of the campe, who had performed ſo good ſeruice in defending the ſea-coaſts, he beſtowed two thouſand Seſtertia apiece: thirdly to euery ſouldiour who accompanied him in that voiage, he allowed fiftie Seſtertia. Well, this ſuperfluitie yet of
B *Pompeies* triumph, ſerued in ſome ſort to excuſe *Caius Caligula* the Emperour, and to make his delicacie and exceſſe to be more tollerable; who ouer and beſides all other effeminat tricks and womanly deuiſes, wherof he was full, vſed to draw vpon his legs little buskins or ſtarlups made of pearle: *Pompeies* precedent (I ſay) in ſome meaſure juſtified *Nero* the Emperour, who made of rich and faire great pearles, the ſcepters and maces, the viſors alſo and maskes which players vſed vpon the ſtage, yea and the very bed-roumes which went with him as hee trauailed by the way: So as wee ſeeme now to haue loſt that vantage and right which we had to find fault with drinking-cups enriched with pearls, yea and much other houſhold ſtuffe and implements garniſhed therewith, ſince that whereſoeuer we go from one end of the houſe to the other, we ſeem to paſſe through rings, or ſuch jewels at leaſtwiſe which were wont to beautifie our fingers on-
C ly: for is there any ſuperfluitie els, but in regard and compariſon hereof it may ſeeme more tollerable and leſſe offenſiue? But to return vnto the triumph of *Pompey*: this victory of his, brought into Rome firſt our cups and other veſſels of Caſſidoine; and *Pompey* himſelfe was the firſt who that very day of his triumph preſented vnto *Iupiter Capitolinus*, ſix ſuch cups: and preſently from that time forward men alſo began to haue a mind vnto them, in cupbourds, counting tables, yea and in veſſell for the kitchin, and to ſerue vp meat in: and verily, from day to day the exceſſe herein hath ſo far ouergrowne, that one great Caſſidoine cup hath been ſold for * foureſcore ſeſterces, but a faire and large one it was, and would containe well three ſextars [*id eſt*, halfe a wine gallon.] There are not many yeres paſt, ſince that a noble man who had been Conſull of Rome, vſed to drinke out of this cup; and notwithſtanding that in pledging vpon a time
D a lady whom he fancied, he bit out a piece of the brim thereof (which her ſweet lips touched) yet this injurie done to it, rather made it more eſteemed and valued at a higher price, neither is there at this day a cup of Caſſidoine more pretious or dearer than the ſame. But as touching other exceſſe of this perſonage, and namely how much he conſumed and deuoured in ſuperfluities of this kind, a may may eſtimat by the multitude of ſuch Caſſidoin veſſell found in his cabinet after his death, which *Nero Domitius* tooke away perforce from his children: and in truth, ſuch a number there were of them, that being ſet out to the ſhew, they were ſufficient to furniſh and take vp a peculiar theatre, which of purpoſe he cauſed to be made beyond the Tyber in the gardens there: and enough it was for *Nero* to behold the ſaid theatre repleniſhed with people at the plaies which he exhibited there in honor of his wife the Empreſſe *Poppæa*, after one child-
E bed of hers, where among other muſicians, he ſung voluntary vpon the ſtage before the plaies began. I ſaw him there my ſelfe to make ſhew of many broken pieces of one cup which he cauſed to be gathered together full charily, as I take it, to exhibit a ſpectacle wherat the world ſhould lament and cry out in deteſtation of Fortune, no leſſe ywis, than if they had bin the bones and reliques of king *Alexander* the Great his corps to be laid ſolemnly in his ſepulchre; and herein he pleaſed himſelfe not a little. *Titus Petronius*, late Conſull of Rome, when he lay at the point of death, called for a faire broad-mouthed cup of Caſſidoine, which had coſt him before-time *three hundred thouſand ſeſterces, and preſently brake it in pieces in hatred and deſpight of *Nero*, for feare leſt the ſame prince might haue ſeazed vpon it after his diſeaſe, and therewith
F furniſhed his own bourd. But *Nero* himſelfe (as it became an Emperour indeed) went beyond all others in this kind of exceſſe, who bought one * drinking cup that ſtood him in three hundred thouſand ſeſterces; a memorable matter (no doubt) that an Emperour, a father and patron of his country, ſhould drink in a cup ſo deare. But before I proceed any farther, it is to be noted, that we haue theſe rich Caſſidoine veſſels [called in Latine Murrhina] from out of the Leuant: for found they be in many places of the Eaſt parts, and thoſe otherwiſe not greatly renowned,

* That is to ſay, columns & pillars, wherin were engrauen the names of cities and nations ſubdued by him in thoſe voyages into Spaine.

* *Octoginta ſeſtertijs*: where you muſt thinke that he vſes *ſeſtertium* in the neuter gender, which is a thouſand *ſeſterty*: for otherwiſe 80 ſeſterces come but to 20 deniers Roman, and that is about 12 *ſh* 6 *d.* ſterling: too much vnder the price of ſuch a jewell: and yet ſome read for *ſeſtertiis*, [*talentis*] and that is as much aboue the proportiõ, for one talent was eſteemed at 5000 ſeſterces.

* 1. The value of 6 talents.

* *Trecentis ſeſtertijs capidẽ*: I ſuſpect this place; for hee ſhould haue inferred a greater ſum than that before of *T. Petronius*: or elſe *capis* is a ſmaller piece than *Trulla*: & that ſhould not ſeeme, if it be deriued à *capiendo*, & ſo called for the capacitie, but rather of the ears, whereby a man may take hold thereof.

but most within the kingdom of Parthia: howbeit, the principall come from out of Carmania. G
The stone whereof these vessels be made, is thought to be a certaine humour thickened and baked as it were within the ground by the naturall heat thereof. In no place shall a man meet with any of these stones larger than small tablements of pillars or counting-bourds; and seldome are they so thicke as to serue for such a drinking cup as I haue spoken of already: resplendant they are in some sort, but that brightnesse is not pearcing, and to say a truth, it may be called rather a polishing glosse or lustre, than a radiant and transparent cleareneſſe: but that which maketh them so much esteemed, is the variety of colours; for in these stones a man shall perceiue certaine vains or spots, which as they be turned about resemble diuers colours enclining partly to purple and partly to white: he shall see them also of a third colour composed of them both, resembling the flame of fire: Thus they passe from one to another as a man holdeth them; in so H
much as their * purple seemeth to stand much vpon white, and * their milkie white to beare as much vpon the purple. Some esteemed those Cassidoine or Murrhene stones richest, which represent as it were certain reuerberations of sundry colours meeting all together about their edges and extremities, such as we obserue in rainbowes: others are delighted with cerataine fattie spots appearing in them; and no account is made of them which shew either pale or transparent in any part of them, for these be reckoned great faults and blemishes. In like maner if there be seene in the Cassidoine any spots like corns or graines of salt: if it containe resemblances of werts, although they beare not vp but lie flat as they doe many times in our bodies: finally, the Cassidoine stones are commended in some sort also for the smell that they do yeeld.

* *Purpura candescente.*
* *Aut lacte rubescente.*

As touching Crystall, it proceedeth of a contrary cause, namely of cold; for a liquor it is I
congealed by extream frost in maner of yce; and for the proofe hereof, you shal find crystal in no place els but where the winter snow is frozen hard: so as we may boldly say, it is very yce and nothing els, whereupon the Greeks haue giuen it the right name Crystallos, *i.* Yce. We haue this crystall likewise out of the East-parts, but there is none better than that which India sends to vs. Ingendred it is also in Asia, and namely about Alabanda, Ortosia, and the mountains adioyning, but in request it is not no more than that which is found in Cyprus: howbeit, there is excellent crystall within Europe, and namely vpon the crests of the Alps. King *Iuba* writeth, that in a certaine Island lying beyond the red sea ouer-against Arabia, named *Neron, there growes crystall: as also in another thereby, which yeeldeth the * Topase pretious stone; where, *Pythagoras* (lieutenant or gouernour vnder king *Ptolome*) digged forth a piece which carried a cubit K
in length. *Cornelius* * *Bocchus* affirmeth, that in Portugall vpon certaine exceeding high mountaines, where they sinke pits for the leuell of the water, there be found great crystal quarters or masses of a wonderfull weight. But maruellous is that which *Xenocrates* the Ephesian reporteth, namely, that in Asia and Cyprus there be pieces of crystall turned vp with the very plough, so ebb it lieth within the ground; an incredible thing, considering that before-time no man beleeued that euer it could be found in any place standing vpon an earthly substance, but onely among cliffes and craggs. It foundeth yet more like a truth, which the same *Xenocrates* writeth, namely, that oftentimes it is carried down the streame running from the mountains. As for *Sudines*, hee saith confidently, that crystall is not engendred but in places exposed onely to the L
South: and verily this is most true, for you shall neuer meet with it in wateriſh countries lying Northerly, be the climat neuer so cold, no though the riuers be frozen to an yce euen to the very bottome. Wee must conclude therefore of necessitie, that certaine cœlestiall humours, to wit, of raine and some small snow together, do concurre to the making of crystall: and hereupon it comes, that impatient it is of heat, and vnlesse it be for to drinke water or other liquor actually cold, it is altogether reiected: but strange it is, that it should grow as it doth, six angled: neither is it an easie matter to assigne a sound reason thereof, the rather for that the points be not all of one fashion; and the sides betweene each corner are so absolute euen and smooth, as no lapidarie in the world with all his skil can polish any stone so plain. The greatest & most weightie piece of crystal that euer I could see, was that which *Liuia Augusta* the Empresse dedicated in the Capitoll, which weighed about fiftie pounds. *Xenocrates* mine authour aboue-named, af- M
firmeth, that there was seene a vessell of crystall as much as an Amphore: and some besides him doe say, that there haue beene brought out of India, crystall glasses containing foure sextars a piece. Thus much I dare my selfe auouch, that crystall groweth within certaine rockes vpon the Alps, and those so steep and inaccessible, that for the most part they are constrained to hang

* Some reade *Netron.*
* Which some take for Chrysolite.
* or *Nepos.*

A by ropes that ſhall get it forth. They that be skilfull and well experienced therein, go by diuers markes and ſignes which direct them to places where there is criſtall, and where alſo they can diſcerne good from bad; for this you muſt think, there be many imperfections and faults therein; as namely, when it is rough or rugged in hand, ruſtie like yron, cloudie and full of ſpeckes; otherwhiles there is a ſecret hidden fiſtulous vlcer as it were within: there lieth alſo in it a certain hard knurre, which is brittle and apt to breake into ſmall crumbs, beſides the corn or grain therein called Sal. Some pieces of cryſtall you ſhall haue which carry a certain red ruſt: others be full of hairy ſtrakes, a man would imagin they were ſo many rifts; but cunning artificers can hide this laſt imperfection when they cut and engraue the piece that hath it: for in truth, if a cryſtall be pure and cleare of it ſelfe, much fairer it is plain, than ſo wrought and engrauen; and
B ſuch cryſtals the Greeks call Acenteta; but aboue all, when they look not like the froth of clear water: laſt of all, this is to be conſidered, that the heauier cryſtall is in proportion, the better account there is made of it. Moreouer, I read of certaine Phyſitians who are of opinion, that there is not a better and more wholeſome cautery for any part of the body that requreth cauteriſing or burning, than a ball or pomander of cryſtall held oppoſit between the member and the Sun beams. But will you heare of another notorious example of folly and madneſſe in theſe cryſtals as well as in Caſſidoins? There are not many yeres ſince a dame of Rome, and ſhee none of the richeſt, who bought one boll or drinking cup of cryſtall, and paid 150000 ſeſterces for it. As for *Nero* the Emperour (of whom I ſpake erewhile) when vnhappy news was brought vnto him of a great ouerthrow and a field loſt to the danger of his owne ſtate and the common-wealth, in
C the height of his rage and a moſt furious fit of anger, caught vp two cryſtall drinking cups and paſht them all to pieces: his ſpight was belike at all the men liuing in that age, & better means he could not deuiſe to plague and puniſh them, than to preuent that no man elſe ſhould drinke out of thoſe glaſſes: and in very truth, a cryſtall being once broken, cannot by any deuiſe whatſoeuer be reunited and made whole againe as before. We haue at this day cups and veſſels of glaſſe that come paſſing neere vnto cryſtall: but wonderfull it is, that notwithſtanding our glaſſes be ſo like, yet they haue not abated and brought downe the price of cryſtal, but rather cauſed it to be far dearer.

In the next degree to cryſtall wee are to place Amber, a thing that hitherto I heare women only ſet daintie ſtore by, and adorne themſelues withall: ſtrange it is, that l'Amber, Caſſidoine,
D and Cryſtall, ſhould thus be in equall requeſt with fine pretious ſtones; marie for Caſſidoin and Cryſtall, in ſome reſpects verily they may ſeeme to deſerue a higher roume, and namely, in regard that both of them are ſo appropriat for to drink water or cold liquor out of ſuch cups: but as for Amber, our delicates and wantons haue not yet deuiſed any probable reaſon why there ſhould be ſuch a reckoning made of it: but ſurely it is the folly and vain curioſity of the Greeks that hath giuen occaſion thereof, and brought it into ſo great a name. And here I muſt beſeech the readers to beare with me in this my diſcourſe as touching the firſt originall of Amber; for I thinke it not impertinent to deliuer what marueiles and wonders the Greeks haue broached as touching this thing, that the age and poſterity enſuing may yet be acquainted with their fabuloſities: firſt and formoſt therefore, many of their Poëts, yea, and as I ſuppoſe, the chiefe and
E principall of them, to wit, *Æſchylus*, *Philoxenus*, *Nicander*, *Euripides*, and *Satyrus*, tell vs a tale of the ſiſters of young price *Phaëton*, who weeping piteouſly for the miſerable death of their brother who was ſmitten with lightning, were turned into Poplar trees, which in ſtead of tears yeelded euery yere a certain liquor called Electrum [*id eſt*, Amber] which iſſued from them where they grew along the riuer Eridanus, which we call Padus, *id eſt*, the Po: and the reaſon why the ſame was named Electrum, is this, Becauſe the Sun in old time was vſually called * Elector in Greeke. But that this is one of their loud lies, it appeares euidently by the teſtimony of all Italie. But ſome of theſe Greek writers and ſuch as would ſeem to be more ſpeculatiue and better ſeene in the works of Nature than their fellowes, haue told vs of certain Iſlands that ſhould lie along the coaſt within the Venice gulfe, called Electrides, forſooth becauſe that amber is there
F gathered, by reaſon that the foreſaid riuer Po fals into the ſea among them: howbeit wel known it is, that there were neuer yet Iſlands ſo named within that tract; no nor any Iſlands at all neere to that place, into which the riuer Padus could poſſibly bring any thing at al down his ſtreames. As for *Æſchylus* the foreſaid Poët, who ſaith that the riuer Eridanus is in Iberia, that is to ſay, Spaine, & otherwiſe that it is called Rhodanus, as alſo for *Euripides* and *Apollonius*, who ſay that

* Ἠλέκτωρ, *quaſi* ἀλήτωρ *faciat*, Because he rouſeth and raiſeth vs in a morning out of our beds.

Rhoſne & Po both meet in one, and diſcharge themſelues together into the ſaid Venice gulfe, G they ſhew their groſſe ignorance in Coſmography, and deſcription of the world; and therfore they would be rather pardoned if they knew not what Amber was. Thoſe that write more modeſtly than the reſt (and yet can lie as well as the beſt) beare vs in hand, that about the ſides of the foreſaid Venice gulfe or Adriatick ſea, vpon rockes otherwiſe inexceſſible, there grow trees which yerely at the riſing of the Dogſtar do yeeld forth this Amber in manner of a gum. *Theophraſtus* contrariwiſe affirmes, that Amber is digged out of the ground. As for *Chares*, he ſaith, that *Phaëton* died in Æthyopia neere vnto the temple of *Iupiter Ammon*, which is the reaſon of a chappell there wherein hee is ſhrined, as alſo of an oracle much renowmed; in which quarters (quoth he) amber is engendred. *Philemon* would make vs beleeue, that Amber is minerall, and that within Scythia in two places it is gotten forth of the earth, in the one it is found white & H of the colour of wax, which they call Electrum; in the other it is reddiſh or tawny, and that is named Sualternicum. *Demoſtratus* cals Amber, Lyncurion, for that it commeth of the vrine of the wild beaſt named Onces or Lynces: the which is diſtinct in colour, for that which proceedeth from the male is reddiſh and of a fiery colour; the other which paſſeth from the female, is more weake in colour, and enclineth rather to whitiſh. Some giue it the name Langurium, and make report of certaine beaſts in Italie named Languriæ. *Zenothemus* tearmeth the ſame beaſts Langas, and by his ſaying, they liue about the Po. *Sudines* talketh of a tree in Liguria, which ſhould beare this Amber: of whoſe opinion alſo was *Metrodorus*. *Sotacus* was verily perſuaded, that it run downe from certaine trees in Brittaine, and thoſe he thereupon called Electrides. *Pytheas* affirmeth, that in Almaine there is the arme of the Ocean called Mentonomon, along I which there inhabit certaine people named Gutti, for the ſpace of ſix thouſand ſtadia; from which, within one daies ſailing, there lyeth an Iſland called Abalus, into which at euery Spring tide, there is caſt vp by the waters of the ſea at a high water, a great quantitie of Amber; and it is taken for nothing elſe but a certain excrement congealed and hardned, which the ſea in that ſeaſon purgeth and ſendeth away. The inhabitants of thoſe parts (ſaith he) vſe it for their ordinary fewell to burne, and doe ſell it to the Saxons and other Dutch, their next neighbours. *Timæus* accorded with him, ſaue only that he would haue the ſaid Iſland to be called *Baltia. *Philemon* was of this mind, that Amber would neuer flame if it were ſet on fire. *Niceas* would haue vs conceiue, that it ſhould be a certaine juice or humour proceeding (I wot not how) from the raies of the Sun, and yet he maketh a reaſon thereof, imagining that the ſaid beames ſhould be K exceeding hot toward the Sun-ſetting, which rebounding from the earth, leaue behind them a certain fatty ſweat in that part of the Ocean; and the ſame afterwards is caſt vp with *tides into the Sea-ſhore and ſands of the Germanes. He writeth alſo, that in Ægypt it is engendred after that manner, where it is called Sacal: as alſo among the Indians, who make more account of it than of frankincenſe. Semblably in Syria, the women (ſaith hee) make wherues of it for their ſpindles, where they vſe to call it Harpax, becauſe it will catch vp leaues, ſtraws, & fringes hanging to cloaths. *Theophraſtus* reporteth, that the ocean caſteth vp amber at tides, to the capes of the Pyrenæan hils: which *Xenocrates* alſo beleeued, who is the laſt that hath written of Amber, and ſuch like. There is at this day liuing, *Aſarubas*, who hath reported, that neer vnto the Atlanticke ſea there is the lake Cephiſis, which the Mores cal *Electrum, and the ſame being chafed L and heat throughly by the Sun, caſteth vp from the mud thereof, Amber, floting aloft vpon the water. *Meneſias* maketh report of a place in Affrike named Cicyone, as alſo of the riuer Crathis, which floteth out of a lough and runneth into the ſea; in which lake or lough, there liue certain kinds of foule which he names Meleagrides and Penelopes: herein amber is engendred (by his ſaying) after the ſame manner as before I ſhewed in the lake Electris. *Theomenes* ſaith, that neere vnto the great Syrtis where the hort-yard and garden of the Heſperides lieth, a man ſhall find, that amber falleth out of the ſaid garden into a lake beneath, and then the virgins attending vpon that place, come ordinarily to gather it. *Cteſias* affirmeth, that among the Indians there is a riuer called Hypobarus, (which word ſignifies as much, as bearing all good veſſels) it runneth out of the North and falleth into the Eaſt ſea, neere vnto a wild mountain, full of trees M that beare amber. He addes moreouer & ſaith, that thoſe trees are called Aphytacoræ, by which denomination is meant, moſt delightſom ſweetnes. *Mithridates* writeth, that toward the coaſt of Germany there lies an Iſland, and the ſame named Oſericta, repleniſhed with woods of Cedar trees yeelding Amber, which runs from them into rocks. *Xenocrates* is of opinion, That Amber was

* or Banomania.

*æſtibus, ſome read æſtatibus, i. in Summer.

* or rather *Electris*, as appeareth a little after.

20030

A was called in Italy not only Succinum, but alſo Thieum: wheras the Scythians name it Sacrium (for there alſo it is engendred:) alſo he ſaith, that others think it is engendred in Numidia. But I wonder moſt at *Sophocles* the Tragicall Poët (a man who wrote his Poëſies, with ſo graue and lofty a ſtile, and liued beſides in ſo good reputation; being otherwiſe borne at Athens, and deſcended from a noble houſe, emploied alſo in the managing of ſtate affaires, as who had the charge & conduct of an army) that he ſhould go beyond al others in fabulous reports, as touching Amber: for he ſticketh not to auouch, That beyond India it proceedeth from the tears that fall from the eies of the birds Meleagrides, wailing & weeping for the death of *Meleager*. Who would not maruell, that either himſelfe ſhould be of that beliefe, or hope to perſuade others to his opinion? For what child is there to be found ſo ſimple and ignorant, who will beleeue, that
B birds ſhould keep their times to ſhed tears euery yere ſo duly, and eſpecially ſo great drops and in ſuch quantitie, ſufficient to engender Amber in that abundance? Beſides, what congruitie is there, that birds ſhould depart as far as to the Indians and beyond, for to mourn and lament the death of *Meleager* when he died in Greece? What ſhould a man ſay to this? Are there not many more as goodly tales as theſe, which Poëts haue ſent abroad into the world? And their profeſſion of Poëtry, that is to ſay, of fayning and deuiſing fables, may in ſome ſort excuſe them. But that any man ſhould ſeriouſly and by way of hiſtory deliuer ſuch ſtuffe, as touching a thing ſo rife and common, brought in euery day in abundance by merchants which were ynough to conuince ſuch impudent lies, is a meere mockerie of the world in the higheſt degree; a contempt offered vnto all men, and argueth an habit of lying, and an impunitie of that vice intollerable.
C

Chap. III.

¶ *Of the true originall and generation of Amber. The ſundry kinds thereof. The exceſſe and ſuperfluitie of people, as touching Amber. The medicinable properties that it affourdeth. Of Lincurium, and the vertues that it hath in Phyſicke.*

D Vt to leaue Poëts with their tales, and to ſpeake reſolutely and with knowledge, of Amber, knowne it is for certain, That engendered it is in certaine Iſlands of the Ocean Septentrionall, where it beateth vpon the coaſts of Germany: and the Almanes call it *Gleſſum. And in very truth, in that voyage by ſea which *Germanicus Cæſar* made into thoſe parts, our countrymen named one of thoſe Iſlands Gleſſaria, by reaſon of the Amber there found; which Iſland the Barbarians call Auſtrauia. It is engendred then in certaine trees, reſembling Pines in ſome ſort, and iſſueth forth from the marrow of them, like as gum in Cherrie trees, and roſin in Pines. And verily, theſe trees are ſo full of this liquor, that it ſwelleth & breaketh forth in abundance: which afterwards either congealeth with the cold, or thickeneth by the heat of Autumn. Now if at any time the ſea riſe by any extraordinary tide, and catch any of it away out of the Iſlands, then verily it is caſt a ſhore vpon the coaſt of Germany, where it is ſo apt to roule, that it ſeemeth (as it were) to hang and ſettle lightly vpon the ſands, whereby it is the more eaſily gotten.
E And for that our anceſtours heretofore in old time beleeued that it was the juice of a tree, they called it therfore in Latine Succinum. That it coms from trees of a Pine kind, may appeare by this, That if a man rub it, he ſhall find the ſmel of Pine-wood: alſo, for that when it burneth, the flame, and fume (both) reſembleth that of Torch-wood. The Germanes make great traffick thereof, aud bring it into Pannonia, and ſo from thence vnto vs, through our prouinces [of Iſtria and Venice;] for from Pannonia, the Venetians firſt (who confine next vpon the marches thereof, and whom the Greekes call Heneti) receiued it by way of merchandiſe in the maritime port townes along the Adriatick ſea, and ſo by that means brought it into name and requeſt: which ordinary traffick may be the reaſon which gaue occaſion to the foreſaid tale that runes of the Po and the Poplars about it, that ſhould weep Amber. And euen at this day the country dames
F of Lumbardie, and thoſe parts beyond the Po, vſe to weare faire carkaners & collers of Amber-beads to adorne themſelues eſpecially, and in ſome ſort for the health alſo of their bodies: for perſuaded they are, that it withſtands the inflammation of the Amygdales & other accidents of the throat and chawes: for that the people of that country are ſubject to *poghes vnder their throat, about thoſe fleſhie parts neere vnto it, by reaſon of ſundry kinds of waters which breed thoſe

*For the perſpicuitie and brightnes like vnto glaſſe.

*This diſeaſe is called *Bronchocele* or *Hernia guttur.s*, ordinary in Sauoy and thoſe parts about Geneva.

thoſe infirmities. The foreſaid coaſt of Germany is almoſt ſix hundred miles from Carnuntum in Pannonia, and yet of late daies much frequented by merchants from all quarters. Certes, a Gentleman of Rome diſcouered thoſe parts, by occaſion that he was ſent thither by commiſſion from *Iulianus* (who had the charge vnder *Nero* for furniſhing of the ſolemne plaies and ſights of ſword-fencers) to buy vp good ſtore of amber. This gentleman I ſay ſurueied diligently al thoſe coaſts, & ſaw the maner of the whole traffick for that commodity, yea & brought into Rome ſuch plenty thereof, that the great nets and cordage (which for defence of the outſtanding and open gallerie within the Theatre were oppoſed againſt the wild beaſts, there to be baited and to fight) were buttoned & ſet out with Amber; the armour likewiſe, the bieres, & other furniture for burial of thoſe fencers which ſhould happen there to be killed, yea, & in one word, all the apparel and prouiſion for one day to the ſetting out of thoſe paſtimes and diſports, ſtood moſt of Amber. The greateſt piece of Amber that he brought ouer, weighed 13 pounds. Moreouer, it is held for certain, That it is to be found among the Indians. *Archelaus*, who ſometime reigned as king in Cappadocia, writeth, That from thence it is brought rude and vnclean, with pieces of bark ſticking within it: but the way to ſcoure and polliſh it, is to ſeeth it in the greaſe of a ſow that ſuckleth pigs. That it doth deſtil and drop at the firſt very clear & liquid, it is euident by this argument, for that a man may ſee diuers things within, to wit, Piſmires, Gnats, and Lizards, which no doubt were entangled and ſtuck within it when it was green and freſh, and ſo remained encloſed within as it waxed harder. Many kinds there be of amber. The white is moſt redolent and ſmels beſt: but neither that, nor yet thoſe pieces which are coloured like wax, be of any price. The high coloured Amber, namely that which is of a deepe yellow enclining to red, is much more eſteemed, and the rather if it be cleare and tranſparant, prouided alwaies that the glittering thereof be not too ardent. Commendable it is in Amber, and ſheweth it to be rich, if it repreſent fire in ſome ſort: but it muſt not be too too fiery. But the excellent Amber is that which is called Falernum, for the colour which it carrieth, reſembling the wine Falernum: and the ſame is clear and tranſparant, with a gay luſtre that pleaſeth & contenteth the eie very wel. And yet ſome there be, who delight more in that Amber which lookes with a mild yellow like to boiled and clarified hony. But this I am to giue you to vnderſtand, That there may be giuen vnto Amber what tincture or colour a man will: but commonly they vſe therto the ſuet of Kids and the root of Orchanet: and no maruaile, ſince that ſome haue deuiſed alſo to enrich it with a purple die. To come vnto the properties that Amber hath, if it be well rubbed and chafed between the fingers, the potentiall facultie that lies within, is ſet on work, and brought into actuall operation, wherby you ſhall ſee it to draw chaffe ſtrawes, dry leaues, yea, and thin rinds of the Linden or Tillet tree, after the ſame ſort as the loadſtone draweth yron. Moreouer, take the ſhauings ſcraped from Amber, and put them into lamp-oile, they will burne and maintaine light both longer and alſo more cleare than weekes or matches made of the very tire and beſt of flax. As touching the eſtimation that our delicates and wantons make thereof: Some there be, who for their pleaſure will giue more for a puppet or image made of Amber to the likenes and proportion of man or woman, be it neuer ſo little, than for the liuely and luſty body indeed of a tal man and valiant ſouldior. But what ſhould I ſay to ſuch? Certainly they deſerue to be wel chaſtiſed for their peruers iudgment, & one rebuke is not ſufficient. Yet can I hold better with them who take pleaſure in other things, & me thinks they haue ſome reaſon therof: for Corinth veſſell, there is good cauſe that a man ſhould ſet his mind therupon, in regard of the ſingular temper of the braſſe, with ſome proportion of ſiluer and gold: in pieces of mettall ingrauen, enchaſed and emboſſed, the curious art and the witty deuiſe ſeen vpon the worke may well rauiſh the ſpirit of the buyer, and draw him on to giue a round price: Touching the cups made of Caſſidonie and Cryſtal, I haue ſhewed already, wherein lies their grace, and what may enamour a chapman and cauſe him to bid well and offer frankly for them: Faire pearles and goodly vniones are commended, for that our braue dames enrich their borders therewith, and ſet out theattire of their heads: gems and pretious ſtones adorne and beautifie our fingers: in ſum, there is no ſuperfluitie that we haue, but grounded it is either vpon ſome colourable vſe that wee may pretend, or els vpon ſome gallant ſhew that it makes: As for this Amber, I ſee nothing in the world to commend it; only it is a mind that folk haue to take affection to it, they know not wherfore, euen of a delicat and fooliſh wantonneſſe. And in truth, *Nero Domitius*, among many other fooleries and gauds wherein he ſhewed what a monſter he was in his life, proceeded ſo far, that he made

20030
copy 1

A made a ſonnet in praiſe of the hair of the Empreſſe *Poppæa* his wife,which he compared to Amber,and as I remember,in one ſtaffe of his dittie he tearmed them Succina,i. Ambre:and from that time our dainty dames and fine ladies haue begun to ſet their mind vpon this colour, and haue placed it in the third ranke of rich tincture:whereby we may ſee there is no ſuperfluity and diſorder in the world,but it hath a pretence or cloake of ſome pretious name or other. And yet I will not diſgrace Amber too much: for why?there is ſome good vſe thereof in Phyſicke.But I muſt tell you againe,our women regard not that one whit;that is not it wherfore they take ſo great a liking to Ambre. True it is that a collar of Ambre beads worne about the neck of yong infants,is a ſingular preſeruatiue to them againſt ſecret poyſon, & a countercharme for witchcraft and ſorcerie.*Calliſtratus* ſaith,That ſuch collars are very good for all ages, and namely to
B preſerue as many as weare them againſt fantaſticall illuſions and frights that driue folke out of their wits:yea and Amber,whether it be taken in drinke,or hung about one,cures the difficulty of voiding vrin. This *Calliſtratus* brought in a new name to diſtinguiſh yellow Ambre from the reſt,calling it Chryſelectrum,which is as much to ſay as gold Ambre. And in very truth, this Amber is of a moſt louely and beautifull colour in a morning. This property it hath beſides by it ſelfe,that it will catch fire exceeding quickly,for if it be neer it,you ſhal ſee it will ſoon be of a light fire. He ſaith of this yellow Amber,that if it be worn about the neck in a collar,it cures feauers,and healeth the diſeaſes of the mouth,throat,and jawes: reduced into pouder and tempered with hony and oile of roſes,it is ſoueraign for the infirmities of the ears. Stamped together with the beſt Attick hony,it makes a ſingular eie-ſalue for to help a dim ſight:pulverized,
C and the pouder thereof taken ſimply alone,or els drunk in water with maſticke,is ſoueraign for the maladies of the ſtomacke. Furthermore, Amber is very proper to falſifie many pretious ſtones which are commended for their perſpicuity and tranſparent cleareneſſe;but ſpecially to counterfeit Amethyſts, by reaſon that I haue already ſaid, it is capable of any tincture that a man would giue it. The froward peeuiſhnes of ſome Authors who haue written of Lyncurium, enforceth me to ſpeak of it immediatly after Amber:for ſay that it be not Electrum or Amber, as ſome would haue it, yet they ſtand ſtiffely in this,that it is a pretious ſtone;mary they hold, that it commeth from the vrine of an Once,by reaſon that this wild beaſt ſo ſoon as it hath piſſed,couereth it with earth,vpon a ſpight and enuie to man,that he ſhould haue no good therby. They affirme moreouer, That the Once ſtone or Lyncurium is of the ſame colour that Ambre
D ardent which reſembleth the fire,& that it ſerueth well to be engrauen:neither by their ſaying doth it catch at leaues only and ſtrawes,but thin plates alſo of braſſe and yron:and of this opinion was *Dimocles* and *Theophraſtus*. For mine own part I hold all to be mee re vntruths:neither do I think, that in our age there hath been a man who euer ſaw any pretious ſtone of that name. Whateuer alſo is written as touching the vertues medicinable of Lyncurium,I take them to be no better than fables,namely,that if it be giuen in drink,it wil ſend out the ſtone of the bladder: if it be drunk in wine,it will cure the jaundiſe preſently,or if it be but carried about one,it wil do the deed: but ynough of ſuch fantaſticall dreames and lying vanities, and time it is now to treat of thoſe precious ſtones,wherof there is no doubt made at al,and to begin with thoſe that by al mens confeſſion are moſt rich and of higheſt price. In which diſcourſe I wil not proſecute
E this theame only,but alſo(for to aduance the knowledge of poſterity in thoſe things that may profit this life) I meane eftſoones to haue a fling at Magicians for their abhominable lies and monſtrous vanities,for in nothing ſo much haue they ouerpaſſed themſelues as in the reports of gems & pretious ſtones, exceeding the tearms and limits of Phyſick,whiles vnder a color of faire and pleaſing medicines,they hold vs with a tale of their prodigious effects and incredible

Chap. IIII.

¶ *Of Diamants and their ſundry kinds. Their vertues and properties medicinable. Of Pearles.*

F THe Diamant carieth the greateſt price,not only among pretious ſtones, but alſo aboue al things els in the world:neither was it knowne for a long time what a Diamant was,vnleſſe it were by ſome kings and princes,and thoſe but very few. The only ſtone it is that we find in mines of mettal. Very ſeldome it is,and thought a miracle to meet with a diamant in a veine of gold,& yet it ſeemes as though it ſhould grow no where but in gold. The writers of antient time

time were of opinion that it was to be had in the mines only of Æthiopia,and namely between G
the temple of *Mercurie* and the Iſland Meroë,affirming moreouer,that the faireſt Diamant that
euer was found, exceeded not in bigneſſe a Cucumber ſeed, whereunto alſo it was not vnlike in
color. But in theſe daies there be known ſix ſorts of Diamants. The Indian is not engendred in
mines of gold,but hath a great affinitie with Cryſtall:and groweth much after that manner; for
in tranſparent and cleere color it differeth not at all,neither yet otherwhiles in the ſmooth ſides
and faces which it carrieth between ſix angles,pointed ſharpe at one end in manner of a top,or
els two contrary waies lozengewiſe(a wonderful thing to conſider)as if the flat ends of two tops
were ſet and joined together:and for bigneſſe it hath bin knowne of the quantity of an Hazel-
nut or Filbard kernill. The Diamants of Arabia be much like to the Indian,only they are leſſe;
they grow alſo after the ſame order:As for the reſt,they are of a more pale and yellow color,te- H
ſtifying out of what country and nation they come, for they breed not but in mines of gold,and
thoſe the moſt excellent of all others. The triall of theſe Diamants is vpon a ſmiths Anuill:
for ſtrike as hard as you will with an hammer vpon the point of a Diamant,you ſhall ſee how it
ſcorneth all blowes,and rather than it will ſeeme to relent,firſt flieth the hammer that ſmiteth,
in pieces,and the very anuill it ſelfe vnderneath cleaueth in twaine. Wonderful and inenarrable
is the hardneſſe of a Diamant:beſides it hath a nature to conquer the fury of fire, nay,you ſhall
neuer make it hot, doe what you can: for this vntameable vertue that it hath, the Greekes haue
giuen it the name Adamas. One of theſe kinds the ſaid Greekes call Cenchron, for that it is as
big ordinarily as the millet ſeed: a ſecond ſort they name Macedonicum,found in the mine of
gold neer Philippi; and this is that Diamant, which for quantity is compared to the Cucum- I
ber ſeed: After theſe,there is the Cyprian Diamant,ſo called becauſe it is found in the Iſle Cy-
prus;it enclineth much to the color of braſſe,but in caſes of Phyſick (as I will ſhew anon) moſt
effectual:Next to which I muſt raunge the Diamant Sideritis,which ſhines as bright as ſteele,
whereupon it tooke that name:in weight it paſſeth the reſt,but in natue it is farre vnlike; for it
will not abide the hammer but breake into pieces; beſides,another adamant will pierce it, and
bore a hole quite through it:which alſo may be ſaid of the Cyprian Diamant:ſo as to ſpeak in
one word,theſe two laſt rehearſed,may go only vnder the name of Diamants:for otherwiſe they
are but baſtards,and not true Diamants. Moreouer,as touching the concord and diſcord that is
between things naturall,which the Greekes call Sympathia and Antipathia(whereof I haue ſo
much written in all my bookes,and endeauoured to acquaint the readers therewith) in nothing K
throughout the world may we obſerue both the one & the other more euidently,than in the Di-
amant: For this inuincible minerall(againſt which neither fire nor ſteele,the two moſt violent
and puiſſant creatures of natures making,haue any power,but that it checketh & deſpiſeth both
the one and the other) is forced to yeeld the gantelet and giue place vnto the bloud of a Goat,
this only thing is the means to break it in ſunder,howbeit care muſt be had, that the Diamant
be ſteeped therin whiles it is freſh drawn from the beaſt before it be cold:& yet when you haue
made all the ſteeping you can, you muſt haue many a blow at the Diamant with hammer vpon
the anuill:for euen then alſo,vnleſſe they be of excellent proofe & good indeed,it wil put them
to it,and break both the one & the other:But I would gladly know whoſe inuention this might
be to ſoake the Diamant in Goats bloud, whoſe head deuiſed it firſt, or rather by what chance L
was it found out & known? What conjecture ſhould lead a man to make an experiment of ſuch
a ſingular and admirable ſecret,eſpecially in a goat,the filthieſt beaſt one of them in the whole
world? Certes I muſt aſcribe both this inuention, & all ſuch like to the might and benificence
together of the diuine powers: neither are we to argue & reaſon how and why nature hath done
this or that? ſufficient it is that her will was ſo,& thus ſhe would haue it. But to come againe to
the Diamant,when this proofe taketh effect to our mind, ſo that the Diamant once crack, you
ſhall ſee it break & crumble into ſo ſmall pieces,that hardly the eie can diſcerne the one from
the other. Wel, lapidaries are very deſirous of Diamants & ſeek much after them:they ſet them
into handles of yron,& therby they with facility cut into any thing,be it neuer ſo hard. More-
ouer,there is ſuch a naturall enmity between Diamants & Loadſtones,that if it be laid neer to M
piece of yron,it will not ſuffer it to be drawn away by the loadſtone:nay,if the ſaid loadſtone be
brought ſo neere a piece of yron, that it haue caught hold thereof, the Diamant, if it come in
place,will cauſe it to let goe the hold. The diamant hath a property to fruſtrathe malicious ef-
fects of poyſon;to driue away thoſe imaginations that ſet folke beſides themſelues;& to expell

vaine

20030
copy 1

A vaine feares that trouble and poſſeſſe the mind: which is the reaſon that ſome haue called it Anachites. *Metrodorus Scepſius* affirmeth, That the Diamant is found in Germanie and the Iſland Baltia, wherein Amber is ingendred: but as far as euer I could reade, he is the onely man that ſaith ſo. This Diamant alſo of Almaine he preferreth before thoſe of Arabia, howbeit no man doubteth that he lieth ſtoutly. After the precious Diamants of India and Arabia, wee in theſe parts of the world eſteem moſt of pearles: but as touching them, I haue written ſufficiently in my ninth booke, where I diſcourſed of ſuch matters as the ſeas do yeeld.

CHAP. V.

B ¶ *Of the Emeraud, and the ſundry ſorts thereof. Of greene gems or precious ſtones, and ſuch as be light ſome and cleare all thorow.*

EMerauds for many cauſes deſerue the * third place: for there is not a colour more pleaſing to the eie. True it is, that we take great delight to behold greene herbes and leaues of trees, but this is nothing to the pleaſure wee haue in looking vpon the Emeraud, for compare it with other things, be they neuer ſo green, it ſurpaſſes them all in pleaſant verdure. Beſides, there is not a gem or precious ſtone that ſo fully poſſeſſeth the eie, and yet neuer contenteth it with ſacietie. Nay, if the ſight hath bin wearied and dimmed by intentiue poring vpon any thing els, the beholding of this ſtone doth refreſh and reſtore it againe, which lappidaries well know, that cut and ingraue fine ſtones; for they haue not a better means to refreſh their eies than the Emeraud, the mild green that it hath doth ſo comfort and reuiue their wearines and laſſitude. Moreouer, the longer and farther off that a man looketh vpon Emerauds, the fairer and bigger they ſeem to the eie, by reaſon that they cauſe the reuerberation of the aire about them for to ſeeme green: for neither Sun nor ſhade, ne yet the light of candle, cauſeth them to change and loſe their luſtre: but contrariwiſe, as they euer ſend out their own raies by litle & little, ſo they entertain reciprocally the viſual beams of our eies; and for all the ſpiſſitude and thickneſſe that they ſeeme to haue, they admit gently our ſight to pierce into their bottome: a thing that is not ordinary in water. The ſame are ſhaped many times hollow, thereby to gather, vnite, and fortifie the ſpirits that maintain our eie-ſight. In regard of theſe manifold pleaſures that they ſhew to our eies, by generall conſent of all men ſpared they are, and lappidaries be forbidden expreſſely to cut and ingraue them: and yet the Emerauds of Scythia and Ægypt be ſo hard, as they cannot be pierced or wounded by any inſtrument: moreouer, when you meet with a table-Emerauld hold the flat face therof againſt any thing, it will repreſent the ſaid obiect to the eie, as well as a mirroir or looking glaſſe. And verily, *Nero* the Emperor was wont to behold the combats of fencers and ſword-plaiers in a faire Emeraud. Now this firſt & formoſt is to be noted, that of Emerauds there be 12 kinds. The faireſt and richeſt of all other, be thoſe of Tartarie and called they are Scythick, of the nation Scythia from whence they came: and in truth, there be none fuller and higher in colour or haue fewer blemiſhes: and looke how far Emerauds goe beyond other precious ſtones, ſo far do the Scythian Emerauds ſurpaſſe all others. The Bactrian Emerauds, as they are the next neighbors, ſo they come neareſt in goodneſſe to the Scythicke: found theſe be in chinks and joints (as it were) of rocks in the ſea, and gathered (by report) about the dog daies, when the Northeaſt Eteſian winds do blow: for then they glitter and ſhine within the earth that is grown about them, by reaſon that the ſaid winds (which in thoſe parts are ſtrong) remoue the ſand away from them, and cauſe them to be ſeen: but theſe by report be far leſſe than thoſe of Scythia. In a third place follow the Emerauds of Ægypt, & they be gotten out of certain craggy hils and cliffes about Coptos, a towne in high Ægypt. As for all others, they be found ordinarily in braſſe mines: that is the reaſon that the Emerauds of the Iſle Cypros be held for chiefe and principall among thoſe nine: and yet their ſingular commendation lieth not in any clear or mild colour that they haue, but their onely grace conſiſteth herein, that they ſeeme moiſt with a certaine fattineſſe, and on which ſide ſoeuer a man do view them, they reſemble the liquid water of the ſea, for tranſparent they be and ſhining withall, that is to ſay, they ſend out a colour of their own, & withal, through their perſpicuity receiue the penetrant beams of our eies. It is reported, That in the ſame Iſle Cypros, about the ſepulchre of *Hermias* a pety king there, and neare vnto the ſea ſides where were pooles and ſtewes of great fiſhes kept to be ſalted, there ſtood in old time a lion of marble, in the head of which Lion were ſet certain faire Emerauds in ſtead of

C

D

E

F

* To wit, after Diamants and Pearles.

eies,

eyes, looking oppoſit into the ſea: but they glittered and pierced ſo deep into the water, that the G
Tunies vpon that coaſt were affraid therat, & fled from the nets and other inſtruments that the
fiſhers laid to take them withall: who maruelled a long time at this ſtrange accident: but in the
end knowing what the matter was, they changed the eies of the foreſaid Lion, and remoued the
Emerauds. But requiſit it is that I ſhould ſet down the imperfections & defaults of Emerauds,
for that a may may ſo eaſily be deceiued and beguiled in the choiſe of them: Firſt therefore all
Emerauds be ſubject to ſome blemiſhes, and yet as we obſerue in men, they haue their parti-
cular defects by themſelues, according to the nation where they be found; for thoſe of Cypres
haue not an vniforme verdure, but you ſhal ſee in one and the ſame ſtone a mixture (as it were) of
diuerſe greenes, more or leſſe in ſundry parts: neither keep they euer that rich greene after one
tenour, which we ſee in the Scythian Emerauds. Ouer and beſides, in ſome you ſhall meet with H
a cloud or ſhadow running between, which doth impeach the cleare color: neither is the ſame
commendable, if it be ouer bright. Theſe faults are the cauſe that Emerauds are diſtinguiſht by
diuers names and kinds: for ſome be darke, and thoſe be called blind: others be thicke, without
any clearneſſe or perſpicuity at all. And ſome again are diſcommended and rejected for diuers
little clouds, which alſo are different for the ſhade aforeſaid: for this little cloud wherof I ſpeak,
is a fault in whiteneſſe, when as in viewing of an Emeraud it looketh not green all through, but
either the eieſight meeteth with ſome white in the way, or elſe at leaſtwiſe in the bottom. And
thus much as touching the faults in colour. But in the very body and ſubſtance of the Emeraud
there be others obſerued, to wit, when there appear either hairy ſtreaks, or congealed ſpecks re-
ſembling cornes of ſalt, or els ſpots of lead. Next to the Cyprian Emerauds, there is reckoning I
made of the Æthyopian, which as king *Iuba* mine authour doth report, are found in Æthyopia,
from Coptos in Ægypt three daies journy: Theſe be of a chearefull and liuely green, but hardly
ſhal you find any of them clear, pure, and of one colour. Among theſe, *Democritus* raungeth the
Hermionian Emerauds and the Perſian: of which, the former ſeeme to ſwell out as if they were
emboſſed and fattie withall: the Perſian are not tranſparent, & yet of a pleaſant greene and vni-
forme, contenting the eie-ſight well enough, though it cannot pierce and enter into them; and
much like they be to the glowing eies of cats & panthers, for we may perceiue them to glitter
and ſhine, and yet they be not tranſlucent. Theſe Emerauds in the Sun loſe their luſtre and be-
come dim, but in the ſhade they ſhine gallantly, yea, and caſt from them their beautifull raies
farther than any other. And yet the general fault in al theſe, is this, if they ſhew the color either K
of gall or the skie; likewiſe if in the Sun they glitter and ſhine cleare, but yet appear not green:
Theſe imperfections are perceiued ordinarily and moſt of all in the Atticke Emerauds, found
in ſiluer mines at a place called Thoricos, yet are not theſe ſo groſſe and fattie as others, and al-
waies they ſeeme more beautifull a far off than neer at hand: theſe are ſubject ordinarily to the
fault called Plumbago, that is to ſay, in the Sun they looke with a leaden hew: Moreouer, this
peculiar quality they haue by themſelues, that ſome of them wear & decay with age, inſomuch
as by little and little their liuely green decaieth; and beſides, in the Sun they loſe their luſtre.
After the Atticke Emerauds, thoſe of Media be accounted the greeneſt, and otherwhiles they
reſemble the green Saphire. Theſe ſeem to be ful of waues, and to containe within them diuers
Capillorum, not catulorum. ſhapes and figures of many things, as for example, poppie heads, birds, wings, and finnes, *locks L
of haire, and ſuch like. Such Emerauds as are not found naturally greene, may be made better
and receiue their perfection, by waſhing them in wine & oile. In one word, there is not a greater
Emeraud to be found than thoſe of Media. As touching Carchedonian Emerauds, I wot not wel
whether they be now out of al requeſt & knowledge, ſince their mines of braſſe haue failed them;
and yet were they alwaies (at their beſt) the ſmalleſt of all others, and bare the loweſt price: the
ſame were brittle & eaſie to be broken, their color alſo was not ſettled but vncertain & change-
able, reſembling for all the world the greene feathers in Peacockes tailes, or the downe of Pige-
ons neckes; as a man held and turned them one way or other they ſhined more or leſſe, being
otherwiſe of themſelues full of veines and skales. A ſpeciall fault there was, wherto theſe Eme-
rauds were ſubject, which lapidaries called Sarcicon, that is to ſay, a certain carnoſity or fleſhi- M
neſſe incident vnto gems. Gathered they were in a certaine mountaine neere vnto Carchedon,
which thereupon was named Smaragdites. K. *Iuba* hath left in writing, That the Emeraud cal-
led Cholos, ſerued the Arabians much in their buildings: for to adorn and beautifie their hou-
ſes, they were wont to encloſe & ſet the ſame in the wals like as the white marble, which the Æ-

gyptians

20030
copy 1

A gyptian name Alabastrites. He reporteth moreouer, that there be many other Emerauds neere by, taken forth of the mountain Taygetus in Laconia, and those therefore be named Laconick, and much like they are to those of Media. He speaketh likewise of others in Sicilie. Reckoned there is in the ranke of Emerauds, a certain gem brought from Persia, named Tanos; howbeit of an vnpleasant green it is, and foule within: as also the stone Chalcosmaragdos, that comes out of the Isle Cyprus, which hath in it certain veins of brasse that trouble the green colour. *Theophrastus* reporteth, that he hath read in the books and records of the Ægyptians, That a king of Babylon sent as a present to one of their kings, one entire Emeraud foure cubits long and three broad. Also, that there had bin within the temple of *Iupiter* among them, an Obeliske made of foure Emerauds, which obelisk notwithstanding was forty cubits long, & caried in bredth four
B cubits in some places, and two in others. He addeth moreouer, that while he wrot his historie, there was at Tyros within the temple of *Hercules*, a pillar standing of one Emeraud, vnlesse haply it were some bastard Emeraud; for such (quoth he) are found, and namely in Cyprus there was seen naturally growing, a stone, whereof the one halfe was a plaine Emeraud, the other a Iasper, as if the humor had not bin fully transformed and conuerted into an Emeraud. *Apion* the Grammarian, syrnamed * Plistonices, wrot not long before, who hath left recorded, That there remained still within the labyrinth of Ægypt, the gyant-like image of their god *Serapis* nine cubits tall, and of one entire Emeraud.

* Contentious, or Victorious.

Moreouer, many are of opinion, that Berils are of the same nature that the Emeraud, or at leastwise very like: from India they come as from their natiue place, for seldome are they to be
C found elsewhere: lapidaries by their art and cunning know how to cut them into six angles, and to polish them smooth; for otherwise their lustre, which is but sad, would be dull and dead indeed, vnlesse it were quickned and reuiued by the repercussion of these angles: for be they polished neuer so much any other way, yet haue they not that liuely glosse which those six faces giue them. Of these Beryls those are best esteemed which carry a sea-water greene, and resemble the greennesse of the sea when it is cleare. Next to them are those called Chrysoberylli: these be somewhat paler, and their lustre tendeth to the colour of gold. A third kind there is approching neere to this, but that it is more pale (howsoeuer some do think it is no kind of Beril, but a gem by it self) and this they call Chrysoprasos. In a fourth degree are placed the Berils named Hyacinthizontes, because they incline somwhat to the Iacinth. And in a fift such as are much of a
D sky colour, wherupon they are named Aëroides. After them be the Beryls Cerini, for that they seem like wax: then the Oleagini, that is to say, of an oile colour. And in the last place bee the Crystalline, which are white, and come very neere to crystals. All the sort of these Beryl stones haue these faults, to wit, white hairy streaks or lines in them, yea and other filthy ordure; being of themselues without these imperfections apt to shed their colour, which soon fadeth. The Indians take a wonderfull pleasure in long Beryls, and commend them for the only stones & gems in the world; as if they cared not to be set in gold, but chose rather to be worne without it: and in truth in that regard their maner is to bore holes through them, and then to file them vp into chains and collars with haires of elephants: howbeit when they meet with some excellent Beryls indeed, which are come to their absolute goodnesse and perfection, they think it not good
E to pierce such, but presently they tip them with gold, that is to say, they set vnto their heads certain knobs in maner of bosses which comprehend and inclose the same. And in very truth, they delight to cut their Berils into long rolls or pillastres in manner of cylindres, rather than after the maner of other gems, because their principal grace and commendation lies in their length. Some are of opinion, that the Beryl groweth naturally cornered and with many faces; and they hold those Beryls to be richest, which being bored through along, haue their white pith taken forth, for to giue them a better lustre of gold put vnto them; by the reuerberation wherof the ouermuch perspicuitie of the stone may seem more corpulent and in some sort corrected. Ouer and aboue the faults already noted, subiect they are also to those imperfections which be incident to the Emerauds, yea and besides to certain specks called Pterygiæ. It is thought, that Be-
F ryls be found likewise in these parts of the world, to wit, about the kingdome of Pontus. As for the Indians, after that crystall was once found out, they deuised to sophisticat and falsifie other gems therewith, but Beryls especially.

Chap. VI.

¶ Of the pretious ſtone Opalus, and all the ſundry kindes. The faults in them, and the means to try which be good. Alſo diuers ſorts of other gems and pretious ſtones.

THe ſtones called Opales differ little or nothing otherwhile from Beryls, and yet the ſame ſomtimes are nothing at all like them, neither is there a gem that they will giue place to, vnleſſe it be the Emeraud: India is the only mother of them: lapidaries therfore & thoſe who haue written books of pretious ſtones, haue giuen vnto them the name and glory of greateſt price; but eſpecially for the difficultie in finding them out and chuſing them, which is inenarrable: for in the Opal you ſhal ſee the burning fire of the Carbuncle or Ruby, the glorious purple of the Amethyſt, the greene ſea of the Emeraud, and all glittering together, mixed after an incredible manner. Some Opals cary ſuch a reſplendant luſtre with them, that they are able to match the braueſt and richeſt colours of painters; others repreſent the flaming fire of brimſtone, yea and the bright blaze of burning oile. The Opal is ordinarily as big as a filberd Nut. And here comes to my mind an hiſtorie among vs as touching the Opal, worth remembrance: for there is at this day to be ſeene one of theſe Opals, for the which gem *Marcus Antonius* proſcribed and outlawed one *Nonius* a Senator of Rome, the ſonne of that *Struma Nonius* (at whom the ſtomack of *Catullus* the Poet did riſe ſo much, ſeeing him as he did, ſit in a ſtately chaire of Ivory called Curulis) and grandfather to that *Servilius Nonianus* whom I my ſelfe haue ſeene Conſul. Now the ſaid Senator when he was driuen to fly vpon this proſcription, took no more of all the goods which he had, but onely a ring wherein this Opall was ſet, which (as it is well known) had bin valued ſomtime at 20000 Seſterces. But as the cruell and inordinate appetite of *Antony* (who for a jewell onely outlawed and baniſhed a Roman Senator) was wonderfull on the one ſide, ſo the peeuiſhneſſe and contumacie of *Nonius* was as ſtrange on the other ſide, who was ſo far in loue with that gem which coſt him his proſcription, and rather than to part with it ſuffered himſelfe to be turned out of houſe and home: and yet the very wild beaſts are better aduiſed than ſo, who are content to bite off thoſe parts of their bodies and leaue them behinde for the hunters, ſeeing themſelues in danger of death for them. In the Opall there be obſerued alſo diuers blemiſhes and imperfections, as wel as in other ſtones; namely, if the colour reſemble the floure of that herb which is called Heliotropium, *i.* Turnſole: alſo if it look like cryſtal or haile, likewiſe if there be a ſpot comming between in maner of a grain or kernel of ſalt: if it be rough in handling, or if there be certain ſmall pricks or ſpots repreſented to the eies: neither is there any pretious ſtone that the Indians can counterfeit ſo well by the meanes of glaſſe, as this; inſomuch as hardly a man ſhall diſcerne the naturall Opal from the falſe, when they haue done withall. But the only triall is by the Sun, for if a man hold an Opall betwixt his thumbe and finger, againſt the beams of the Sun, if it be a counterfeit, he ſhall find thoſe diuers colours which ſhewed therein, to run all into one and the ſame tranſparent colour, and ſo to reſt in the body of the ſtone; whereas the brightneſſe of the true Opal eſtſoons changeth, and ſends forth the luſtre to and fro more and leſſe, yea and the glittering of the light ſhineth alſo vpon the fingers. This gem, for the rare and incomparable beauty and grace that is in it, moſt Writers haue called Pæderos.

There is alſo another kind of Opalos apart by it ſelf, according to the opinion of ſome, who ſay it is called by the Indians Sangenon. It is ſaid that that there be Opals in Egypt and in Arabia, like as in the kingdom alſo of Pontus; but ſuch of all other beare the loweſt price. In Galatia likewiſe, and in the Iſles Thraſos and Cyprus: for albeit they haue the louely beautie of the Opalus, yet their luſtre is nothing ſo liuely and lightſome, and ſeldome ſhal you meet with any of them that is not rugged: their chief colours ſtand much vpon braſſe and purple; the freſh verdure of the greene Emeraud is away, which the true Opal doth participate. This is generally held, that they are more commendable which be ſhadowed as it were with the colour of wine, than delaied with the clearneſſe of water.

Thus far forth haue I written of gemmes and pretious ſtones which be eſteemed principall and moſt rich, according to the decree generally ſet downe and pronounced by our nice and

coſtly

20030
copy 1

A coſtly dames: for we may conclude vpon this point more certainely, going by their ſentence, than grounding vpon the iudgement of men: for men (kings eſpecially and great men) make the price of each gem according to their ſeuerall fancies. *Claudius Cæſar* the Emperour made no reckoning of any but the Emeraud and the Sardonyx, and theſe ordinarily he wore vpon his fingers: but *Scipio Africanus* (as ſaith *Demoſtratus*) tooke a liking to the Sardonyx before him, and was the firſt Roman that vſed it; and euer ſince, this gem hath bin in great requeſt at Rome: in regard of which credit, I will raunge it next to the Opall. In old time the Sardonyx, as may appeare by the very name, was taken for the pretious ſtone which ſeemed to be a * Cornalline vpon white, that is to ſay, as if the ground vnder a mans naile were fleſh, and both together tranſparent and cleare: and in very truth, the Sardonyx of India is ſuch, according to *Iſmenias*, *De-*
B *moſtratus*, *Zenathemis*, and *Sotacus*. As for theſe two laſt named, they verily doe name all the reſt that are not cleare and ſhew not through them, Blind Sardonyches, ſuch as the Arabian be; and theſe haue carried away the name of Onyx, without any mention or apparence at all of the Sarda or Cornalline: and theſe ſtones haue begun of late to be knowne and diſtinguiſhed by their ſundry colours; for ſome of them haue their ground blacke or much vpon azure and the naile of a mans hand: for it hath bin generally thought and beleeued, that ſuch hath a tincture of white, and yet not without a ſhew of purple, as if the ſaid white enclined to a vermillion or Amethyſt. *Zenathemis* writeth, that theſe ſtones were not ſet by among the Indians; notwithſtanding otherwiſe they were ſo large and bigg, as thereof they made ordinarily ſword handles and dagger hafts: and no maruaile, for certaine it is, that in thoſe parts land flouds comming
C downe with a ſtreame from the hils, haue diſcouered ſuch and brought them to light. He ſaith alſo, that they were at the beginning highly accepted of in thoſe parts; for that there is not in maner a ſtone engrauen, that will imprint the ſeale vpon wax cleanly without plucking the wax away, but it: and through our perſuaſions, the Indians alſo grew into a good conceit of them, and tooke pleaſure in wearing the ſame: and verily, the common people of India make holes through them, and ſo weare them enfiled as carkans and collars about their neckes only. And hereupon it commeth, that thoſe are taken to be Indian Sardonyches or Cornallines which be thus bored through. As for the Arabicke, excellent they are thought to be which are environed with a white circle, and the ſame very bright and moſt ſlender: neither doth this circle ſhine in the concauitie or in the fall of the gem, but glittereth onely in the very boſſes; and beſides,
D the very ground thereof is moſt blacke. True it is, that the ground of theſe Sardoins is found in the Indian ſtones to reſemble wax or horne, yea within the white circle, in ſo much as there is a reſemblace in ſome ſome ſort of a rainbow, by means of certain cloudie vapors ſeeming to proceed from them: and verily the ſuperficiall face of this ſtone is redder than the ſhels of Lobſters. As touching thoſe that be in colour like to hony or lees (for this is taken to be an imperfection and fault in Cornallies) they be all rejected; likewiſe if the white circle that girdeth it about ſpread and do not gather round and compact together: ſemblably, it is counted a great blemiſh in this gem, if it haue a veine of any other colour (but that which is naturall) growing out of ſquare: for the nature of this ſtone is ſuch, like as of al things els, not to abide any ſtrange thing to diſturbe the ſeat therof. There be alſo Armeniacke Cornallines, which in all reſpects
E elſe are to be liked, but for the pale circle that claſpeth them.

By occaſion of this ſtone Sardonyx, I am put in mind for the names ſake, to write of the gem Onyx alſo: for notwithſtanding there be a ſtone ſo called in Carmania (which is the Caſſidoin) yet there goeth alſo a gem vnder that name. *Sudines* ſaith, that the pretious ſtone Onyx hath a white in it reſembling the naile of a mans finger: it hath likewiſe (quoth hee) the colour of a Chryſolith, otherwiſe called a Topaſe, of a Cornalline alſo, and a Iaſper. *Zenathemis* affirmeth, that the Indian Onyx is of diuers and ſundry colours; to wit, of a fiery red, a blacke, a * horne grey; hauing alſo otherwhiles certaine white ſtrakes or veines in faſhion of eies compaſſing it about; and in ſome of them you ſhall ſee white ſtreaks or veins likewiſe to goe croſſe and by as betweene them. *Sotacus* maketh mention moreouer of an Arabian Onyx, but it differeth from
F others (ſaith hee) in this reſpect, That the Indian Onyx hath certaine ſparkes in it, and the ſame enuironed and compaſſed about with white circles either ſingle or many fold, farre otherwiſe than the Indian Sardonyx; for in the former, the white ſeemed to be pointed prickes, but in theſe they bee compleat circles. As for the Arabian Onyches, there bee found of them blacke, with white circles. *Satyrus* reporteth furthermore, that the Indian Onyx is fleſhie; that in one

* *Sarda.*

* Whereof haply they be called *Cornallines.*

part it resembleth a Rubie otherwise called a Carbuncle,in another a Chrysolith,and an Amethyst,yet he maketh no account of such:but the true Onyx indeed (quoth hee) hath very many veins,and those of sundry colors;garnished also it is with circles as white as milk:and albeit the colors of the veins be inexplicable as a man casteth his eie vpon them seuerally,yet meeting as it were all in one,they make a good consort and yeeld a lustre most pleasing to the sight. Now that I haue treated of the Onyx,I must not deferre to say somewhat also of the nature of Sarda, which maketh the other half of the stone Sardonyx,and so by that means(as it were by the way) to discourse of those gems that are of an ardent and fiery colour. G

Chap. VII.

¶ *Of Carbuncles or Rubies,and their sundry kindes: of their defaults and imperfections: of the meanes to trie them. Of other precious stones resembling the fire.* H

AMong these red gems,the Rubies otherwise called Carbuncles, challenge the principall place,and are esteemed richest:they haue their name in Greeke of the * likenesse vnto fire, and yet fire hath no power of them,which is the reason that some call them Apyroti. As touching their kinds: there be Rubies of India,and Rubies of the Garamants, which carry the name also of Carchedonij,*i.* Carthaginian,in regard of excellency, by reason of the wealth and puissance of the city Carthage the Great. In this ranke, some doe place the Ethyopian Rubies and the Alexandrian,which are found indeed among the cliffes of the hill Orthosia, but trimmed & brought to their perfection by the* Alabandians. Moreouer,in all sorts of Rubies,those are taken for the male which shew a quick red more fire-like than the rest; and contrariwise female,such as shine not so bright but after a faint manner. In the male it is obserued, that some seeme to flame more cleare and pure,others are darker and blacker: there be againe that shine brighter than the rest,yea,and in the sun giue a more ardent and burning lustre:but the best simply be those which are called Amethystizontes,that is to say,that in the end of their fire resemble the blew violet color of the Amethyst. The next in goodnesse to them,are those which they call Syrtitæ;and such do glitter and shine of their own nature:by reason whereof, they are discouered soon whersoeuer they lie, by the reuerberation of the Sun-beams. As touching the Indian Rubies,*Satyrus* saith,they are not found cleare,but for the most part foul;howbeit,after they be scoured,their brightnesse is most fiery. He affirmeth moreouer,that the Ethyopian Rubies are greasie and shine not out,but seeme to haue a fire burning within as if it were infolded in some thing about it. *Callistratus* holdeth opinion,that if a Carbuncle or Rubie be laid vpon a thing,it ought to yeeld certain white clouds,in the edges and extremities of the glittering that it makes;but if it be held vp or hung in the aire,it flameth & burneth out fire red:and hereupon it is,that most men haue called it the white Carbuncle; like as they haue named those Indian Rubies * Lithizontes,which shine more faintly & with a browniſh or duskish flame. As for the Carchedonian Rubies,*Callistratus* saith,they be far lesse than others;wheras of the Indians some are so big,that being made hollow they wil contain the measure of one sextar. *Archelaus* writes, that the Carchedonian rubies be blacker than others to see too; but if they be quickened as it were with fire or Sun,or be held bowing forward,they are more ardent and fiery than any other: the same in a shady house,seeme purple;in the open aire,flaming; against the raies of the Sun, sparkling:he auoucheth moreouer,that the fiery heat thereof is so actual,that if a man seal with them,though it be in a shadowie and coole place, they will melt the very wax that is stamped therewith. Many authors haue written,that the Indian Rubies be whiter than the Carchedonian;and contrarie to the nature of the Carchedonian, if they be bended forward, they lose much of their viuacitie,and be dimmer and more dull by that means: also, that in the Carchedonian Rubies which be male,there are seene certain raies as it were of starres twinckling within;wheras the female contrariwise,sparckle all their fire without-forth: that the Alabandines be more darke and blackish than others,and withall rough in hand. It is said moreouer,that there bee certaine stones growing in Thracia,of the same colour that Rubies, and which will not be chafed and made hot in the fire. *Theophrastus* writeth,that there bee Rubies found about Orchomenus in the country of Arcadie,as also in the Isle Chios: and as for the Orchomenian, they be of a blacker kinde,and serue to make mirroirs of. The Troezenian Rubies (by his saying) are I K L M

of

* For the Greeks call them πυρῶπτες.

* These are called yet by Lapidaries, Alabandines, or Almādines.

* As one would say, more like some ordinary stone than a precious gem,

20030
copy 1

A of diuers colours and ſpotted with white ſpecks comming in among: and the Corinthian Rubies be more pale and whiter than the reſt. *Bocchus* writeth, that there be brought Rubies from Marſils and Lisbon in Portugall; but with much adoe and great difficultie they are found, by reaſon of the clay wherein they be inlapped, in certain deſarts and forreſts burnt with the Sun. In ſum, there is not a harder thing than to diſcern theſe ſundry kinds of Rubies one from another; they are ſo eaſie to be counterfeited and falſified by the art and skill of lapidaries & goldſmiths, who haue a caſt to lay ſome foile vnder, to make them for to ſhine and glitter like fire. Men ſay, that the Æthyopians haue a deuiſe to ſteep their duskiſh and dark Rubies in vineger; for in 14 daies they will be pure and gliſter, yea, and continue ſo 14 moneths after. There is a way to counterfeit Rubies with falſe glaſſe ſtones, which they will make ſeem Rubies as like as is poſſible; but the
B grinding vpon a mill ſoone diſcouereth the fraud, like as it doth in any other artificiall and ſophiſticat gems whatſoeuer; for their matter is more ſoft and brittle withall than the fine and pure ſtones indeed: alſo the falſe Rubies are detected by the hardneſſe of the powder that is fetched from them, & the weight; for theſe glaſſe Rubies be farre lighter: and otherwhiles a man ſhall ſee in theſe falſified Rubies certaine little riſings in manner of bliſters or bladders, which ſhine like ſiluer. Moreouer, there is found in Theſprotia a certaine minerall Rubie called Anthracitis, reſembling coles of fire: but whereas ſome authors haue written, that ſuch grow in Liguria, I take it to be a meere vntruth, vnleſſe haply in times paſt ſuch might be found there. It is ſaid alſo, that there be of theſe kind of Rubies, which are compaſſed about with a white veine, and their colour is fierie as wel as of the reſt before-named: but this peculiar property they haue
C by themſelues, That being caſt into the fire, they ſeeme dead and doe loſe their luſtre: contrariwiſe, if they be well ſprinckled and drenched with water, they ſeeme to glow, yea and to flame out againe.

There is a ſtone much like to this, called Sandaſtros, which ſome name Garamantites, growing among the Indians in a place likewiſe ſo named. It is engendred alſo in that part of Arabia which regardeth the South Sun. The chiefe grace and commendation of Sandaſtros, is to bee cleare, and to haue certaine drops as it were of gold like ſtars ſhining within, that is to ſay, alwaies in the body of the ſtone, and neuer in the coat or out ſide: in regard of which ſtarre-like ſpecks, there is attributed ſome religious matter to theſe ſtones, for that they repreſent in ſome ſort to them that behold them, the ſeuen ſtars called Hyades, both in number and alſo in order
D and maner of diſpoſition: which is the reaſon, that the wiſe men of Aſſyria named Chaldæi, doe obſerue them with much deuotion. Moreouer, theſe Sandaſtres are diſtinguiſhed by the ſex, for the male ſeeme to haue a more ſad and deep colour, and by the reuerberation of their fire within giue a tincture to thoſe things that they touch or lie neer to: and the Indian verily of this kind are ſaid to dim the eie-ſight. As for the female Sandaſtres, they carry not ſuch an ardent ſhew of fire, but are more pleaſant to the eie, as beeing attractiue rather than burning. Some writers there be, who prefer the Arabian Sandaſtres before the Indian, ſaying that the Arabian are like to the Chryſolithes that be ſomewhat ſmokie. As for *Iſmenias*, he affirmeth, that the Sandaſtres are ſo tender that they cannot bee poliſhed: in a great errour therefore bee they who call this
E ſtone Sandareſos: but all authors herein accord, That the more ſtars do make apparence in them, ſo much better is the price. Furthermore, this is to be noted, that the neareneſſe in name, otherwhiles is the cauſe of errour; as we may ſee by Sandaſer, which *Nicander* called Sandaſerion, others Sandaſeron: and in truth, this Sandaſer ſome take to bee Sandaſter; and the Sandaſter indeed, Sandareſos; which is found likewiſe amongſt the Indians, bearing the name of the place where it groweth: in colour it reſembleth an apple, or elſe greene oile: and in truth, no account is there made of it.

As touching Lychnites, ſo called for the reſemblance that it hath to the blaze of a candle lighted, which giueth a ſingular grace to it, and maketh it very rich, it may be ranged wel among theſe fierie and ardent ſtones: found this is about Orthoſia and throughout all Caria and the places adjoining; but the moſt excellent come from the Indians, which ſome haue thought and
F ſaid to be the milder kind of Carbuncle or Rubie balais. In a ſecond degree of worth and account vnto this Lychnites, is Ionis, ſo called of the March violet which in colour it doth very much reſemble.

Ouer and beſides, I find other ſorts of Rubies different from thoſe aboue named; for ſome of them hold of the freſh and glorious purple of Lac, others ſtand as much vpon the Scarlet or

Crimsen: which being chafed in the sun, or otherwise set in a heat by rubbing with the fingers, G
will draw to them chaffe, strawes, shreads, and leaues of paper. The common Grenat also of Carchedon or Carthage, is said to do as much, although it be inferior in price to the former. These Grenats are found vpon the hils amongst the Nasamons, and as the inhabitants are of opinion, are ingendred by means of a certaine diuine dew or heauenly showre: found they are twinckling against the moon-light, and especially when she is in the full. In times past, all the trafficke of the Grenats was at Carthage, whereupon they took the name of Carchedon. But *Archelaus* saith, that there be of them in Egypt also about the city Thebes; howbeit, such are brittle, full of veins, and like to a cole going out and ready to die. I find, that drinking cups haue been made of this stone, as also of the former, called Lychnites. Generally, all rubies be very hard for to be cut; and this ill quality they haue, That they neuer do seale cleane, but ordinarily plucke some H
of the wax away with the signet: contrariwise, the Cornalline or Sarda, signeth very faire without any of the wax sticking to it: this Sarda giueth part of the name to the Sardonyx: the gem
* A city, whereupon it tooke the name, and not of Sardinia the Isle, as some thinke. it selfe is very common, found first about * Sardis; but in truth, the principall is that which commeth from about Babylonia, out of certaine quarries of stone, where it was found sticking within another stone in manner of the heart. After this manner, it is said, that the Persians had sometime minerall Cornallines, but the mine now doth fade: howbeit, there be of them in many other places besides, to wit, in Paros and Assos. The Indians send vnto vs three seuerall kindes, to wit, the red, the fatty (called therupon Demium) & the third which ordinarily haue a ground of siluer-foil laid vnder them to giue a lustre. The Indian Sardes or Cornallines are transparent and carry a through light with them: the Arabian be more thicke: there be found of them also I
about Egypt, but they haue commonly a ground of gold-foile. These gems likewise are distinguished by the sex, for the male haue a more bright and orient lustre; the female are not so resplendent, but shine as it were through a grosse & fatty matter. In old time, there was not a pretious stone in greater request, than the Cornallin: & in truth, *Menander* & *Philemon* haue named
* μάσεγ δὲ τὴ παῤῥάδ᾽ ἢ σμάραγδος *Menander in Pedio*: speaking of the Emeraud and Cornaline. this stone in their * Comœdies, for a braue and proud gem: neither can we find a precious stone that maintaineth the lustre longer than it, against any humor wherin it is drenched; and yet oile is more contrary to it than any other liquor. To conclude, those that be of the colour of honey, aie reiected for nought; howbeit, if they resemble the colour of earthen pots, they be worse than those.

K

Chap. VIII.

¶ *Of the * Topaze, and the sundry kinds of it. Of * Callais: and of other greene pretious stones not transparent.*

* Some take it for our Chrysolith.
* It is thought to be our Turquois,

THe Topaze or Chrysolith, hath a singular green colour by it selfe, for which it is esteemed very rich; and when it was first found, it surpassed all others in price: they were discouered first in an Isle of Arabia called Chiris, wherein certaine rouers (Troglodytes) being newly landed, after they had bin driuen thither by tempest and vrged with famine, began to feed vpon herbs and dig for roots, and by that meanes met with the Topaze stone: This is the opinion of *Archelaus*. But K. *Iuba* reporteth, that there is an Island within the red sea called Topazas, distant L
from the continent 300 stadia, the which is oftentimes so mistie, that sailers haue much ado to find it, whereupon it tooke that name: for in the Troglodytes language (saith he) Topazin is as much to say, as to search or seek for a thing. It is said, that the first that tooke a liking vnto the stone, was queene *Berenice* the mother of *Ptolome* the second, and that by the meanes of *Philemon* (lieutenant generall to her son in those countries) who presented one of them to the said queen. Of which Chrysolit, *Ptolomæus Philadelphus* K. of Egypt, caused the statue of his wife *Arsinoë* to be made, 4 cubits long; and in the honour of the said queene his wife, dedicated it in a chappell named the Golden temple. The moderne writers do report, that there be found of these Chrysolits about Alabastrum a towne in Thebais, a prouince in high Egypt; and two kinds they make thereof, to wit, Prasoides, and Chrysopteros: which later commeth neare to that golden Berill M
called Chrysoprasson, for that the colour thereof resembleth fully the juice of Porret; and of all precious stones it is the largest: this property it hath aboue all other gems, That only it comes vnder the file to be polished for noble men; wheras all other be scoured by the grindstones comming out of Naxos. This stone will weare with vsage.

This

20030
copy 1

A This ſtone in regard of colour may be accompanied with the Turquois called Gallais, for a certain green it hath inclining to yellow. It is found beyond the fartheſt parts of India among the inhabitants of the mountaine Caucaſus, to wit, the Phicarians and Aſdates; they grow vnto a very great bigneſſe, but the ſame is fiſtulous and full of filth. The pureſt and richeſt of this kind be thoſe of Carmania. But in both countries they be found in ycie cliffes hardly acceſſible, where you ſhall ſee them bearing out after the manner of boſſes like vnto eies: they ſtick to thoſe crags & rocks ſo lightly, that a man would ſay that ſaw them, how they grew not naturally out of the rocke, but were onely ſet too by mans hand. And for that the place where they doe grow, is ſo ſteep that a horſeman is not able to ride vp to them, and becauſe the people of that country be loth to climb ſo high with their feet, being otherwiſe acquainted ordinarily to the
B horſeback, beſides, in regard of the danger in venturing to climb for them, therefore they reach them a far off with ſlings, and ſo driue them down, with all the hard moſſe about them: and in very deed, a commodity this is of great reuenue, & beſides, the rich men know not the like jewell to weare about their necks. By a collar or chaine of theſe Turquoiſes, men are judged wealthy more or leſſe: and this is the glory that they take from their childe hood, to be able to ſay, that thus many Turquoiſes they haue pulled and caſt downe by that manner of ſlinging. And yet in the practiſe of this feat, all ſped not alike; for ſome you ſhall haue to throw downe many faire Turquoiſes at the firſt fling; and many for it again who weary their armes and courſe after them, & yet cannot get one Turquois. This (I ſay) is the maner of chaſing or hunting Torquoiſes: and when they be gotten, they muſt come into the lapidaries hands to be cut and formed to
C what faſhion you will: and in truth they be otherwiſe brittle and eaſie to be wrought vpon. The beſt Turquois is that which approcheth neareſt to the graſſe green of an Emeraud, howbeit, all the grace that they haue, ſeems to come from outward help: being ſet in gold, they looke moſt beautifull, neither is there a precious ſtone that becommeth gold better. The fairer that a Turquoiſe is, the ſooner looſeth it the colour by oile, ointment, or wine: contrariwiſe, the baſer that they be, the better do they hold their own and maintain their luſtre. Neither ſhal you meet with any precious ſtone more eaſie to be falſified and counterfeited with glaſſe, than a Turquoiſe. Laſtly, ſome writers affirme, That they be found in Arabia, within the neſt of certain birds called Melacoryphi, which is as much to ſay as blacke-cops.

As touching green ſtones, there be many more kinds: but of the baſer ſort we reckon one of a
D Porret colour, which we cal Praſius, and the firſt kind of it is all green; whereas the ſecond hath vpon the green, certaine red ſpots like bloud, which cauſe it to ſeem vnpleaſant to the eie, and rough in hand: the third is greene, but yet parted with three white ſtrakes.

The ſtone Chryſopraſius, *i.* the ſea water or Horehound green, is preferred before the other: in ſome ſort it reſembleth the green juice of a Leek, but it declineth ſomwhat from the Topaze, as if it were between it and gold. Some of theſe are ſo great and big, that there be drinking cups made thereof, after the faſhion of boats: but pilaſtres or round ſtaues in manner of cylindres or rolls, are very quickly framed of ſuch ſtones. Theſe be found among the Indians: like as another ſtone, which is called * Nilios: A weak luſtre it hath, and will not long continue, for looke but a while wiſtly vpon it, you ſhall perceiue it ſoone to fade. *Sudines* ſaith, That there be of them
E found in Syverus, a riuer that paſſeth through the countrey of Attica: in colour it reſembleth a ſmokie Topaze, or otherwhiles that of a hony colour. K. *Iuba* reporteth, That it is bred in Æthyopia, and namely about the bankes and ſides of a riuer which we call Nilus, whereupon it commeth to be named Nilios.

* Thought to be the Almain Chryſolite.

There is a ſtone called Molochites, for that the greene colour which it hath, commeth neare vnto a Mallow, and is more dim than the reſt whereof I haue ſpoken. Commended it is highly in ſignets to ſeale faire: and beſides it is ſuppoſed to be by a naturall vertue that it hath, a countercharme to preſerue little babes and infants from all witchcrafts and ſorceries.

A kind of Iaſper likewiſe there is of a greene colour, and the ſame oftentimes is tranſparent: and although there be many other ſtones go beyond it in richeſſe, yet it retaineth ſtill the anti-
F ent glory and honor that it had. A gem it is, common to many other countries: India yeeldeth it vnto vs like to an Emeraud. That of Cyprus is very hard, and of a greyiſh fatty colour, betweene white and greene. The Perſians ſend vs a Iaſper like vnto the skie or aire, and thereupon it is called Aërizuſa: and ſuch a one is that which commeth from the Caſpian hills. The Iaſper about the riuer Thermodoon is blew as Azure. In Phrygia you ſhall haue it purple: in

Cappa-

Cappadocia partly purple and partly blew, but no kind of luſtre hath it at all. Out of Amiſes, a city in Pontus, we haue Iaſpers brought, much like to the Indian: and the Iaſper of Chalcedon is muddy and troubled. But it were better to ſet downe their degrees in goodneſſe, rather than to ſtand vpon the countries from whence they are tranſported. The beſt Iaſper then is that eſteemed which ſtandeth much vpon purple or Lac: the ſecond is incarnat, or of a roſe colour: the third reſembleth the Emeraud in greenneſſe. To euery one of theſe ſeuerall kindes, the Greekes haue impoſed ſignificant names. And in a fourth place the Greeks haue ranged another called Borea, like to the morning skie in the time of Autumne; and this may well be called Aerizuſa. There is a Iaſper in colour like to the Sarda, *i.* the Cornalline, as alſo reſembling much the violets: there be as many more ſorts behind, which I haue not touched, but ſubject they be al to blemiſhes, as namely being blew or like to Cryſtal or *waterie fleam. Laſt of all, we haue a Iaſper called Terebinthizuſa by the Greekes, but as I take it very vnproperly, as if it were compounded of many gems of one and the ſame kind; and therefore the better ſort of ſuch are incloſed within a circle of gold, yet ſo as they be open both aboue and beneath, neither is any thing but the edges only compaſſed with gold. The faults or imperfections of the Iaſper be theſe, If the luſtre indure not long, notwithſtanding it glitter a far off; alſo if it ſhew a ſpot like vnto a graine of ſalt; beſides all other which I haue already named in the reſt. Moreouer, Iaſpers may be falſified by the meanes of glaſſe: and this is ſoone detected, namely, when they caſt a reuerberation of their luſtre outwardly, and hold it not within. To conclude with the ſtones called Sphragides, they are not much vnlike to the Iaſpers. And this gift they haue aboue all the reſt, that they make the beſt ſignets, and ſeale faireſt.

πορφυριζουσα, ῥοδιζουσα. σμαραγδιζουσα.

*τῇ μίξει, which Pliny inconſiderately hath turned Myxus.

CHAP. IX.

¶ *Sundry kinds of Iaſpers.*

OF diuers ſorts of Iaſpers, al the Eaſt part (by report) are moſt affected to that which is like the Emeraud, and they carrie it ordinarily about them as a countercharme. The ſame if it be compaſſed round about with one white croſſe line in the midſt, is called Grammatias; if with many, Polygrammos. And here by the way I can hold no longer, but my mind ſerues me very well to challenge the Magitians, who haue giuen it out, That this ſtone is very good for thoſe to haue about them who are to make ſome publick ſpeech or ſolemne Oration to the people. Moreouer, we haue a Iaſper called Onycho-puncta & Iaſponyx, which ſeemeth to incloſe a cloud within it, & in ſome ſort to reſemble the ſnow. This Iaſper is faſhioned like to a Star, and beſet with diuers reddiſh points: a man that ſaw it, would ſay it were a kind of Megarian ſalt. There is beſides a Iaſper which ſeemeth as if it were infected with ſmoake, and this is called Capnias. Concerning the bigneſſe of the Iaſper, I haue ſeene one of them nine inches long, which ſerued for to repreſent the viſage of *Nero* the Emperour, ſtanding ready armed with a cuirace.

As touching the precious ſtone Cyanos, I muſt ſpeake of it apart, notwithſtanding I haue of late mentioned and applied it to one of the names of the Iaſper, to wit, that with the blew colour. The beſt Cyanos is that of Scythia; the next commeth from Cypros: and in the laſt place we are to reckon the Ægyptian. This ſtone is very apt to be counterfeited, and eſpecially by tincture: ihe inuention whereof is aſcribed to a king of Egypt, who was highly honoured for beeing the firſt that gaue a colour to it. Diſtinguiſhed theſe ſtones alſo are by the ſex, for there be of them both male and alſo female. Otherwhiles you ſhall perceiue a certaine pouder in them as it were of gold, and yet not like to that of Saphires: for the Saphire alſo glittereth with marks and pricks of gold. Saphires are likewiſe ſometime blew: mixed alſo with purple, although that be very ſeldome: the beſt are among the Medes, yet in no place be they tranſparent. Moreouer, they are vntoward for to be cut and engrauen, by reaſon that the lapidarie ſhall meet with certaine hard knots of Cryſtall comming here and there betweene. The bleweſt are thought to be the male.

Next after theſe, I am to range thoſe ſtones that bee of a purple colour, and ſuch as decline ſomewhat from them, and yet ſeem to depend of them: of which, I muſt place in the firſt ranke as principall, the Amethyſts of India: and of them there bee found in a part of Arabia, which bordereth vpon Syria, and is called Petræa: alſo in Armenia the leſſe, in Ægypt, and in France: but

20030
copy 1

A but the fouleſt and of moſt baſe account,be thoſe of Thaſos & Cyprus. The reaſon of the name Amethyſt,is generally thought to be this,that notwithſtanding it approch very neer to the colour of wine,yet before it throughly taſt therof,it turneth into a March Violet color: and that purple luſtre which it hath,is not altogether fiery,but declineth in the end to the color of wine. There is not one of theſe Amethyſts,but it is tranſparent with a violet colour. Eaſie they are alſo to be cut and ingrauen. And as for the Indian Amethyſts,they haue the full and rich colour of the Phœnicean purple die;and in truth,the diers wiſh that they may but giue a tincture anſwerable to it. Verily this purple colour is pleaſing to the eie, neither doth it ſtrike or pierce the ſight ſo forcible as the Rubies do. In a ſecond rank are to be ranged the Amethyſts inclining to the Iacinths;the color of which ſtone the Indians call Sacon,like as the gem it ſelfe Sacodian:
B Now if the color be more weak and feeble,they call it Sapinos:and this Amethyſt in a third degree is named Paranites in the marches of Arabia, which name it taketh of the people. The fourth kind reſembleth the colour of wine. The fift declines neer to Chryſtall,ſaue only that toward the bottom thereof,it ſtandeth of a certaine whitiſh purple: but this is nothing eſteemed, for the excellent Amethyſt indeed being held vp in the aire, ought to ſhine in manner of a Ruby,and to carry a certain purple luſtre,mildly participating of the incarnat roſe color: Such Amethyſts as theſe ſome chuſe rather to call Pæderotes,like as a kind of Opale; others, Anterotes:many giue them the name of *Venus* gems,for the great grace that they haue,& decent louelineſſe which they ſeem to ſhew both in faſhion and colour,eſpecially without-forth. The Magitians,as vain herein as in all other things,ſeem to bear vs in hand that they haue a ſpecial ver-
C tue to withſtand drunkenneſſe,wherupon they ſhould be called Amethyſts:neither ſtay they ſo, but tel vs,that if the name of the Moon and the Sun be ingrauen in them and ſo worn about the neck hanging,either with the hairs of a Cynocephalus head,or els ſwallows feathers,they are a ſoueraigne remedy againſt charms and ſorceries that be practiſed, with poiſoning. Nay they would make vs beleeue that there is a way to vſe them,which wil cauſe men to be gracious with princes who haue any negotiation with them,and that by the means thereof they ſhal find eaſie acceſſe to their preſence,and fauor in their eies. Alſo,by their ſaying, they are of force to auert haile and ſuch like diſtemperature of the weather, yea, and to turn away Locuſts,ſo there bee a charm in maner of a praier ſaid withall,the form whereof they alſo do preſcribe & ſhew:and no maruell;for they haue promiſed the like of Emerauds,if there were inchaſed in them the forme
D either of Ægles,or the flies named Beetils. In ſetting down which toies and vanities, they ſhew well enough in what contempt they haue mankinde, and how they are diſpoſed to mocke the world.

It followeth now by good order to ſpeak of the Iacinths,which,albeit they differ much from Amethyſts in ſome reſpect,yet in luſtre they approch very neare:and this is only the difference between them,that the braue violet colour,which in the Amethyſt is ful and rich, in the Iacint is delaied and weaker. The Iacint alſo at the firſt ſight is pleaſant and acceptable,but the louely beauty therof vaniſheth away before it haue giuen a man enough. And ſo far is it off from contenting the eie fully and ſatisfying the pleaſure therof,that it fades ſooner than the dainty flour of that name,*i*. Hyacinthus,ſo quickely doth the luſtre paſſe away, in manner before it come to
E the eie. Æthyopia furniſheth vs with Iacinths & Chryſolithes both,which are tranſparent and carry the colour of gold:howbeit thoſe of India bee preferred before them; they of Bactriana likewiſe,if they be not ſpotted and flecked with diuers colors. The worſt of all others,be the Arabian:for they be not only skewed in colour,but alſo foule and troubled:and look what radiant luſtre they haue,interrupted it is with a cloud of ſpots:and if any chance to be clear otherwiſe, yet a man that looketh on them,would ſay they were full of their owne duſt. The beſt are thoſe, which being laid to gold,cauſe it to looke whitiſh in manner of ſiluer, in compariſon to them. Such as be cleare and tranſparent, Goldſmiths vſe to ſet within a hoope of gold, ſo as they may be ſeen both beneath and aboue. The reſt had need of a ground of Latton foile to giue them a luſtre: howbeit,now adaies thoſe that are not skilfull lapidaries haue taken vp a cuſtome to cal
F ſome Iacints Chryſelectri,which incline to the color of a baſe gold called Electrum; the which in a morning are more beautifull and glorious to the eie,than all the day after. Thoſe Iacinths that come from Pontus,are knowne by their lightneſſe:ſome of them be hard and of an Orange red;others be ſoft and foule. *Bocchus* mine author reports, That they be found in Spaine alſo, in that place where he ſaith they ſink pits for to leuel water, and out of which the peaſants doe

take

take forth cryſtal. He affirmeth alſo, That he hath ſeen a*Chryſolith of twelue pound weight. G
*or Citrine Iacinth.
Moreouer, there be certain Iacinths which haue a white veine comming between, and thoſe are called Leucochryſi. And of this kind ſome be named Capniæ, becauſe they be ſmokie. You ſhall find of them like vnto glaſſe beads, and yet of a ſhining yellow in manner of Saffron. And verily falſe Iacinths there be counterfeited by glaſſe ſo artificially, that a man ſhall hardly diſcerne them by the eie: howbeit handle and feele them, you ſhall ſoone find the deceit; for the fine Iacints indeed are colder naturally than thoſe that be counterfeit. Among theſe Iacints, I may raunge wel ynough thoſe ſtones which are called Melichryſi, which ſhew as if cleare hony ſhone through gold. Theſe we haue from India: but of all other they are moſt ſubject to iniurie and will ſooneſt breake. The ſame country yeeldeth alſo a gem called Xyſtion, whereof there is ſuch plentie, that the very common people do weare them. H

If we ſhould ſpeake of white ſtones, the principall of them all is the gem named Pæderos; And yet conſidering that vnder this name there paſſe other* fair & beautiful ſtones (ſuch a prerogatiue hath the word to ſignifie ſome excellencie of louelines) there may be queſtion made, how it can be properly vſed for one gem, or one colour; yet ſurely there is a kinde of pretious ſtone by it ſelfe called Pæderos, and the ſame worth the looking on; and there ſeem to meet together a skie color, and the ſame in his manner greeniſh vpon a cleare and tranſparent Cryſtal: accompanied theſe be with a purple and a certain yellow and bright gold colour of Muskadel, and the ſame is alwaies the laſt colour that appeareth outwardly and giueth the luſtre: and yet a man that beheld this ſtone, would ſay that the head thereof were crowned with a chaplet of purple: and as it appeareth to haue theſe colours confounded all together, ſo it ſeemeth as if I euery one had a ſeueral luſtre by it ſelfe. A more pure and clearer gem there is not againe: comfortable to the head & pleaſing to the eie. The beſt ſimply of this kind we haue from the Indians, who call it Argenon. In a ſecond degree to it is that of Ægipt, where it is called Senites. Of a third ſort there be in Arabia, but thoſe are rough. Thoſe of Natolia and the kingdome of Pontus, are not ſo radiant and quicke as the others: and yet from Galatia, Thracia, and Cyprus, we haue ſuch as be more feeble than they. If you would know what faults be incident to theſe Pæderotes particularly: they cary otherwhiles a languiſhing luſtre; troubled they be with vnnaturall colours; and generally ſubject they are to all the defects and imperfections of others.

*Of which name there is Opalus & the Amethyſt.

In the ſecond place of white gems, is * Aſteria to be counted: a wonderfull propertie it hath in Nature, for which it deſerues to be chiefe; for that it keepeth encloſed within a certain light K
*Gira ſole.
in manner of the apple in the eie: which according as a man doth hold or turne, hee ſhall ſee how it will ſend and transfuſe it from the owne place; one would thinke that it walked within and ſhifted from place to place. And the ſame, if it be oppoſed againſt the beames of the Sun, caſteth forth bright and white raies of the owne, in manner of a ſtarre, whereupon it tooke the name Aſterias: and very hard it is to be engrauen. Thoſe which come out of India be preferred before them of Carmania.

In like manner a white pretious ſtone there is called Aſtrios, approaching neer to Cryſtall: this is engendred among the Indians and along the coaſts of Pallene: From the verie centre within, there ſhineth a kind of ſtar in manner of a full Moone in the height of her brightneſſe. Some giue this reaſon of the name, that being held againſt any ſtars, it receiueth from them a L
light and ſendeth the ſame from it againe in manner of beams. And they hold that the beſt be in Carmania, and there is not another gem againe leſſe ſubject to blemiſhes and imperfections than it. As alſo that a worſe kind thereof is called Ceraunias: and the worſt of all other reſembleth the blaſe or flame of lampes and candles.

As touching Aſtroites, many make great account of it: and ſuch as haue written more diligently thereof, doe report, That *Zoroaſtres* hath highly commended it and told wonders thereof in art Magicke.

Sudines ſpeaketh of another gem called Aſtrobolos, and ſaith it is like vnto a fiſh eie, and caſteth forth white glittering raies againſt the Sunne.

Among white pretious ſtones may be reckoned that which they call Ceraunia, which is apt M
to receiue light and luſtre both from Sunne and Moone and other ſtarres. It ſelfe looketh like Cryſtall cleare, howbeit, the luſtre that commeth from it ſeemeth to be of a blue Azure color: and Carmania is the natiue place therof. *Zenathemis* confeſſeth, That it is a white gem, and hath within a ſtarre-like fire, which ſeemeth to run too and fro and change place, according as a man turneth

20030
copy 1

A turneth it. He affirmeth alſo, that the foreſaid Ceraunię will become dul and duskiſh; which if they be ſoked for certain daies together in vineger and ſal-nitre, will recouet their light and conceiue a new fire in maner of a ſtar, which will continue for ſo many months as they lay daies infuſed, & after that loſe their luſtre again. *Sotacus* hath ſet down two kinds more of Ceraunia, to wit, the black and the red, ſaying, that they reſemble halberds or ax heads. And by his ſaying, the black, ſuch eſpecially as be round withall, are endued with this vertue, that by the means of them cities may be forced, and whole nauies at ſea diſcomfited; and theſe (forſooth) hee called Betuli, whereas the long ones be properly named Ceraunię.

It is ſaid there is one more Ceraunia yet, but very geaſon it is, and hard to be found, which the Parthian Magitions ſet much ſtore by, and they only can find it, for that it is no where to be
B had but in a place which hath bin ſhot with a thunderbolt.

Next after the Ceraunia, there is a ſtone named Iris: digged out of the ground it is in a certain Iſle of the red ſea, diſtant from the city Berenice 60 miles. For the moſt part it reſembleth Cryſtal; which is the reaſon that ſome haue termed it the root of Cryſtall. But the cauſe why they call it Iris is, That if the beams of the Sun ſtrike vpon it directly within houſe, it ſendeth from it againſt the wals that be near, the very reſemblance of a rainbow both in form and colour, and eftſoons it will change the ſame in much variety, to the great admiration of the beholders. For certain it is known, that ſix angles it hath in manner of Cryſtal; but they ſay that ſome of them haue their ſides rugged, and the ſame vnequally angled, which if they be laid abroad a-
C gainſt the Sun in the open aire, do ſcatter the beams of the Sun that light vpon them to & fro; alſo that others do yeeld a brightneſſe from themſelues, and thereby illuminat all that is about them. As for the diuers colours which they caſt forth, it neuer hapneth but in a dark or ſhadowy place: whereby a man may know, that the varietie of colours is not in the ſtone Iris, but comes by the reuerberation of the wals. The beſt Iris is that which repreſents the greateſt circles vpon the wall, and thoſe which be likeſt to rainbowes indeed. There is another gem called Iris, like to this in all reſpects, but that it is exceeding hard. *Horus* ſaith, that if it be calcined and puluerized, it is a ſingular remedie againſt the biting of Ichneumones: alſo, that naturally it is to be found in Perſis.

Much like in form and ſhape to Iris, but not of the ſame effect, is there another ſtone called Zeros: a man that ſees it would take it to be a cryſtal, with a black ſtrake parting it ouerthwart.
D Thus hauing laid abroad the pretious ſtones & jewels which are diſtinguiſhed by ſundry kinds of principal colors, I wil proceed to the reſt, and diſcourſe of them alphabetically.

Chap. X.

¶ *Of certaine gems digeſted in order according to the Alphabet.*

THe Agat was in old time of great eſtimation, but now it is in no requeſt. Found it was firſt in Sicily neere to a riuer called likewiſe Achates, but afterwards in many other places. It exceeds in bigneſſe, and is full of varietie in colours, whereby it hath gotten many names;
E for called it is Phaſſachates, Cerachates, Sardachates, Hæmachates, Leucachates, and Dendrachates, as if the veins thereof reſembled a little tree. As touching the Agath, called Antachates, as it burneth you ſhall haue it to ſmel like vnto Myrrh. Alſo there is an Agath of a reddiſh colour reſembling coral, and thereupon called Coralloachates: and the ſame is beſet with certain ſpots or drops of gold in manner of the Saphyr: of which kind there is paſſing great plentie in Candy, where they call it the holy or ſacred Agat; for people are perſuaded that it auai-leth much againſt the ſting of venomous ſpiders and ſcorpions: which propertie I could very well beleeue to be in the Sicilian Agaths, for that ſo ſoone as Scorpions come within the aire and breath of the ſaid prouince of Sicilie, as venomous as they be otherwiſe, they die thereupon. The Agats likewiſe found among the Indians haue the ſame operation, and beſides doe re-
F preſent many other miracles; for you ſhall find imprinted naturally in them the forme and proportion of riuers, woods, and laboring horſes: a man ſhal ſee in them coaches and little Chariots or horſelitters, together with the furniture and ornaments belonging to horſes. As for phyſitians; they make their grinding ſtones therof for fine pouders. And it is holden for a truth, that only to behold and looke vpon an Agath, is very comfortable for the eies. If they be but held

in

in the mouth, they quench and allay thirſt. The Phrygian Agats haue no part of green in them. G
Thoſe that be found about Thebes in Egypt are without red and white veins: howbeit, theſe alſo be effectuall againſt ſcorpions. Of the ſame credit likewiſe are the Cyprian Agats. Some hold opinion, that the ſingular grace and commendation of an Agat, is to be clear and tranſparent like glaſſe. There be found of them in Thrace, & about the mountain Oeta, in the hil Pernaſſus, in Lesbos and Meſſene, and ſuch haue floures imprinted in them like thoſe which grow in the highwaies and paths by the fields: alſo in the Iſland of Rhodes. But the Magitians obſerue diuers other ſorts; and as for thoſe that be like vnto a Lions skin, they haue the name to be powerfull againſt ſcorpions. In Perſia they are perſuaded, That a perfume of ſuch Agaths turneth away tempeſts and all extraordinarie impreſſions of the aire, as alſo ſtayeth the violent ſtreame and rage of riuers. But to know which be proper for this purpoſe, they vſe to caſt them H
into a cauldron of ſeething water; for if they coole the ſame, it is an argument they be right. but to be ſure that they may do good, they muſt bee worne tied to the haires of a Lions mane: for as touching thoſe Agates which ſeeme to haue the print of an Hyænes skin, the Magitions cannot abide them, as cauſing diſcord in an houſe. But they hold, That the Agath of one ſimple colour cauſeth thoſe wreſtlers to be inuincible who haue it about them. And a proof hereof they take by ſeething it in a pot full of oile, with diuers painters colours; for within one two houres after it hath ſiuered and boiled therein, it will bring them all to one entire colour of vermilion. Thus much of Achates or the Agath. The ſtone which is named Acopis reſembleth Sal-Nitre: hollow and light it is in manner of the pumiſh ſtone, howbeit ſpotted with golden
ſpots or drops in manner of ſtarres. Seeth this gently in oile, and therewith anoint the body, it I
riddeth away all wearineſſe and laſſitudes, if wee may beleeue the Magitions. The ſtone Alabaſtrites is found about Alabaſtrum a city in Egypt, and Damaſco in Syria, white of colour it is, and intermedled with ſundry colours. This beeing calcined with Sal-gem and reduced into pouder, is ſaid to correct a ſtinking breath and ſtrong ſauor of the teeth. In the geſiers of cocks there be found certaine ſtones, called thereupon Alectoriæ, which in ſhew reſemble Cryſtall, and be as big as beans. *Milo* that great Wreſtler of Crotone vſed to carry this ſtone about him, whereby he was inuincible in all the feats of ſtrength or actiuitie that hee tried, as Magitions would ſeem to perſuade vs. Androdamas is a ſtone of a bright colour like ſiluer, and in manner of a Diamant, ſquare, and alwayes growing in a table Lozenge-wiſe. The Magitions ſuppoſe,
that it tooke that name of repreſſing the anger and furious violence of men. As touching Ar- K
gyrodamas, whether it be the ſame or another ſtone, Authors haue not reſolued. Antipathes is a ſtone all blacke, and nothing at all tranſparent. You ſhall find whether it bee a true ſtone or no by ſeething it in milke, for no ſooner is it put in, but it cauſeth the milke to look like Myrrh. The Magitions would haue vs to thinke, That it is good againſt Witchcraft and eye-biting eſpecially. Arabica is paſſing like vnto Ivorie, and for Ivorie might it go, but that it is ſo hard, which bewraieth it to be a ſtone. It is thought, that as many as haue it about them ſhall finde eaſe of the paine of the ſinues. The ſtone Aromatites is thought principally to grow in Arabia, and yet it is found in Egypt about Pyræ: but whereſoeuer it is to be had, a hard ſtone it is, in colour and ſmell both reſembling Myrrhe: in which regard it is much vſed of queenes and
great ladies. Asbeſtos is ingendred within the mountaines of Arcadia, and is of an iron gray L
colour. As for Aſpilate, *Democritus* ſaith, that it is bred in Arabia, and of a fiery colour: which by his ſaying, ought to be tied with camels haire, and ſo hung faſt about them that be troubled with the ſchirroſities of the ſpleen: alſo (if he ſay true) it is found in the neaſt of certain Arabian birds. Another alſo of that name groweth there in the cape Leucopetra, but it is of a ſiluer colour, and glittereth withall: excellent to be worne about one againſt the phantaſticall feares and imaginations in the night ſeaſon. The ſame *Democritus* ſaith, That in Perſis, India, and the mountaine Ida, there is a ſtone found named Artizoë, gliſtering bright as ſiluer, three fingers thicke, formed in manner of a Lentil, and of a pleaſant and delectable ſauor: The Sages of Perſia neuer go about the election and ordering of a King; but they thinke it neceſſarie to haue it
about them. As for the Augites, many be of opinion, that it is no other ſtone than Callais, to M
wit, the Turquois. Amphitane is a ſtone knowne by another name alſo, Chryſocolla: found it is in that part of India where the Piſmires-Volant do take out gold; where it reſembles gold, and is in faſhion fourſquare. It is reported conſtantly, that it hath the ſame force naturally that the Loadſtone hath, but that it draweth gold to it as well as iron. Aphrodiſiace is partly white,

and

20030
copy 1

A and partly reddiſh. Aſyctos being once heat at the fire, will continue a ſeuen-night after hot: blacke it is and ponderous, hauing certaine veins that diuide it: it is thought to be good againſt cold. As touching Ægyptilla, *Iacchus* taketh it for a white ſtone, with a veine partly of a Sard or Cornalline, and partly blacke, paſſing through it ouerthwart: howbeit the common ſort take Egyptilla to be blew, with a black mote in the bottome.

As for the ſtone Balanites, there be two kinds thereof; to wit, of a greeniſh colour, and reſembling Corinth braſſe: the former commeth from Coptos, the other out of the region Troglodytica; and they haue a fierie vaine cutting them juſt in the mids. The ſame Coptos ſendeth other ſtones to vs beſides, to wit, thoſe which be called Batrachitæ; the one like in colour to a frog, a ſecond to * yvory, the third is of a blackiſh red. *Baptes, how ſoeuer otherwiſe it be ſoft and ten-
B der, yet an excellent odor it hath. The ſtone called Belus eie is white, and hath within it a black apple, the mids wherof a man ſhall ſee to glitter like gold: this ſtone for the ſingular beautie that it hath, is dedicated to *Belus* the moſt ſacred god of the Aſſyrians. There is another ſtone named Belus, growing (as *Democritus* ſaith) about Arbelæ, to the bigneſſe of a wall-nut in manner and forme of glaſſe. As for Baroptenus or Baroptis, it is black, interlaced as it were with certain knots, both white and alſo of a ſanguine red, after a ſtrange and wonderfull manner. Botrytes is found ſomtime black, otherwhiles red, & like it is to a cluſter of grapes when it beginneth firſt to knit. As for it which is more like to the hair of women, *Zoroaſtres* calleth it * Boſtrychites. * Bucardia reſembleth an oxe heart, and is to be found onely about Babylon. Brotia is ſhaped in manner of a Tortoiſe head: it falleth with a crack of thunder (as it is thought) from hea-
C uen: and if we wil beleeue it, quencheth the fire of lightning. Bolæ are found after a great ſtorm or tempeſt, reſembling a clod.

Cadmitis were the very ſame which they cal Oſtracitis, but that otherwhiles it is compaſſed about with certain blew bubbles. Callais comes very neere to the Saphir, but that it is whiter, and reſembleth rather the water of the ſea about the ſhore. Capnites (as ſome think) is a kind of ſtone by it ſelfe, beſet with many wreaths, and thoſe ſeeming to ſmoke, as I haue ſaid already in due place: the naturall place of it is Cappadocia and Phrygia: in ſome ſort it is like yvory. As touching Callainæ, it is commonly ſaid, that they be found alwaies many joined together. Catochites is a ſtone proper to the Iſland Corſica: in bignes it exceedeth ordinary precious ſtones: a wonderfull ſtone, if all be true that is reported thereof, and namely, That if a man lay his hand
D thereupon, it will hold it faſt in maner of a glewie gum. Catopyrites groweth in Cappadocia. Cepites or Cepocapites, is a white ſtone, and the veins therein ſeem to meet together in knots; and ſo white and cleare withall, that it may ſerue as a mirrour to ſhew ones face. Ceramites in colour reſembleth an earthen pot. As for Cinædiæ, they be found in the braine of a fiſh named Cinædus: white they be and of a long faſhion, and of a wonderfull nature, if wee may beleeue that which is reported of the euent which they ſignifie; and namely, that according as they bee cleare or troubled in colour, they do preſage either ſtorms or calm at ſea. Cerites is like to wax; and Circos, vnto wreaths or circles. Corſoides, is made in maner of a gray peruke of haire: Corallo-achates, vnto a Corall ſet with gold ſpots: Corallis, to Vermillon, and is ingendred in India and Syene. Craterites hath a colour betweene the Chryſolith and the baſe gold Electrum,
E of an exceeding hard ſubſtance. Crocallis doth repreſent a cherry. Cyſſites is engendred about Coptos, and is of a white color: it ſeemeth as it were to be with childe, for ſomthing ſtirs and ratleth within the belly if it be ſhaken. Calcophonos is a blacke ſtone: if a man ſtrike vpon it, he ſhall perceiue it to ring like a piece of braſſe: and the Magitians would perſuade thoſe that play in Tragœdies to carry it about them continually. As for the ſtone Chelidonia, there be two ſorts of it: in colour they do both reſemble the Swallow, and of one ſide which is purple, you ſhal ſee black ſpots intermingled here and there among. Chelonia is no more but the very eie of an Indian Tortoiſe: of a moſt ſtrange nature by the Magitians ſaying, and working great wonders, but they will lie moſt monſtrouſly: for they would promiſe and aſſure vs, That after one hath well rinſed or waſhed his mouth with hony, and then lay it vpon the tongue, hee ſhall
F preſently haue the ſpirit of propheſie, and be able to foretell of future things all a day long, either in the full or change of the Moon: but if this be practiſed in the wane of the Moon, he ſhall haue this gift but onely before the Sunne-riſing: vpon other daies, namely while the moone is croiſſant, from ſix of the clock or ſun-riſing ſix houres after. Moreouer, there be certaine ſtones called Chelonitides, becauſe they be like to Tortoiſes, by which theſe Magitians would ſeeme

* *Ebori*: ſome ſay, *Ebeni*, *i.* Ebene.
* *i.* Amber died red with the iooт of Orchanes.
* A kind of Amiantum or Alume de plume.
* A kind of Turquoiſe.

to tell vs by way of propheſie and reuelation, many things for to allay tempeſts and ſtormes: G
but eſpecially the ſtone of this kinde which hath golden drops or ſpots in it, if together with a flie called a beetle it be caſt into a pan of ſeething water, it will auert tempeſts that approch. Chlorites is a ſtone of a graſſe green colour, according as the name doth import; and by the ſaying of Magitians, it is found in the geſier of the bird called Motacilla or Wagtaile, yea and is ingendred together with the ſaid bird. They giue direction (forſooth as their manner is) to inchaſe or incloſe it with a piece of yron, and then it will doe wonders. Choaſpites taketh that name of the riuer Choaſpes, green it is and reſplendent like burniſhed gold. Chryſolampis is found in Æthyopia; all the day long of a pale colour, but by night it glowes in manner of a cole of fire. Chryſopis is ſo like to gold, as a man would take it for no other. The ſtones called Cepionides, grow in Æolis about Atarne, a little village now, but ſomtimes a great town: they haue H
many colours, and be tranſparent; ſometimes in manner of glaſſe, otherwhiles like Cryſtall or the laſper: ſuch alſo as be not cleare through, but foule and thick within, are notwithſtanding ſo pure and neat without, that they will repreſent a man or womans viſage as wel as a mirroir or looking glaſſe.

D Daphnias is a ſtone, whereof *Zoroaſtres* writeth, and namely that it is good againſt the falling ſickneſſe. Diadochus is like to Berill. Diphris is of two kinds, the white and the black, the male and the female; wherein may be perceiued very diſtinctly, thoſe members that diſtinguiſh the ſex, by reaſon of a certain line or vein of the ſtone. Dionyſias is a blacke ſtone and hard withall, hauing certain red ſpots intermingled: if it be ſtamped in water, it giueth the taſt of wine, and is thought to withſtand drunkenneſſe. Draconites or Dracontia, is a ſtone ingendred in the brains I
of ſerpents, but vnleſſe it be cut out whiles they be aliue, namely after their heads be chopt off, it neuer grows to the nature of a precious ſtone; for of an inbred malice and enuie that this creature hath to man, if perceiuing it ſelfe to languiſh and draw on toward death, it killeth the vertue of the ſaid ſtone: and therefore they take theſe ſerpents whiles they be aſleepe, and off with their heads. *Sotacus* (who wrote that he ſaw one of theſe ſtones in a kings hand) reports, that they who go to ſeek theſe ſtones vſe to ride in a coach drawn with two ſteeds, and when they haue eſpied a dragon or ſerpent, caſt in their way certain medicinable drugs to bring them aſleep, and ſo haue means and leiſure to cut off their heads: white they are naturally & tranſparent, for impoſſible it is by any art to poliſh them, neither doth the lapidary lay his hand to them.

E Encardia is a precious ſtone, named alſo Cardiſcæ: one ſort there is of them, wherein a man K
may perceiue the ſhape of an heart to beare out: a ſecond likewiſe there is ſo called, of a greene colour, and the ſame doth repreſent alſo the forme of an heart: the third ſheweth the heart only black, for all the reſt is white. Enorchis is a faire white ſtone; the ſame being diuided, the fragments thereof do reſemble a mans genetoirs, whereof it took that name. As touching Exhebenus the ſtone, *Zoroaſtres* ſaith, that it is moſt beautifull and white, and therewith goldſmiths vſe to burniſh and poliſh their gold. As for Eriſtalis, being of it ſelf a white ſtone, ſeemes as a man holdeth it to wax red. Erotylos, which ſome cal Amphicome, others Hieromnemon, is commended much by *Democritus*, for ſundry experiments in propheſying and foretelling fortunes. Eumeces groweth in the Bactrians country, like to a flint; being laied vnder a mans head lying aſleep vpon his bed, it repreſenteth by viſions and dreams in the night all that hee is deſirous to L
know, euen as well as an oracle. As for Eumetres, the Aſſyrians call it the ſtone or gem of *Belus* the moſt ſacred god among them, & whom they honor with greateſt deuotion: as green it is as a leeke, and ſerueth very much in their ſuperſtitious inuocations, ſacrifices, and exorciſms. Eupetalos hath foure colors, to wit, of azur, fire, vermilion, and an apple. Eureos is like the ſtone of an oliue, chamfered in manner of winkle ſhels, but very white it is not. Eurotias ſeemeth to haue a certain mouldines that couers the black vnderneath. Euſebes ſeemeth to be that kind of ſtone whereof (by report) was made the ſeat in *Hercules* temple at Tyros, where the gods were wont to appear and ſhew themſelues. Mereouer, any precious ſtone is called Epimelas, when being of it ſelfe white, it is ouercaſt with a blacke colour aloft.

G The gem Galaxias, ſome call Galactites, like vnto thoſe laſt before-named, but that it hath M
certain veins either white or of a bloud color running between. As for Galactites indeed, it is as white as milk, and therupon it took that name. Many there be who call the ſame ſtone Leucas, Leucographias, & Synnephites, which if it be bruiſed yeeldeth a liquor reſembling milk, both in color and taſt; & in truth, it is ſaid, that it breeds ſtore of milke in nources that giue ſuck: alſo

that

20030
copy 1

A that if it be hung about the necks of infants, it cauſeth ſaliuation; but being held in the mouth, it melteth preſently. Moreouer, they ſay, that it hurteth memory and cauſeth obliuion: this ſtone commeth from the riuer Achelous. Some there be, who call that Emeraud Galactites, which ſeemeth as it were to be bound about with white veins. Galaicos is much like to Argyrodamus, but that it is ſomewhat ſouler: commonly they are found by two or three together. As for Gaſidanes, we haue it from the Medians, in colour it reſembleth blades of corne, and ſeemes beſet here and there with floures: it groweth alſo about Arbelæ: this gem is ſaid likewiſe to be *conceiued with young, and by ſhaking to bewray and confeſſe a child within the wombe, and it doth conceiue euery three moneths. Gloſſi-petra reſembleth a mans tongue, and groweth not vpon the ground, but in the eclipſe of the Moone falleth from heauen, and is thought by the B magitians to be very neceſſary for pandors and thoſe that court faire women: but we haue no reaſon to beleeue it, conſidering what vaine promiſes they haue made otherwaies of it: for they beare vs in hand, that it doth appeaſe winds. Gorgonia is nothing els but Coral: the name Gorgonia groweth vpon this occaſion, That it turneth to be as hard as a ſtone: it aſſuageth the trouble of the ſea and maketh it calme: the magitians alſo affirme, that it preſerueth from lightning and terrible whirlewinds. As vaine they be alſo in warranting ſo much of the hearbe Guniane, namely, that it will worke reuenge and puniſhment vpon our enemies.

* Haply our Bezoar.

The pretious ſtone Heliotropium, is found in Æthiopia, Affricke, and Cyprus: the ground thereof is a deepe green in maner of a leeke, but the ſame is garniſhed with veins of bloud: the reaſon of the name Heliotropium is this, For that if it be throwne into a pale of water, it chan- C geth the raies of the Sun by way of reuerberation into a bloudie colour, eſpecially that which commeth out of Æthiopia: the ſame being without the water, doth repreſent the body of the Sun, like vnto a mirroir: and if there be an eclipſe of the Sun, a man may perceiue eaſily in this ſtone how the moone goeth vnder it, and obſcureth the light: but moſt impudent and palpable is the vanity of magitians in their reports of this ſtone; for they let not to ſay, that if a man carrie it about him, together with the herbe Heliotropium, and beſides mumble certaine charmes or prayers, he ſhall goe inuiſible. Semblably, Hephæſtites is of the nature of a looking-glaſſe, for although it be reddiſh or of an orenge colour, yet it ſheweth ones face in it: the meanes to know this ſtone whether it be right or no, is this: in caſe being but into ſcalding water, it preſently cooleth it; or if in the Sun it wil ſet on fire any dry wood or ſuch like fewel: this ſtone is D found growing vpon the hill Corycus. Horminodes is a ſtone ſo called, in regard of the greene colour that it hath reſembling the herbe Clarie; for otherwhiles it is white, and ſometime againe blacke, yea and pale now and then; howbeit hooped about it is with a circle of golden colour. Hexecontalithos, for bigneſſe is but ſmall, and yet for the number of colours that it hath, it got this name: found it is in the region of the Troglodytes. Hieracites changeth colour all whole alternatiuely by turns; it ſeemeth to be blackiſh among kites feathers. Hamnites reſembleth the ſpawne of fiſhes: and yet ſome of them be found as it were compoſed of nitre, and otherwiſe it is exceeding hard. The pretious ſtone called Hammons-horne, is reckoned among the moſt ſacred gems of Æthyopia: of a gold colour it is, and ſheweth the forme of a rams horne: the magicians promiſe, that by the vertue of this ſtone, there will appeare dreames E in the night which repreſent things to come. Hormeſion is thought to be one of the louelieſt gems that a man can ſee, for a certaine fiery colour it hath, and the ſame ſpreadeth forth beams of gold, and alwaies carrieth with it in the edges a white and pleaſant light. Hyenia tooke the name of the Hyens eie: found they are in them when they be aſſailed and killed: and if we may giue credit to Magitians words, if theſe ſtones be put vnder a mans tongue, hee ſhall preſently propheſie of things to come. The bloud-ſtone Hæmatites is found in Æthiopia principally, & thoſe be ſimply the beſt of al others, howbeit there are of them likewiſe in Arabia and Affrick: in colour it is like vnto bloud, and ſo called: a ſtone that I muſt not ouerpaſſe in ſilence, in regard of my promiſe that I made to reproue the vanities and illuſions of theſe impudent & barbarous magicians who deceiue the world with their impoſtures: for *Zachalias* the Babylonian, F in thoſe books which he wrote to king *Mithridates*, attributeth vnto gems all the deſtinies and fortunes that be incident vnto man: and particularly touching theſe bloud-ſtones, not contented to haue graced them with medicinable vertues reſpectiue to the eies and the liuer, he ordained it to be giuen vnto thoſe for to haue about them, who carry any Petition to a king or great prince, for it would ſpeed and further the ſuit: alſo in caſe of law matters it giueth good iſſue

and ſentence on their ſide,yea and in wars,victory ouer enemies. There is another of that kinde, G
called by the Indians Henui,but the Greekes name it Xanthos:of a whitiſh colour it is vpon a
ground of a yellow tawnie.

I The ſtones called Idæi Dactyli,be found in Candy:of an yron colour they be,and reſemble
in forme the thumb of a mans hand. As touching Icterias,there be foure kinds therof,to wit
one like to a pale coloured bird called the Lariot;and therefore is thought to be good againſt
*Lividior. the jaundiſe:a ſecond there is of the ſame name,but more enclining to a * ſwert color:the third
reſembleth a green leafe,broader than the former,weighing little or nothing,and is beſides full
of pale and wan veins:the fourth is of the ſame colour, but it hath blacke veins running too and
fro. The ſtone called *Iupiters* gem,is white,light, and tender. The ſtone Indico taketh name of
thoſe nations from whence it commeth;the colour outwardly is ſomewhat reddiſh, and if it be H
rubbed,there commeth from it a certain purple humor in manner of a ſweat. There is another
of that name,but it is white,and ſheweth like vnto duſt or powder. The ſame Indians haue ano-
ther gem called Ion,for that it reſembleth the colour of the March violet; but ſeldome ſhall a
man ſee it with a freſh and gay blew indeed.

L The ſtone Lepidotes doth repreſent skales of fiſhes in ſundry colours. Lesbias taketh name
of the Iſle Lesbos the natiue place thereof:howbeit they are found in India likewiſe. Leucoph-
thalmos, is otherwiſe reddiſh or tawnie, howbeit in that colour it carrieth the forme of an eie,
both for white and blacke. Leucopetalos ſheweth white in manner of ſnow,and yet the ſame is
garniſhed with a luſtre of gold. Libanocrus in colour reſembleth frankincenſe,but a liquor or
moiſture it yeeldeth anſwerable to hony. Limoniates ſeemeth to be all one with the Emeraud. I
As touching the vnctuous ſtone Liparis, I find this only written of it, That a ſtinke or perfume
thereof fetcheth forth any venomous vermine. The ſtone Lyſimachus is like vnto the marble
of Rhodes,and hath in it certaine veines or ſtreakes of gold: This ſtone muſt be poliſhed vpon
marble:and when all the ſuperfluities be fetched off,it is found to grow narrow pointwiſe. Leu-
cochryſos ſeemeth to be made of a Chryſolith, hauing white veins or ſtreakes betweene.

M A gem there is called Memnonia,but I haue not read the deſcription thereof. As for Media,
it is a blacke ſtone,and found it was firſt by that famous *Medea*,of whom the Poëts write ſo
many fables, yet certaine veins it hath of a golden colour:a kind of ſweat iſſueth from it yellow
as ſaffron,and in taſt much reſembling wine. Meconites doth repreſent expreſſely,poppy heads.
The ſtone Mitrax we had from the Perſians,and the mountains along the red ſea:many colours K
it hath,and againſt the Sun it glittereth diuerſly. Meroctes is green like vnto a leeke,and yet if
you rub it,you ſhall ſee a humour come from it like to milke. The Indian ſtone Morion(which
is moſt blacke and yet tranſparent) They call Pramnion:if it be intermingled with the fiery red
of the Carbuncle or Rubie,they call it Alexandrinum;like as the Cyprian, Morion,which hath
a ſhew of the Sarda or Cornalline:found there be of them in Tyrus and Galatia. *Xenocrates* re-
porteth,that vnder the Alpes alſo they be gathered. Theſe be the gems that be fitted for to en-
graue the forme of any thing from a pattern. As for Myrrhites,it hath the colour of Myrrhe,and
the forme of a fine pretious ſtone:it yeeldeth the ſmell of a ſweet perfume or ointment,and be-
ing rubbed giueth a ſauour alſo of Nard. As touching Myrmecias,it is blacke,and hath certain
riſings in it like to werts. Myrſinites in colour reſembleth hony,and in odour the myrtle. Me- I.
ſoleucos is a gem diuided juſt in the mids with a white line: contrariwiſe, Meſomelas, when
there is a blacke line cutteth threugh any other colour in the middeſt.

N Naſamonites is in colour like to bloud,howbeit certaine blacke veins it hath. Nebrites is a
ſtone conſeciate to god *Bacchus*: it tooke that name of the reſemblance which it hath to thoſe
skins of deere that he was wont to weare: there be others of the ſame kind, but blacke they are.
The gem Nympharena keepeth the name of a city and nation in Perſia;and it reſembleth the
teeth of a water-horſe.

O Orca is the barbarous name of a certaine pretious ſtone,which is very pleaſant vnto the eie:
wherein concurre together blacke,yellow,greene,and white. Ombria,which ſome call Notia,is
*As the haire growing in the forhead, and ſuch things, whereof aſſay was giuen firſt to the fire. ſaid to fall from heauen in ſtormes,ſhowers of raine, and lightening, after the manner of other M
ſtones,called thereupon Ceraunia and Brontia:and the like effects are attributed to it, as be re-
ported of Brontia:and thus much moreouer, That ſo long as it lieth vpon the hearth of an altar,
the * libaments will not burne that be offered thereupon. Orites is in forme round as a globe:
ſome call it Siderites,it will abide the fire and feele no harme therby. Oſtracias or Oſtracites is
made

20030
copy 1

A made in manner of a ſhell,and is exceeding hard. A ſecond kind there is of it reſembling an Agath,but that an Agath in the polliſhing ſeemeth to looke greaſily, which the Oſtracias doth not. And the harder kind of this ſtone is of that power,that the fragments thereof will ſerue to engraue other gems. As for Oſtracites,it took the name of an Oyſtre ſhell,which it doth repreſent. The Barbarians haue a pretious ſtone,which they call Ophicardelos;blacke of colour,and the ſame encloſed with two white lines or circles. As touching the ſtone Obſidianus, I haue written ſufficiently in the book going next before: and yet there be certain gems of that name, and carrying the ſame color,not only in Æthyopia and India,but alſo in Samnium,as ſome are of opinion,yea,and in the coaſts of the Spaniſh Ocean.

Panchrus,according to the name,ſeemeth to conſiſt(in manner) of all colours. Pangonius is P
B no longer than a mans finger:it differeth from Cryſtall in this onely, that it hath more angles in number, whereupon it got the name. As for Paneros, what manner of ſtone it is *Metrodorus* hath not ſet down,howbeit he reciteth an elegant verſe of queen *Timaris*, which together with the ſtone ſhe conſecrated to *Venus*: whereby is giuen to vnderſtand, That by the meanes thereof ſhe became fruitfull and bare children: Some there be who call this gem Panſebaſton. Now concerning the gems of Pontus,knowne by the name of Ponticæ,there be many ſorts of them. One is full of ſtars,garniſhed with bloudy or blacke ſpecks in maner of drops;and this is counted among the ſacred ſtones:another in ſtead of ſtarres hath ſtrakes and lines onely of the ſame colours:and there be of them again which repreſent the forme of mountaines and vallies. The gem Phloginos,which is called likewiſe Chryſites, is found in Ægypt, and is likened vnto the
C Oſtracias of Attica. Phœnicites tooke the name of the ſimilitude that it hath to a Date. And Phycites was ſo named,becauſe of the likenes it hath to the ſea weed or lectuce,named Phycos in Greeke. Perileucos is a ſtone, ſo called by occaſion of a whitiſh lace that ſeemeth to go from the mouth of the gem downe to the very bottome. The gems Pæantides,which ſome name Gemonides, are ſaid to conceiue and to bring forth other litttle ſtones: but a ſingular vertue they haue to help women that be in trauell of child-birth. Such be found in Macedonie, neere vnto the monument or ſepulchre of *Tireſias*,and that which they bring forth,ſeemeth like vnto water growne to be congealed into yce.

The Sunnes gem is white, and after the manner of the Sunne, whoſe name it beareth, it ca- S
ſteth forth ſhining raies round about on euery ſide. Sagda is a ſtone,which the Chaldæans find
D ſticking to ſhips,and they ſay it is greene as Porrets or Leekes. Samothracia the Iſland yeelds vs a pretious ſtone of the owne name, blacke of colour,light in hand, and like to [rotten]wood. As for Saurites,it is found (by report) in the belly of a green Lizard,ſlit open with the edge of a cane or reed. Selenites is a pretious ſtone,white & tranſparent, yeelding from it a yellow luſtre in manner of hony,and repreſenting within it the proportion of the Moone, according as ſhee groweth toward to the full,or decreaſeth in the wane againſt the change: This admirable ſtone is thought to be found in Arabia. Siderites is much like to yron: and ſuppoſed it is, That if it be brought among them that are at ſome variance or controuerſie already in law, it will breed diſcord and maintain diſſention ſtill. Of this Siderites is made another ſtone,which is engendred in Æthyopia,called Sideropœcilos,for the ſundry ſpots therein. Spongites is like vnto a
E ſponge,euen as it carrieth a name reſpectiue vnto it, Synodontites commeth from the braine of certaine fiſhes called Synodontes. The ſtones Syrtitæ be found in the ſhore of the Syrtes in Barbary,yea,and in Lucania, ſhining with the colour mixt of ſaffron and hony, but within they containe certaine ſtarres, which haue but a dim and duskiſh light. The ſtone Syringites is hollow throughout in manner of a pipe, and is like vnto a ſtraw betweene two joints.

Trichrus that commeth out of Affricke is blacke, howbeit if it be rubbed it yeeldeth three T
kinds of humours from it; to wit, from the root or bottome blacke, out of the mids like bloud, and in the head white. Telirrhizos is of an aſh colour or reddiſh, and yet the bottome thereof is a louely & ſightly white. Telicardios is much eſteemed in the realme of Perſia, where it is engendred:in colour it reſembleth the heart,and they call it there in their language,a Spot. The
F ſtone Thracia is of three kinds; the firſt green, the ſecond more pale,and the third full of ſpots of bloud. Tephritis,although otherwiſe it be of the color of aſhes,yet it repreſents a new Moon croiſant and tipped with hornes. Tecolythus ſeemeth like to the ſtone or kernill of an Oliue: It is not raunged in the number of pretious ſtones,but whoſoeuer licke thereof, ſhall find, That it will breake the ſtone and expel it. The ſtone called *Venus* haire, is exceeding black and ſhining;

how it maketh a ſhew of red haires ſprinkled among. G

V Veientana is a gem proper vnto Italie, found about Veij, a citie in Tuſcane: this ſtone is blacke and croſſed through the middeſt with a white path.

Z Zanthenes (as *Democritus* writeth) is found ordinarily in Media: in colour it reſembleth baſe gold Electrum: and if a man doe ſtampe it in Date wine and Saffron together, it will relent in manner of wax, and caſt a moſt ſweet and pleaſant ſmell. Zmilaces is a ſtone which the riuer Euphrates yeeldeth, like to the marble of Proconneſus, but that in the middeſt it hath a greeniſh colour. Finally, Zoroniſios is engendered in the riuer Indus: commonly it is called the Magicians gem: more of it I find not written.

Chap. XI. H

¶ *Of certaine pretious ſtones, taking their names from the members of mans body, from beaſts alſo and other things.*

BEſides thoſe gems comprehended vnder the Alphabet, there be more pretious ſtones alſo compriſed after other ſorts of diſtinction, according to diuers ſignificant varieties: for ſome there be which bear the names of certain members of the body; as for example, Hepatites, of the liuer; Steatites, of the ſundry ſorts of fat, greaſe or tallow of each beaſt. Adad * Nephros is a ſtone worſhipped among the Ægiptians, ſo is Theudactylos alſo. As for Adad, hee is the chiefe god among the Aſſyrians. The ſtone Triophthalmos groweth together with the Onyx ſtone, and repreſenteth three eies of a man together. I

* It taketh the name of the kidnies.

There be gems take their names likewiſe of beaſts, to wit, Carcinias of the colour which the ſea-crab hath; Echites, of a Viper; Scorpites, either of the color or form of a Scorpion; Scarites, of the fiſh Scaurus, *i.* a Gilthead; Triglites, of the Barble; Ægopththalmos, of a Goats eye; like as another, for the reſemblance that it hath to the * eie of a ſwine. Geranites tooke name of a cranes color; euen as Hieracites of the Hawkes or Faulcons color. Aëtites reſembles the color of that Ægle which hath a white taile. Myrmerites ſheweth the forme of a Piſmire creeping within the ſtone; ſo doth Cantharias, of Beetles. Lycophthalmos hath the reſemblance of a Wolfes eie, and conſiſts of 4 colours; the outward parts are tawnie, enclining to a bloud red, in the middeſt there is a black, encloſed within a white circle, as like to the ſaid eie as poſſibly can be. The ſtone Toas is like to a Peacock, euen as the gem Chelonia to the Tortoiſe. In Hammochryſos there is a reſemblance of ſand, as if ſand & gold were entermingled. Cenchrites is made like to the graines or ſeeds of Millet ſcattered here and there. Dryites hath a great affinity with the ſtock of a tree: and the ſame will burn after the maner of wood. Ciſſites is white, and in that white ſhining ſeemeth to be claſped euery where with leaues of yvie. Narciſſites likewiſe is diſtinguiſhed and parted with veines of yvie. Cyamea is black, but being broken, it yeelds out of it a reſemblace of a Beane. Pyren is ſo called by reaſon of an oliue ſtone or keruill which it reſembleth: within this ſtone there appeare otherwhiles as it were fiſh bones. Chalazias as it carrieth the name of haile, ſo it repreſenteth as well the color as the ſhape thereof; but as hard it is as the Diamant: It is reported alſo, that if it be put into the fire, yet it wil continue cold & not alter a whit. The fire ſtone Pyrites is verily black: but rub it with your finger, you ſhal find it to burne. Polyzonos is a black ſtone of it ſelfe, but many white fillets it hath about it. Aſtrapias is white or blue like Azur, yet from the middeſt thereof iheir ſeeme to ſhoot raies of lightening. In the ſtone Phlegontis there appeare a burning flame within, and neuer commeth forth. In the Granat named Authracitis, there is a ſhew otherwhiles of ſparkles running to & fro. Enhydros is euermore abſolutely ſmooth and white, containing within a certain liquor that moueth too and fro if a man ſhake it, as he may perceiue in egges. Polytrix is a greene ſtone, bedecked with fine veines in manner of the haire of ones head: but (by report) it will make the haire to ſhed off as many as carry it about them. Of a Lions skin, Leontios beareth the name: like as Pardalios of a Panther. The golden color in the Topaze gaue it the name Chryſolith: ſo the graſſe green of a Leeke was occaſion of the name Chryſopraſos: and of hony was deuiſed the colour and name Melichrus, although there be many kinds of it. As for Melichloros it is of two colours, partly yellow, and partly reſembling hony. Crocias is yellow as Saffron: and Polia ſheweth a certaine greyneſſe in manner of Spart. As for Spartopolios the blacke, it ſheweth like ſtriſtly veins to the other, but much harder. Rhodites took name of the Roſe: Melites of the apple, the colour wher-

copy 1

A of it shews: Chalcites of brasse; and Sycites of a fig. I see no proportion or reason at all between the stone Borsycites and that name; this stone is blacke and branching, and the leaues are white, or red like bloud; no more than I do in Gemites, which representeth (as it were) engrauen in the stone, white hands clasped one within another. As for Ananchitis, it is said, That spirits may be raised by it in the skill of Hydromantie: like as by Synochitis, the ghosts which are raised, may be kept aboue still. What should I speake of the white Dendritis, which if it be buried in the ground vnder a tree that is to be fallen, the edge of the axe that heweth it, will not turne or wax blunt. There be a number of other, and those in nature more prodigious than the rest: for which the Barbarians haue deuised strange names, professing to vs, that they were stones indeed. for mine owne part it shall suffice that I haue disproued their lies in these abouenamed.

B

Chap. XII.

¶ *Of new stones, and those naturall. Of such as be counterfeit and artificiall. Of diuers formes and shapes of gems.*

THere grow still precious stones vnlooked for euery day, that bee new and haue no names, such as that in Lampsacus, where one was found in the gold mines so faire and beautifull, that it was thought a present worth sending to K. *Alexander* the Great, as *Theophrastus* writeth. As touching the stones Cochlides, which now are most common, they seeme rather artificial than natural: and verily it is said, That in Arabia there be found of them huge masses which
C are sodden in hony 7 daies and nights together continually; by which means, after that all the earthy and grosse refuse of this stone is taken away, the stone it selfe remaineth pure and fine: and then comming vnder the lapidaries hand, they be diuided into sundry veines, and reduced into drawne or inlaid worke of Marquetage, as he will himselfe. And herein is seen the cunning of the cutter, for that it is so vendible, & euery mans mony. In old time they were made of that bignesse, that the KK. of the East had their horses set out therewith, not only in their frontstals, but also in the pendants of their caparisons. And verily, al other precious stones being decocted in hony, look faire and neat with a pleasant lustre: but principally the Corsicks, which abhor all things els that are more eager than hony. Moreouer, this is to be noted, that our lapidaries haue a tearme for those stones which are of diuers colors, and they call them Physes, as if they had
D not another vsuall name for them: & this they do in the subtilty of their wit, to make them seem more wonderful by these strange words of art, as if they would vendicat them for their very wonders of Natures worke: whereas indeed there be an infinit number of names, deuised all by the vain Greeks, who knew not how to make an end, which I purpose not to rehearse; and verily, after I had discoursed of the noble and rich stones, I contented my selfe in some sort to specifie those of a baser degree, such I mean as were more rare than others, & to distinguish them that were most worthy to be treated of. But this eftsoons would be remembred, that one & the selfsame stone changeth the name, according to the sundry spots, marks & werts that arise in them: according also to the manifold lines drawn in them, the diuers veins running between, and the variety of colors therein obserued. It remains now to set downe some generall obseruations indifferent to all sorts of gems, and that after the opinion of the best approoued and experienced
E authors in this kind. Any stones that be either hollow & sunk in, or bearing out in bosse or belly be nothing so good as those which cary an euen and leuell table. The long fashioned gems are most esteemed: next to them such as be formed like to lintil seed: after them those that be round in manner of a targuet: and as for such as be made with many faces & angled, they be of al other least accounted of. To discern a fine & true stone from a false and counterfeit, is very difficult, forasmuch as there is an inuention to transform true gems into the counterfeit of another kind. And in truth men haue deuised to make Sardonches by setting and glewing together the gems named Ceraunia, & that so artificially, that it is vnpossible to see therein mans hand: so handsomly are couched, the black taken from this, the white from that, & the vermilion red from a-
F nother, according as the richnes of the stone doth require, & all those in their kind most approued. Moreouer, there be in my hands certain books of authors extant, whom I wil not nominate for all the good in the world, wherein is deciphered the manner and means how to giue the tincture of an Emeraud to a Crystall, & how to sophisticat other transparent gems; namely, how to make a Sardonyx of a Cornalline, & in one word, to transform one stone into another: & to say a truth, there is not any fraud or deceit in the world turneth to greater gain and profit than this.

CHAP.

G

Chap. XIII.

¶ *The way how to make proofe of fine precious ſtones.*

LEt other writers teach how to deceiue the world by counterfeiting gems, for mine own part I will take a contrary courſe, and ſhew the means how to find out falſe ſtones that be thus ſophiſticat: for ſurely, wanton and prodigall though men and women bee in the exceſſiue wearing of theſe jewels, yet meet it is they ſhould be armed and inſtructed againſt ſuch couſiners. And albeit I haue already touched ſomwhat reſpectiuely as I treated of the chiefe & principall gems, yet I wil adde ſomwhat more to the reſt: firſt and formoſt therfore this is obſerued, That all ſtones which be tranſparent, ought to haue their triall in a morning betimes, or at the H
fartheſt (if need ſo require) within foure hours after morning light, but in no wiſe later. Now there be diuers experiments that ſerue for this purpoſe, to wit, the weight of a ſton, for commonly the fine gem indeed is heauier than the other: ſecondly, the very body and ſubſtance is to bee conſidered; for it is an ordinary matter to ſee in the ground and bottome of falſified ſtones certain little puſhes as it were riſing out; to feele them rough in hand outwardly; alſo to perceiue their filaments not to continue their luſtre ſurely, and to beare it out to the very eie, but commonly in the way to vaniſh and be ſpent. But the moſt effectuall proofe of all, is to take a little fragments, to be ground afterward vpon a plate of yron: but lapidaries wil not indure this triall; they refuſe alſo the experiment made by the file: furthermore, the fragment of the black Agath
or Geat, wil not raſe or skarifie true gems. *Item*, Falſe ſtones if they be pierced or ingrauen, will I
ſhew no white. Such difference there is moreouer in ſtones, that ſome ſcorne all ingrauing with an yron punſon: others likewiſe cannot be cut but with the inſtrument or grauer bent & turned back: but there is not one but may be ingrauen with the Diamant. And verily, the moſt material thing herein, is to heat the grauing ſteele or punſon.

As touching riuers that affoord precious ſtones, Aceſines and Ganges are the chiefe: and of all lands, India is the principall.

And now hauing diſcourſed ſufficiently of al the works of Nature, it were meet to conclude with a certain general difference between the things themſelues, and eſpecially between country and country. For a finall concluſion therefore, go through the whole earth and all the lands lying vnder the cope of heauen, Italy wil be found the moſt beautiful & goodlieſt region vnder K
the Sun, ſurpaſſing all other what ſoeuer, and worthily to be counted the chiefe and principall in euery reſpect: Italy (I ſay) the very lady and queen, yea, a ſecond mother next to dame Nature of the world: chiefe for hardy men, chiefe for faire and beautifull women, inriched with captaines, ſouldiers, and ſlaues: flouriſhing in all arts and ſciences, abounding with noble wits and men of ſingular ſpirit; ſcituat vnder a climat moſt wholeſome and temperate, ſeated alſo commodiouſly (by reaſon of the coaſts ſo ful of conuenient hauens) for traffick with all nations, wherein the winds are moſt comfortable (for it extendeth it ſelfe and lieth to the beſt quarter of the heauen, euen in the midſt juſt between Eaſt and Weſt;) hauing waters at command, large foreſts & faire, and thoſe yeelding moſt healthful air; bounded with mighty rampiers of high mountains, ſtored with wild beaſts, and thoſe harmleſſe: finally, the ground ſo fertile for corn, the ſoile ſo battle for L
herbage, as none to it comparable. In ſumme, what ſoeuer is neceſſary and requiſit for the maintenance of this life is there to be had, in no place better: all kind of corne and grain, wines, oile, wooll, linnen, woollen & excellent bœufs; as for horſe-fleſh, I haue alwaies heard, euen from the mouth of thoſe that be profeſſed runners in the race with horſe and charriot, That the breed of Italy paſſeth al others: for mines of gold, ſiluer, braſſe, & yron, it gaue place to no country what ſoeuer, ſo long as it pleaſed the ſtate to imploy it that way; and in lieu of thoſe rich commodities which it hath ſtill within her womb, ſhe yeeldeth to vs variety of good liquors, plenty of al ſorts of corn, and abundance of pleaſant fruits of all kinds. But if I ſhould ſpeake of a land after Italy (ſetting aſide the monſtrous and fabulous reports that go of India) in my conceit Spaine is next in all reſpects, I meane thoſe coaſts which are inuironed with the ſea. M

An Aduertiſement.

WHereas in the former edition this page was ſtuffed full of Errata, which were occaſioned by reaſon of the various matter and words vſed in this Hiſtorie, not common obvious in other Authors; ſuch care in this ſecond Edition hath beene taken, as that they haue all beene amended, whereby the Readers paines to mend, or be offended with them, is taken away. This I thought good to giue notice of, leaſt any ſhould thinke them omitted, not amended.
